The total value of imports into France from the United States during the year ending June 30, 1875, was $34,512,556; and the exports from France to the United States during the same period amounted to $33,977,524. The ratio of increase of imports and exports since 1855 may be seen from the following figures, representing the average annual general and special commerce, including specie movements, in millions of francs:

Of the aggregate tonnage about 86 per cent. belonged in 1870 to French vessels, against 88 per cent. in 1869. Foremost among the countries with which France had maritime relations in 1870 were England (3,940,025 tons), Italy (923,718), Algeria (632,602), Russia (526,893), United States (524,558), Turkey (419,866), and Germany (315,364). The strength of the French mercantile navy, exclusive of small fishing vessels, was on Jan. 1, 1870, as follows:

In that year 3,681 vessels (including 240 steamers) of 369,288 tons belonged to ports of the Mediterranean, and 13,097 vessels (214 steamers) of 605,873 tons to ports on the Atlantic. The merchant marine has increased since 1867 by 3,000 vessels, with a gain in capacity of about 180,000 tons. The coast fisheries in 1871 employed 17,998 boats, with 60,635 men. About 80 per cent. of the foreign trade is carried by land. The coasting trade of France is very large. There are 242 ports, the principal of which, in the order of their importance in this branch of commerce, are Marseilles, Havre, Bordeaux, Rouen, Aries, Honfleur, Rochefort, Dunkirk, Cete, and Libourne.—France has an excellent and extended system of railways. Paris is the central starting point of these roads, which, running in every direction, place the metropolis in direct communication with nearly all parts of the country. They may be divided into the following great lines, each of them sending off numerous branches: 1, the Northern railway, leading to the N. E. frontier, where it connects with the Belgian roads; 2, the Eastern or Strassburg, by Mex, Chalons-sur-Marne, and Nancy, to the banks of the Rhine; 3, the Southeastern or Mediterranean, passing through Fontainbleau, Dijon, Lyons, and Avignon, to Marseilles; 4, the Orleans, which branches at Orleans into the Central railway, which runs in a S. direction, and the Southwestern or Bordeaux, which first follows the Loire, then runs from Tours to Bordeaux, and terminates at Bayonne, connecting with the Spanish lines; 5, the Western, connecting the metropolis with the seaport of Brest, through Versailles, Le Mans, and Rennes; 6, the Northwester or Havre, traversing the valley of the Seine. Two other lines of great importance start from Bordeaux: one, the Southern, connects this city with the Mediterranean at Cette; the other gives direct communication between Bordeaux and Lyons, under the name of the Great Central. The aggregate length of railways in operation in September, 1872, was 10,612 m. The aggregate length of telegraph lines at the beginning of 1870 (inclusive of Alsace and Lorraine) was 26,282 m.; of wires, 71,930 m. France is well provided with highways, which are divided into national, military, departmental, communal, and vicinal roads, the cost of each class being respectively defrayed by the government, the departments, or the communes to which they belong. The first class of these thoroughfares, about 200 in number with an aggregate extent of upward of 20,000 m., are wide highways, paved or macadamized, and bordered with fine trees; the departmental roads are tolerably good, but the communal are indifferent, and too often out of repair, as they are not like the others under the charge of civil engineers appointed by the government. The canals, 79 in number, have an aggregate length of about 3,000 m.; among the principal are: the Southern canal (canal du Midi), which runs from Cette to Toulouse, where it joins the Garonne, and thus connects the Mediterranean with the Atlantic; the canal of Burgundy, between the Yonne
and the Saône, and the canal of the Rhône and Rhône, connecting these two rivers; the canal of the Centre, between the Loire and the Saône; the Loing, Nièvre, and Orléans canals, opening a communication between the Seine and the Loire; the St. Quentin canal, which is remarkable for its tunnel, and connects the Oise with the Scheldt; the canal of Brittan-
y, the longest of all, running from Nantes to Brest, 230 m. The railways, highways, and canals are placed under the superintendence of a special department known as the board of en-
gineers of bridges and public works (ingénieurs des ponts et chaussées). Each department has its chief engineer.—The present government of France is a republic, that form having been pro-
claimed on Sept. 4, 1870, immediately after the downfall of Napoleon III., when a provisional government was instituted. In the hands of a national assembly, at first called only for the purpose of debating on the terms of peace with Germany, the organization of government gradually assumed a more definite form; and although the labors of this assembly have not yet (May, 1874) resulted in a positive and accepted permanent constitution, the present administration of the country pending the completion of this work may be considered fixed as follows. The executive power is exercised by a president, who is responsible to the as-
sembly. The term of office of Marshal Mac-
Mahon, who succeeded M. Thiers in this office in May, 1873, has been fixed at seven years by a special decree of that body, passed in Novem-
ber. Under the president, and appointed by him, are the ministers of justice, foreign affairs, the interior, finances, marine and colonies, public instruction, public works, agriculture and commerce, and war, all of whom are also responsible to the assembly. Each department under these has its chief and under secretaries. The national assembly is made up of members elected at different times since its constitution in February, 1871. By a law passed May 24, 1873, a council of state was created, consisting of 28 members elected by the assembly, and 15 appointed by the president. The functions of this body are restricted to the giving of advice on bills presented to the assembly by the government, or on matters submitted to it by the president or ministers. The internal administration of each department is in the hands of a prefect, who is assisted by a council of prefecture, and has under his direction the sub-prefects of the arrondissements; a mayor, aided by a municipal council, is at the head of each commune. The mayors of towns with more than 20,000 inhabitants, and of the capit-
als of departments and arrondissements, are appointed by the government. In other towns the mayor is elected by the municipal councils. Councils of arrondissement and councils of department hold sessions of a few days twice every year to regulate the assessment of taxes and give expression to the wishes and wants of their respective communities. Such are the administrative arrangements all over the coun-
try, with the exception of the department of the Seine and the city of Lyons, which have an organization of their own.—For the admin-
istration of justice France has 27 courts of appeal established in so many of the principal cities, and holding jurisdiction over from one to seven departments. They are composed of a president, several vice presidents, and from 20 to 60 councillors, to whom must be added an attorney general (procureur général), as-
isted by advocates general and substitutes. The principal of these courts is that of Paris. Under them, each arrondissement has its court of original or primary jurisdiction (tribunal civil ou de première instance); each canton, its tribunal of justice of peace and its simple police court. At the head of the judiciary establish-
ment stands the court of cassation, which is a supreme court of appeal in both civil and criminal cases. The crime of high treason falls under the jurisdiction of an exceptional high court of justice. The judicial courts (in each department) are organized juries, but take cognizance of criminal cases only. The court of accounts (cour des comptes), although not a regular tribunal, may be also mentioned here; it is established to audit and examine all the accounts connected with the public revenue and expenditure. Besides the regular judi-
ciary courts, tribunals of commerce and councils of prud'hommes, chiefly composed of commer-
cial men, have been established in the principal manufacturing and commercial towns, to decide upon cases connected with trade and manufact-
ures. The penitentiary institutions of France, in which great improvements have been made within the last 80 years, are generally well managed and free from abuses. Besides the bagne of Brest, Rochefort, and Toulon, most of the inmates of which have been transported to the penal colonies of Guiana, there are 23 cen-
tral prisons for convicts of various grades, the principal being at Clairvaux, Gaillon, Melun, Poissy, and Clermont-de-l'Oise.—Religious toler-
ation is established by a law which se-
cures equal freedom and protection to every kind of worship; but all forms of religion not expressly recognized by the government are likely to suffer from the regulation which makes meetings of more than 50 persons dependent upon previous authorization by the police. A vast majority of the population belong to the Roman Catholic church. The French government not only supports the pastors of this church, but also those of the Protestant and Jewish communions. France, exclusive of its colonies, is divided into 84 Catholic dioceses, 67 of which are bishoprics and 17 archbishoprics, viz.: Aix, Albi, Auch, Avignon, Besançon, Bordeaux, Bourges, Cambrai, Chambéry, Ly-
ons, Paris, Rennes, Rheims, Rouen, Sens, Toul-
ouse, and Tours. Every bishop and archbishop is assisted by vicars general and a chapter. The dioceses are divided into parishes, which, according to their importance, are intrusted to
priests holding for life, or to ministers removable at will by the bishops. The former are called *cura inamovibile*, the permanency of their office being recognized by the civil authority; the latter *cura amovibile*, of which the number in 1872 exceeded 40,000; that of convents, 2,600. Each diocese has a petit séminaire or college, where the classics, mathematics, natural and mental philosophy are taught; and a grand séminaire, or theological seminary. The French Protestants mostly belong to the Lutheran and Reformed or Calvinistic churches, both of which are recognized by the state, which annually appropriates a sum for their support. The Lutherans were greatly diminished in number by the cession of Alsace and Lorraine to Germany; their largest congregations are now found in the departments of Doubs and Seine. In 1872 they had 69 pastors, and about 74,000 church members, with presbyterials, councils and 8 consistory, under the superintendence of a director at Paris. The Calvinists, who mostly inhabit the departments of Seine, Gard, Charente-Inferieure, Ardèche, Drôme, Tarn, Tarn-et-Garonne, Lozère, and Deux-Sèvres, have 596 church pastors, presbyterials, 108 consistory, a central council sitting at Paris, and a theological college at Montauban. The population connected with this church is estimated at 488,000.

Of the Protestant churches which receive no government support, the more important are the following: the union of evangelical churches, founded in 1849, with 45 churches and about 8,000 members in 1872; the Methodists, with 24 ministers and 1,916 members; and the Baptists, with 8 congregations and about 800 members. The Jews, numbering about 46,000, who are found principally in the large towns of the east and south, have synagogues at Paris, Nancy, Bordeaux, and Marseilles, with a central council in the capital. The clergy of the Catholic church, which previous to the French revolution was the holder of fully one third of the landed property, and had a yearly income amounting to very near $40,000,000, now receive a salary, the aggregate amount of which in the budget of 1873 was 51,000,000 fr.—The government has a direct and supreme control over public instruction, through the instrumentality of that powerful institution known as the university of France, and the combined action of its civil officers in the administration thereof. The minister of public instruction, placed at the head of the whole organization, is assisted by an imperial council and a body of 18 inspectors general. The country is divided into 15 districts, each with its academy; the seats of these institutions are at Aix, Besançon, Bordeaux, Caen, Clermont, Dijon, Douai, Grenoble, Lyons, Montpellier, Nancy, Paris, Poitiers, Rennes, and Toulouse. Each academy is governed by a rector, with an academy inspector for every department. The rector is assisted by an academical council, of which he is the presiding officer; the academy inspector, by a departmental council presided over by the prefect. Three grades of instruction are recognized, superior, secondary, and primary. Superior instruction, embracing the higher branches of human knowledge only, is given by a number of faculties, the professorships of which are intrusted to men of tried capacity and talent. There are 6 faculties of theology (all Catholic), 12 of law, 2 of medicine, 15 of science, and 15 of letters. Secondary instruction is supplied by secondary schools of medicine and pharmacy, national lycées and communal colleges, under-seminaries, chiefly for theological students, and private institutions and schools. In 1878 there were 78 lycées, 236 communal colleges, 19 professional schools, and a large number of private institutions. The aggregate number of scholars in the public institutions was about 70,000, the under-seminaries not included. The above two branches of public instruction are under the special control of the rectors and academy inspectors. The third, primary instruction, is especially intrusted to the care of the prefects, aided by special inspectors. For primary instruction there are about 69,000 schools established all over the country. These are supported by the communes; part of their pupils are admitted free of expense; the others pay a trifling annual charge. Asylums for children complete the establishments of primary instruction. Normal schools for the education of primary teachers exist in nearly all the departments, and have worked satisfactorily. The majority of the professors in the national lycées are educated at the superior normal school in Paris. Candidates for the Catholic priesthood are educated in theological seminaries or grands séminaires under the exclusive control of the Catholic bishops; and ministers in the Protestant seminary at Montauban. These schools are of course out of the pale of the university. So are also the polytechnic school, where naval, military, and civil engineers, artillery officers, &c., are educated; the military schools of St. Cyr, La Flèche, and Saumur; the practical schools for artillery and engineering, &c.; all of which are under the supervision of the minister of war. Some other practical schools connected with the navy, civil engineering, the mines, manufactures, forests, &c., are respectively controlled by the ministers to which they more properly belong. The central school of art and manufactures at Paris, a dependency of the ministry of public works, deserves particular notice on account of its general usefulness. Of similar importance are the collège de France, where lectures are delivered on the highest topics of science and literature; the museum of natural history; an admirable collection of animal, vegetable, and mineral wealth, connected with the *jardin des plantes*; and the lectures on oriental languages delivered at the national library. Above all these learned institutions stand the French
academy, the academies of inscription, of science, of the fine arts, and of moral and political sciences, which compose the five classes of the institute of France.—The charitable institutions of France are very numerous. Hospitals and asylums exist in nearly every town of importance. These establishments, some of which hold considerable property, are supported by the state, the department, or the commune. The largest and wealthiest are at Paris, Lyons, Bordeaux, Rouen, Marseilles, Lille, and Nantes. There are military and marine hospitals under the control of the secretaries of war and the navy. The former are established in the principal fortified places, about 40 in number. The four marine hospitals at the great seaports of Cherbourg, Brest, Rochefort, and Toulon can accommodate more than 6,000 patients, and are taken care of by sisters of charity and male overseers. Of several asylums for disabled soldiers and sailors who have served their country for a period of years, the most celebrated is the hôtel des invalides at Paris, having a marshal of France for its governor, a large staff of officers, and liberal revenues. It contains nearly 8,000 old soldiers. Among the other institutions are the blind asylum, known as the hospice des quinquenges; and the institution for the education of the blind at Paris; the institutions for deaf and dumb there and at Bordeaux; over 40 lunatic asylums, the most important of which is at Charenton, near Paris; foundling hospitals, &c. Poor-relief boards (bureaux de bienfaisance) give indoor and outdoor relief to the paupers of the various communes. Various societies for the assistance of prisoners or the sick, and a vast number of philanthropic associations of all kinds, are dispersed throughout the country. There are 46 monts de piété (pawnbroking establishments), with a capital of nearly 50,000,000 francs, making yearly loans to the amount of about 60,000,000 francs. Such loans are gratuitous in five of the establishments; interest in the others varies greatly. The first savings bank (caisse d’épargne) was established in 1818 at Paris; and on Jan. 1, 1870, there were 523 in all parts of the country. The aggregate number of depositors was 1,986,007; the aggregate amount of deposits about 632,000,000 francs.—A double system of taxation exists in France. The direct taxes are those laid on land (contribution foncière), on houses (contribution des portes et fenêtres), on persons (contribution personnelle et mobilière), and on licenses (impôt des patentes). The indirect taxes, besides the import and export duties, comprise excise charges upon wines, brandies, salt, gunpowder, tobacco, postage, public stages and coaches, stamped paper, registry of deeds and sales, &c. This complicated system requires an army of public officers and collectors of every rank, private and general receivers, payers, &c. These are under the control of the minister of finance, who is assisted by numerous finance inspectors and the court of accounts. Besides the government taxes, there are many local ones, mostly established in the towns of importance to defray local expenditures; they are generally known under the name of octrois. The yearly estimate of receipts and expenditures is called the budget, which is proposed by the minister of finance and voted upon by the national assembly. The following table presents the expenditures as estimated in the budgets at different periods:

<table>
<thead>

</table>

This list gives the expenditures as estimated in the budgets to be voted on by the legislative bodies; the actual expenditures generally exceeded these estimates by a large amount. This accounts for the increase of the public debt, which has been much larger than the aggregate of differences between receipts and expenditures given in the several budgets. The accounts of actual revenue and expenditure, known as the comptes définitifs, have generally not been published until the end of the fifth or sixth year after the vote on the estimates. Thus when the budget of 1872 was voted by the national assembly, the last compte définitif made public was that for 1867. As had been usual with financial statements throughout the second empire, this compte définitif showed a large deficit actually existing at the end of the fiscal year 1867, although the budget when voted upon had shown a small surplus. The following tables give summaries of the budget for 1872 as voted upon by the assembly, and that of 1873 as projected by the government:

The following table gives in detail the items of the budget for 1873:

**EXPENDITURES.**

*(Same in France,)*

1. Public debt and annual appropriation:
   - Consolidated debt: 548,277,132
   - Funded debt: 448,035,078
   - Flotant debt: 120,348,858

2. Expenses of the President's household: 728,600
3. National assembly: 4,000,000
4. Supplementary appropriation for the Legion of Honor: 14,000,000
5. Appropriation for the marine hospitals' fund: 7,000,000

Total: 1,101,008,500
The continued deficits from 1814 to 1869 were covered by loans inscribed in the grand livre de la dette publique, bearing interest, and known as the rentes at 3, 4, 4½, and 5 per cent. During the 18 years of the restoration (1815-'30) the national debt was more than trebled; under Louis Philippe (1830-’48) it increased but one fourth; under Napoleon III. the consolidated debt alone rose from 5,577,000,000 fr. in 1858 (bearing 2½%, 000,000 fr. interest) to 11,710,-
000,000 fr. in 1870 (bearing 4%, 000,000 fr. interest). In consequence of the enormous expenses caused by the war against Germany, the interest on the consolidated debt had increased in 1873 to 542,000,000 fr., representing a nominal principal of 15,801,000,000 fr. The other liabilities of the state, including the floating debt (1,000,000,000 fr.), amounted in the same year to 6,831,500,000 fr., thus swelling the entire public debt of France to 22,822,500,000 fr., bearing an annual interest of more than 1,000,000,000 fr. —The military establishment of France is based on the law of July 27, 1879, which went into operation Jan. 1, 1879. According to this law, every Frenchman must personally render military service, substitution and enlistment for money being forbidden; and every Frenchman not declared unfit for military service may be called upon from the age of 30 to that of 40 years to enter the active army or reserves. He must be enrolled for five years in the active army, four years in the reserve of the active army, five years in the territorial army, and six years in the reserve of the territorial army. Young men who can prove a certain amount of education by passing an examination are permitted to enlist as volunteers for one year only, and to obtain thereby exemption from service in the active army. Soldiers of the active army who can read and write, and have learned their duties, may be furloughed for an indefinite time. The reorganization of the army was not yet completed in 1878. In 1878 the infantry embraced 126 regiments of 4 battalions each, 4 regiments of zouaves, 8 of Turcos, 1 foreign regiment, 80 battalions of chasseurs, and 8 battalions of light African infantry; in all, 184 regiments and 39 battalions, or 9,850 battalions. The cavalry was composed of 12 regiments of cuirassiers, 20 of dragons, 14 of chasseurs, 10 of hussars, 4 of chasseurs d’Afrique, and 8 of spahis; in all, 63 regiments. The artillery, according to the budget for 1878, is to be brought to 39 regiments, to which must be added 1 regiment of pontonniers, 10 companies of workmen, 8 companies of gunners, and 2 regiments of train. The engineers embraced thus far 8 regiments of sappers and 1 company of workmen. The government return of 1871 gave the nominal strength of the army on the peace footing as 404,193 men and 86,886 horses, and on the war footing, 767,727 men and 148,288 horses. France is divided into 23 military divisions, governed by generals of division, and the most important by marshals, and into as many subdivisions (under brigadier generals) as there are departments. The headquarters of the divisions are in the following cities: Paris, Rouen, Lille, Châlons-sur-Marne, Besançon, Lyons, Marseilles, Montpellier, Perpignan, Toulouse, Bayonne, Bordeaux, Nantes, Rennes, Bastia, Tours, Bourges, Clermont,
LIMOGES, and Grenoble (two divisions having no assigned headquarters in 1872). No other country possesses so many fortresses as France. After an imperial decree of June 26, 1867, had stricken 98 fortified places from the list of fortresses, there still remained 119; these are divided into 8 of the first class, 13 of the second, 23 of the third, and 75 of the fourth. The most important are the following: 1, along the N. frontier, Lille, Douai, Condé, Valenciennes, Maubeuge, Givet, Mézières, Sedan, Longwy; 2, along the E. frontier, Belfort, Besançon, Fort de Joux, Lyons, Grenoble, Briançon; 3, along the Mediterranean coast, Antibes, Toulon, Marseilles, Céte, Fort St. Elme, Fort Vendres; 4, along the Pyrenees, Bellegarde, Mont Louis, Perpignan, Bayonne; 6, along the W. and N. coasts, the islands of Alderon, Rade, Noirmoutiers, Belle-Isle and Groix, Rochefort, La Rochelle, Lorient, Brest, St. Malo, Mont St. Michel, Cherbourg, Havre, Boulogne, Calais, and Dunkirk. The government has six arsenals at Dauai and Toulouse, and factories of gunpowder, muskets, cannon balls, &c. Its military arsenals and warehouses are very numerous. The French navy at the end of 1871 was composed of 69 iron-clad vessels, 264 screw steamers without armor, 65 paddle-wheel steamers, and 119 sailing vessels; in all, 501 vessels, the steamers with a total of 96,627 horse power, and the whole fleet carrying 3,045 guns. The naval staff consisted of 2 admirals, 18 vice admirals, 32 rear admirals, 132 ship captains, 290 frigate captains, 929 lieutenants, and 610 ensigns. The sailors, afloat and ashore, numbered 58,500. The grand total of men in the service of the fleet, including engineers, dockyard laborers, and others, was 74,000. On a war footing the strength of the navy can be raised to 180,000 men. There are boards of marine engineers, of hydrographical engineers, of inspectors, &c. Naval schools, and several schools of application, for the education and scientific improvement of the officers, and even the seamen, are connected with the navy department. A board of admiralty, another superintendent the naval works, and a third attending to the improvement of instruction among the sailors, act as advisers to the minister of marine. The maritime territory of France is divided into five districts or prefectures, subdivided into arrondissements and quarters. The naval prefects reside at Cherbourg, Brest, Lorient, Rochefort, and Toulon, and under them officers, called heads of service, commissaries, and under-commissaries, are placed in the several subdivisions.—France could once boast of the extent of her colonial possessions in America, and also for a while in Asia. She has lost the greater part of them, and possesses now only the following: 1, in Africa, Algeria on the N. coast, several islands, seaports, and military posts on the banks of the river Senegal, the island of Goree on the coast of Senegambia, S. of Cape Verde, Réunion (formerly Bourbon island), E. of that continent, in the Indian ocean, and the islands of Mayotte, Nossi-Bé, and Ste. Marie, near Madagascar; 2, in Asia, the districts of Pondicherry, Karikal, Chandernagore, Yansom, and Maké in Hindostan, and six provinces of Cochin China; 3, near the coast of North America, the islands of St. Pierre and Miquelon; 4, in the Caribbean sea, Martinique, Guadeloupe, Marie-Galante, Les Saintes, Desirade, and one half of St. Martin island; 5, in South America, French Guiana, or Cayenne; 6, in the Pacific ocean, the Marquesas islands, or Mendaña archipelago, the Loyalty islands, and New Caledonia. Tahiti and dependencies, the Towamotou islands, the Gambier islands, Touboua, and Yavita, all in Polynesia, and Cambodia in Further India, are under French protection. The population of Algeria in 1873 was 2,414,218; the aggregate population of the other French colonies amounted in 1872 to about 2,800,000; that of the protected countries to 1,024,000. The aggregate area of the colonies was estimated at 422,000 sq. m.; that of the protected countries at 85,500 sq. m.—France, which comprises the largest part of the country known in ancient times as Gailla Transalpina (see Gaul), owes its name to the Franks, one of those confederations of German tribes that invaded and dismembered the Roman empire during the period between the 3d century and the end of the 5th. They were probably inhabitants of the country about the lower Rhine, united with those living near the mouth of the Weser. Crossing the former river, they settled in the northern part of Belgium under various chiefs, and, after a long and violent struggle with the Romans through several centuries, during which they were often completely driven back, successful conquest brought them gradually to the banks of the Somme. Meanwhile other hordes of barbarians had taken possession of several other provinces of Gaul; the Burgundians had peacefully shared the eastern part of this country with the Gallo-Romans, while the Visigoths, already masters of nearly the whole of the Spanish peninsula, extended their military rule over the population of Aquitania. The cities of Armorica had formed themselves into a confederation, and the central part of Gaul from the Somme to the Loire was alone held by the Romans. Such was the condition of the country about 481, when Khlodwig or Clovis, a young man, supposed to have been the grandson of Merovens, from whom the Merovingian dynasty took its name, succeeded to the rulership over the Frankish tribe living in and around the city of Tournay. In 486 this king invaded the Roman province, conquered the governor, Syagrius, at Soissons, and thus secured to himself the possession of the whole country to the Loire. Ten years later, after forcing back to Germany some rival tribes which had crossed the Rhine in the hope of dividing the spoils with the Franks, Clovis,
yielding to the entreaties of his wife Clotilda, consented to be baptized, and henceforth all the Catholic bishops of Gaul were enlisted in his cause. Their powerful influence helped him greatly in consolidating his authority among the Gallic population, and carrying his conquests southward. A single victory won in 507 at Vouillé over the Visigoths, who were Arians, gave him the possession of nearly all Aquitania. On his death in 511 his kingdom extended from the banks of the Rhine to the Pyrenees, thus including the whole of Gaul, with the exception of the province occupied by the Burgundians, the Mediterranean shore, which had been retained by the Visigoths through the aid of Theodoric, king of the Ostrogoths, and the peninsula of Brittany. This kingdom, although partitioned among the four sons of Clovis, was soon increased by the conquest of Burgundy (about 584); and Klithoer or Clotaire I., the youngest of those princes, surviving his brothers and nephews, could for a while (588–611) boast of possessing a larger empire than his sire. A new division among his own sons brought on long civil wars between the eastern Franks and Austrasians, between the Rhine and the Meuse, and the western Franks or Neustrians, who lived W. of the latter river. The Burgundians, who under their new masters had preserved their name, sided alternately with the one or the other; while the Aquitanians, taking no interest in a conflict among their barbarian conquerors, were little affected by it. This bloody period, in which two women, Brunehaut and Fredegonda, figured conspicuously, extended over the latter part of the 6th century and the beginning of the 7th (607–619). It ended with the defeat of the Austrasians; and Clotaire II., who at its close ruled over the conquering nation, during the latter part of his reign held the whole of the Frankish dominion under his sceptre. So did his son Dagobert (628–639), who had a taste for magnificence, and took as his principal minister Eligius or Éloi, the most celebrated silversmith of his time, who was canonized as a saint. His successors were mere phantoms of royalty, and have been styled "lazy kings" (rois fainéants). They still preserved the royal title, while the power was wielded by the mayors of the palace, who, from the condition of private officers of the king's household, had by help of the aristocracy risen to the rank of prime ministers in each of the three kingdoms, Austrasia, Neustria, and Burgundy, of which the Frankish dominion consisted. Through their rivalry the old contest between the Austrasians and the Neustrians revived; and notwithstanding the political talents displayed by Dagobert and his successor Chilperic II. (660–681), the Neustrians were at length controlled by the mayors of Austrasia, who soon took the title of dukes, and finally acquired absolute possession of the Frankish kingdoms. Pepin of Héristal, the most illustrious among these nominal ministers and real monarchs, governed them in the name of several successive kings. After his death (714), his natural son Karl, celebrated under the name of Charles Martel, seized and wielded with an iron hand a still more extensive power. He especially signalized his reign by defeating the Saracen invaders of France between Tours and Poitiers in 732. Twenty years later (752) his son Pepin the Short confined the last of the Merovingsians, Childeric III., within the walls of a convent, and, with the consent of the clergy and the approval of the pope, assumed the title of king. His father and himself, the first two princes of the Carolingian dynasty, raised the Frankish power to its highest pitch. Pepin (752–788), firmly establishing his authority all over Gaul, forced into complete submission Aquitania, which during the reign of the rois fainéants had succeeded in maintaining its independence, and conquered Septimania, a province along the Mediterranean shore, which had been held by the Arabs of Spain. He made his influence also felt in Italy, where the Lombards became his tributaries, while his liberality toward the pope brought to his side the agency of religion. His son, Karl the Great or Charlemagne, following the same policy, showed himself the most faithful protector of the holy see, overthrew the Lombard monarchy, and placed the iron crown upon his own head in 774; waged for 22 years (772–804) a merciless war against the Saxons, who were finally subdued and compelled to embrace Christianity; destroyed the last remnants of the barbarous Avars who had settled in Hungary; and tried his arms against the Moors of Spain. He thus made himself the master of an empire which included not only Gaul, but also Germany to the Saale, the largest part of Italy, and N. E. Spain. He styled his dominion the "new empire of the West," and was crowned emperor by the pope at Rome in 800. He aimed indeed at a complete restoration of the ancient Roman empire by marrying the Byzantine empress Irene; but this was prevented by revolutions at Constantinople. He greatly advanced the civilization of his realm by establishing schools and patronizing science and literature, and gave his court a world-wide fame throughout his reign. His son, Louis le Debonnaire (814–840), a weak and superstitious prince, was peculiarly unfitted for the heavy task which devolved upon him; and the selfish ambition of Louis's successors hastened the national and social disruption. Less than 80 years after Charlemagne's death his empire was divided into three kingdoms by the treaty of Verdun (843), and 45 years later (888), through the imbécility of his great-grandson, Charles the Fat, it had entirely fallen to pieces. From this period dates the partition of the kingdoms of France, Italy, and Germany, with the secondary states of Lorraine, Burgundy (for a time known as the kingdom of Arelate or Arles), and Navarre. Amid the convulsions which led to this consummation,
the power of the nobles had been rapidly increasing; the dukes and counts, who had been at first mere officers of the kings, had succeeded in making their dignities hereditary; and Charles the Bald, just before his death in 877, not only sanctioned their pretensions, but extended the principle of inheritance to all the fiefs. Such was the foundation of the feudal system, the origin of which may be said to coincide with the beginning of France proper. The name France first appears in history about the 9th century, and applies to the country W. of the Scheldt, the Meuse, the Saône, and the Cévennes; and henceforth we distinctly see a French nation forming by the fusion of the Frankish with the Gallo-Roman element, and a new language, a mixture of the German and the Latin, sprang up at the same time. The Carolingian family were soon opposed by national princes who had courage and talent; and after a struggle which went on during the latter part of the 9th and nearly the whole of the 10th century, they were finally deprived of their hereditary throne. Previous to this a new race, the Normans, had established themselves in N. W. France. They had carried on a system of piracy along the coast as early as the reign of Charlemagne, and since then they had several times pushed their incursions into the very heart of the country. The weak Charles the Simple at last had recourse to concessions to check their continued attacks, and in 912 the lands situated W. of the lower Seine were ceded to Rollo, the chief of a large horde of these Northmen, and Normandy soon became one of the most flourishing and best regulated provinces in France. Its dukes held the first rank among the feudal princes, when Hugues or Hugh Capet, the duke of France, on the death of Louis V., collected an army, seized the throne, and assumed the title of king (987), founding the Capetian dynasty, which reigned continuously more than 800 years through several collateral branches, and is still represented by the Bourbon family. This ruler and his immediate successors pursued a quiet and conservative course, and though taking little part in the great events which occupied the rest of Europe in their time (the earliest crusade, &c.), they fortified their own power and upheld their royal supremacy, which during the 12th and 18th centuries was established on a solid foundation by kings of considerable ability. Louis VI. (1108-1187), a king of great activity and bravery, forced many of the nobles into submission, and greatly strengthened the royal power. Philip Augustus (1180-1223), the most sagacious prince of his time, nearly doubled the royal domains. Besides Normandy, Touraine, Anjou, Maine, and a large part of Poitou, the sovereignty of that country had been adjudged by parliament to King John of England, who held them by inheritance, he acquired by various means the counties of Artois, Vermandois, Valois, Auvergne, and other territories. The count of Flanders vainly allied himself with the English king and Otto IV. of Germany. Philip gained over his combined enemies a brilliant victory at Bouvines in 1214; and thenceforth the royal power was paramount; France, though long distracted in the south by the Albigensian struggles, was thus enabled to play a conspicuous part in European affairs; and the rank to which Philip's policy raised her was fully maintained by the wisdom of his grandson, Louis IX. (1226-70). The traditional policy was followed under his reign; treaties and marriages were concluded which secured the ultimate possession of Languedoc and Provence, while the commons, or the third estate, as it was then called, was placed under the more immediate control of the king. The introduction of the Roman law and the regular constitution of the parliament, forming a high court of justice which was to supersede gradually all feudal jurisdictions, were important additions to the efficiency of the royal power; the limitation and definition of the powers of the church, through Louis's pragmatic sanction in 1268, was another step in this direction; while the king's personal good qualities conciliated the respect and affection of the nation. The influence thus secured for the royal title was sustained by Louis's successors, Philip III. and Philip IV. (the Fair), who, though greatly inferior to their ancestor in ability, completed the monarchical system that was to prevail for several centuries. They leaned more than ever upon the third estate in order to counterbalance the ascendancy of the two privileged orders. Men of low birth had already been introduced into the parliament; under Philip IV. (1265-1314) their influence increased, and representatives of the third estate were admitted to the general assemblies of the nation, which before had consisted only of deputies from the clergy and the nobility. The chief events of Philip's reign were the treaty with Pope Boniface VIII., by whom he had been excommunicated, but whom he finally overcame and took prisoner; the removal of the papal see to Avignon; and the suppression of the order of knights templars, whose immense possessions in France were confiscated to the crown, while the knights were banished, imprisoned, and many even executed under circumstances of the greatest cruelty. Philip was succeeded in turn by Louis X., Philip V., and Charles IV. The Capetian kings, whatever may have been their faults and personal shortcomings, succeeded in giving so powerful an organization to the kingdom as to enable it to stand the brunt of the foreign and civil wars which were to threaten its existence under the younger branch of Valois (1328-1389). The rivalry of France in the fifteenth century, consequent upon the accession of Duke William of Normandy to the throne of the latter, had already been the cause of occasional hostilities between the two nations; it came to a decisive crisis during the first half of the 14th century.
On the direct branch of the Capetians becoming extinct by the death of Charles IV. without male heirs, Philip of Valois, both by right of relationship and by choice of the peers, succeeded to the throne, becoming the Valois dynasty; but Edward III. of England, by virtue of hereditary right derived from his mother's side, claimed not only such provinces on the continent as had been taken from his ancestors, but the whole kingdom of France. In this way began that protracted conflict which French historians call the "hundred years' war" (1337–1453), a period covering the reigns of John II. (1380–85), Charles V. (1364–80), Charles VI. (1380–1422), and the greater part of the reign of Charles VII. (1429–61). Twice France was on the eve of becoming a dependency of the English crown. In 1440 an English fleet destroyed the naval force of France at Sluis, on the coast of Flanders; in 1446, at Crécy, the English archers won an unexpected victory over the flower of French chivalry; and ten years later, at Poitiers, the Black Prince not only defeated King John, but made him prisoner. The states general were also the scene of a deadly struggle between the regent and the third estate, so that royalty itself was put in jeopardy; companies of adventurers and mercenary troops ravaged the provinces; the peasantry of several districts, driven to despair by the oppression of their lords, broke out in a fearful insurrection, which was named the Jacquerie, and marked by all the horrors of a servile war. Charles V., by his vigorous policy, succeeded in quelling internal disorders; and with the help of his great constable, Du Guesclin, he regained in a few campaigns all the English acquisitions in France, with the exception of a few important seaports. When both died, in 1480, the kingdom was in a fair way to regain its former prosperity. But the minority of Charles VI., and his subsequent derangement, again placed France into a series of calamities. The conflict between the various classes of society was renewed with increased fury; rival factions, headed by princes of the royal family, the dukes of Orleans and Burgundy, waged against each other a war of treachery and assassination; while the English, encouraged by the forlorn condition of their enemy, again invaded France. For the third time the French chivalry suffered defeat at Agincourt (1415). John the Fearless being treacherously murdered by the Orleansists or Armagnacs, in an interview which was intended to bring about peace, Burgundy, that is, the N. E. part of France, threw itself into the arms of the English. An insane king, a queen of foreign origin impelled by her unnatural hatred to her son the dauphin, and a prince carried away by his thirst for vengeance, concluded the marriage of Louis, the title of Louis XI. by the royal inheritance of France was delivered up to her deadly enemy. Henry V. of England, on marrying the princess Catherine, was appointed heir to Charles VI., and meanwhile was to assume the power of regent. France seemed now to be irretrievably lost; but the country suddenly rallied its forces, chiefly under the leadership of Joan of Arc, by whom the national enthusiasm was roused to the highest degree, and succeeded in defeating the English power. The disinherited son of Charles VI. was now triumphantly conducted to Rheims to receive there the royal union (1429); but it required 24 years more of constant warfare to finally drive the invaders from the country. This was accomplished in 1453, with the exception that the seaport of Calais remained in English hands, to be retaken 105 years later. After these long trials, France was at last enabled to exercise her recuperative powers; her population increased at a rapid rate, industry and art flourished, and the last vestiges of the past calamities disappeared. Meanwhile her kings had returned to their traditional policy of enlarging the royal domains and consolidating the royal power by the destruction of the feudal aristocracy. To this task none applied himself with greater zeal than Louis XI. (1461–88), the son and successor of Charles VII. Many nobles of every rank were delivered to the executioner. The most powerful of all, Charles the Bold, duke of Burgundy, against whom Louis had long carried on intrigues by every means in his power, fell in a conflict with the Swiss allies of the duke of Lorraine, before Nancy, in 1477; the king at once seized upon part of the large inheritance left by that formidable vassal, and the duchy of Burgundy and Picardy were thus annexed to the crown. The fine provinces of Anjou, Maine, and Provence, besides claims upon the kingdom of Naples, were bequeathed to Louis by the last prince of the house of Anjou; the king of Aragon resigned to him the counties of Roussillon and Cerdaigne; and France, reaching thus her natural frontiers toward the south and the southwest, became one of the great powers on the Mediterranean. On the northwest, by the marriage of Charles VIII. with Anne of Brittany, she gained possession of that large province, which had hitherto been nearly independent. Under Charles VIII., the son and successor of Louis, a French force invaded Italy in 1494, and conquered the kingdom of Naples without opposition; but the conquest was lost still more quickly than it had been gained. This was the first of a long series of Italian wars in which France was almost constantly engaged for more than half a century, with varying success, and under several monarchs. With Charles VIII., who died without male heirs in 1498, the direct line of Valois ended, and Louis, duke of Orleans, the nearest heir to the throne, and grandson to a brother of Charles VI., became king under the title of Louis II. Though Louis I. was the first met with some success in his Italian campaigns, tried all the arts of diplomacy to secure his conquests; but he was no match for the Italian politicians of the 16th century, and still less
for the crafty Ferdinand of Aragon. By the latter he was expelled for ever from Naples, of which he had partly taken possession; while Pope Julius II., the republic of Venice, and the princes of Italy, availing themselves of Spanish, German, and even English alliances (forming at one time what was called the holy league), forced him out of the duchy of Milan, which he claimed in right of his grandmother, Valentina Visconti, and which he had twice conquered. Francis I., the successor and distant relative of Louis, in his turn appeared in Italy as a conqueror, and his first victory at Marignano or Melegnano (1515) seemed to forebode permanent conquest; but he was opposed by the emperor Charles V., and after his disastrous defeat at Pavia in 1525, he was carried a prisoner to Madrid. Here, in order to regain his disreputable character of 1526, to a treaty, by which he forfeited Burgundy and all claims to Naples, Milan, Tournay, and Arras. But no sooner was he set at liberty than he secured from the pope his release from the oaths binding him to this arrangement, and concluded with the holy see, the duke of Milan, and the republic of Venice the second holy league. In 1527 Henry VIII. of England was induced to join the alliance. But the results of the struggle that followed were unfavorable to the French. Pope Clement VII. was forced to conclude an accommodation with the emperor, and Francis was compelled to acquiesce in the so-called "ladies' peace," concluded at Cambrai (1529) by female relatives of the contending monarchs, which was but little less disastrous than that of Madrid. In the mean time, and while the wars between the king and Charles V. had been in progress, a new force had appeared in European politics. The formation had begun, and the emperor was now obliged to turn his attention to Germany. During the two or three years following the peace of Cambrai, the dissensions in that country afforded Francis an opportunity of weakening his rival by more or less directly encouraging the Protestant princes there in their hostile attitude toward the imperial power. The French army was also strengthened during this period; an alliance was concluded with England in 1532; and in 1536 the war again broke out, after Francis had in vain endeavored to persuade Charles to a peaceable acknowledgment of his Italian claims. A severe struggle followed; and though a peace for ten years was signed at Nice in 1538, and the ministers of Francis strove to keep it, various incidents led to a renewed hostility, and in 1542 the conflict again began. It soon took an unfavorable course for the French; the emperor had by 1544 so far invaded French territory that he even threatened Paris; and in September of that year the peace of Crespy put an end to the war during the life of Francis; for so exhausted were the resources of the kingdom that no further campaign could be undertaken before that king's death in 1547. His son and successor, Henry II., the first part of whose reign was occupied with a war against England, renewed in 1552 the struggle against the Hapsburgs, which continued with brief intermissions till 1559, when the peace of Cateau-Cambresis gave to it a decidedly favorable termination for the French. The English, who had allied themselves with the enemy, gave up by this treaty their last possessions in France. In the last years of the conflict, however, Henry II. had allied himself with the Protestant princes of Germany, and had thus in some degree, though unwillingly, favored the spread of the Protestant ideas in France, where Calvinism had already gained a wide-spread influence among the people, and had found many adherents among the nobles. Both Francis I. and Henry II. had attempted to check the progress of the new beliefs, and had resorted to the greatest oppression and persecution to attain this end. Henry's son and successor, Francis II. (1553-'60), so increased these during his short reign as to arouse the Hugenots to self-defence, which they were now strong enough to attempt; and with this period began the disastrous religious civil wars which raged so fiercely in France, and lasted with more or less violence till 1568. No fewer than eight such wars were waged during the reigns of Charles IX. and Henry III., a period of 28 years. The Protestants held their ground with tenacity; the most illustrious among their chiefs, Admiral Gaspard de Coligny, accomplished wonders; but thoroughly honest and too ready to confide in the honesty of others, he permitted himself to be deceived by the false promises of Catharine de Medici, Charles's mother, and with thousands of his companions was treacherously murdered on St. Bartholomew's night, 1572. This fearful massacre did not however annihilate the Protestants, who continued the struggle against the holy league or Catholic union, which had been organized for the better protection of the Catholic church in France, and which was upheld by the pope as well as Philip II. of Spain. The head of the league, Duke Henry of Guise, secretly aimed at the crown, and his popularity seemed to warrant his success, when Henry III. during the session of the states general at Blois, in 1588, had him despatched by his body guards, known as the "forty-five." A few months later, in 1589, the king himself fell by the dagger of the fanatic Jacques Clément, leaving his crown to Henry of Navarre, the head of the family of Bourbon, and the leader of the Protestants. The struggle henceforth took essentially a political turn; and Henry, joined by but a few of the Catholics who had served his predecessor, and much reduced in circumstances, had great difficulty in making good his claims to the crown. His personal qualities and bravery finally conciliated many of the Catholic royalists, but he could hope to be recognized as king by the majority of the nation only on his conversion to Catholicism. To this he assented, July 25, 1593;
and now his whole attention was given to the pacification of his kingdom. This he effected by concluding with Spain the treaty of Vervins, May 2, 1698, upon the conditions of the old treaty of Osteau-Cambresis, and by publishing the celebrated edict of Nantes, which granted to the Protestants full religious liberty, admission to all offices, and several places of security, among others the strong city of La Rochelle. Henry, having thus inaugurated the Bourbon dynasty, now devoted himself entirely to the work of healing the wounds which had been inflicted on the country during nearly 40 years of bloodshed and devastation. Assisted by Sully, his friend and minister, he restored order in all branches of public service, and effected great improvement in the condition of the people. He then returned to the old policy of Francis I., and meditated the humiliation of the house of Austria; great preparations were made for the enterprise, and Henry was on the eve of his departure for the army, when he was assassinated by Ravaillac, May 14, 1610.

This calamity interrupted for nearly 15 years the progress of the kingdom at home and abroad. Under the regency of Henry's widow, Maria de' Medici, mother of Louis XIII., disorders were renewed; the public treasure was recklessly wasted; and the kingdom was distracted by war between the queen mother and the young king, soon after the latter reached his majority. Happily a great minister, Cardinal Richelieu, took the reins of government in 1624, consolidated the power of the monarch at home, and, partly reviving the political designs of the late king, threw the influence and arms of France into the European conflict called the thirty years' war. While annihilating the political power of the French Protestants, he energetically supported the German Protestants in their struggle against the house of Austria; to this end he spared neither money nor troops; and on his death, in 1642, the rival of France had been already many times humbled. The successor of Richelieu, Cardinal Mazarin, pursued the same policy; and the first years of the reign of Louis XIV., who ascended the throne as a child in 1648, were marked by brilliant victories, most of them won by the young duke d'Enghien, afterward the "great Condé." The treaty of Westphalia in 1648 not only asserted the triumph of religious and political liberty in Germany, but the victory of France over Austria, a victory which added to her territory the provinces of Alsace. The troubles of the Frondé, a faint image of the old civil wars, detracted nothing from the influence gained abroad by the French government, and Mazarin concluded with Spain, in 1669, the treaty of Pyrenees, which secured two other provinces to France, Artois and Roussillon. Thus, agreeable to the plans of Louis XIV., a kingdom well prepared for the full exercise of absolute power. Under this monarch France rose to the height of fortune and glory, while he himself was placed above all control. From the day of Mazarin's death (1661) he assumed the direction of public affairs, and his ministers, with the exception perhaps of Colbert and Louvois, were little more than clerks, intrusted with the execution of his designs. The first years of his administration were the most useful. Colbert devoted himself to improving all the resources of the kingdom; every branch of revenue became prosperous; and, as at the beginning of the century under Henry IV., the national wealth increased with unusual rapidity. Intellectual progress kept pace with material, and everything conspired to create a literary period of unusual magnificence. A short war against Spain, which was terminated by the treaty of Aix-la-Chapelle in 1668, scarcely interrupted this happy commencement; but it had awakened suspicions among the neighboring powers, and a triple alliance was formed between Holland, Spain, and England. Scarcely four years had elapsed when Louis XIV., at the head of more than 100,000 men, invaded Holland, which, being deserted by England, could be preserved only by the united exertions of Spain and Germany; the contest lasted six years; the French armies, under Condé, Turenne, and Luxembourg, were victorious in nearly every encounter, while French fleets distinguished themselves against the united naval forces of Spain and Holland. The peace of Nimeguen, 1678, put an end to regular hostilities, but not to the encroachments of Louis XIV., who, inflated by success, seized upon provinces and cities which, according to his own construction of past treaties, belonged to France. Louis had now reached the zenith of his greatness; he had added to his kingdom Flanders, Franche-Comté, the imperial city of Strasburg, and several other important territories; he was feared abroad and respected at home; he was Louis the Great for his subjects, and even his enemies scarcely refused him this title. The league of Augsberg, devised by William of Orange, had united together the emperor, Holland, Sweden, and Savoy, and was joined by England on the revolution of 1688. Louis XIV., who undertook to reestablish James II. on his throne, engaged in a desperate struggle against this powerful coalition, and maintained it for nine years; his armies and naval forces, the former especially, still achieved many triumphs; and when the peace of Ryswick was concluded in 1697, the allies, although they boasted of success, were nearly as much exhausted as their opponent. The war of the Spanish succession, which followed the death of Charles II. of Spain in 1700, was brought about by mere family ambition. A more formidable coalition opposed the schemes of the king, who aimed at placing his grandson upon the Spanish throne; the twofold coup de grace was given at the same time, Marlborough and Prince Eugene, were at the head of the allied armies; defeat after defeat befall the French forces, and the kingdom seemed reduced to extremities; but after
a contest of 12 years' duration, Louis succeeded in his bold undertaking; and by the treaties of Utretch and Rastadt (1712 and 1714) the house of Bourbon inherited the best part of the Castilian monarchy. The burden which he had borne was, however, far too heavy for his weak successors; he had moreover taxed the energies of France and stretched the royal power to such an extent that a reaction was unavoidable, and had by tyrannical and imprudent acts already introduced many of those abuses and elements of discord which were to have such disastrous results. The 18th century was an age of depression, decay, and ruin for all the institutions, doctrines, and classes that had hitherto commanded respect. Royalty lost its prestige, both through the unbounded licentiousness of the regent duke of Orleans and the king himself, and through the irresistible corruption or imbecility of its ministers; nobility became degraded; the great constituted bodies fell into general contempt; the national treasury was exhausted; and an uncontrollable spirit of censure and railment hastened the work of destruction. Even the remedies that were tried, such as the wild financial schemes of Law under the regent, only added to the universal confusion. Politically the French government, controlled in turns by unscrupulous princes, by Cardinal Fleury (who, however good his internal administration, failed to support the national dignity abroad), by the clever and infamous Cardinal Dubois, and by the king's mistresses, gradually sank in the eyes of Europe; and toward the end of Louis XV.'s reign it could scarcely be ranked among the great European powers. The four wars in which France then participated, against Spain (1717-19), for the succession of Poland (1733-38), for the succession of Austria (1740-48), and finally the seven years' war (1756-63), were productive only of disgrace and disaster. The widespread political degeneracy of the time was in some degree offset, it is true, by the remarkable intellectual activity which made itself felt in all departments of literature, and especially manifested itself in the teachings of that school of philosophy whose social, political, and metaphysical theories so largely affected the course of events during the remainder of the century.—Louis XV. died in 1774, and his grandson Louis XVI. ascended the throne at a period which was perhaps the most inglorious of French history. Carlyle, in one of the opening paragraphs of his "French Revolution," compares the country, as it was left by the dead ruler, to a powder tower about which unquenchable fire was smouldering. "With Pompadourism and Durbarrism, his Fleur-de-lis has been shamefully struck down in all lands and on all seas; Poverty invades even the Royal Exchequer, and Tax-farming can squeeze out no more; there is a quarrel of twenty-five years' standing with the Parlement; everywhere Want, Dishonesty, Unbelief, and hot-brained Scolists for state physicians; it is a portentous hour." This description is not exaggerated. The tyranny and lawlessness of the nobles and privileged classes, the burden of heavy taxation and oppression, which rested almost entirely on the lowest orders, the reckless mismanagement exhibited in every branch of the public service, and the unrestrained personal vice and extravagance of those in authority, had driven the great mass of the people into a bitterness of feeling almost beyond description; while the exhausted kingdom, with its recuperative forces apparently destroyed, seemed to be on the verge of financial as well as political ruin. The various abuses that had grown up and increased during nearly the whole century were now at their height, and it seemed evident that a disastrous crisis was approaching. In this condition of affairs Louis XVI. began his reign, undoubtedly with some idea of the state of his kingdom, and with the best intentions toward reform; but, as events proved, without the strength necessary to carry out his good intentions. Maurepas, a man eminently unfit for the work in hand, was placed at the head of the ministry. An attempt to conciliate the people was made by the restoration of the parliament of Paris; but instead of promoting reform, this body proved a positive hindrance to it. Turgot and Malesherbes, associated with Maurepas in the ministry, acted with considerable efficiency in the endeavor to improve the state of affairs, but were deposed through the influence of the court party as soon as they sought to interfere with the immunities of the privileged classes. Similar causes defeated the less earnest efforts of the ministers who followed them in quick succession. Necker, who became minister of finance in 1777, and held the office during the time in which France carried on war against England and in aid of the American colonies, at first seemed to improve matters slightly; but the expenses of the war, the usual opposition of the nobles and clergy to any scheme of general taxation, with other causes, led to his deposition soon after the publication of his celebrated Compte rendu au roi. Calonne, who succeeded him in 1788, by extravagance and a reckless contracting of loans, plunged the finances into a more hopeless condition than ever; and in 1786 the king was induced to call together the assembly of notables to consider the state of affairs, and especially to deliberate on certain schemes of Calonne. This assembly, which had before been convened by Henry IV. and Louis XIII., consisted of a number of leading persons selected by the king from all parts of the kingdom; and on this occasion, the last time in French history of its convocation, it included 7 princes of the blood, 9 dukes and peers, 8 field marshals, 22 nobles, and 98 high officials of different classes; 144 members in all. These met in February, 1787; but when Calonne's report revealed to them the extent of the existing debt and deficit, and proposed, with other measures, a land tax from which
the privileged classes should not be exempt, there arose an opposition which compelled his retirement. He was succeeded by Brienne, archbishop of Toulouse; but the notables continued to oppose all plans for general taxation, and in May their assembly was dissolved. Various other methods of raising money were now devised; but the parliament of Paris refused to register the royal acts ordering their enforcement, and the king only compelled their registration by resorting to a so-called bed of justice. (See BED OF JUSTICE.) The parliament protested, and the king, in an open resistance, banished the members to Troyes, but not before they had issued a spirited remonstrance and a demand that the states general should be convened. This violent act on the part of the king caused general indignation, and partly owing to this, and partly to the necessity for new loans, he retracted it soon after, and in September the parliament returned. The conflicts and disputes that followed its reassembling, however, led to a new step, the constitution of a cour plénière, which should pass upon the royal edicts; and this measure aroused more opposition than ever, the duke of Orleans and several powerful nobles joining the general expression which pronounced it an illegal attempt to entirely set aside the parliament's authority. In the provinces armed disturbances took place. All classes of the people, as well the privileged orders as the rest, now hoped for some amelioration through the calling of the states general; and this was everywhere loudly demanded. The king finally yielded; Brienne was deposed and Necker recalled; and the general assembly of deputies from all the recognized classes, constituting the states general, at last assembled at Versailles in May, 1789; this being the first con vocation of such a body since 1614. But the constitution of the new assembly soon led to unexpected results. The privileged classes, the nobles and clergy, insisted that the meetings of the body and all its deliberations should be conducted with strict regard to the old class distinctions, the three estates meeting and voting separately, as in former times, an arrangement by which the two higher estates would have been enabled to neutralize the action of the commons. For the first time this classification met with the most determined opposition; and in June, on the proposition of a member, the abbé Sieyès, the deputies of the third estate declared themselves the sole body having a right to act as the legislature of France, and summoned the nobles and clergy, as bodies representing only certain classes, to attend their deliberations. At first only eight clerical deputies and no nobles obeyed their summons, and the commons now (June 17) solemnly proclaimed themselves the legislators of the country, and constituted themselves a body under the name of the national assembly (in history specifically designated the constituent assembly; see CONSTITUTIONAL CONVENTION).

A day or two later a majority of the clergy manifested a disposition to join them. Aroused by these proceedings, the king made an ill-advised attempt to check the course of events; and on the 20th, when the deputies of the commons, accompanied by many clerical deputies, came to the place of meeting, they found their entrance prevented by a garrison of soldiers. In the greatest indignation, they gathered in a tennis court near by, and here took a solemn oath not to dissolve their assembly until a constitution for the kingdom should be decided upon and established on a firm basis. A meeting in the church of St. Louis on the 22d gave them added strength; and when, a few days later, the king appeared before them and, though delivering a half-conciliatory address, insisted upon their dispersing and meeting as prescribed, Mirabeau was unanimously sustained in sending to Louis his famous message: "We are here by the power of the people, and we will not be driven hence save by the power of the bayonet." With these events the revolution may be said to have begun. The financial affairs and other business, to consider which the assembly had been called, had been pushed into the background, and the graver questions as to the rights of the people, the reorganization of government, and individual liberty, with which the American war had greatly aided to familiarize men's minds, now occupied the attention of all France. If the assembly had gone far beyond what had been foreseen, the body of the people, long oppressed, and now excited by the revolutionary clubs and the leaders who spoke to them of a republic, were ready to go much further than the assembly. A great part of the garrison of Paris shared the excited feeling of the populace, and events, of which we shall here give only a brief summary, now followed in rapid succession. The king and his advisers collected a body of troops in Paris, and deposed and banished Necker. On July 12, when the people heard of Necker's renewed dismissal and of his departure from Paris, the popular uprising began. A national guard under Lafayette was formed, and weapons and ammunition were taken from the public arsenals. On the 14th followed the attack and sack of the Bastile. (See BASTILE.) The people of the provinces speedily followed the example of the Parisians, and popular demonstrations of opposition began in all parts of the kingdom. Louis, who at first sought to conciliate the assembly by recalling Necker, and to quiet the people by confirming Lafayette's appointment, by appearing at the hôtel de ville wearing the tricolored cockade, and by other means, met with only the most temporary success. The assembly, although they had long before, at the order of the yielding king, been joined by the nobles, daily took more decided measures. Schemes of general taxation were adopted; and on Aug. 4 the assembly took the decided step of abolishing all feudal rights and privileges of rank, and made their well known deo-
laration of the rights of men. They debated further upon a form of constitution, and early in September they voted that the legislative power should be vested in a chamber of deputies that should be chosen biennially. On Sept. 21, after violent disputes, they conferred upon the king the right of a suspensive veto with regard to the proceedings of this body. The king accepted these measures. In the mean time the manifestations of popular excitement had continued in Paris with but brief intermissions; and the prevailing scarcity of money and of food, the discussions concerning the royal veto, the flight of many of the higher and most unpopular nobles, and other causes, had kept the excitement at a high pitch. The proceedings at a ball given for a royal regiment at Versailles aroused the populace still more; and on Oct. 5 a vast multitude, comprising a large number of women, with some thousands of gardes françaises and national guards, went from Paris thither, and a tumult ensued, which was barely checked by Lafayette’s interposition. Daybreak of the 6th witnessed renewed violence; the palace was invaded and several of the king’s guards were killed; and the exhibition of popular force resulted in the consent of the king and the assembly to transfer themselves to Paris. The assembly now extended the right of suffrage to nearly all the people, who were to choose electors, who should in turn elect national deputies; decreed the confiscation of church property for the benefit of the state, and the creation of assignats (see Assignats); and passed an act reorganizing the country into departments and smaller divisions. Louis confirmed all these measures; and in February, 1790, he appeared in the assembly, where he was received with considerable enthusiasm, and sought to display a conciliatory and liberal spirit. On July 14 he took the oath of support to the new constitution, with the deputies and other authorities, in the champ de Mars; and for some time it seemed as if a constitutional monarchy would remain established. But the conflicts in the provinces continued and increased; the assembly became more and more sharply divided into contending parties, and the popular orators incited the people to further demands. The details of the history of this period may be found in the biographies of the principal actors in its events; especially in those of Mirabeau, at this time the greatest man of the assembly, and of Marat, Desmoulins, Danton, and others, leaders of the republican clubs, now more than ever powerful. (See especially Jacobins.) A great part of the army shared the popular feeling; and those nobles who had emigrated (already called les émigrés), gathering on the frontiers and seeking to raise troops, added to the causes of the coming storm. The majority of the clergy, to take an oath of conformity to the civil constitution of their order as prescribed by the assembly led to further troubles; the influence of the clubs in the assembly increased; the king was compelled to dismiss his ministry. Mirabeau seemed the only man capable of controlling affairs at this crisis. At the beginning of 1791 there was a probability that secret negotiations and his own inclination might induce him to take office under the king and give his most powerful aid to the preservation of the monarchy; but all hope of this was brought to an end by his fatal illness, and he died on the 2d of April, at the most critical moment. In the months which followed the aspect of events grew daily graver. On the night of June 20 the king made an ill-arranged and disastrous attempt at flight from France, intending to escape and ultimately join the forces of the émigrés, with whom Austria, Spain, Hanover, Sardinia, and Switzerland had united in a league to resist the revolution. Louis was stopped at Varennes and carried back to the capital. The assembly now fully assumed the executive power; and though the king’s flight was not itself made the formal ground of any action against him, with its failure the last vestige of his authority disappeared. Indeed, the assembly formally suspended the royal power until the completion of a new constitution upon which they were engaged—the one subsequently called, from the day of its completion, the constitution of the 8th of September. A multitude, influenced by the leaders of the clubs, gathered in the champ de Mars (July 17) to demand the deposition of the king, but Lafayette dispersed them after a brief conflict. The constitution of Sept. 8 prescribed that the legislative power should rest in an assembly chosen biennially, as had been before voted; and still, as before, the nominal executive authority remained with the king, as did the suspensive veto. Louis took the oath to support this constitution on Sept. 14, and on the 8th the assembly dissolved, after passing a vote for the raising of 100,000 men for the defence of the frontiers. Prussia had on Aug. 27 joined the coalition of the powers of Europe against France, which completed the revolution which excluded from the legislative assembly (which began its sessions on Oct. 1) all members of the outgoing constituent assembly, and prescribed new elections, had the effect to throw the leadership of the new body into the hands of the more democratic party. Of the 745 members, the majority had been chosen through the influence of the clubs. Almost every shade of democratic opinion was represented, from the earnest and high-minded republicanism of the leaders of the party soon to become famous as the Girondins, to the violent extremes which found expression through men like Lacroix, Chabot, and Couthon. The most important early measures of the session were those which declared the émigrés guilty of high treason, and condemned the recalcitrant priests as galley-slaves. Louis refused these measures, and thus essentially stimulated the rapidly increasing opposition to the royal power. An army of 160,000 men was now (December) raised by order of the assembly.
Early in 1792 the property of the émigrés was confiscated. The Girondists had gained the complete leadership of the assembly; and in March the king was forced to dismiss his ministers and to form a new ministry from members of this dominant party. Dumouriez held the portfolio of foreign affairs, and, although the only member not a Girondist, was the acknowledged leader. Urged on by him and by the assembly, the king on April 20 reluctantly declared war against Austria; and the long conflict between France and the monarchical powers of Europe was begun. At the news of the first defeats of the French army, the greatest popular excitement broke out in Paris. A series of decisive measures was passed by the assembly in the weeks following; the banishment of the priests and the formation of a force of 20,000 national or federal guards near Paris, acts in direct defiance of the few vestiges of royal power still remaining, were the most important of these. The collection of 20,000 republican troops especially, under the direct influence of the Jacobins (a club composed of the most violent agitators), though ostensibly for the protection of the king and capital, could seem nothing but a threat to Louis, whose body guard the assembly had voted to disband. On June 18 the king dismissed his ministers. On the 19th the assembly was officially informed that he had vetoed both the above named measures. On the 20th a great body of the populace armed with pikes appeared before the meeting place of the assembly, demanded the abolition of the royal veto, forced their way into the hall, read an address in which the king was threatened with death, and afterward marched with violent demonstrations to the Tuileries, where they found prepared for defence, and protected by national guards with cannon. No force being employed against them, however, they pressed into the palace, and for an hour the king, the royal family, and their adherents were exposed to the greatest danger. Pétion, mayor of Paris, at last succeeded in dispersing the mob. In spite of all efforts the leaders of this movement were not punished; affairs grew daily graver, both at home and abroad. The assembly now took more and more decisive measures, and on July 5, after Vergniaud's famous speech (La patrie est en danger), they swept away the last remains of even formal power from the king by decreeing solemnly “the country in danger,” declaring themselves the permanent ruling body, calling the people to arms, and establishing a kind of exaggerated martial law throughout the nation. By the 1st of August all seemed prepared for a violent crisis. The people had been further excited against the king by news that the proclamation of the duke of Brunswick in his favor, and by the entry of the Prussian army into Champagne; the more violent party had rapidly gained the upper hand in the assembly and in Paris among the populace, where multitudes of armed men were in constant movement, ready to “enforce the will of the people;” their real leadership was in the hands of the men who had established themselves as the representatives of the Paris sections at the hôtel de ville, and who later, on the night of the 10th of August, laid aside all pretence of subjecting to the regularly constituted authorities and formed themselves into an insurrectionary commune. (See Commune de Paris, I.) All was ripe for a violent uprising, and on the night of Aug. 9–10 the outbreak came. Summoned by the ringing of bells and the drum roll beaten in the streets, a force made up of the more violent classes of the populace and a comparatively small proportion of national guards collected and took up their march, hastily formed into columns, against the Tuileries. A part of the guard posted about the palace affiliated with them and compelled the opening of the gates from within; the king allowed himself to be persuaded to seek safety in flight to the meeting place of the assembly; the Swiss guard alone began a defence which seemed likely to be successful. Suddenly they received from the king a message commanding them to cease all resistance and retire to their barracks. They obeyed, and gave up their posts. The assailants, however, now renewed the attack with greater fury, the combat became a massacre, and four fifths of the Swiss were butchered. In the assembly, where Louis had taken refuge, the greatest excitement meanwhile prevailed. At the proposal of Vergniaud two acts were passed, one providing for the calling of a national convention to assume the full power of government, the other temporarily suspending the king from all authority, and providing for his transfer to and virtual imprisonment in the Luxembourg: this destination was next day changed to the Temple, to which Louis and the royal family were taken on the 18th. The Paris commune, which had been the moving cause and director of the acts of the 10th, was now at the real head of affairs, and could force the assembly into merely following its wishes. Acts of an even more violent nature speedily succeeded. A special commission was organized with power to arrest and try all those who might be under suspicion of opposing the “welfare of the country,” and those who were called “the conspirators of the 10th of August” (the royalists and defenders of the Tuileries); and this first of the revolutionary tribunals soon brought about a perfect reign of lawlessness. The priests who had refused to take the prescribed oath were sought out and imprisoned; and under Danton's leadership the commune exercised unlimited control over life and property. In the mean time the news of the Prussian advance through Lorraine increased the excitement. The news of the taking of Verdun produced a climax of violence. The populace committed the wildest excesses; troops of armed men entered the
prisons where the priests and other suspected persons were confined, and there, on Sept. 2, began the slaughter known as the September massacres. It is estimated that between 1,500 and 1,500 prisoners were put to death. In the provinces similar though less important acts were committed. On Sept. 21 the newly elected national convention took the place of the legislative assembly. In this new body the Jacobins and more violent agitators were greatly in the majority, and their party, called "the Mountain" from its occupying the elevated seats in the hall, far outnumbered the Girondins, which now represented the more conservative element; besides these definite parties, a large part of the convention occupied an indecisive middle ground. On Sept. 26, on the motion of Collot d'Héricois, France was enthusiastically proclaimed a republic, and the convention at once entered upon a series of decisive measures against all relics of the old régime. The fortunes of the war on the frontiers had meanwhile changed; the Prussians had retired, the French under Dumas entered Belgium, Montespouo pressed into Savoy, and the force under Custine captured several important positions on the German frontier. The party of the Mountain and the popular leaders took the credit for these successes; their influence was greatly increased; and, urged on by them, events now rapidly took the direction, toward which they had long been tending, of more violent personal measures against the king. On Dec. 11 Louis was brought to trial on various charges, and after a long and intensely exciting trial he was sentenced to death on Jan. 20, 1793, and on the 21st was guillotined in the place de la Révolution (now the place de la Concorde). France was now speedily involved in an almost inextricable confusion. Insurrections took place in all parts of the kingdom; in the Vendé, from the beginning the seat of formidable royalist risings, the most violent disturbances broke out, and threats were made of advancing on the capital, England, by whose government the French ambassador was dismissed immediately on the news of the king's execution, united with the German empire, Holland, Spain, and Naples, against the revolutionary government of France. Paris itself was soon under the rule of an organized terrorism, at the head of which were Danton, Marat, Desmoulins, and their associates. A revolutionary tribunal and a "committee of public safety" were formed (March 10 and April 6), which were endowed by the convention with what was in effect an absolute power over persons and property. The law securing to the members of the convention immunity from personal arrest and injury was shortly afterward repealed; undoubtedly this was brought about as a preliminary step to the effort soon to be made to destroy the Girondins, between whom and the new leaders of affairs there existed the bitterest conflict; a conflict to be intensified when a violent quarrel put an end to a temporary affiliation which Danton had made with the Girondist leaders. Their fall was finally brought about after a most violent debate, during which several accusations were brought against them and rejected, among others that of having been associated in some way with Dumas in his acts. (See Dumouriez.) Bands of the armed mob gathered before the hall of the convention and demanded their punishment, and on June 2 the arrest of the Girondist leaders was decided. They were at first only sentenced to nominal arrest in their own houses; but it was not long before those who did not conceal themselves were seized and imprisoned in the Conciergerie. (See Girondists.) These acts of the convention produced violent disturbance in the provinces and in many of the large cities of the kingdom, great numbers of the people taking the part of the Girondists and opposing the violence of the new leaders at the capital. But in Paris the terrorists were now fully established in power, and proceeded daily to strengthen their rule by renewed steps against their remaining enemies. The great majority of the people, especially in the provinces, looked upon Marat as the head and life of the terrorists; but when on July 18 he was killed by Charlotte Corday, the error of this belief was seen. The murder, instead of aiding the imprisoned Girondists, only furnished their enemies with another accusation against them; while the real leadership of the party was now obviously, where it had long actually been, almost entirely in the hands of Robespierre, whom Marat's death only left more at liberty to carry out his own plans. On Aug. 10, 1793, still another constitution, and this time a radically democratic one, was adopted, but it was voted that it should not go into actual effect until the end of the war. The convention made great changes in the organization and leadership of the army, and by the most strenuous exertions, and the proclamation of a lettre en masse, now brought men into the field by hundreds of thousands. In the provinces the conflict with the opposition was carried on with the most relentless cruelty. In the Vendée, among the royalist inhabitants, terrible slaughter was made. In Bordeaux, Marseilles, and Lyons, which had resisted the authorities at Paris, but had been subdued, the most barbarous massacres were perpetrated. Carrier in Nantes invented novel horrors (the noyades). Toulon endeavored to escape the fate of these cities by surrendering to the British; but it was recaptured and treated with the same cruelty. Similar measures marked the civil conflict in all parts of the kingdom, the forces of the convention overrunning and ravaging the country. Meanwhile the war of the coalition against France did not make much progress. The allied powers were embarrassed by complications among themselves. Paris itself had been fairly given over to anarchy; all industry was
at an end, and the mob plundered as it chose, or was “supported” by the government of the commune on the property seized from the rich. Bœuf had openly declared in an address that “terror was the order of the day.” The convention passed a decree (Sept. 17) against all those persons whom it defined as “suspected,” and a course of violence that resembled that of the old Roman proscriptions began against those held to be enemies of the new régime. The queen, Marie Antoinette (who had been a close prisoner since the death of Louis), and the imprisoned Girondists, were among the first victims. After a brief form of trial in the first part of October, Marie Antoinette was guillotined on the 16th. The Girondists, after a brilliant defence, were executed Oct. 31. Several acts of the convention strongly marked the prevailing anarchy. By a decree of Oct. 5 the Gregorian calendar was done away with and a new revolutionary calendar introduced, which, by a retroactive provision, was supposed to have begun Sept. 22, 1792. From this time onward the Christian religion was formally abolished, and the worship of Reason substituted, through the influence of Hébert, Anarchist Cloots, and their followers—that party in the revolutionary commune which comprised the most violent extremists, and which was already known under the name of the Hébertists or enfangé. But the “men of terror” now approached the first of those dimensions which precluded their fall. Robespierre, who was rapidly making his way toward nearly absolute power, saw that the acts of the Hébertists would weaken his influence with the populace, and for this and other reasons he desired to be rid of them. Through his influence they were arrested and accused on various grounds, and 20 of them were executed March 24, 1794. Danton and his adherents, including Guistille Demoulin, who now advocated clemency, were the next opponents to be cleared from Robespierre’s path; and though the conflict was in this case harder, his influence was sufficient to carry it through successfully. On March 31 the Danton party were arrested, the fear of Robespierre forced the convention to bring accusations against them, and on April 5 they were also brought to the guillotine, leaving Robespierre, with his companions St. Just and Couthon, in power. Under these leaders the order of affairs was again changed. Robespierre introduced still another religion, under the name of the worship of the Supreme Being, proclaiming a solemn fête at its introduction, which was little more than a farcical display of his own egotism. The rule of violence redoubled its horrors and atrocities; indeed, the period now following is that which is generally known especially as the reign of terror. The convention could not refuse the most extravagant commands of the powerful triumvirate; it was even obliged to assent to a proposal giving to the revolutionary tribunal the right to summon before it, without question, the deputés themselves. The terrible executions par fours were begun, before a reorganized tribunal that was to “act more vigorously” than the former one. These executions were nothing less than promiscuous slaughters of all those against whom the most trifling accusation could be brought forward or invented; 60 to 70 persons, according to the most temperate statements, being daily brought to the guillotine. In Paris alone there are said by good authorities to have been 1,500 executions during the seven weeks through which this state of affairs endured. Such a course could not be long continued, and at length the reaction came. Opposition to Robespierre sprang up within the committee of public safety itself; and when on July 26 he demanded its renewed reorganization, the convention for the first time dared to refuse him. This step gave an opportunity to his enemies to turn against him; and in a single day his almost dictatorial power was gone. On July 27 (9th Thermidor) his arrest was ordered. Paris was now once more in uproar: a violent conflict began between the adherents of Robespierre and the troops of the convention, on whose side the sections and the national guards arrayed themselves. At first he was rescued by his party, but their success was only temporary. Their opponents won in the end a complete victory, and on July 30 Robespierre and a great number of the leaders of the terror were guillotined on the same spot where their victims had suffered. With this act of justice an end may be said to have been put to the reign of the proletariats and the worst classes of the Paris population; and the more intelligent citizens began to regain that share of influence of which they had been so long deprived. On Nov. 12 the Jacobin club was closed. The more moderate deputies of the convention, who had fled or been banished, gradually reappeared in Paris. Although insurrections, caused partly by the prevailing want and suffering, partly by intrigues of the former leaders of the mob, broke out from time to time (especially on April 1 and May 20, 1795), they were put down, after sharp conflicts, in one of which (May 20) the convention was driven from its hall for a time. Under the influence of the more moderate opinions that now again gained the upper hand in the convention, a new constitution was formed. This was “the constitution of the year III.,” bearing throughout the traces of the return of an intelligent and responsible class to the conduct of public affairs. It provided for the institution of two legislative bodies, the council of 500 and the council of ancients, numbering 260. The executive power was placed in the hands of a directory of five members. But a decree of the convention, by which it prescribed that two thirds of the new assembly of 500 must be chosen from the convention’s own members—a measure designed to prevent either royalists or ultra democrats from controlling the new body—gave rise to a new
and formidable uprising, in which parties were most singularly divided. The royalists, hoping to seize this opportunity to regain power and nutrition the way for a restoration of the monarchy, were those who began this insurrection and the conflict against the convention; the middle class (bourgeoisie), fearing the return to power of the extreme democrats, joined the royalists; and the convention had upon its side the army and the populace of the suburbs, the once ruling proletariat. Both sides prepared for a violent conflict, the royalist party having much the greater force at command.

But the convention placed their troops under the command of Napoleon Bonaparte, then a young general, but of the greatest promise; his skill and determination gave the convention a complete victory (Oct. 5, the 18th Vendémiaire). During the later portion of the revolution, and while these events occurred at the capital, the French army had won some successes in its war with the foreign powers in coalition against it, partly through actual victories, partly through the mismanagement and jealousies in the ranks of its enemies. The results of these successes may be briefly summarized. Prussia, whose troops had been gradually forced to withdraw across the Rhine in 1798, had carried on the war in only a half-hearted fashion during 1794, and, jealous of Austria and now in harmony with the other powers, had withdrawn from the coalition and made peace in April, 1795. Spain had concluded peace in July of the same year. Belgium had been overrun and taken possession of by the French. The Austrians had been forced back across the Rhine; the allied armies of England and Holland had been gradually pushed back, and although during the last few months they had shown renewed energy in the carrying on of the war, they had had as yet accomplished but little. Early in September the French army had crossed the Rhine, near Düsseldorf, and penetrated to Frankfurt, while another detachment had taken Mannheim. But this last body soon met with a defeat which greatly tended to turn the tide; Mannheim was re-taken and the army driven back. In France itself the Vendée was again in insurrection. Such was the state of affairs when, on Oct. 29, 1795, the new government began, the convention having been dissolved on the 26th. (See DIRECTORY.) But the condition of things at first grew rapidly worse. England, Russia, and Austria, in a new coalition, began to carry on a more vigorous warfare. It was not until Carnot's plan for a general offensive movement of the French troops was put in operation, that the current of success was decidedly turned in favor of the French. Bonaparte was put in command of the army which was now to advance against the Austrians from Italy, and the account of the campaign he there conducted in 1796 and 1797, given at length in his biography (see BONAPARTE, NAPOLEON), will show how completely he changed the condition of affairs. (For other military events under the directory, see HOCHER, JOCARD, MARENGO, and MORTAIX.) At the time of Loéville (April 18, 1797) France controlled all Italy; Austria was rendered all rights in Belgium and recognized those republics which France established. The most important internal affairs during this period were the schemes for financial improvement, which came to but small results. The royalist party had, been gradually gaining ground throughout the kingdom, and the directory was constantly absorbed in the endeavor to prevent an outbreak, which, in the prevailing condition of want and general bankruptcy, could not but put an end to its power; an outbreak constantly threatening both from royalists and the democratic party which had risen from the intrigues of the defeated Jacobins. The directory sought to preserve its own influence by using these parties as balances to one another. In the elections of 1797 the royalists made such inroads as to give them a majority in the council of 800; and this hastened the approaching crisis. The republicans found their support chiefly in the army; and with the aid of this, Bonaparte being on their side, they prepared and carried out a decisive movement. On the night before Sept. 4 (18th Fructidor) the hall of the council was surrounded by troops and cannon. The Tuileries was occupied with little opposition. The royalist members of the council were arrested, and the remainder of the body pronounced a decree of banishment against them, and declared their elections illegal. The republicans were again in power. On Oct. 17 a formal peace was concluded with Austria at Campo Formio, which confirmed the advantages of the treaty of Leoben with some important additions. From this point the history of France becomes so entirely identified for nearly 18 years with that of a single man, that we may refer for all details of that period to the article BONAPARTE, NAPOLEON, and confine ourselves in this place to the briefest summary of events. The brilliant victories of the French under Bonaparte in Egypt and their simultaneous defeats on other theatres of war (1798–9) prepared the way for those acts which were to make him the ruler of the nation. When, on his return from the East, the young general overthrew the vacillating directorial government with the two councils, and formed a new constitution, his course was generally approved. Chosen first consul for ten years, Dec. 20, 1799, he broke up the coalition which had been formed against France by his victory at Marengo, June 14, 1800; forced Austria and the German empire to conclude the peace of Lunéville in 1801, and England that of Amiens in 1802; and by a concordat with the pope re-established Christian worship in France. Consul for life, Aug. 2, 1802, then hereditary emperor, May 18, 1804, he reformed and reorganized legislation at home by the formation of the civil code, the organization of
public instruction, and the improvements he introduced in all the branches of public service; while he added to his military and political glory by his triumphs at Austerlitz, Jena, Friedland, Eckmühl, and Wagram, and by the treaties of peace which he signed at Presburg (1805), Tilsit (1807), and Vienna (1809), with the great powers of Europe, successively brought by England into coalition against him. He had now reached the height of his power and glory; he had placed his brothers on the thrones of Holland, Westphalia, and Spain, and his brother-in-law on that of Naples; he thus extended his influence over nearly the whole of western Europe, and became the most powerful ruler of the world. But his insatiate ambition and arbitrary rule were incessant causes of hatred and opposition against him among the sovereigns and the nations of Europe; they did not cease from efforts for his overthrow. His power was sustained by his successful resistance which he met with in the Spanish peninsula (1808-1813); and his prestige was ruined by his disastrous expedition to Russia in 1812. The European nations, recovering their courage, united against him; and their combined exertions inflicted upon him at Leipzig, Oct. 16-19, 1813, a blow from which he never recovered. It was in vain that he accomplished wonders during the campaign of 1814; he could not expel his enemies from the French territory; he was dethroned, and a prince of the house of Bourbon, the brother of Louis XVI., received from the conquerors the sceptre of France, now restricted to her old limits. The sudden return of Napoleon from Elba overthrew this new power; and for 100 days, from March 20 to June 28, 1815, he was again the sovereign of France; but the battle of Waterloo (June 18, 1815) destroyed his power for ever, and the Bourbons, reinstated by foreign bayonets, once more ruled the kingdom. From this time the history of France can be again followed in the biographies of her rulers, of whose reigns we give here but a brief review. Louis XVIII., the first monarch under the restoration, granted a charter to his subjects, and, keeping carefully within the limits of that instrument, died in 1824 in undisturbed possession of his throne, although, in compliance with orders from the holy alliance, he had in 1823 sent a French army to put down the liberal revolution in Spain. His brother and successor Charles X., a man whose character inclined him toward a less liberal government, anxious to take back the little liberty France was enjoying, tried to divert public attention by supporting the Greek insurrection against Turkey (1827-38) and conquering Algiers (1830). But these enterprises failed to conciliate public opinion, and when the king attempted to suspend some of the most important guarantees secured by the charter, a formidable insurrection broke out, July 27, 1830. Charles was obliged to abdicate; and after a few days' interval the head of the younger branch of the house of Bourbon, Louis Philippe, duke of Orléans, was appointed "king of the French" (Aug. 9) by the chamber of deputies. The choice, being acceptable to the middle classes or bourgeoisie, was maintained; and notwithstanding some occasional outbursts of republicanism among the people, the July monarchy, as it was called, lasted for nearly 18 years. At first Louis Philippe seemed willing to fulfil the expectations of the liberalists, supported Belgium against Holland, and seized upon Ancona to counterbalance the influence of the Austrians in Italy. But by degrees his policy was changed; the government proved reactionary at home and devoid of energy abroad; and the popular favor on which it had relied deserted it. A political manifestation in favor of parliamentary reform brought on another revolution, Feb. 24, 1848; and although the majority of the nation would have preferred the continuance of a constitutional liberal monarchy, the irresistible course of events precipitated them into a republic. (See Lamartine.) The middle classes, being apparently resigned to their present fate, professed to be ready to give this new form of government a fair trial; but within a few months the majority of their representatives in the constituent assembly, frightened by socialist movements and a terrible civil struggle in the capital (June 28-30), gave strong evidence of hostility to it. A so-called republican constitution was adopted, and on Dec. 10, 1848, Louis Napoleon Bonaparte, the nephew of Napoleon I., was elected president of the French republic for a term of four years, by 6,484,226 votes, against about 1,450,000 given to Gen. Cavaignac, who had crushed the June insurrection. (See Bonaparte, Napoleon III.) Internal dissensions, some signs of which were apparent, soon estranged the majority of the legislative assembly, which succeeded the constituent in 1848, from the president; and rumors of revolution became rife as the epoch of a new presidential election approached. The expected revolution took place, Dec. 2, 1851; by a bold stroke of policy the president dissolved the assembly, assumed dictatorial powers, and made an appeal to the people, asking them to sanction by their votes what had been done. The support of the army had been previously secured, and various unconcerted attempts at armed resistance were smothered by energetic and bloody measures. The revolutionary president, who alone controlled the elections, was chosen for a term of ten years by 7,489,216 votes; a new constitution, very much like the consular one framed by Bonaparte in 1799, was promulgated; and finally, on Nov. 7, 1852, the senate made a motion for the reestablishment of the empire; this having been assented to by a vote of 7,824,159 citizens, the empire was proclaimed, Dec. 2, 1852, and Louis Napoleon ascended the throne with the title of "Napoleon III., hereditary emperor of the French by the grace of God and the
will of the people." An unusual financial and commercial activity marked the first years of his reign; the crédit foncier and the crédit mobilier companies were established in Paris; many important public works were undertaken, and though speculation was unduly encouraged, the general material condition of the country was undoubtedly much improved. On Jan. 29–30, 1853, Napoleon married Eugénie de Montijo. The chief event of the early portion of this reign was the Crimean complication, in which, largely through the influence of Napoleon and his advisers, an alliance was formed by England, France, and Turkey against the demands of Russia, and war was declared on March 27, 1854. Several large public loans were negotiated in open market (almost the first time this had been done in France), to provide for the expenses of carrying on the naval and military operations, and active warfare was almost immediately begun in the Black and Baltic seas and on the Crimean peninsula. The conduct of the war by the French government largely increased the military prestige of the nation, as well as the popularity and strength of Napoleon's rule, especially as during its continuance measures for enhancing the domestic prosperity of the country were by no means neglected. An international exhibition and the meeting of a statistical congress took place in Paris in 1855, and during the same year several personal visits of European sovereigns to the French capital tended to give Napoleon a recognition which was not at first accorded to him. Two unsuccessful attempts at the assassination of the new emperor were, however, made during the same period. On March 16, 1856, the prince imperial was born at the Tuileries. On March 30 peace was concluded with Russia, France coming out of the conflict with the prestige of the first military power of Europe, while the French government also rapidly acquired great diplomatic influence. Napoleon was made arbiter in several important questions between European powers; and he added to his influence at home by taking part in the war against China in the East, and by occupying New Caledonia. In 1856 another attempt was made to assassinate him, on this occasion by Orsini and his fellow conspirators, several of whom suffered death. The affairs of Italy now began to occupy attention, and Napoleon's decision to interfere in Italian matters against the Austrian government, first openly intimated in January, 1859, led to the declaration of war against Austria in May of that year. The conflict which followed, though leaving the affairs of Italy in a somewhat undecided state, added to the French military prestige, and the peace of Villafranca, July 11, 1859, which was confirmed by the treaty of Zürich in November, left France in a position of even greater authority than before in European politics. In 1860 Savoy and Nice were ceded to France by Italy, as had probably been secretly arranged with Victor Emmanuel before the war. This act excited among the other European powers the greatest suspicions of Napoleon's designs, which were not allayed until after his interview with several of the leading German princes at Baden in June, at which he expressed himself satisfactorily to them as regarded his further intentions. During all this period Napoleon had not discontinued his activity in the East, and especially in the colonies. The war in China terminated successfully for the allies, by the capture of Peking in October, 1860. Those gradual aggressions in Further India, which terminated in 1863 in the French occupation of Cochlin China and in the establishment of a protectorate over Cambodia (see CAMBODIA, and COCHIN CHINA), had also begun. In 1860–61 an expedition was sent to Syria to protect the Christians there from such violence as had been exhibited shortly before in the Damascas massacres. But while the French prestige was greatly increased in the East by these acts and successes, the emperor's schemes for establishing the Hapsburg prince Maximilian on the throne of Mexico ended in so ignominious a failure as to do much toward undermining the opinion of his power that had been held in Europe; nor could the course which European affairs themselves took in the few years next succeeding be other than dangerous to the continued influence of France. The rapid aggrandizement of Prussia was especially regarded with a jealous eye by the French government, and Napoleon in vain endeavored to prevent by diplomatic measures the results which he foresaw from the Schleswig-Holstein war, and the war of Prussia against Austria in 1866. Among these were his efforts to obtain possession of Luxemburg, resulting in the neutralization of that territory. The internal affairs of France during this period had also been of much importance. The conclusion in 1860 of a commercial treaty with England, strongly in the interest of free trade, had created a great excitement and vehement opposition among the manufacturers and industrial classes of the empire, and led to much debate in the corps législatif. In November of the same year an imperial decree made several changes in the powers and rights of the senate and legislative body, which permitted much greater freedom in the interpellation of ministers, and in criticism of the acts of the government. This decree was followed by several other somewhat liberal measures, among them two which placed the vote on the financial budget in the hands of the corps législatif, and also conferred on that body the power over appropriations, &c., which had before been settled simply by an imperial decree. The laws concerning the press were also somewhat lightened; but the tendency toward a more liberal government manifested in these acts of the emperor did not long continue. The decrees concerning the corps législatif, however, permitted the growth in that assembly of an opposition party which
rapidly gained in numbers and influence, was considerably increased at the next elections (1863), and during the decade between 1860 and 1870 contributed greatly to the growth of public opinion against the Napoleonic government. The falling fortunes of the Mexican expedition, the various diplomatic defeats suffered by the emperor in his European negotiations, the endeavors of the government partly to interfere with the elections in the departments, the unsatisfactory management of the finances, and many other causes, combined to rapidly increase this feeling, which, assisted by the publication of political satires and pamphlets, became every day more formidable. The course which Napoleon pursued during the Prusso-Austrian war in 1866 did not tend to restore confidence in him; and the excuses by which his ministers sought to smooth over the obviously vacillating and feeble policy he had pursued during its continuance and after its close, and the open rebuffs he had met with from the Prussian government, rather aided than checked the growing opposition. The year 1867, although the international exposition (which was opened in the spring in Paris with great splendor) made it outwardly appear a prosperous period for the French government, was in reality a time of sharp political struggles at home, and of complications abroad. In the course of the former the members of the opposition in the corps législatif did not hesitate to openly pronounce the imperial policy of the preceding years a failure; and the financial and military measures of the emperor met with but an indifferent support from that body. Among external affairs the “Roman question,” the problem of the position of the Papal States in relation to the rest of Italy, had assumed an aspect which seemed likely to require prompt action if the imperial policy was to be sustained. When in the autumn of 1867 an Italian uprising against the continuance of the papal power in Rome occurred, under Garibaldi’s influence and leadership, and the government of Victor Emanuel manifested the greatest hesitancy in undertaking an active interference, Napoleon was driven to more energetic measures. An ultimatum was sent to Florence on Oct. 16, and on the 30th a body of French troops, brought from Toulon by sea, entered Rome; on Nov. 3 they reinforced the papal troops at the battle of Mentana against the Italian forces, and secured the defeat of the latter; and no part of the force was withdrawn until the pope’s authority was reestablished. Even then small garrisons were left in Rome and Civitá Vecchia; and, as much diplomatic negotiation on the part of France with the other great powers did not lead to a settlement of the question which was at the same time satisfactory to the government of Victor Emanuel and that of the emperor, these garrisons were retained pending the decision of the matter; and they did not finally leave the Italian capital until other and far different events had brought about Napoleon’s downfall, nearly three years later. Among the more important measures of the legislative sessions of 1868 were the new press law, which very slightly increased the freedom of the press; the law greatly enlarging the army, and including provisions for prolonging the term of service and arming the troops; and the provision for a loan, for military purposes, of 429,000,000 francs. The growth of public opinion against the emperor and his ministers was most conspicuous during this year. Republican demonstrations were made both in Paris and in the provinces; Rochefort’s Lanterns and many other publications aided the growing sentiment; while the trials of several prominent offenders only increased the excitement. The legislative session of the early part of 1869 was chiefly noteworthy for the revelations made during its continuance of the condition of the finances of the empire. The failure of the crédit mobilier revealed the unauthorized proceedings of Hausmann, the prefect of the Seine, to whom had been due the great embellishment of the capital during the ten years preceding—embellishments and improvements undertaken largely with a view of giving employment to the more turbulent portions of the working people, but pursued with reckless extravagance, and with complete disregard of the rights and interests of the poorer classes. The exposure of the entirely unauthorized means by which money had been obtained for these and other purposes, and of the general confusion prevailing in financial affairs, created great excitement; and it was only with extreme difficulty that the government carried its measures for the year through the corps législatif. The elections in May resulted, in spite of the most energetic exertions of the emperor’s adherents, in the return of a much greater proportion of opposition deputies than had ever before been chosen. The debates in the corps législatif were now of such a nature that Napoleon hastened to ward off a possibly approaching crisis by the promise of speedy liberal measures and reforms, and to prevent further action by causing the adjournment of the body. The promised measures were embodied in the senatus consultum of Sept. 6, 1869; but the emperor’s failure to convocate the legislature for its new session on the prescribed day led to renewed excitement. On Nov. 29, however, it was finally opened; and its first acts clearly showed the strength of the liberal party. The appointment (in January, 1870) of Ollivier to the premiership and the removal of Hausmann were the earlier events of the session. Great excitement was caused, and popular disturbances were renewed, by the shooting of Victor Noir by Prince Pierre Bonaparte, on Jan. 10, and indignation was greatly increased by the acquittal of the prince in March following. The arrest of Rochefort and the tumults in consequence; the long continued strikes in several great factories, and the discontent of the laboring classes; the delay of the emperor
in giving immediate force to several promised reforms, and the general distrust of his intentions combined to diminish the at first unusual popularity of Ollivier's ministry. The new government, which had seemed about to introduce in France a constitutional régime, gradually lost the public confidence. In March the draft of a new constitution was submitted to the corps législatif. While it confirmed the measures of reform already adopted, it did not include the hoped-for provision making the ministers responsible to the legislature instead of to the emperor; and it conferred upon the emperor the right to "appeal to the people" to sustain him in his acts; a provision which was generally looked upon as a mere cover for the continuance of the old personal government, and a device for concealing Napoleon's retreat from his promises to give to the legislature that power which it should have in a constitutional form of administration. The new constitution itself was submitted to the people, by this form of "appeal," instead of to the corps législatif. Having been confirmed by a senatus consultum (April 20), a plébiscite was ordered upon it for May 8. By the most strenuous exertions of the imperialists, and their interference everywhere with the elections, the result was made to show more than 7,000,000 affirmative votes, against fewer than 2,000,000 negative and illegal ballots. The large cities cast a great proportion of the negative votes; in the army and navy 47,000 persons voted "No." In spite of this result, the situation of internal affairs was extremely grave; and it is not to be doubted that, in the hope of warding off a more serious crisis, Napoleon rather favored than retarded the progress of those foreign complications which, in the early summer of 1870, began to assume a threatening aspect.

For a considerable period indefinite rumors of a possible alliance between France and Austria against the increasing power and pretensions of Prussia had agitated European diplomacy. Of late they had gained in distinctiveness. The position of Austria did not appear decided, but in France unmistakable manifestations of a hostile spirit on the part of the government were made; chief among them, perhaps, was the appointment to the ministry of foreign affairs of the duke de Gramont, well known for his hostility to Prussia. Hardly had this appointment been made when an unexpected event occurred, which hastened the rapidly increasing complications, and furnished what was taken by the French as an immediate cause of war. This was the declaration of the candidature of the Hohenzollern prince Leopold for the throne of Spain. On July 8 Ollivier and Gramont declared in the corps législatif that such a candidature, agreed upon without the knowledge of the French government, could not be permitted by France. The greatest excitement against Prussia followed, both in the corps législatif and among the people. The voluntary withdrawal of Prince Leo-
pold did not end the matter. Benedetti, the French ambassador to the Prussian court, who had been instructed to request the king of Prussia to command Prince Leopold's retirement from the candidacy, was now instructed to demand of that monarch an explicit promise that no prince of Hohenzollern should ever in the future be a candidate for the Spanish crown. This demand, especially when pressed upon the king (who was then at Ems) in an unwarranted and even insolent manner, was decidedly refused (July 19). The king denied to Benedetti another interview; and the latter was recalled by Napoleon, while Prussia immediately withdrew her representative from the French court (July 14). Five days later, and after the failure of the proffer of mediation made by England and also by the pope, war was formally declared by France (July 19).

The short time elapsing between the first public warnings of approaching hostilities and this formal declaration had been sufficient to permit popular enthusiasm in both countries to rise to the highest pitch; but in the matter of actual military preparations the two nations found themselves, as events proved, in widely different conditions. In France, where measures for the increase and reorganization of the army and for the improvement of the military situation in all respects had occupied for several years a considerable part of the attention of the legislature, the preparation for a possible war had been perhaps more conspicuous than in the North German confederation; but so much less thorough in many respects had been the carrying out of the French military system that its results did not bear out the estimates upon which both people and government relied. The French army at the beginning of 1870 nominally numbered on a peace footing about 400,000 men; it was supposed from the estimates that it could be raised on a war footing, and including the national guard and all branches of the service, to nearly twice that number. That these expectations, however, were based upon exaggerated estimates of the numbers as well as of the immediate availability of the troops at command, appeared at the very beginning of military movements. The number of troops in the active army at the disposition of France at the beginning of the war was, according to the best military authorities about 427,000; there were about 87,000 regular reserve troops in addition to these; and the entire force of men who, besides all those just named, could still be called out in the most extreme emergency (chiefly those employed in garrison duty), was about 187,000. The active or field army, which it is alone necessary to consider at this time, had been rapidly prepared for war for several months before the declaration. The preparation of munitions and the purchase of horses and provisions were carried on with great energy throughout the months of May and June; while the organization of the line and the as-
FRANCE

signments of officers to its divisions and brigades were at the same time pushed forward. Yet so defective had been the arrangements of the government that the outbreak of hostilities found the army in great part unprepared, while the preparations for their mobilization were in the most incomplete condition. The "army of the Rhine," the first portion of the active force which was in any way ready for service, was pushed forward as rapidly as possible to the Rhenish frontier; but most of its munitions and equipment, instead of going forward at the same time, followed at irregular intervals; and the troops, arrived at their destinations, were subject in consequence to the most fatal delays. The whole strength of this first active army that appeared in the field did not exceed, by the highest estimates, 810,000 men; and of these probably not more than 270,000 constituted the "army of invasion," with the advance of which at the frontier actual hostilities began. In contrast with this state of affairs, the military system of Germany exhibited the greatest advantages. Not only did the immediate support of the South German states (upon whose neutrality, if not upon their positive opposition to Prussia, Napoleon had undoubtedly relied) enable King William to bring into the field an active army more than one third greater than that of France; but the perfect organization which prevailed especially in the Prussian, and in less degree throughout the whole German military force, enabled him to do what was of perhaps even more importance, concentrate immediately on the frontier a well disciplined, perfectly trained, and completely prepared body of men; anticipating the movements of the enemy by taking advantage of his delay. Directly after the declaration of war, Germany found at its immediate disposition an active force of about 447,000 men, ready for the very beginning of hostile operations; and behind this was a reserve of 189,000, and a second reserve of about 225,000, to say nothing of the Landwehr, or home militia. From the active force of 447,000, three armies were formed: the first, under Gen. von Steinmetz, took up its position (as the right wing) near Treves; the second, under Prince Frederick Charles, occupied the Rhenish Palatinate; the third, under the crown prince of Prussia, assembled on the frontier of Baden, from Mannheim to Rastadt. While the German forces had assembled in these positions, the French army of the Rhine had, after the delays we have explained, arranged itself as follows: The 1st corps, under Marshal MacMahon, was posted near Strasburg; the 5th corps (Gen. Faily) further to the northward, along the frontier of the Palatinate, near Bitsch; in the centre, the 3d corps, under Bazaine, assembled near Mainz; the 2d corps (Gen. Frossard) was pushed forward toward the Rhenish frontier near St. Avold; the 4th corps (Gen. Ladmirault) was near Thionville, on the left wing; reserves, under Bourbaki and Canrobert, were respectively at Nancy and at the camp of Châlons; the 7th corps, under Gen. Félix Donay, occupied the fortress of Belfort. In these positions the opposing armies stood ready for action in the last days of the month of July. A few skirmishes, of trifling importance, had taken place; but no decisive movement had been made on either side. On the 28th Napoleon, who had from the beginning announced his intention to lead the army, left Paris with the prince imperial, and proceeded to Metz to take the actual command, having on the 23d appointed the empress regent of France during his absence. On the day of his arrival at Metz he issued a proclamation to the troops. On July 81 King William left Berlin for the field, accompanied by his chief political and military advisors, Bismarck and Moltke; he also issued proclamations of encouragement, one to the people of Germany, the other to the army. On Aug. 3 he established his headquarters temporarily at Mentz. On the same day active hostilities began with the attack by three French divisions of Frossard's corps upon the garrison of Saarbrück, about 1,800 men, who were speedily driven back; they retreated across the Saar to St. Johann, while the French occupied the heights before the first named town. But the results of the engagement were unimportant, nor did the French use even the slight advantage they had gained. Immediately afterward the three German armies began an advance, in which (as the general line of direction pursued tended toward the line of the Moselle and the French centre) the third army took the initiative, inasmuch as it, being the most southerly in position, had the most ground to traverse in executing the contemplated movement. Beginning the march on Aug. 4 from their position east of Landau, the forces of the crown prince pressed forward un molested as far as the neighborhood of Weissenburg. Here their advance guard was attacked by the French under Gen. Abel Donay, and the first serious conflict of the war began; ending, after five hours of fighting, with the retreat of the French, who lost their general, while the Germans occupied their abandoned position. On the 5th they continued the advance to Sulz. MacMahon, meanwhile, with the main body of his command, of which Donay's division had been but an advance guard, took up his position at Wörth, and prepared for battle. On the morning of the 6th the greater part of the crown prince's forces had so far pushed forward that the armies stood opposing one another, and the German advance guard met the French left wing near Görsdorf, somewhat northwest of the position of the centre. The engagement that ensued there became gradually general, and spread along the whole line of the opposing armies to the north, to the end of the day, MacMahon, on the main points of MacMahon's position, were carried after desperate resistance, and the defeat of the French terminated, shortly after four in the afternoon, in a retreat, and finally almost in a panic, the
scattered forces fleeing through the passes of the Vosges, pursued by the German cavalry. The crown prince at once continued his march toward a junction with the other branches of the 10th the German army. While these events had happened in the march of the crown prince's forces, the armies of Steinmetz (first army) and Prince Frederick Charles (second army) had effected their junction, advanced across the Saar, occupied Saarbrück, and, on Aug. 6, in the neighborhood of Saarbrücken and Forbach, after a most bloody conflict for the possession of the French position on the heights of Spichern, had won another complete victory, driving Frossard both from his first line of battle and from the position he afterward endeavored to take up near St. Avold. The remnants of his corps retreated toward Metz, where Bazaine's corps was also joined by Ladmirault's from Thionville, and by troops under Bourbaki and Cambronne. The three German armies were now not long in effecting their junction upon French territory. The first and second carried on their gradual advance; while the third passed through the Vosges, taking Lützelstein and Lichtenberg after short resistance, and leaving Bitsch and Pfalzburg surrounded by detachments of troops. By the 11th the three armies were together, forming an almost unbroken line. The headquarters were established in Saarbrücken. By the 14th the first German army had advanced to the immediate neighborhood of Metz; and there, in the afternoon of that day, by a successful attack upon the 8th French corps, which had been sent out to cover the withdrawal of troops from the fortress, baffled the first attempt of the French to retreat to the line of the Marne. The engagement, which took place near Courcelles, and gradually assumed larger proportions, ended with the retreat of the French troops into the fortifications, and secured to the forces of Prince Frederick Charles the necessary time to take up a position for cutting off the French army concentrated at Metz, which Napoleon now left under the chief command of Bazaine, from junction with other French forces. On the evening of the 15th the 8th corps of Prince Frederick Charles's command took up their march toward the river, crossed it, and pressed northward as far as the villages of Gorze and Orville. The next morning the march was continued as far as the neighborhood of Mars-la-Tour and Vionville. Here began, about 10 A.M. on the 16th, the engagement which proved to be the most bloody and sharply contested struggle of the war thus far. Beginning by an attack by the Germans upon the much superior force of the enemy which had been encamped at this point, and sustained forward for a large portion of the day until the 10th of corps and Prince Frederick Charles advanced to its aid in the afternoon, the battle ended in the defeat of the French, though with an immense loss of men to the German army. Bazaine now withdrew his troops to a considerable distance, took up a position between Gravelotte and St. Privat-la-Montagne, and there massed almost his whole force, preparatory to the great battle of Nancy. During this the Germans also made ready, and on the 18th the hotly contested battle of Gravelotte began, ending in a renewed defeat of the French, and in their retreat within the fortifications of Metz. The results of this engagement were most important. By it nearly one half of all the French troops in the field were effectually shut up within a surrounded fortress; while the Germans, leaving the greater part of the first and second armies as a besieging force before the city, were free to execute the movement which was now at once begun—the advance against the army of MacMahon, which was reorganizing at Châlons, reinforced by Failly's corps, a part of Félix Douay's, and numerous reserves. For the purpose of this and of further movements, the organization of the German forces was now somewhat changed. A fourth army was formed, under command of the crown prince of Saxeony, from portions of the other armies, and from the troops who had up to this time been engaged in guarding the German coast against a naval attack, which was hardly to be any longer feared. Less important changes were also made in the organization of the first and second armies, and the forces of the third were considerably increased. The advance of the last named body and of the army of the crown prince of Saxeony was begun on the 19th, the very day after the battle of Gravelotte; the king of Prussia assuming the command of the united force, which was now to enter upon operations which continued to the gates of Paris. The army under the crown prince of Saxeony (army of the Meuse, as it came to be called) advanced along the highway toward Châlons. The third army at the same time crossed the Meuse and advanced toward Bar-le-Duc. Toul had been previously attacked, and a besieging force was now left to invest it, while the remainder of the army continued its progress. In its gradual advance it was met by the news that MacMahon had withdrawn from Châlons, and had taken up his march to Rheims, and beyond it in the direction of Reithol, evidently with the intention of relieving Bazaine's army. In consequence of this intelligence the German march was immediately turned northward, in order to intercept the French army and occupy a position between it and Bazaine. The opposing armies rapidly approached each other, as the French pressed forward from the neighborhood of Vouziers along the Meuse; and after several minor engagements between detached parties, on Aug. 20 a large and decisive engagement took place between the corps of Gen. Failly in their camp near Beaumont, drove them from it, and after both sides had been reenforced began a battle which resulted in the retreat of the French beyond the Meuse and their further withdrawal toward
Sedan. Here MacMahon massed his army and prepared for a more important conflict. The emperor Napoleon was now with this portion of his forces. After the first defeat he had relinquished the command of the armies to his marshals (Aug. 8), and the management of affairs in the capital to a new ministry (Palkao's) under the empress regent; and leaving Metz immediately after the battle of Courcelles, he had gone to MacMahon at Châlons. The prince imperial had been sent to Belgium when the situation had first become critical. The opposing forces were now prepared for an inevitable and decisive engagement. The battle of Sedan was begun by the Germans Sept. 1. The troops of the army of the Meuse and the third army, by a series of manœuvres and after severe fighting, drove the French from all sides to that fortress, where, almost surrounded, entirely defeated, and without provisions or defences sufficient to endure a siege even of a day, they were compelled to capitulate. The emperor surrendered himself to King William in person, Sept. 2, and was carried a prisoner to Wilhelmshöhe. In dead, wounded, and the vast number of prisoners of war, the French had thus lost in a few days an army of nearly 150,000 men. The news of Sedan created intense excitement at Paris. In the night of Sept. 3–4 Jules Favre demanded in the corps législatif the deposition of the emperor and his dynasty; the popular indignation against Napoleon and his party was without bounds. On the 4th the people filled the streets and thronged to the hall of the corps législatif and thence to the hôtel de ville. Here Gambetta, in the midst of the most tumultuous applause, proclaimed the republic; and a provisional government of national defence was at once formed. This was under the presidency of Gen. Trochu and the vice-presidency of Favre, and included Emmanuelle Arago, Clerfayt, Ferry, Gambetta, Garnier-Pagès, Glais-Bizoin, Pelletan, Picard, Rochefort, and Simon. In the evening a decree of the new government declared the corps législatif dissolved and the senate abolished. Jules Favre was placed in charge of foreign affairs. The empress fled from Paris and took refuge in England. The government of national defence issued an address to the army; and a circular was sent to the European powers explaining the attitude of France. The most energetic measures were begun for putting Paris in a position for defence. Later in the month Favre had an interview with Bismarck at Ferrières, in which he unsuccessfully sought to negotiate terms of peace. A similar purpose was the cause of a visit of Thiers to the principal European courts. The elections for a ministry in the assembly of imperial officials, which were decreed during the month by the government of national defence, were postponed from time to time on account of the difficulty of communicating with the country at large. After the battle of Sedan there was but little to impede the advance of the German army to the capital. On the 5th they entered Rheims, and only minor skirmishes and trifling engagements attended their further march, until on the 16th they had closely approached Paris, advancing in the general form of a half circle. A sortie by Gen. Ducrot on the 19th was repulsed, and a few days later the actual investment of the city was begun, with the army of the Meuse on the northern and northeastern sides, the third army on the southern and southeastern, and bodies of cavalry guarding the approaches to the western front. The German headquarters were established at Versailles. A portion of the French government of national defence remained in the capital; a portion, in order to be in communication with the provinces, was established at Tours; among the latter was Gambetta, who exercised the functions of minister of war at the same time that he led in the government of the interior, thus combining in his hands most of the executive power of the governing body. The siege of the capital, which now began, will be found described in the article París. Almost simultaneous with its beginning was the fall of Strasbourg, which capitulated in the night of Sept. 27–28. Toul had surrendered on the 23d. Söissons and Scheltetstadt, among the chief places besides Metz which still resisted, capitulated respectively on Oct. 16 and 24, and on the 27th Metz itself also yielded, Bazaine surrendering 178,000 men. (See Metz). The chief attention was now concentrated upon Paris. All the attempted sorties of the besieged proved useless, while great discontent and suffering prevailed within the city. The members of the government in the capital had the greatest difficulty in repressing popular tumults and disorder. The military situation in the rest of France was of such a character as to give little hope of rescue by those French troops still in the field. After the fall of Metz, Prince Frederick Charles had marched the greater part of his command southward, to engage the enemy's "army of the Loire," now increased, in part by the addition of small bodies from the defeated troops of other corps, to about 150,000 men. This army, under Gen. Aurelle de Paladines, had at first won some successes, defeating Gen. von der Tann, the German commander who held Orleans, and retaking that city (Nov. 8, 9, 10). The latter, retreating, massed his troops on the Eure; but Aurelle de Paladines did not follow up his advantage, and the Germans soon took the offensive. Several minor engagements occurred, and now Aurelle attempted to march almost his entire force toward Paris; but meeting and attacking the 10th division of Frederick Charles's army, he was defeated near Beaune-la-Rolande (Nov. 28) and forced to withdraw again to Orleans, near which city he took up a position for battle. A series of battles followed, ending with a decisive defeat of the French on Dec. 4, the
FRANCE

Germans capturing the town and many prisoners, while the remainder of Aurell's troops retreated in confusion. (See ORLEANS.) From the remnants of this defeated force were now organized two new armies, under Bourbaki and Chanzy. The Germans made a corresponding division, Frederick Charles leading a part of his command against Bourbaki, who took up a position near Bourges, while the remainder, with other troops, under the command of the grand duke of Mecklenburg, advanced against Chanzy, whom they defeated at Beangency, Dec. 8, and followed in his subsequent retreat to Blois (13th), Vendôme (16th), and thence (dividing into two detachments) toward Le Mans and Tours. On the 31st Chanzy made an attempt to recover his ground, but was again defeated in the neighborhood of Vendôme. Still continuing his efforts at advance, the forces of the enemy were now concentrated against him, and he was gradually forced back, in a long series of minor engagements (Jan. 6 to 11). Finally he was overwhelmingly defeated and his army fairly broken up and put to flight, in severe combats at Cornillez, Sts. Croix, and Le Mans (Jan. 12). With these German victories the war in this portion of France may be said to have ended. In the north, the newly organized army under Gen. Faidherbe, seeking to advance to the relief of Paris from that direction, had been opposed by the Germans (a part of the first army) under Gen. Manteuffel. Massed at first chiefly at Amiens and Rouen, the French were defeated at the former place on Nov. 27, the town being occupied on the 28th; from the latter place they retreated, and it was occupied without resistance on Dec. 6. From Lille and Arras Faidherbe again tried to advance toward Paris by passing behind the Germans; but Manteuffel again checked him in an engagement at Pont Noyelles, near Amiens, Dec. 28; and when he again assumed the offensive, a few days later, defeated him once more at Bapaume, Jan. 2 and 8, 1871. Manteuffel, transferred to the south, was now succeeded by Von Goeben, who put an end to Faidherbe's fourth attempt by inflicting upon him an overwhelming defeat at St. Quentin, Jan. 19, leaving his army completely disorganized, and bringing to a conclusion all serious operations in this quarter. The few fortresses and cities that had still held out after the fall of Metz had also surrendered one by one before this time (Thionville, Nov. 24; La Fère, Nov. 27; Mézières, Jan. 2; Rocroy, Jan. 5); and only in the south did any really serious opposition to the German arms remain in the field. Here, where Gen. Cambriens had been forced back during the month of October, 1870, by the Germans under Von Werder, until he had retreated to Besançon, the aspect of affairs was somewhat different from that presented in the north. Von Werder, whose force was too small to take Besançon, had taken Dijon (Oct. 30); but Ricciotti Garibaldi, who commanded a body of French troops, had, by successive advantages gained over outlying detachments of German troops, approached the place during November, and on the 26th began an attack. This was only repulsed after a fierce struggle; and the French were pursued, but without important results. On Dec. 18 Von Werder again defeated the French near Nuits; but on the 27th he was compelled to abandon Dijon on account of the advance of an army under Bourbaki, who had left his position on the Loire, and was marching to the relief of the fortress of Belfort, which had been besieged by the Germans since Nov. 2. Von Werder, withdrawing from Dijon to Vesoul, and thence to Villers-sel (where he had a short engagement with the enemy's left wing), finally took up a position near Héricourt, where, with his small force, he awaited the attack of Bourbaki's army of 150,000. In a three days' fight which followed (Jan. 15-17, 1871) he so completely repulsed it that the French were finally driven into full retreat. The approach of the army of Manteuffel at almost the same time compelled the French troops to abandon Dijon. The retreating army of Bourbaki (who had now been succeeded by Clinchant) did not again assume the offensive; but, slowly pressed toward the southeast by the advancing Germans, who had several conflicts with its rear guard, it finally ended its share in the war by retreating over the Swiss frontier on Feb. 1, thus finally withdrawing from the field. In the mean time the situation of Paris had become hopeless; and on Jan. 28 arrangements for its capitulation had been concluded between Jules Favre and Bismarck by the convention of Versailles, which also provided for a general armistice of three weeks (afterward extended to March 18), during which there should be general elections for a national assembly to decide upon the question of further war or peace. By the terms of the convention, the Germans took possession of the forts, the army of Paris were declared prisoners of war (except the national guard and a division of 12,000 others), and the seat of war in the southeast (near Belfort) was expressly excepted from the armistice. The elections, after a violent discussion among the members of the government of defense as to the course to be pursued, took place on Feb. 8, and resulted in the choice to the assembly of a majority of legitimist and Orleansist members, as opposed to republicans, and in placing its control in the hands of the more conservative or prudent party as regarded the conclusion of peace. The first sitting of the new body was held in Bordeaux on the 12th, and on the following day the government of national defence formally gave up to it its powers. On the 17th Thiers was chosen chief of the executive of the republic. On the 19th he delivered an address to the assembly, urging upon it the duty of immediately making peace and endeavoring to restore
the prosperity and credit of the country; and on the same day he nominated the following ministers, who were confirmed: foreign affairs, Favre; justice, Dufaure; interior, Picard; instruction, Jules Simon; public works, De Larrey; commerce, Lambrecht; war, Leflo; marine, Admiral Pothuau. To this list Pouyet-Quertier was added as minister of finance, Feb. 24. A commission, the active members of which were Thiery, Favre, and Picard, was appointed to negotiate with the Germans. They arrived at Paris Feb. 21, together with a supervising committee of 15 members of the assembly; and on the 26th the preliminary treaty of peace was signed at Versailles. It contained the following provisions: France ceded to Germany the greater part of Alsace and Lorraine (see Alsace-Lorraine); it agreed to pay as war indemnity five million of francs, one milliard during 1871, the remainder within the next three years; the German troops should be gradually withdrawn from French soil as the indemnity was paid, so that the last force should leave it with the last payment; the indemnity should carry an interest of 5 per cent. till paid; the French troops should withdraw and remain beyond the Loire until the conclusion of a final treaty of peace (except garrisons for Paris and the other fortified towns); the inhabitants of Alsace and Lorraine should enjoy for a certain period (afterward fixed at six months) certain privileges in respect to trade; the negotiations for a definitive treaty of peace should begin at once at Brussels. These conditions were accepted and the preliminary treaty confirmed by the assembly March 1, by a vote of 546 to 107. In the same session the deposition of Napoleon and his dynasty was formally declared. A special stipulation, also accepted with the treaty, had provided for the entry of the German troops into a part of Paris, which, however, they were immediately to evacuate on the acceptance of the full treaty by the assembly. This triumphal entry took place on March 1 and 2. On the 8th, the news of the acceptance being received, the Germans again withdrew. The arrangements for the negotiation of final peace were now complete. On the 12th Versailles was evacuated also, and the assembly at once transferred its seat from Bordeaux to that city. But Paris had not yet ended its suffering. The withdrawal of the enemy was almost immediately followed by the uprising of the populace and the rule of the commune; and for nearly two months the unfortunate capital endured a second and even more terrible siege at the hands of the French themselves. (See Commune de Paris, II.) Only at the end of May was order restored, and the whole country in a condition of actual peace. The definitive treaty with Germany, the conditions of which were substantially the same as those agreed on at Versailles, had been signed at Frankfort on the 10th of May.—The first measures taken by the assem-

389 VOL VII._26

bly after the conclusion of the war (besides the negotiation of a most successful loan of 2,500,000,000 francs) tended naturally toward the more permanent constitution of the government. The only matter bearing upon this hitherto decided had been the law providing for more liberal measures in the communal and municipal governments and elections, which was passed by the assembly on April 14. The legitimist and Orleanist parties in the assembly at once became conspicuous in the discussion. On June 8 the proscription of the Bourbon and Orleans princes, which had been in force respectively since 1830 and 1848, was revoked; and on Dec. 19, after a stipulated delay for confirmation, the latter took the seats in the assembly to which they had been elected. The count de Chambord, the Bourbon claimant of the throne, though he at first returned to France, soon after issued a proclamation declaring that he could resign none of his claims, and would not abandon the white flag of the Bourbons; and this done, he returned to his residence at Frohsdorf. It soon became evident that for the time being, at least, no other form of government than the republic could be adopted. The elections held July 2 to fill vacancies in the assembly resulted in the great majority of cases in the choice of republican members; and the tendency of even conservative opinion was also in this direction. On Aug. 13 the members of the left centre introduced into the assembly a bill prolonging the presidency of Thiers for three years, conferring upon him the official title of "president of the French republic," and providing for the appointment by him of a ministry responsible, like himself, to the assembly. The bill also secured to the assembly the constituent power, thus enabling it to undertake subsequently the discussions of plans for the permanent constitution of France. After a violent debate, this proposition passed on the 31st. On Oct. 12 a supplementary treaty with Germany was signed at Berlin, providing for some details, and making some few changes in regard to the ceded territory. At the beginning of 1873 the discussions as to a permanent form of government were renewed. Supplementary elections held on Jan. 7 resulted in the choice of four radicals, nine moderate republicans, and four conservatives. The conservatives now held the ascendancy in the assembly, and the advocates of a monarchical government for a time seemed likely to develop sufficient strength to carry through their plans. Toward the end of January the count de Chambord published another manifesto, in which he again asserted his right to the throne. But neither party was strong enough to insist upon any decided measures; and the only really effective legislative action was that referring to the material affairs of France. In January a tariff bill was submitted to the assembly by Pouyet-Quertier, imposing many new duties and taxes on raw materials, which provoked great opposition both through-
out the country and in the legislature. President Thiers vigorously supported the bill; and when, on Jan. 19, the assembly rejected it, he sent in his resignation (Jan. 20). This the assembly almost unanimously begged him to retract; and he finally consented to continue in office, as did also the ministers, who had resigned with him. On Feb. 2 the assembly passed a bill authorizing the government to inform England and Belgium of the termination of the commercial treaties existing with those nations. On March 7 the payment of two milliards of the war indemnity was formally completed at Strasbourg; and, in accordance with the terms of the treaty, the German troops at once evacuated a large portion of the occupied territory. After a long debate, the army bill proposed by the government, providing for the enforcement of compulsory service, fixing the term of service at five years, and making other provisions, was adopted on June 22. On Aug. 20 the sessions of the general councils of the French departments began; and their proceedings, though of course principally devoted to the discussion of departmental affairs, gave incidentally additional evidences of the strength of republican sentiment and the improbability of success for the monarchists. This evidence was strongly confirmed by the results of the supplementary elections held on Oct. 21. The assembly nevertheless, on reconvening after a recess from Aug. 4 to Nov. 11, showed a strongly conservative tendency, and monarchical projects again became conspicuous in political discussions, but without result. A fusion of the right and right centre added to the conservative strength. On Nov. 18 an exciting debate took place as to whether the government had sufficiently endeavored to suppress the radical movements in the provinces, especially the demonstrations excited by Gambetta. Thiers defended his action and demanded a vote of confidence; but the unsatisfactory manner in which this was carried gave rise to a new disagreement between the president and assembly. This was greatly increased by the report (Nov. 28) of a committee appointed to draft an address in reply to the president's message, in which that document was sharply criticised. Thiers again threatened resignation, but the matter was compromised by the adoption (Nov. 29) of a proposition for the appointment of a committee of 80, who should prepare a bill strictly defining the relations of the executive and the legislature to one another, and otherwise regulating the responsibility of different branches of the government. This committee was chosen on Dec. 5. On the 10th a manifesto was published by members of the left (including Gambetta, Créminoux, and other leaders), demanding the dissolution of the national assembly, as the means of diverting the evils threatened by the conflicts of party in the existing body, and the election of a new legislature. Petitions to the same effect, received from the departments, were rejected by the assembly on the 14th. On the 19th the assembly rejected a motion for the abolition of duties on raw material. The beginning of 1873 put an end to many of the plans of the Bonapartist party, which had been the weakest of the contending factions in the assembly and the country; for on Jan. 9 the ex-emperor Napoleon died at Chislehurst, England. Immediately, there began at Versailles the prolonged discussion and negotiation excited by the report of the committee of 80 on the president's powers and the powers of the assembly. Beginning with the proposition to permit the president only to address the assembly on certain specified occasions, and otherwise restricting his privileges, the constitutional project of the committee was several times modified on account of Thiers's disagreement with it. During the long debates concerning it Thiers several times made threats of tendering his resignation. On March 18 the committee's report was finally adopted by the assembly in a modified form. On the 16th a new agreement with the Germans regarding the remainder of the indemnity was signed, providing for the payment of the whole during the year 1873, and the withdrawal of the German troops during the same period. A bill for the exile of the Bonaparte family was passed March 29. On April 27 supplementary elections were again held, resulting in the choice of several prominent radicals. During the month of May President Thiers made a number of changes in the ministry, which, as they were not accepted as sufficiently conservative by the members of the right, placed him again in sharp opposition to that portion of the assembly, and precipitated the decisive conflict which had so long been threatening between the executive and the majority of the legislature. Thiers himself brought about the crisis by urging in an address to the assembly on May 24 the definitive establishment of the republic. This definition of his policy and that of the new ministry had indeed been forced upon him by an interpel- lation presented by the right, with the evident intention of compelling a vote upon his explanation, which should be decisive in regard to the continuance of himself and the ministry in power. Accordingly, no sooner had the president ended his address than the right presented an order of the day refusing to consider the form of government as under discussion, and regretting that the new ministry did not afford sufficient guarantees of a conservative policy. This, which was equivalent to a vote ofwant of confidence, was passed by the close vote of 360 to 844. Thiers and the ministry at once sent in their resignations, which were accepted; and Marshal MacMahon was in the same sitting chosen president of the republic. The important events of MacMahon's administration have thus far been comparatively few. For a time after his election, and especially during the summer, there seemed a probability that the efforts of the legitimists to restore a monarchy
under the count de Chambord (in whose favor the Orleans branch of the Bourbon family had agreed to yield their claim) might be successful. Many monarchists were appointed to office; the party daily gained in apparent influence; the celebration of the anniversary of the declaration of the republic on Sept. 4 was forbidden; and the hopes of the legitimists appeared to be on the point of fulfillment, when they were suddenly brought to an end by the letter of the count de Chambord to M. de Chenu on Oct. 30, in which he distinctly refused to make the concessions that were necessary to the acceptance by the assembly of a monarchy under his rule, and declared his determined adherence to the white flag of the Bourbons. After the recess of the assembly from July 27 to Nov. 5, the opening message of President MacMahon called for action to secure some degree of permanence and stability to the government. The right demanded that the executive power be conferred on MacMahon for a term of ten years. By a compromise this was lessened; and in the night of the 19th-20th a law was passed making his term seven years. One of the most important events subsequent to this was the conclusion of the long trial of Marshal Bazaine, by a court martial of which the duke d'Anmaule was president, on a charge of treason in surrendering his army and the fortress of Metz without sufficient cause. On Dec. 10 he was found guilty and sentenced to death; which sentence was commuted by President MacMahon to 20 years' seclusion, after degradation from his rank. The payment of the last installment of the war indemnity had taken place on Sept. 5, and by the 16th France was free from foreign occupation. During the period since the war her material prosperity has been restored with remarkable rapidity; new commercial treaties with Great Britain and Belgium were approved in July, 1878; and French industries and trade have again reached an entirely normal condition. But the political situation continued to be unsettled in the early part of 1874, owing to the systematic agitation of monarchists against the republican institutions of the country, to which new elections in various departments have given repeated sanction. On March 16, the 18th birthday of the prince imperial, the Bonapartists celebrated his majority at Chislehurst, hailing him as Napoleon IV.; to which he replied in a set speech, appealing to the decision of a new plebiscite. Foreign relations also continued complicated; the German empire proposed increased armaments, avowedly from fear of French retaliation, and emphatically evinced its determination to wield a paramount influence in Italian and eastern affairs. The cabinet of the duke de Broglie resigned May 16, in consequence of the defeat of the electors of Calais, succeeded on the 22d by one under Gen. de Cissey. The ministry of war, composed of anti-republicans, and with little prospect of stability. (See MacMAHON.)

FRANCE.

FRANCE, Isle of. See MAURITIUS.

FRANCE, Language and Literature of. The French is the most important of the six Romanic languages produced from Latin by the influence of other tongues. The Italian, the Roumanian or Wallachian, the Provencal, Spanish, and Portuguese are its sisters. The Belgic Gaul probably spoke Celto-Tutonic, the Aquitanian Celto-Iberic, while the Celte or Gallie proper occupied the centre of the country, and at the same time Greek colonies held points on the Mediterranean sea. The language of Rome overwhelmed all these idioms. The Gallic, however, was yet spoken in the 8th century; Celticism was perceptible in the lingua rustica, or degenerate Latin, at the close of the 6th century; and the ancient vernaculars continued to exist afterward. The rustica extended from the Rhine to the Pyrenees in the 4th century. The corruption of the Latin was similar in all countries from the Danube to the mouth of the Tagus, and the above mentioned languages differ only in consequence of the various barbarous tongues that have acted upon them. Since the Suevi, Visigoths, Burgundians, Franks, &c., made no efforts to destroy the languages of the inhabitants of Gaul, comparatively few words of theirs survived in the lingua rustica. Many Celtie elements had combined with the Latin even before Caesar, and some were introduced afterward; but it is difficult to distinguish them from the Latin stock on account of their common origin from the storehouse of the Indo-European family of languages. The Latin jargon, tainted by Germanic ingredients, is called lingua Romana, and also Gallica or Gallicana. It coexisted for some time with the Frangiaka (Francisca, Francicea), or Theotica or Tudescye; and although it continued to exist with more vigor than the last named, it was eventually called lingua Franco-Gallica, or rather Franco-Roman, langue francaise. While the Frankish prevailed in the north and east of the country, the rustica or Romana was spoken south of the Loire, although also used in the Frankish regions. The council of Tours (818) recommended the use of both the rustico and Tudesc versions of the homilies. The Latin grammatical suffixes were gradually dropped, and the accusative case was in general taken as the new word. Auxiliary verbs were successively introduced from the Teutonic idioms, the case endings were supplied by prepositions, the personal endings of verbs by pronouns, or both by the fragments of ancient endings and by pronouns before the verb. In the 10th century the Latin ill, este were converted into the article le and the pronouns il and et (ce), the latter being pronounced et. According to Raynouard's hypothesis, the lingua Romana was separated into two dialects. The Visigoths and Burgundian S. of the Loire said ce (Latin ac), German achen, akin to the Franks and Normans (who established themselves in France in 912) along the Seine used
oil; hence the southern or Provengal dialect was named la langue d’oc, and the northern (Roman-Wallon) la langue d’oil. After 879 the four of the former was at the court of the kings of Arles, and in 927 the chief point of the latter was at the court of the duke of Normandy. Less troubled by wars and more thoroughly Romanized, the south produced distinguished troubadours during two centuries, while the north had, somewhat later, its trouvères, both named from trouver, to find: finders of songs, poets. From the beginning of the crusades to the death of St. Louis (1055–1270) the two dialects approached toward a fusion. The vulgar language was employed in the crusades in rousing the populace, whose war cry was, *Diez el colt* (God wills it). A few fragments of the Bible date before 1100; but popular heroic and religious songs appear to have been composed and recited by the jongleurs (joelateurs).

The development of chivalric poetry in Provence was checked by the persecution of the Albigenses; the language of the troubadours was proscribed, and, together with the political rule of the north, the idiom of Picardy (a branch of the langue d’oil) extended toward the south. The real French language began to be developed about the time of the conquest of Constantinople by the French crusaders, at the beginning of the 13th century. Already before the conquest of England by William (1066) English youths were sent to be educated in France; but the conquest made the Norman-French the official and court language in England. Froissart’s “Chronicles” (14th century) is the first work in genuine French. Francis I. substituted the language for Latin in public transactions. Rabelais greatly enriched it; Ronsard and Du Bellay, Amiot and Montaigne, and others, developed it further. The religious reform, political troubles, the influence of the Italian wars and queens, modified it greatly. The introduction of Arabic words is chiefly due to the crusades, and that of Greek and Latin words and of scientific terms to the study of those languages and to the cultivation of the natural sciences. The *académie française*, established by Richelieu for the regulation of the national language (1635), the influence of the court, the labors of the Port-Royalists, especially Pascal (1656), and a galaxy of great writers, purified, augmented, and diffused it more and more. It was first used as a diplomatic language at the conferences of Nimeguen (1678).—The French is certainly a very clear tongue, on account of the strictly logical order of its syntax, but very monotonous, and incapable of the composition of words already fixed, as well as of bold poetical turns. The French language, in short, is, like every other, the exponent of the nationality, vicissitudes, intelligence, culture, and taste of the people that speak it. It is written with the same letters as the English. K and W occur only in Breton, Norman, and Flemish names incorporated into French, and in other foreign words.

There are 12 distinct vowels as regards their quantity; they are represented by six letters called vowels, or by their combination, and by the half of m, v, x, a, e, â, y, and four nasals, au, in, on, en. Including all modifications (d, t, s, d, t, e), and the so-called e muet, they stand for 20 sounds of which Malvin-Cazal and Michele of the conservatoire de musique count 17. Of consonants there are 20, represented by 18 letters, viz.: b, k (also written e and ch in chaleur, q, u, and g as in sang et eau), d, t (and ph), g hard (also gh), gu, the sound of English si and zi in citation, crier (written g before c, t, and y, and j before all vowels except i and y), h (unless mute), l, l mouillé as in the English million (written ill, il, or I, and now generally dropping the sound of l, as mou-yé), m, n, n mouillé as in the English onion (written gn, nh), p, r, s (also c before e, i, y; also x in Bruxelles, t in nation), t (also final d when pronounced with the next word, as grand homme). s (also final y, when pronounced with the next word, as neuf année), y as in the English yes, with the preceding power of s (for instance, payer, pronounced pe-yé), s (written also s, z, when pronounced with the next word, as les eaux, aux esprits), and the sound of the English sh, as in shall (written ch). Most consonants are not uttered when final, unless they are joined to a succeeding word which begins with a vowel or h mute. s, z, s, t, being the principal grammatic letters, are most frequently joined in this manner. On French pronunciation Malvin-Cazal, Mme. Sophie Dupuis, and Becherelle (*Plus de grammairiens*) may be advantageously consulted.—The dialects and patois of the French language are: I. The academic, consecrated by the best literature. II. Old French: 1. Walloon (rouchi), in Belgium and West Luxembourg; 2. Franco-Flemish; 3. Picard and the dialect of Artois. All these are Franco-Romantic. III. New French. A. In the north: 1. Norman; 2. patois of Paris and Champagne; 3. of Lorraine and the Voges; 4. the Bourgiguon; 5. patois of Orleans and Blois; 6. of Anjou and Maine. B. In the middle and west: 1. Auvergnat; 2. Poitevin; 3. Vendéen; 4. Bas Breton; 5. Berrioch; 6. Bordelais and Gascon. C. In the east: 1. Franco-Comtois and its varieties in Valais and Nendòtel, and partly in the cantons of Fribourg and Bern; 2. Vaudois (Roman, Romain); 3. Savoisien and Génévois; 4. Lyonnais; 5. patois of the cities of Dauphiny. D. In the islands of Jersey and Guernsey, Anglo-Norman. French is also spoken with various local peculiarities or corruptions in Algeria, on the Béne, in the Mascarene and Seychelles islands, French Guiana, the French West Indies, the greater part of Haiti, in Illinois, Michigan, Louisiana, and some other of the United States, by the habitans of Lower Canada and even some aboriginal tribes, and in some settlements in Asia and Oceania. There are also small French colonies in the banat of Temesvár and
elsewhere. It is the most generally known of all languages among civilized nations, and many illustrious foreigners, as Leibnitz, Humboldt, Gibbon, and Sir William Jones, have written some of their works in it. The dialects of the langue d’oc, particularly the Limousin, Languedocien, and Provençal, are spoken S. of a line passing through the departments of Charante, Charante-Inférieure, Haute-Vienne, Creuse, Allier, Puy-de-Dôme, Haute-Loire, Ardèche, Drôme, and Isère. Celtici (Breysad) is spoken by about 1,000,000 people in Finistère, Côte-du-Nord, and Morbihan; Basque by about 150,000 in Basses-Pyrénées; Flemish in parts of Le Nord and Pas-de-Calais; Catalan in Pyrénées-Orientales; and Italian in Corsica.

Among the authors of grammars of the French tongue are: J. Sylvius (1587); Robert and Henry Stephens (Paris, 1588 and 1579); Ramus, Grammaire françoise (1499); Vange, Enseignement sur le langue française (1447); the Port-Royal writers, Lancelot and Arnauld, Grammaire générale et raisonnée (1686, often republished); Wallis, Grammaire française (1754); Beauzée, Grammaire générale (Paris, 1767); Levizac, “Theoretical and Practical Grammar of the French Tongue” (1801); Fabre, Syntaxe française (1803); Guérout, Grammaire française (1808); Lhomond, Élements de la grammaire française (last ed., 1885); Girault-Duvivier, Grammaire des grammairains (1811, many times reprinted); Landais, Grammaire générale et raisonnée, a compilation from numerous sources (1866); Noël and Chapsal, Nouvelle grammaire française (1823, many times republished). Still later are the grammars of Le Tellier, Foitevin, and Larousse. Among the best dictionaries are those by Robert Stephens (French and Latin, 1543); Aimar de Ramonnet (1608); Richelet (1800); Furetière (1690); Menage (1849); the famous dictionary of Trévoux, so named from its place of publication (1704); those of Boiste and Bastien (1800), Roquefort, Raymond, Leveaux, and Landais; several works by Charles Nodier; and Bescherelle, Dictionnaire national, ou Grand dictionnaire critique de la langue française (3 vols. 4to, 1843-6). The Dictionnaire de l’académie française was published in 2 vols. fol. in 1694, and has been several times reprinted. A Dictionnaire historique de la langue française, on a grand scale, is in preparation by the academy. The latest and best dictionary is that of E. Littré in 4 vols. 4to (Paris, 1863-73). Girard (1738), Beauzée (1769), Roubaud (1865), and Guizot (1890-92) have written on French synonyms; and Gérard (1801), Henry (1811), Villemain, in the dictionary of the academy, J. J. Ampère (1841), F. Wey (1845), and F. Gémin (1845-57), on the history of the French language.—LITERATURE. The earliest literature of France is that of the troubadours and troubéres. The latter, who wrote in the soft southern langue d’oc, produced short lyrical effusions on love or matters of trifling import; they flourished most during the 11th and 12th centuries. The troubéres, on the other hand, in their narrative poems, known as chansons de geste, and written in the energetic langue d’oil, treated of great national subjects and celebrated the heroic deeds of illustrious kings and knights. Some of their compositions, the earliest especially, have a striking character of grandeur, which may sometimes be not unfavorably compared with that of the ancient epic poems. These chansons de geste, which are also called romans, are very numerous, and have been classified into three cycles, bearing respectively the names of Charlemagne, King Arthur, and Alexander. The first cycle of course includes all the poems that celebrate the deeds of the great Frankish emperor, his descendants and vassals; one of the oldest and perhaps the most magnificent of this category is entitled La chanson de Roland ou de Remiens, the Armorician cycle or that of King Arthur is filled with the traditional legends connected with old Britain and the achievements of the Norman warriors; the Roman de Brut, or that of King Arthur of Britain, on one side, and the Roman de Rou, or that of the dukes of Normandy, on the other, may be said to be the double foundation on which all the poems belonging to this series rest. The cycle of Alexander consists of poems in which recollections of Greece and Rome are strangely mixed with chivalric notions and legends of fairy land. The “History of the Taking of Troy,” composed about 1160 by Benoît de St. Maure, and the “Romance of Alexander,” about 1180, by Lambert le Cors and Alexandre de Paris, are fair specimens of these compositions. They were succeeded by satirical and allegorical poems of equally vast proportions, some of which enjoyed unparalleled popularity, such as the Roman du renard and the Roman de la rose, from which Chaucer afterward adapted and partly translated his “Rouman de la Rose.” The fabliaux and several lighter kinds of poetry cultivated by the troubadours were also treated by the trouvères, who found here an appropriate field for their ingenuity and ready wit. Among those who excelled in the fabliaux was Renart, who lived in the reign of St. Louis. Songs were not neglected, and those of Abélard in the 12th century enjoyed a wide popularity. Audeffroy le Bastard, Queens of Bethune, and the castellan of Concy were among his most distinguished successors. Thibaud, count of Champagne and king of Navarre, deserves to be particularly mentioned; the songs in which he alludes to his love for Queen Blanche of Castile, the mother of King Louis IX. of France, have given him historical celebrity. The progress of prose was slower than that of poetry, but the 18th century presents two specimens showing that it had already acquired a certain degree of power and polish; these are the “Chronicles of the Conquest of Constantinople,” by Villehardouin.
(1207), remarkable for its soldier-like simplicity and straightforwardness, and the Mémoires in which Joinville tells of the heroic deeds and private virtues of the good king Louis IX. The whole literature of the 14th century culminates in Froissart's "Chronicles," which remain the model of this kind of writing, and present the liveliest pictures of society and manners during that period of war and gallant enterprise. Christine de Pisan and Alain Chartier deserve notice for their intelligent efforts toward the improvement of prose. This improvement is fully illustrated in the 15th century by the Mémoires of Comines, which present a striking delineation of the characters of Louis XI., and his contemporaries. Already a popular poet, Villon, had given evidence in his poems that French verse was able to reach a high sphere of excellence; and Duke Charles of Orleans that it had lost nothing of its gracefulness. The revival of classical learning and the religious reformation exercised a powerful influence on French literature in the 16th century. Its principal characteristics being freedom of thought and variety of style, writers cannot be judged according to a single standard. In originality Rabelais and Montaigne are entitled to the first rank. The former, whom Lord Bacon styled "the great jester of France," was a profound scholar, physician, and philosopher, and contented himself with the renown of a profane humorist. His nondescript romance, the "History of Gargantua and Pantagruel," is filled with strange tales, wild notions, amusing quibbles, and gross buffooneries, interspersed with a seasoning of good sense, sound philosophy, and raillery. A writer of more refinement and keener wit was Montaigne, whose "Essays," one of the standards of French literature, are a series of free and familiar disquisitions upon every subject, couched in the most easy and winning style, but skeptical and cynical throughout. His views were partly reduced to a system by his friend and disciple Charron, in his treatises De la sagesse and Des trois vertus. Meanwhile the reformation had been vindicated by Calvin in his Institution de la religion chrétienne, a masterly piece of writing, which afforded convincing evidence that French prose had now acquired strength and gravity enough to become a fit vehicle of religious eloquence; and, later in the century, an admirable pamphlet, the Satire Ménippeé, and some speeches of the chancellor L'Hôpital, proved it to be flexible enough for political purposes. Its capacity for lighter subjects had been previously demonstrated by the tales of Margaret of Navarre. Amyot invested it with new graces by happily blending Grecian and French beauties in his translation of Plutarch's "Lives." In poetry this period was less successful. Clément Marot (1495-1544) had indeed exhibited elegance, grace, and wit, in his epistles, epigrams, and elegies; but he had merely given perfection to inferior branches of poetry. Ronsard attempted a higher flight; he tried to invest French verse with that power, variety, and inspiration which he so much admired in Greek metres; but his violent introduction of foreign forms and elements into the vernacular was far from attaining the fortunate results he anticipated; in spite of all his defects, however, he contributed to elevate the tone of French poetry. In the 17th century, Malherbe appeared as the reformer, or rather the regulator, of poetry; a man of fastidious taste and meagre imagination, he ridiculed the artistic luxuriance of Ronsard, and introduced a style of grammatical correctness and dry elegance which sometimes reached pompousness, but was destructive of feeling and enthusiasm. His polishing process was nevertheless of great service to poetical language; and his odes, stanzas, and other pieces present many beautiful lines, which are frequently quoted. Mathurin Reygnier (1573-1618) was the earliest of the French satiric poets, and his verses are full of vigor. Balzac devoted his attention to the improvement of prose; and his semi-philosophical works, his epistles especially, were valuable at the time as models of careful and harmonious rhetoric. Such were also, notwithstanding their mannerism, the frivolous but witty letters of his friend Voiture. Both were great favorites at the hôtel Rambouillet, the headquarters of a society of wits and fashionable ladies, who acted as arbiters of good taste and elegance. Many social reunions were now in reality literary clubs, which gave particular attention to philological propriety; one of these, receiving from Cardinal Richelieu the title of the French academy, was especially appointed "to establish certain rules for the French language, and make it not only elegant but capable of treating all matters of art and science." Leaving mere disquisitions about words to such societies, three great men now enriched French literature with works in which style was only a medium for conveying original conceptions or powerful thoughts. Pierre Corneille brought tragedy to a degree of grandeur which has not been surpassed on the French stage; Le Cid, Horace, Cinna, and Polybe are still the objects of admiration; while Poméée, Rodogune, Héraclius, Don Sanché, and Nicomède, though less perfect, abound with striking beauties. Descartes, in his Discours sur la méthode, showed that the French vernacular was now equal to the highest philosophical subjects; and Pascal, in his Lettres provinciales, in which comic pleasantry and vehement eloquence are happily blended, first framed a standard of French prose. Such was the opening of the splendid literary epoch which is generally styled the age of Louis XIV.; and following it came a galaxy of superior minds, who, under the royal patronage, applied themselves to perfecting every branch of literature. Sacred eloquence was successfully cultivated, and the pulpit was adorned by
the funeral orations of Bossuet, full of pathos and religious melancholy; of Flechier, remarkable for artistic finish; the sermons of Bourdaloue, the powerful dialectician, of Massillon, the most exquisite and most attractive of preachers, and of Fenelon, two of whose sermons place him in the same rank with Bossuet. Tragedy, in the hands of Racine, lost perhaps a little of the imposing character with which it had been invested by Corneille, but teemed with the most touching human feelings, clothed in a language unapproachable for correctness, elegance, and sweetness. Andromaque, Ipipagnos, and Phedre remind us of the productions of ancient Greece, while Athalie brings on the stage in a style of adequate splendor an episode of the Hebrew annals. Comedy, which had been successfully attempted by Corneille in Le menteur, reached its highest pitch with Moliere; his masterpieces, Le misanthrope, Tartuffe, L'Avare, and Les femmes savantes, are profound and humorous creations. L'Ecole des maris and L'Ecole des femmes, which are scarcely inferior, Amphitryon, a licentious but exceedingly attractive comedy, Le festin de Pierre, a strange mixture of the comic and dramatic elements, several farces, Le bourgeois gentilhomme and Le malade imaginaire, afford abundant evidence of Moliere's flexibility of genius no less than of his power of observation. After him, but at a great distance in point of merit, Regnard, Dancourt, and Dufresny furnished the French stage with light comic sketches. Fable, through La Fontaine's genius, was but comedy on a smaller scale; this inimitable poet, whose popularity is unrivalled as it is unfailing, had presented in his collection of fables "a drama in a hundred acts," animated by truthfulness and keenness of observation, transparency of narrative, and humorous fancy. Most of these qualities are also found in his miscellaneous poems, and especially in his "Tales," whose licentiousness, however, renders them unfit for general reading. Didactic, philosophical, and satirical poetry, that is, poetry under its less poetical forms, had as its representative Boileau, who finished the work previously undertaken by Malherbe; his Art poétique, his Epitres, his Satires, as well as his heroic-comic poem Le Iutrin, are remarkable for good sense and symmetry; they abound with wise maxims and common truths finely expressed, but are entirely deficient in poetical enthusiasm. Moral philosophy was not neglected. Malebranche, the disciple of Descartes, the sagacious and imaginative author of La recherche de la vérité, Bossuet in his Connaissance de Dieu et de soi-même, Fenelon in his treatise De l'existence de Dieu, and Pascal in fragments which have been collected under the title of Pensées, considered the highest problems of humanity from a Christian point of view. Robert-Estienne, of Lyons, in his Sentences et maximes wrote a libel upon mankind, and La Bruyère in his Caractères drew vivid and amusing sketches of human characters, manners, and oddities. History, which under the pens of Saint-Réal and Vertot was but a faint imitation of the style of ancient historians, was treated with some energy by Mazarin in his Histoire de France, and with ingenuity by Fleury in his Histoire de l'Eglise, while Bossuet clothed it with an imposing character of eloquence in his Discours sur l'histoire universelle, and with the earnestness of theological discussion in his Histoire des variations des Églises protestantes. The personal Mémoires of Cardinal de Retz concerning the wars of the Fronde are among the masterpieces of familiar history. Hamilton's Mémoires du comte de Gramont brings us to lighter kinds of literature. The novels of Mme. de Lafayette, Zadie and La princesse de Clèves, present a faithful though somewhat ideal picture of elegant society, into which we penetrate through the familiar letters written by Mme. de Sévigné to her daughter and friends; these letters furnish us with a complete and lively panorama of the social life of the age. Fenelon's Télémaque, which is written in an epic form, and can scarcely be ranked among novels, created a deep sensation at the end of the 17th century, being considered an indirect censure of Louis XIV., gained great popularity on the same account during the following reign, and deservedly keeps a high rank among French standard works; it marks the crowning point of a remarkable literary period.—We now reach the age that has been called philosophical par excellence. A number of free thinkers, among whom Bayle, the author of the great Dictionnaire historique, is the leading spirit, and certain poets, Chaulieu especially, had been paving the way for the coming philosophers. The 17th century had been on the whole a religious age; the 18th was eminently an age of skepticism and infidelity. Literature now became a means of conveying bold opinions or assailing time-honored creeds and institutions. Four men of genius, Montesquieu, Voltaire, J. J. Rousseau, and Buffon, exercised the most powerful influence over their contemporaries, while each acted a different part in the general struggle. Montesquieu, a writer of unusual scope of mind, combining a masculine vigor with great brilliancy of style, commenced his career by publishing Les lettres persanes, a satire on French manners, government, and even religion. He illustrated the philosophy of history in his Considerations sur la grandeur et la décadence des Romains, a masterpiece of historical style; and finally produced the Esprit des lois, a profound disquisition upon general legislation—"a book," says Vinet, "with which genius was inspired by justice and humanity." Voltaire, the true personification of his age, proactive in disposition as well as in talents, was destined by his faults no less than by his gifts to come at once a leader; and the power he seized when still young, he preserved unimpaired to his last moment. He was for half a century the king of public opinion. His wonderful ver-
satellite enabled him to treat successfully almost all branches of literature; as a tragic poet he takes rank next to Corneille and Racine; his tragedies, Merope, Zabre, Malomè, Alcide, &c., combine pathos with dramatic interest and liveliness of style; his Discours sur l'homme and other philosophical poems are to be classed with the first of their kind; while his miscellaneous effusions, as numerous as they are sprightly, raise him in this sphere above any other French poet. The perspicuity of his mind appears in his Dictionnaire philosophique et other philosophical works; and his wit in his novels, which, notwithstanding their licentiousness, are models of their kind. His various works on history, Charles XII, Le siège de Louis XIV, L'Étude sur les maîtres des nations, are still read with profit and pleasure; while his bulky correspondence is scarcely excelled by that of Mme. de Sévigné. If Voltaire may be said to have been the master of minds, J. J. Rousseau was the master of souls. His passionate eloquence conquered the coldest and even the most prejudiced; eloquence indeed is the mainspring of all his works. As a writer of impassioned prose he has no superior, scarcely an equal, among the most perfect of his rivals. His first essay, Discours contre les sciences et les arts, which he wrote when 38 years of age, was a declaration of war against civilization; the second, Origine de l'inégalité parmi les hommes, was an attack upon the existing social order. In his Emile he drew a visionary plan of education, and in his Contrat social proclaimed the principles of popular sovereignty and universal suffrage. His Nouvelle Héloïse is a novel in which love and paradox are blended together, while his Confessions excite a mixed feeling of sympathy and disgust. Buffon occupied a less agitated sphere, devoting his labors to the description of nature; and his great Histoire naturelle is a literary masterpiece, though its scientific reputation has passed away. Diderot, a passionate and incorrect writer, and D'Alembert, a great geometer, founded the Encyclopédie, a vast review of human knowledge, often threatening to social order, always hostile to religion. Hélvétius in his treatise Du l'esprit, D'Holbach in his Système de la nature, Lamettrie in his Homme-machine, and Raynal in his Histoire philosophique des deux Indes, far exceeded the doctrines of the encyclopedists; while other writers, such as Vauvenargues, Fontenelle, whose style is yet admired for its clearness and elegance, Condillac, a most perspicacious analytic philosopher, Mably, a bold publicist, and Condorcet, who wrote afterward an Essai sur le progrès de l'esprit humain, mostly kept on the side of moderation. The various branches of literature connected with philosophy were the most productive; but the others were far from being neglected, as appears from the following names, which we take almost at random: Crébillon and Ducis, both tragic poets, appealing, the former to terror, the latter to sympathy; Marivaux, whose novels and comedies were very famous in their day, and some of whose plays still keep the stage; Gilbert, a satirist of uncommon power; Le Sage, the author of Gil Blas, the most celebrated novel of the age, and of Turcaret, perhaps the best comedy next to those of Molière; Beaumarchais, the author of the Barbier de Séville; Bernardin de Saint-Pierre, the author of Paul et Virginie; La Harpe, whose Cour de littérature was once popular; Duclos, Milé, Delaunay, and Saint-Simon, whose Mémoires gained a deserved celebrity; Barthélemy, who wrote the Voyage du jeune Anacharsis en Grèce; Ruhlire, a historical essayist; Prévost, who produced the novel of Manon Lescaut; Marmontel, the author of Bilitaire; Grezette, the author of Vert-Vert; and J. B. Rousseau and Lebrun, the lyric poets. The age was not poetical; poetry had degenerated into verse making, and the verse makers, in imitation of Thomson's "Seasons," indulged in all sorts of descriptive pleasantries. Ducis, the most skilful of them, gained a reputation by various didactic poems, and by translating, not without a certain degree of accuracy, the "Georgics" of Virgil. Florian wrote fables which rank next to those of La Fontaine, and his novels are yet popular. Toward the end of the century imitation was the order of the day, and the only poet who was gifted with originality, André Chénier, died on the scaffold before his best effusions were published. Neither the revolution nor the empire was favorable to literature. Some tragedies after the classical pattern, among which those of Joseph Chénier may be mentioned, a few light comedies, besides novels and short poems, were not sufficient to relieve the general dulness. Mme. de Staël and Chateaubriand were the forerunners of a revival; but the improvement was perhaps owing less to the Cérinme and L'Almaagnes of the former, Le génie du Christianisme and Les martyrs of the latter, than to the influence upon the public taste of the masterpieces of English and German literature, which found more and more admirers in France. The romantic school now inaugurated a new era. Through the exertions of many young and original writers new life was infused into nearly every branch of literature, poetry, history, philosophy, and the drama. An animated controversy was maintained in pamphlets and periodicals, between the supporters of reform and the adherents of the classical school; but the contest reached its utmost fury when Alexandre Dumas, Victor Hugo, Alfred de Vigny, Frédéric Soulié, and others produced on the stage dramas framed according to their own ideas of the Shakespearian style. The performances of these dramas were indeed regular battles between the opposing literary parties; and it was only at the end of several years that the younger body of combatants came out victorious. Among the plays thus received with both enthusiasm and censure, Henri III et sa cour, Antony, Térèse,
and Angèle, by Dumas, Hernani, Ruy Blas, Marion Delorme, Lucrèce Borgia, and La rois s'amuse, by Hugo, are still remembered; while numberless pieces, successful at the time, have since fallen into complete oblivion. In fact, the only gain resulting from this protracted dispute was the abrogation of the obsolete rules which had so long regulated the French stage. A reactionary movement was attempted when the illustrious actress Rachel appeared with such striking effect in the tragedies of Corneille and Racine. Ponsard and Latour St. Ybars returned to the old form of tragedy; but the Lucrèce of the former and the Virginia of the latter enjoyed but ephemeral success, while the "School of Good Sense," as the adherents of this movement were styled, reckoned only a few light comedies by Émile Angier.

This school had been preceded in the line of tragedy by Casimir Delavigne, who, gradually deviating from the classical model, attempted to reconcile the classic and the romantic systems, in his Marino Faliero, Les enfants d'Édouard and Louis XI. Meanwhile Eugène Scribe was day by day increasing his enormous stock of successful comedies, or rather vaudevilles, on a larger or smaller scale.—Novels, which with the exception of De Vigny's Cinquième Mars, had been scarcely noticed during the excitement of dramatic reform, became the rage as soon as was the point of being accomplished. Foremost among the novelists of the present century in point of power and celebrity is the poet and dramatist Victor Hugo, whose Notre Dame de Paris, Les misérables, Les travailleurs de la mer, and L'Homme qui rit have achieved a wide renown. George Sand (Mme. Dudevant) acquired reputation by her Indiana (1832), and established her claim to be considered one of the finest writers of her time by her subsequent performances, Valentine, Lélia, Jacques, André, Simon, Mau-prat, Conule, Le champi, La mors du daïble, La petite Fadette, La filleule, L'homme de naissance, and by her Histoire de ma vie. Alexandre Dumas, the inexhaustible story-teller, won unqualified popularity by his Trois mousquetaires, Vingt ans après, Le vicomte de Bragelonne, La comte de Monte Cristo, Joseph Baillame, Le collier de la reine, Ange Piton, Le comte de Charly, and other romances, in all filling more than a hundred volumes.

Eugène Sue also achieved great popular success with Les mystères de Paris, Le Juif errant, and Martin l'Enfant trouvé, depicting in glaring colors the miseries of society. Honoré de Balzac undertook to present, under the title of La comtesse humaine, a daguerrotype of every aspect of French society during his time; this immense work was interrupted by death; but some parts of it, complete in themselves, are invaluable for depth of observation and sentences of delineation: Eugénie Grandet, Le père Goriot, La recherche de l'absolu, Le contrat de mariage, Modeste Mignon, Les parents pauvres, Les scènes de la vie privée, &c.

Frédéric Soulié, who, although his popularity is not as great, is nearly the equal of those we have just named, evinced uncommon talents in his historical novels of southern France, among which Le vicomte de Béiers specially deserves to be mentioned. Still greater power characterized his pictures from the social world: La lionne, La comtesse de Montrion, Diane et Louise, Le lion amoureux, and Les mémoires du diable. Alphonse Karr, in his Sous les tilleuls, Midi à guéters heures, Genètêre, Cloîtêle, and numerous short tales, has given unrivalled specimens of good sense, fine feeling, and genuine humor. By the originality, delicacy of style, and charm of fancy which Alfred de Musset displayed in his nouvelles, such as Frédéric et Bernerette, Emmeline, Les deux maîtresses, Le fils du Titton, et Mimi Pinaon, he is entitled to a high rank as a novelist. Such is also the case with Prosper Mérimée, whose Chronique du temps du Charles IX., Colomba, Le vœu étrusque, and Arène Guillo are gems of their kind. Prominent among the comic writers was Paul de Kock, whose novels were nearly as numerous as those of Dumas, and who wrote also many vaudevilles. Besides these masters of novel writing we can merely mention their contemporaries, Mme. Charles Reymond, Mme. Émile de Gifardin, Théophile Gautier, Charles de Bernard, Élie Berthet, Ponsard de la Terrail, Jules Sandeau, Émile Souvestre, Paul Féval, and Méry. Among the later novelists, Henri Murger, Alexandre Dumas fils, Léon Gozlan, Arsène Houssaye, Champfleury, Ernest Feydeau, Gustave Flaubert, Émile Gaborian, Octave Feuillet, Hector Malot, Edmond About, Cherbuliez, and the literary partners Eckmann-Chatrian, deserve mention. Jules Verne has written remarkable scientific romances, which have been translated into English and widely read. Of nearly the same class are the fanciful scientific works of Guimelmin and Elysée Reclus. —Poetry is far from being as popular in France as the novel, and poets have been and are still very slightly regarded by the public; but four of them have such claims to admiration as to be dear even to the least poetic minds; these are Béranger, Lamartine, Victor Hugo, and Alfred de Musset. The first named, who wrote nothing but songs, is at once the most national and the most popular of all, as well as the best known in foreign countries. Although song-makers are numerous in France, there is only one who deserves to be mentioned after Béranger; this is Pierre Dupont, who, however, stands far behind his master, Lamartine, whose effusions present a combination of harmony, human feeling, and religious sentiment, is the favorite of crowds that incline to sentimentality and reverence. His Méditations, Harmonies, and Recueilllements poétiques, his Jocelyn and Chute d'un ange, are still read and admired. Victor Hugo, though a leader in all departments of French literature, has not been less successful as poet than novelist. His Îles et ballades, Orientales,
Feuilles d'automne, Chants du criquacuile, Voix intérieures, Les rayons et les ombres, and Contemplations are poems of sentiment and fancy; while his Châtiments are bitter satires against Napoleon III. and his associates. His latest poem, L'Année terrible, is a passionate lament for the misfortunes of France in 1871. In 1874 he published a novel called Quatre-vingt-treize, which delineates the great year of the first French revolution, 1792. Alfred de Musset, perhaps the most original of the four, is less known than either of them outside of France, but in his own country his reputation is very high. Among the other poets, Casi- mir Delavigne, whose Messeniniennes rivalled for a while the success of Lamartine's Méditations, Auguste Barbier, the author of the Iambes, Victor de La Prade, and the brilliant and original Théophile Gautier, must not be omitted. Nor must we fail to mention Jean- min, the barber poet, whose writings in the langue d'oc have made him popular in the south of France and famous abroad. Frédé- ric Mistral, a Provençal writer, has acquired a unique reputation by his works in the lan- guage of his native province.—History is un- doubtedly the most successful branch of mod- ern French literature. A larger number of valuable historical works have been published within the last 50 years than during any other equal period of time; and the taste for such per- formances is still on the increase. M. Guizot, the great philosophical exponent of social in- stitutions and moral revolutions, and Augustin Thierry, the artistic historian of the middle ages, stand foremost among the promoters of this historical movement. The Essais sur l'his- toire de France, by the former, the Histoire générale de la civilisation en Europe and Histoire générale de la civilisation en France, which he wrote before engaging actively in political life, and his Histoire de la révolution d'Angle- terre, which he completed after leaving the ministry in 1848, are monuments of philosophical history; while the Lettres sur l'histoire de France of Augustin Thierry, his Histoire de la conquête de l'Angleterre par les Normands, his Écarts des temps mérovingiens, and his Histoire de la formation du tiers-état en France, present a happy combination of dramatic narrative and perspicuous discrimination. Amédée Thierry, Augustin's brother, presents lively pictures of Gaul and other countries before and during the fall of the West Roman empire. Three writers have devoted their efforts to a full recital of the general history of France: Sismondi, whose voluminous work is an inexhaustible mine of knowledge and thorough research; Michelet, who combines the profound learning of a Bene- dictine monk with the humorous fancy of a poet; and last but not least, Henri Martin, who, under the impulse of patriotic enthusiasm, has successfully embodied in his book the results of modern science, while infusing into its pages a lively and never slackening interest. Barrante, after giving (1824-5) in his Histoire des ducs de Bourgogne an attractive specimen of purely narrative history, published histories of the French convention and of the directory, in which, though he is accurate and impartial, his monarchical predilections are strongly ap- parent. Capesigue, who died toward the end of 1872, wrote voluminously on the reaction- ary side of French history from Philip Augus- tus to Louis Philippe. The revolutionary period has engaged the attention of many historians, among whom the most prominent are Thiers, Mignet, Michelet, and Louis Blanc. The first, by his Histoire de la révolution, at once gained a popularity which gave him an introduction into political life. His subsequent Histoire du consulat et de l'empire has given him a still higher rank as a writer, though not as an impartial and trustworthy historian. The histories of Michelet and of Louis Blanc, who both wrote brilliant Histoire de dix ans (1830-40), besides several other works, are marked with strong democratic opinions; while that of Mignet, a vivid yet substantial sketch, bears the impress of philo- sophical impartiality. This writer has also pro- duced several miscellaneous historical works which are highly valued: Histoire de Marie Stuart; Charles Quint, son abdication et sa mort; Philippe II et Antonio Peres; and a large compilation, Histoire des négociations relatives à la succession d'Espagne, containing beautiful narratives, preceded by an admirable introduction. Lamartine also figures among the historians; his Histoire des Girondins, which appeared in 1847, created a deep sensa- tion by its magnificent style and enthusiastic spirit. He subsequently published the Histoire des constituants, Histoire de la restaura- tion, Histoire de Turquie, &c., more remarka- ble for showy eloquence than soundness and accuracy. Napoleon III. deserves to be men- tioned among the historians for his Histoire de Jules César, two volumes of which were published in 1865-6. Great historical publica- tions have appeared under the patronage of the government or of learned societies, the Collection des historiens de France, and the Histoire littéraire de la France, among the number. Villemain ought to be reckoned among the historians, not only for his Histoire de Cromwell, but for the admirable pictures of men and society in his excellent Tableaux de la littérature, and his Souvenirs contemporains. Vanlambel has written an excellent Histoire de la restauration, which deserves more fame than it has gained. Lanfrey's historical works are eminently judicious; his Histoire de Na- poleon has attracted much attention both at home and abroad by its new views about the great emperor. Taxile Delord's Histoire du Second Empire is equally judicious and more impartial. Garnier-Pagés completed in De- cember, 1873, a history of the revolution of 1848. —Archaeology, to speak only of produc- tions of this century, has not been neglected, as is evidenced by the works of Letrange, Raou-
Rochette, and more recently by those of Beulé, Bellognet, De Rivière, Lartet, and Quatrefages. Champollion threw new light upon ancient Egypt by his system of deciphering hieroglyphics. The study of oriental languages, promoted by Sylvestre de Sacy, has been successfully continued by De Saulcy, Ménard, Oppert, and Renan, in the Semitic languages. Lenormant, Mariette, Chabas, and De Rouge have distinguished themselves as Egyptologists. The works of Abel de Rémusat, Stanislas Julien, Bournouf, De Rosny, and Hervey de St. Denys are valuable contributions to the accidental knowledge of the Chinese, Japanese, and Sanskrit. —Philosophy was brought back to spiritualist principles by the natural reaction against the materialism of the preceding age. This revolution, prepared by Royer-Colliard, Maine de Biran, and others, has been accomplished by Victor Cousin and his disciples, who, under the name of eclecticism, unfurled the banner of spiritualism. The eloquent lectures which Cousin delivered at the Sorbonne exercised a powerful influence over the rising generation; they have been printed, with corrections and considerable additions, under the title of COURS DE PHILOSOPHIE, FRAGMENTS DE PHILOSOPHIE, and DU Vrai, du Beau et du Bien. Joubert and Damiron, who acknowledged him as their master, contributed to the progress of the same doctrines, which were advocated by Cousin’s younger disciples, Émile Saisset, Amédée Jacques, Vacherot, Paul Janet, Adolphe France, and Jules Simon. The books of the last named, Du devoir, De la liberté de conscience, and De la liberté, are among the most meritorious performances for healthfulness of tone, honesty of purpose, and generosity of mind. Besides the ecletic school, four philosophers of great originality and uncommon power have shone each in his own sphere, viz.: Joseph de Maistra, the zealous apostle of absolute power, in his treatise Du patrie, and the eccentric author of the SOUVÈS DE ST. PÉTERSBOURG; Ronald, who in his LÉGISLATION PRIMITIVE, as well as in his other philosophical writings, upheld the cause of monarchy and the church; Ballanche, the mystic dreamer, who in his PALINGÉNÉSIE SOCIALE attempted to represent through a series of symbolical narratives couched in a poetical style the various phases of the history of mankind; and Lamennais, who, at first a bold and independent defender of the papal power, was gradually led to become the advocate of pure democracy. His Essai sur l’indifférence en matière de religion, Les PAROLES D’UN CROYANT, Le livre du peuple, Une voix de prison, and ESQUISSES D’UNE PHILOSOPHIE, show the various steps of this transformation, while they are placed among the masterpieces of French eloquence. To the same philosophical position of Auguste Comte offers a system of philosophy which has found many disciples in other countries, especially in England and America. Among the writers on social science, Saint-Simon and Fourier are incontestibly the most conspicuous; and although their doctrines have been rejected as a whole, they have exercised a powerful influence over the age. Pierre Leroux, Louis Blanc, and Proudhon may be mentioned as in some sort their disciples. The historian Michelet and Edgar Quinet take rank among fanciful philosophers by a number of publications. —The various branches of natural science boast of many original and powerful writers, at the head of whom we must place Georges Cuvier, author of LE RÈGNE ANIMAL DISTRIBUÉ D’APRÈS SON ORGANISATION, and RECHERCHES SUR LES OSSAMENTS FOSSILES, with an admirable introduction entitled DISCOURS SUR LES RÉVOLUTIONS DU GLOBE. Cuvier’s great contemporaries Lamarck, Jussieu, De Candolle, Lacépède, and Latreille, and rival, Étienne Geoffroy Saint-Hilaire, must be mentioned with him. The son of the latter, Isidore, is worthy of his father, and many disciples of these great men, among whom are Duméril, Jussieu, and Alcide d’Orbigny, have published brilliant scientific works. Mineralogy boasts of Élie de Beaumont, Baudant, and Dufrénoy; chemistry especially of Lavoisier; and chemistry and physics of Thénard and Dumas, Gay-Lussac, Berthollet, Despretz, Pasteur, Berthelot, Chevreul, and Dumas. French medical literature is particularly rich, from the contributions of Bichat, Boussingault, Corvisart, Magendie, Trouseau, Claude Bernard, and many others. Mathematical sciences have distinguished representatives in Lagrange, Laplace, Ampère, Biot, Leverrier, and especially Arago, who has no equal for clearness of exposition and perspicuity of style. Among the travellers of this century whose writings have been of most service to science or who have attracted particular attention are Bonpland, Freycinet, Duperrey, Dumont d’Urville, René Caillé, Victor Jaquemont, Fontanier, Father Huc, Dubois de Montpigneur, Saint-Martin, Marcey, D’Abbadié, and De Beauvoir. —Many able pens have been devoted to political economy and philosophy: Michel Chevalier, whose LETTRES SUR L’AMÉRIQUE have made him known in the United States, Léon Faucher, Rossi, Adolphe Blanqui, Frédéric Bastiat, André Cochet, De Beaumont, and De Tocqueville. The last is well known in America by his singularly philosophical treatise DE LA DÉMOCRATIE EN AMÉRIQUE. The admirable historical essays of Laférrière upon French jurisprudence must not be forgotten. The political writers who deserve to be named, even after the interest of the daily questions they treated is gone, are numerous. Among them are Armand Carrel, the model journalist Courrier, and Cormenin, his imitator, perhaps his equal in point of pungency and wit, though far from possessing the same classical perfection. The French historians and literary critics are a legion. Among the most prominent we may mention Sylvestre de Sacy and Saint-Marc Girardin, who were admitted to the French academy, the former merely as a journalist, the latter on account of his versatile talents.
as a political writer, able critic, and elegant lecturer, Philibert Chasles, Prévost-Paradol, Cuvillier-Fleury, Ernest Renan, Hippolyte Rigaud, Henri Taine, Edmond Scherer, Caro, and Jules Janin, the feuilletonist. Gustave Planche and Sainte-Beuve are entitled to a prominent place in this class of writers; the former was a sound and unsparing critic, in the fine arts as well as literature; the latter excelled in the delineation of literary characters, and also published a Tableau de la poésie française au 16e siècle and a history of the Port-Royalists. Charles de Remusat and Albert de Broglie have treated historical matters from a philosophical or religious point of view. Théophile Gautier, Edmond About, Paul de Saint-Victor, Léon Delaborde, Vitet, and Delcieuze have particularly devoted themselves to fine-art criticism; Delcieuze, Félix, Hector Berlioz, Fiorentino, and Scudo, to musical matters. Of recent writers, Ernest Renan by his Vie de Jésus, Les apôtres, Saint Paul, and L'Anti-Christ, and Hippolyt Taine by his Histoire de la littérature anglaise and works on art, have attracted much attention throughout the civilized world. Of late years public affairs and political questions have so much occupied the mind of France that literature has languished; and although there has probably been no falling off in intellectual activity, the rising generation of writers do not seem on the whole to equal their predecessors.—See Histoire littéraire de la France, by Dom Rivet and other Benedictine monks, continued by members of the institute (22 vols. 4to, 1753-1858); La France littéraire (1826-42), and La littératurefrançaise contemporaine (1837-44), by J. M. Quéréard; Histoire littéraire de la France avant le 13e siècle, by Ampère (3 vols. 1888-90); Tableau de la littérature au moyen âge, by Villermé (3 vols. 12mo, last ed., 1857); Essai sur l'histoire littéraire du 16e siècle, by Saint-Marc Girardin and Philibert Chasles (1827); Tableau de la poésie française au 16e siècle, by Sainte-Beuve (1828); Histoire de la littérature française, by Demo-geot (new ed., 1857); Histoire de la littérature française, by D. Nisard (last ed., 1867); Catalogue général de la librairie française, from 1640 to 1865, by Otto Lorenz (1871); and Études sur la littérature contemporaine, by Edmond Scherer (1872-8).

FRANCE. Wines of. In respect to soil, climate, and the abundance and variety of the wines which she produces, France has been called the vineyard of the earth. Nearly seven eighths of her territory is grape-bearing, and the products of her vines being for the most part but slightly alcoholic, lier people are, as a rule, wine drinkers without being addicted to intemperance. With the exception of the extreme northern and northwestern departments, the whole country is more or less devoted to the culture of the grape; but as certain soils and exposures are better adapted to that purpose than others, the wines of high commercial value are produced in limited and comparatively isolated districts. By far the greater part of the French vintage is consumed within the country, or is mixed with or employed to imitate various wines of established reputation. The total product of the country amounts to between 1,500,000,000 and 2,000,000,000 gallons, worth about $350,000,000. — First in importance as an article of commerce, and in the estimation of connoisseurs for their intrinsic excellence, are the wines produced in the department of Gironde, a part of the old province of Guienne, of which Bordeaux is the capital; whence the district is also viticulturally known by its old name of the Bordelais. Gironde is practically divisible into five wine-producing districts: Médoc, a strip of territory on the left bank of the river Gironde, extending from Blanquefort, near Bordeaux, to the mouth of the Graves, or high plains near the confluence of the Garonne and the Dor-dogne; the Côtes, or slopes on the right bank of the Garonne; the Palus, or low marshy territory on both banks of the Garonne, in the immediate neighborhood of Bordeaux; and the district of Entre-deux-Mers, or low lands between the Dordogne and Garonne. Within this area more than 350,000 acres are devoted to vineyards, whose annual production exceeds 50,000,000 gallons, five eighths of which are red and three eighths white wines, worth $56,000,000. The poorest kinds are sold at less than a franc the gallon, while the best fetch in favorable seasons considerably more than 20 francs. The distinguishing qualities of the wines of Gironde are purity, sub-astringency, lightness, and fragrance. In its general features Médoc is a long, narrow plain, inclining somewhat to the Gironde, and containing about 45,000 acres of vineyards, producing annually 8,000,000 gallons. Of these nearly one eighth are high-class wines, an equal amount are simply fine wines, and the remainder are ordinary qualities. The two first mentioned grades yield a net product of about 5,000,000 bottles. They are red in color, and, notwithstanding a slight characteristic roughness, have great flavor and strength without being intoxicating, and after lying several years in the bottle acquire a delicious bouquet. They not only bear transportation better than other French wines, but are even improved by long sea voyages. It is customary to arrange them in three categories: 1, the classified wines, of which there are about 60 growths recognized by the commerce of Bordeaux; 2, the citizen or bourgeois wines; 3, the peasants, or wines of the small proprietors. The classified growths are again subdivided into four or five kinds, the first of which comprises the celebrated first three growths (les trois premiers crus) of the whole Médoc, viz., the Château Margaux, Château Lafitte, and Château Latour, which are of equal excellence and of enormous price even in France. In this division it is also customary to include the Château Haut-Brisson, a red
wine of great richness and delicacy belonging to the neighboring district of Graves. Among the second and other growths, well known and excellent wines are the Mouton, Léoville, Guan-Larose, Pichon-Longueville, Cos-Destournel, Pontet-Canet, Château de Beycheville, &c. To all red wines exported from Médoc, and in fact from the whole Bordelais, to Great Britain and the United States, it has long been customary to apply the general name of claret, derived from the French clairet, which simply means a clarified wine. The product called claret is, however, properly a mixture of several kinds of wine, the strong-bodied varieties of Spain and southern and southeastern France being mingled with the ordinary growths of Gironde, to suit the English and American palate. The term is unknown in France. A comparatively small amount of genuine Médoc wine reaches this country, as the popular taste here inclines to a factitious, reinforced wine, having body and spiritual strength, rather than to the natural product of the vineyards. The same may be said of Great Britain, notwithstanding she is the principal consumer of the first-class wines of Médoc. The amount of mixing carried on at Bordeaux is prodigious. Her exports of wine are twelve times greater than the production of the entire Médoc, and half of these exports sell as Bordeaux wine; so that it is fair to assume that the growths of Gironde are several times multiplied by the addition or substitution of other wines. There are 42 communes in Médoc in which wine is made, from each of which the wine takes its name, although the grand wines are named after the estates on which they are made. A Margaux wine means a wine from the commune so called, and must not be confounded with Château Margaux, which is wine from a particular estate in that commune. Other familiar names are Paulliac, in which Château Lafitte is situated, St. Julien de Reignac, and St. Estèphe. South of Médoc lies the district of Graves, which produces wines, both red and white, of greater body and more spirited than those just described, and bearing some resemblance to the growths of Burgundy. The best of the red wines is the Haut-Brion, heretofore mentioned. The district of Santerne, a prolongation of that of Graves, extending along the left bank of the Garonne, produces exclusively white wines, the best of which, though of delicate flavor and pure aroma, are excessively sweet in comparison with the wines of Médoc. The latter quality has been given to them of late years by the makers in consequence of the growing demand for sweet Santerne wines in Russia. The poorer grades of Santernes are thin and acidulous. The principal growths of the district are the Barsac, Bommes, and Sauternes, the first of which produces the Château Doutet, the second the Château La Tour Blanche, and the third the world-renowned Château Yquem, which sells for from 15,000 to 15,000 francs the tonneau of 200 gallons at the vineyard, and is esteemed almost too costly for use. The wine of Château Suduiraut, of the Preignac growth, also very celebrated, is worth not above 4,000 to 5,000 francs the tonneau. The remaining districts of Gironde produce wines of a quality considerably inferior to those above described. The best are grown in the vineyards of St. Émilion, in the valley of the Dordogne, and differ considerably from the Médoc wines, recalling many of the qualities of fine port wine. Adjoining St. Émilion is the district called Libournais, and N. W. of that, on the right bank of the Gironde, are Fronsaldais and Blayais, yielding considerable quantities of red and white wines of good quality, much of which is exported under various names to America. —Roussillon, formerly a province in the extreme southern part of France, but now merged in the department of Pyrénées-Orientales, contains about 130,000 acres of vineyards, which produce liqueur wines, dry wines, and a number of sound, full-bodied varieties, employed, with the addition of spirits, in the manufacture of imitation port and similar wines. The most esteemed growths of the first class are the muscat, the Malvoisie, and the Macabéo, which are for the most part sweet, rich in aroma, and fiery. There is but a limited demand for them in France, and the greater part go to Russia and America. North of Roussillon lie the departments of Aude, Hérault, and Gard, forming part of the old province of Languedoc, in which more than 650,000 acres are devoted to vineyards. The wines are rich in color, spirited, and full of body, but coarser and less finely flavored than those of Gironde, and are exported to all parts of France to be mixed with the Burgundies, Bordeaux, and other famous growths. They are generally called vin du midi, wines of the south, and are classified as wines for distillery and wines of commerce, the latter being again subdivided into fine and ordinary red, and white dry and white liqueur and muscat wines. The choicest growths are found in the departments of Hérault and Gard, the former of which is said to yield more wine than the whole kingdom of Portugal. The St. Gilles wines, made in Gard, are of a brilliant purple color and possess unusual strength and body, which qualities they impart to weaker wines, whence they are called vin formes and vin de remède. Not a little of the so-called sherry and port wine of commerce is manufactured from the St. Gilles. The luscious and fragrant Frontignans and Luneis, which are made from muscat grapes, belong to Hérault, and were once in great favor as liqueur wines. Large quantities of alcohol are also distilled in this department, most of which is sold in France. The department of Basses-Pyrénées produces about 10,000,000 gallons of wine, of which the growths of Jurançon and Oan, red and white, are most esteemed. In addition to the districts above mentioned, every de-
partment of southern France produces wines of a similar character, but generally of an inferior quality, which serve their purpose as 
as de remade.—To the valley of the Rhône belongs another division of wines, the greater and more reputed part of which are produced on the right bank of the river. The Côte du Rhône, as that part of the department of Gard is called which borders on the Rhône, produces red and white wines not unlike those of St. Gilles, but of finer quality. On the left bank of the river, in the neighboring department of Vaucluse, are the vineyards of Châteauneuf-du-Pape, the wines of which, being spiritual and dark-colored, are exported in large quantities to Bordeaux and Burgundy to be mixed with the poorer growths of those districts. Further up the Rhône, on its right bank, in the department of Ardèche, are produced the white wines of St. Péray, both dry and effervescent. The former are spiritual, delicate, and of an agreeable bouquet; the latter heady and sweet, but the sweetness arises from the natural juice of the grape, and not from the addition of sugar, whence it is considered more wholesome than champagne. Crossing to the left bank of the Rhône again, we find at Tain, in the department of Drôme, which is a part of the old province of Dauphiné, the famous vineyards of the Hermitage, so called from the retreat which one Gaspard de Sterinberg, a courtier of Queen Blanche of Castile, is said to have built early in the 18th century on a lofty, round-topped hill rising abruptly from the river. Its S. and S. W. sides descend in a series of terraces to the river level, and are covered with vines on which the sun plays the whole day, maturing the juices of the grapes to absolute perfection. The vineyards are of three kinds, according to the soil of which the terraces are composed, and the high quality of the wine depends upon the combination of the growths of these vineyards, which are always sold mixed; so that a proprietor, in order to have his produce classified as of first quality, must hold property in the three vineyards. Nine tenths of the wines are red. The first growths are sent to Bordeaux to be mixed with the clarets which are made up for the English market, and only the second growths are sold in the trade as Hermitage. But these, when genuine, are esteemed the best wines of southern France, being distinguished by body and richness, a lively purple color, and a peculiar bouquet. The white Hermitage is of great rarity and delicacy, and will keep for 50 years. The vineyards of Condrieu, in the department of Rhône, south of Lyons, produce a white effervescent wine of luscious taste and agreeable aroma, which is described as an imperfect champagne. In the commune of Ampuis, a few miles distant, is the vineyard of the Côte d’Or, sharing with it the river. It has an exposure scarcely less favorable than that of the Hermitage. It produces red wines, of remarkable clearness, strength, and bouquet, the first quality of which ranks among the best in France. North of Lyons and along the Saône and other tributaries of the Rhône lie the districts of Beaujolais, Mâconnais, and Côte de Châlons, the wines of which, while differing in many respects from those of Burgundy and the valley of the Rhône, may be said to form a connecting link between them. The Beaujolais, formerly part of the province of Lyonnais, but now mainly forming an arrondissement of which Villefranche is the chief place, lies between Mâcon and Lyons on the right bank of the Saône. The district being hilly in parts, the vineyards are designated as high or low Beaujolais, according to their situation and elevation. The low Beaujolais produces a greater quantity of wine, but of a coarser quality, than the high. The best growths are those of Chénas, Fleury, Lanché, and St. Étienne-la-Varenne, light-colored wines, and the Juliennas, which represents a class of fine, strong, and deep-colored wines. The products of the Beaujolais are as a rule more acid and delicate than those of the valley of the Rhône, and are largely consumed in France. The Mâconnais is the district lying around Mâcon, and immediately N. of the Beaujolais. It formed part of ancient Burgundy, and its wines are regarded as a species of second class Burgundies. They are both red and white, the former class greatly predominating in quantity but not in quality. The best red growths are those of Thorins, Romanèche, St. Amour, and Davayé, the finer grades of which are not unfrequently taken into Burgundy and sold as wine of that country. Much of the red Mâcon is alcoholic and exceedingly acid; but the latter quality, the result of unscientific methods of making the wine, is not considered an objection by the natives, who almost invariably drink their wine mixed with water. White Mâcon is produced in the vineyards of Pouilly and Fuissé, in the extreme northern part of the district. The Pouilly wine is the finest product of the Mâconnais, and in good years is scarcely surpassed by any wine made in France. It is dry, of a deep golden hue and a superb bouquet, but, like all the wines of the district, is a little too heady. The Fuissé is inferior in quality, and mostly used to mix with the Pouilly. The remaining wines of the Saône valley are those of the Côte de Châlons, under which name are comprised the vineyards of the arrondissement of Chalon-sur-Saône. The best growths have an admirable exposure and are nearly related to the Burgundies properly so called, but, owing to a vicious system of culture, are of vastly inferior quality. The best of them are employed to mix with Burgundies.—The Burgundy wine district is often popularly described as comprehending the departments of Yonne, Côte-d’Or, and Saône-et-Loire, which were all included in the ancient province of Burgundy. But the name of Burgundy was not attached to the department properly so called, but, owing to a vicious system of culture, are of vastly inferior quality. The best of them are employed to mix with Burgundies. The products of Yonne bear no closer rela-
tion to the latter than do those of Saône-et-Loire. This restricts the production of genuine Burgundy wines to the department of Côte d'Or, literally the "golden side," so called from a series of low hills, about 36 miles in length, which stretch from the neighborhood of Châlon-sur-Saône, through the heart of the department, to Dijon. Along the slopes of this ridge, which has a general S. S. E. exposure, lie the vineyards and estates, frequently extending a mile or two on the plain beneath, which produce the famous growths of Burgundy. These may be divided into two classes, of which the finer includes Chambertin, the favorite wine of Napoléon I., Richebourg, Corton, Tâche, Romanée de St. Vivant, Romanée Conti, and Clos de Vougeot, all of superlative excellence and enormous price, and some of them of very limited supply. The Clos de Vougeot vineyard, one of the largest, contains just above 120 acres, some of which is poor land, while the Chambertin contains less than 12, and the Romanée Conti only 64 acres. With so limited an area of production, the choice growths of Burgundy are necessarily rarely met with. Next to these come the wines of Nuits, Volnay, Pommard, Beaune, Vosne, Chambolle, and a number of other vineyards, which are little inferior to those of the first class. These wines are all red and are distinguished by suavity of taste and spirittuous bouquet. They possess more body than the wines of the Bordeaux, and are more heating; but the popular objections to them, that they cause gout and will not bear transportation, are not entirely sustained. Good Burgundy is exported to many parts of the world, and everywhere is held in equal esteem with the best Bordeaux wines, although in the opinion of experts it can only be drunk in absolute perfection in or near the district in which it is produced. This may account for the fact that it is much less frequently found in America than the wines of Bordeaux. As to its effects upon the physical system, it may suffice to say that the proportion of gouty persons is no greater in Burgundy, where the wine is universally drunk, than in parts of Europe where it is comparatively unknown. A marked peculiarity of the Côte d'Or is that it produces not only some of the best wines in the world, but some of the worst. Owing to rude and primitive and often filthy processes of promoting the fermentation of the grape juice, which are in a measure common to all the vineyards of the department, a large proportion of the wine has a harsh, disagreeable taste, and will not keep; and it is said that there is not an inn or hotel along the Côte in which a bottle of Burgundy fit for travellers to drink can be obtained. An improvement in the making of the wine may not materially increase the production of the first growths, but it would greatly aid the reputation of the lower grades. The white wines of Burgundy are less numerous than the red, and less known outside of France. The purest is the Mon-
holding 44 gallons each, and there left to ferment. The residue of the grapes left in the press after the first drawings is used for making a common red wine. About the beginning of December the wine, being then clear, is drawn from the lees, and the mixing of various growths, the first important operation in the production of champagne, commences. This process requires great skill and judgment, for upon its successful performance the flavor and body of the wine in great measure depend. Champagne is seldom the product of a single vineyard, but is a combination of a number of growths. In this respect it holds a peculiar position among French wines. The growths having been mixed in large vats in the proportions determined upon by the manufacturer, the combination is again drawn into barrels, where it is fined, after which it is allowed to rest until the spring. Up to this time the wines are rarely tampered with by the introduction of sugar or brandy; but in unfavorable seasons the former substance is sometimes necessary to enable them to undergo the operation of a second fermentation, without which it is impossible to make them sparkle (mousseur). Next comes the operation of bottling, which commences in April and continues until June. The liquid is now of a uniform amber color, and, if of good quality, will be not unpalatable. The bottles, which are the same as those from which the wine is drunk when finally prepared for drinking, are filled to within an inch or so of their mouths and then corked. The corks having been fastened down securely with string and wire, or by the more recent method with clamps, the bottles are conveyed into cellars or caves and laid carefully on their sides. The secondary fermentation ordinarily commences in June and continues during the summer, pending which, especially when the grapes begin to ripen, or in stormy weather, a loss estimated at from 10 to 15 per cent., and sometimes reaching 25 per cent., is sustained by the bursting of the bottles and the consequent escape of the liquor. When the fermentation is finished and the breakage has nearly ceased, the stacks of bottles are overhauled, and those bottles in good condition are restacked. After a lapse of 18 months, during which the wine is allowed to lie at rest, it is shaken at intervals for several weeks, until a thick deposit is found in the neck of each bottle, which is removed by the process of disgorging. The cork is discharged with a loud report, and the froth, which immediately rises and is partly projected, carries with it all the impurity collected in the neck. Champagne prepared in this manner is quite dry, containing no sugar whatever perceptible to the taste. But a further operation is necessary in order to prepare it for exportation or commerce. This consists in adding to each bottle a certain percentage of melted rock candy mixed with brandy or some finely flavored wine. The amount introduced varies according to the country in which the wine is to be consumed, England using the minimum and Russia the maximum. The bottles are then recorked, and secured by strings and wire or clamps, and the air is excluded by covering the necks with tin foil or sealing wax. The wine is now between two and three years old and ready for use. Of the bottled wines produced in Champagne four varieties are known to commerce: 1, champagne non-mousseux or still champagne, that is, wine which has been fully fermented, fined, bottled in the usual manner of mousseux wines, and allowed to rest a long time; 2, champagne crémant, which forms a slight cream of effervescent bubbles upon its surface when poured into a glass; 3, champagne mousseux, which upon being opened projects the cork with an audible report, and rises gently over the mouth of the bottle; and 4, champagne grand mousseux, which projects the cork with a loud report and immediately overflows from the bottle. The prices of champagne vary at the place of manufacture from $4 the dozen bottles to $18 or $20, but $10 will give the consumer a sound wine of excellent quality. Of the 25,000,000 bottles or upward annually produced, one sixth part goes to the United States; England, Russia, and the East Indies consume each about the same quantity; and the remainder is distributed among other European countries. Most of the wine sent to the United States purports to come from Rheims, although in fact it is the product of vineyards scattered throughout the arrondissements of Rheims and Epernay; and its reputation rests upon the names of its manufacturers rather than upon the locality where it is produced. As a remedial agent, champagne, though a factitious product, is highly esteemed for its diuretic and strengthening properties. It comforts and resteth the stomach, and is a recognized antidote to nausea.—To the wine districts above described it is necessary to add but a few others. The department of Dordogne, the ancient province of Périgord, which lies E. of the Bordelais, yields red and white wines, of which the former resemble St. Emilion, while the latter partake partly of the qualities of Frontignac and partly of those of Barsac. Bordeaux is the principal receptacle for the wines of this district. The department of Vienne, formerly Haut-Poitou, produces about 12,000,000 gallons of mediocore quality. The departments of Lot and Lot-et-Garonne, lying S. of Dordogne, form an extensive wine-producing district, of which Cahors is the central point. The wines are white, rose-colored, and black, and much of the last named variety is sent to Bordeaux to strengthen and color light wines. The Cahors wines have little bouquet, but are strong in body, and the dark varieties will keep 50 years in the bottle. The department of Charente, lying N. of Dordogne, and through which flows the river Charente, is largely devoted to the culture of the vine. The wines are used for distillation immediately after the
fermentation is over, and from them is produced the best brandy made in France. The centre of this manufacture is the town of Connois, whence the name frequently applied to French brandy.

**FRANCIA (free county), an ancient province of France, now comprised in the departments of Jura, Doubs, and Haute-Saône. Its capital was Besançon. It is drained by the Saône, Doubs, and Ain, is partly covered with forests, and contains iron and coal mines, marble quarries, and salt pits. The country was originally inhabited by the Sequani, and was called Maxima Sequanorum by the Romans. In the 5th century it was occupied by the Burgundians, and subsequently became a part of the Frankish dominions. After the disruption of the Carlovingian empire it passed through various changes, finally falling to the German empire. It was then governed by its own counts, although the name of Francia-Conté does not occur until near the middle of the 12th century. In 1490 Giovanni Bentivoglio invited the artists of neighboring cities to adorn his palace in Bologna. Francis, zealous to uphold the honor of Bolognese art, competed with the strangers, and painted some noble works for the Bentivoglio chapel, one of which, an altarpiece with portraits of the Bentivogli, is probably as fine a specimen of his style as exists. Later in life Francis attempted fresco painting, of his proficiency in which he has left a notable example in the series illustrating the Life of St. Cecilia, now in decay. His style partakes of the characteristics of Perugino and G. Bellini.**

**FRANCIA, José Caspar Rodríguez (commonly called Dr. Francia), dictator of Paraguay, born in Asuncion about 1757, died there, Sept. 20, 1840. He boasted that he was of French extraction, but his father is supposed to have been born in Brazil, of Portuguese descent, and to have emigrated to Peru as a agriculturalist along with other settlers. His mother was a creole. He was educated for the priesthood, received the degree of doctor of divinity, was for a short time a professor of theology at Cordova de Tucuman, then applied himself to the practice of the law, and gained a reputation for ability and rectitude, was appointed to several public offices. After the declaration of independence by the Paraguayans in 1811, he became the secretary of the revolutionary junta, the other members of which were two assessors and a president, Don Fulgencio Yegros. The latter and Francia were in 1818 appointed joint consuls for one year, but Francia was the moving spirit of the government. At his instigation the consulship was abolished in 1814, and he was made dictator for three years, at the end of which he continued to serve his election as dictator for life. He combined in his own person almost all the powers of the government. He monopolized the cultivation of mate or Paraguay tea, and of other products of the country, but husbanded the national resources with great sagacity, gave a powerful impulse to the rearing of horses and cattle and to the cultivation of rice and grain, and established a standing army and guard houses along the frontiers, to protect the people against attacks from the Indians. He devised a code of laws, promoted education, checked the abuses of the clergy, improved the appearance of the capital, and, while neighboring states were in anarchy, secured for Paraguay a comparative degree of tranquillity. He peremptorily declined all intercourse with other South American states, and almost all foreign nations, and detained all foreigners who set foot in the country. No export or import trade was allowed without the dictator's license, and death awaited those who were detected in leaving the country without his special permission. Those opposed to his rule were either shot or imprisoned. The principal victims of his administration were pecu-
administration in three works: "Letters on Paraguay" (2 vols., London, 1838), "Francis's Reign of Terror" (1839), and "Letters on South America" (8 vols., 1843). A graphic sketch of his life and character was given by Thomas Carlyle in an article in the "Foreign Quarterly Review" (1848), in which the dictator is greatly lauded for his eccentric and ruthless energy and justice. C. A. Washburn, in his "History of Paraguay" (1871), paints him in the darkest colors.

FRANCIS, the name of several sovereigns of France, Germany (including Austria), and the Two Sicilies.

I. FRANCE.

FRANCIS I., king of France, son of Charles, count of Angoulême (cousin german of Louis XII.), and Louise of Savoy, born at Cosne, Sept. 12, 1494, died at Rambouillet, March 81, 1547. He married Claude, daughter of Louis XII., in 1514, and succeeded him as nearest heir, Jan. 1, 1515. Louis was meditating the reconquest of the Milanese, which he claimed as heir of his grandmother, Valentina Visconti, at the moment of his death; and the youthful king, having renewed his predecessor's treaty with England, immediately crossed the Alps with an army of about 40,000, by passes previously considered impracticable. The Swiss army employed by the duke of Milan, to defend the foot of the Alps was driven back, but being joined by reinforcements gave him battle at Marignano (Melegnano), 10 m. S. E. of Milan, Sept. 13, 1515. It was a fierce contest, since called the battle of the giants; and though the Swiss had only infantry to oppose to the finest cavalry in Europe, they retired only on the second day with a loss of 12,000. Francis had lost 8,000 of his best troops, but he had displayed extraordinary valor and skill; and his name became at once the most distinguished in Europe. In the chivalric spirit of the age he accepted knighthood on the spot from the chevalier Bayard, whose final charge had completed the victory. After the battle Francis wisely granted the Swiss an honorable peace, and secured their constant alliance. He also made a concordat with the pope, and, master of Milan, returned in triumph to Paris. In 1517 he made a treaty of friendship and alliance against the Turks with the emperor Maximilian and his grandson Charles I. of Spain, and in 1518 a treaty with England, by which Tour- nay was returned to France. He was now established firmly at home; the power of the feudal nobility was gone, and his parliament was wholly subservient. Maximilian died in January, 1519, and Francis became a competitor for the imperial sceptre with Charles I., afterward Charles V., of Germany, for the imperial sceptre. Charles prevailed in the electoral council in consequence of a recommendation of Frederick the Wise, elector of Saxony, and Francis betrayed the passions natural to disappointed ambition. His chagrin forced from him expressions of dispar-
agement of his successful rival, which were re-
sented; and from this jealousy, as much as
from conflicting interests, arose that hostility
between these princes which kept Europe in
 turmoil during their reigns. It was easy to
find causes of strife; Italy and Navarre af-
forded them abundantly. But before engaging
in war, each strove to gain to his interests the
English king Henry VIII, who obviously held
the balance in his hand. Charles hastened to
pay this monarch a personal visit at Dover as
he passed from Spain to his dominions in the
Netherlands, and at the same time secured the
influence of Cardinal Wolsey by a virtual prom-
ise of the papacy. Francis invited Henry to
France, where, by a splendid hospitality, he
hoped to gain both the cardinal and his master.
The sumptuous interview took place in the
plain between Guines and Ardes, which his-
tory commemorates as the field of the cloth of
gold (June 4–24, 1520). Unprecedented mag-
nificence, feats of chivalry, and gallant exer-
cises of every description, occupied the two courts.
The kings themselves, according to Fleuranges,
had a personal wrestling match in private. Fran-
cis easily overthrew his antagonist, but by his
frank and generous bearing won his friendship.
Henry, however, flattered by Charles, whose
visit he returned after his conference with
Francis, was easily secured to the interest of
the emperor, and declared that he wished to
remain impartial, but should pronounce against
the aggressor. The French king began hostili-
ties by seizing Navarre. His troops also in-
vaded Spain, but were routed and chased be-
beyond Navarre. Charles attempted to enter
France from the north. He was repelled at
Mézières by the chevalier Bayard, and Fran-
cis marched into the Netherlands. By some
strange over-cautionness he lost an oppor-
tunity of cutting off the whole imperial army.
Meanwhile Cardinal Wolsey effected a league
between his sovereign, the emperor, and the
pope, against Francis. A papal army, under
Prosper Colonna, seized Milan, and disposess-
ee the French of all their Italian conquests
except the fortress of Cremona. Francis, in
the midst of these disasters, received from
Henry of England a declaration of war (May
29, 1522). Undaunted, however, although his
treasury was utterly exhausted, he succeeded
in putting the kingdom in a state of defence.
The constable de Bourbon at this crisis, reject-
ing the queen mother’s invitation to marriage,
and robbed by the incensed woman through
legal chicanery of his family estate, not only
offered his sword to the emperor, but proposed
to incite a rebellion in France. The conspiracy
was discovered, and Bourbon fled; but an in-
vasion of English and imperialists, which ad-
vanced to within 11 leagues of Paris, compelled
Francis to moderate his spirit and to attempt
the war into Italy. He nevertheless despatched
an army of 30,000 men against Milan, which
failed through the incapacity of Bonnivet, its
commander. Bourbon principally conducted
the imperial operations in this quarter, and
in conjunction with Pescara (1524) drove the
French, after a rout at Bliagasso, into their
own country. In this defeat the chevalier
Bayard, who commanded the vanguard, was
killed. The imperialists entered Provence.
Francis hastened in person to relieve Marseilles,
carried all before him, pursued the enemy again
into Piedmont, and laid siege to Pavia. He
was here defeated in a great battle, Feb. 24,
1525. His Swiss allies fled; and Francis, unhorsed,
after killing with his own hand seven of the
enemy, at length yielded his sword to the
Neapolitan viceroy Lannoy, and was hur-
rried a prisoner to Madrid. Europe was filled
with alarm. The emperor’s unworthy behavior
to his gallant captive, together with his grow-
ing power and ambition, roused the animosity
of Henry of England, who now declared for
France, and demanded the liberation of the
king, as did also Rome, Venice, Florence, and
Genoa. But the emperor insisted on large
cessions of territory, the restoration of the con-
stable de Bourbon to all his rights, the mar-
rriage of Francis with Charles’s sister Eleanor,
queen dowager of Portugal, and the delivery
of his two eldest sons as hostages for his good
faith. Francis at last signed a treaty on these
conditions, but at the same time caused a secret
protest against them to be drawn up, and was
liberated March 17, 1526, his sons taking his
place at Madrid. He at once demanded and
obtained from the pope absolution from his oath
to fulfill the treaty, and, gracefully thanking
the English king for his sympathy and alliance,
sent forth armies again to Italy. If, say French
historians, he was guilty of perjury, then was
every man in France his accomplice. Charles,
overreached, and now opposed by all Italy as
well as France and England, sent Bourbon
with an army of mercenaries against the pope.
Rome was sacked, and the pope was imprison-
ed. A French army, under Lantreoc hastened
to avenge the insulted pontiff, but after a series
of triumphs was destroyed by disease before
Naples. Meanwhile Francis challenged Charles
V. to a duel; the emperor accepted; but the
year 1528 was consumed in their mutual
charges and recriminations. Both sovereigns
were exhausted of men and money, and peace,
an obvious necessity for all the belligerents, was
concluded at Cambrai by the mother of Francis
and the aunt of Charles (Margaret of Austria)
in August, 1529. The king of France retained
Burgundy, surrendered his Italian claims, and
promised 2,000,000 crowns ransom for his
sons. Francis at the same time married Queen
Eleanor. This treaty secured to France a
few years of peace, during which Francis en-
couraged letters and art, and, after wavering
for a time between the influence of Louise
of Savoy and Mary of Burgundy, made his
peace against the reformation, and persecuted
the reformers with great rigor. On July 16,
1535, however, he issued an edict of tolera-
tion. This change had a political cause. In
1588 the duke of Milan put to death an agent of the king of France, charged with murder. Seizing this as a pretext for war, Francis took up arms again, and in 1588 overran Savoy. Charles in the spring of 1588 marched upon Provence, and the French troops hurried again to the defence of that region. Charles lost half his army through famine and disease, the country having been laid waste purposely by the French commander, and with the remainder fled before the light troops of the province. At the same time the prince of Nassau, who had invaded the north of France, was compelled to retreat. Soon after these events, the eldest son of Francis died, poisoned, as was supposed. The crime was laid to the charge of the emperor, probably without any foundation; but the circumstance carried the exasperation of the two sovereigns to the extreme of decency. Francis attacked the Netherlands, and even formed an offensive alliance with the Turkish sultan Solyman; but the pope and the queen of Hungary interposing with offers of mediation, a truce of ten years was concluded at Nice (1588). The rivals exchanged visits and embraced; and Charles promised to invest a son of the French king with the sovereignty of Milan, but the promise was never fulfilled. Charles giving the duchy instead to his son Philip. War again broke out in 1543, and Francis sent five armies against various quarters of the imperial dominions, and gained a great battle at Ceresole (April 14, 1544), but without important consequences. After a short invasion of France by Henry VIII. and Charles in alliance, peace was concluded with the emperor at Crespy, Sept. 18, 1544. The war with England continued, but without remarkable actions, until June 7, 1546. This treaty, like that of Nîmes, was followed by renewed persecution of the reformers. Having no more need to maintain his Protestant alliances, Francis carried out a most cruel decree against the Vaçois, desolating the country and killing the inhabitants by thousands. The king's health had been hopelessly ruined some years before in consequence of one of his many amours, and death at length ensued. Francis was an unhesitating libertine, though during the latter years of his life his attention was given to wiser thoughts; but notwithstanding his vices and his cruelty to the Protestants, admiration cannot be withheld from many gallant and noble traits of character, which might have been blessings to his country had he been content with any other than military glory. His challenge to Charles V., and his court rules of honor and chivalry, did much to establish the practice of duelling. Yet he introduced into France many improvements of art and learning. Of his medals in the spring of the new year; in the national library of Paris, the original Louvre, Fontainebleau, and Chambord. By his first wife he had seven children; by the second none. To his son Henry II. he bequeathed a treasury with a surplus of 400,000 crowns.

**FRANCIS II.** king of France, born in Fontainebleau, Jan. 19, 1548, died in Orleans, Dec. 5, 1560. He was the eldest son of Henry II. and Catharine de Medicis. His father had succeeded in obtaining some important advantages over the emperor Charles V. and the house of Spain, and in terminating favorably a long series of wars, chiefly in Italy and the Netherlands, against the growing might of that house. Henry died in 1559 of a wound accidentally received in a tournament. Francis, then a sickly boy of 16 years, possessed of neither character nor talent, succeeded to the throne. He had already (in April, 1559) married the daughter of James V. of Scotland, the beautiful and afterward unhappy Mary Stuart. Her influence gave the reins of government to her uncles, Francis, duke of Guise, and the cardinal of Lorraine. The arrogant sway of these two ambitious and unscrupulous princes alarmed and irritated the princes of the blood, Anthony, king of Navarre and his brother Louis of Condé, who became the leaders of a Protestant party in opposition to the court. Everything concurred to produce civil commotion. Protestantism had penetrated, in the form of Calvinism, into France. Its spirit suited that of the feudal nobility, and the profanity and corruption introduced by the Italian Medici into the court and manners of France, and the influence of strangers, disposed the people to rebellion. It was by secret plots, however, rather than by open revolt, that the Protestant princes tried to wrest power from the hands of the Guises. A great conspiracy was organized, having Condé at its head, and embracing the most prominent nobles of France. It was agreed to enter Amboise on a certain day in detached parties, to massacre the Guises, and seize the person of the king. But the plot was disclosed almost at the moment of execution, by two Protestants, the duke of Guise secretly assembing a body of troops, and cutting to pieces the forces of the conspirators as they were entering the town. His triumph was stained with barbarous cruelty, and the waters of the Loire were colored with the blood of those who fell in combat or perished on the scaffold. The court gazed at the executions, as scenes of public festivity, from platforms and the windows of the castle. Arrests and executions throughout the country followed. The duke of Guise was made lieutenant general of the kingdom. The axe was brought into play to stifle the opposition of the princes, and the inquisition was set up to repress Calvinism. A royal edict made the bishops, instead of the parliaments, judges of heresy. The Huguenots, seeing in this edict their speedy destruction, prepared to resist, and the court convoked at Fontainebleau the court of peers for the purposes of seizing the two princes of Bourbon; but they came with an escort strong enough to protect them. The princes of Lorraine convened the states general at Orleans. Condé had tried to dissemble his mortification after the failure
of Amboise, and was now imprudent enough to appear. He was arrested, tried, and soon condemned to die as a traitor. The death of Francis I., however, saved his life and enabled him to the leadership of the Huguenots. The young king had long suffered from an abscess in his ear, and died after a reign of 17 months, so suddenly that rumors of poison, now regarded as unfounded, spread, and were believed throughout the country; the more easily, as assassination was becoming fashionable in France, and the queen mother was renowned for her love of alchemy and the use of poisons. Francis bequeathed to his brother and successor, Charles IX., then a boy of ten years, a treasury loaded with debt, and a state full of the elements of civil war. The regency was intrusted to Catharine de Medici, whose intrigues fostered civil and religious dissensions.

II. GERMANY AND AUSTRIA.

FRANCIS I. (Stephen), emperor of Germany, born Dec. 8, 1708, died at Innspruck, Aug. 18, 1765. He was the son of Leopold, duke of Lorraine, and of a niece of Louis XIV., and was the great-grandson of the emperor Ferdinand III. In 1729 he succeeded his father, but in consequence of the war of the Polish succession, his duchy was given in 1733 to the ex-king Stanislas, father-in-law of Louis XV., to revert after his death to France, and he received the reversion of the duchy of Tuscany, where the house of Medici was about becoming extinct. Francis in 1736 married Maria Theresa, daughter and heiress of the emperor Charles VI. Charles appointed him generalissimo, and he subsequently fought in a successful campaign against the Turks. After the death of the last of the Medici in 1737, Francis went with Maria to Florence, the capital of his new dominion. The emperor dying in 1740, he returned to share with his wife the regency of the Austrian dominions, though without any real power in the administration, and fought for her rights in the wars which ensued. Francis was elected emperor of Germany in 1745, and acknowledged by Bavaria and Prussia in the same year, but not by France and Spain until the peace of Aix-la-Chapelle in 1748. Being of a mild and peaceful disposition, and influenced more by aversion than by ambition, he promoted commerce and agriculture, particularly in Tuscany, but left the heavier cares of government to his wife, who in 1756 became involved in the seven years' war with Prussia. Two years after the termination of this war Francis died, leaving the German crown to his son Joseph II., for whom, however, his mother reigned till 1780, and Tuscany to his younger son, afterward Leopold II.

FRANCIS II., emperor of Germany (I. of Austria), born in Florence, Feb. 13, 1768, died in Vienna, March 2, 1806. He was the son of the emperor Leopold II. and of Maria Louisa, daughter of Charles III., king of Spain. He was educated first at the polished and popular court of Florence, then at that of Vienna. He accompanied his uncle Joseph II. in his campaign against the Turks in 1797, and received the title of commander-in-chief of the army, though still a youth of 31 years, the old and experienced general Landon being his assistant and adviser. After the death of Joseph (1790), Francis held the reins of the empire for a few days, till the arrival of his father from Florence, whom he followed in the next year to the convention of Pultitz, where the emperor and the king of Prussia formed the first coalition against revolutionary France. Leopold died in 1792, and Francis was successively crowned king of Hungary, emperor of Germany, and king of Bohemia. He was soon surrounded with difficulties and dangers. Hungary was in a state of national excitement, and the Belgian provinces were ripe for revolt. The legislative assembly of France obliged Louis XVI. to declare war against him in April, 1792. The victories of Dumouriez and the revolt of Belgium, the victories of Custine on the Rhine, the execution of Louis XVI., and that of Marie Antoinette, the aunt of Francis, rapidly followed. It was in vain that Clerfayt obtained some advantages over the French, and that Francis took the command of the army in person. The armies of the republic soon drove back the allies: Francis's own federates deserted him, and in 1795 Tuscany, Sweden, Spain, and Prussia concluded at Basel a treaty of peace with the republic, whose Italian army, now commanded by Bonaparte, conquered in the next two years the whole north of Italy. Francis himself, notwithstanding some slight advantages gained by his brother the archduke Charles over Moreau, in southern Germany, was finally forced to conclude the treaty of Campo Formio (Oct. 17, 1797), in which he sacrificed Belgium, Milan, and a Rhenish province of the empire, in exchange for Venice. Changes in France and new French aggressions tempted Austria, Russia, and England to another war in 1799. The allied armies were successful for a while under the archduke Charles in Germany, under Hotze in Switzerland, and under Kray and Suvaroff in Italy. But reverses came; Suvaroff was recalled by his emperor, and Napoleon became master of France by a coup d'état, and of Italy by the passage of the Alps and the battle of Marengo (June 14, 1800), while Moreau fought his way through southern Germany toward Vienna. These disasters compelled Francis to the peace of Lunéville in 1801, by which he lost a portion of Germany and acquired a portion of Italy. England made peace with France at Amiens, but broke it again, and framed a new coalition, in which the emperors Francis and Alexander, and the king of Sweden took part, while Prussia remained neutral, and Bavaria, Wurttemberg, and Baden were ready to side with the French. Francis expected the first attack from Italy,
and sent thither his brother Charles, who gained a battle over Masséna; but Napoleon broke through Germany, and his sudden march threw the Sun King with his 24,000 men under Mack, the retreat of the archduke Ferdinand, and the great battle of Austerlitz (Dec. 2, 1805), in which the two allied emperors were present, made him the dictator of the treaty concluded at Presburg, Dec. 26, in which Francis lost the Tyrol, Venice, and 3,000,000 subjects, and received only Salzburg. The electors of Bavaria and Wurtemberg now took the title of kings as a reward for their support of the victor. Francis was compelled to remain neutral in the fourth coalition, and to acknowledge the confederation of the Rhine founded under Napoleon's protectorate. The French ambassadors declared that they no longer recognized a German empire or a German constitution; and Francis, who had in 1804 assumed the title of hereditary emperor of Austria, solemnly laid down that of emperor of Germany in August, 1806. The peace of Tilsit and the alliance of Napoleon and Alexander threatened Austria with destruction and drove Francis to the most energetic measures. He armed the ancient German militia, and summoned the Hungarian nobles to a general rising in their old fashion. Three brothers of the emperor were sent with armies across the German, Italian, and Polish frontiers, but Austria stood this time alone, while Napoleon was assisted by Poles, Russians, and Germans. With the exception of the battle of Aspern and Essling, May 21 and 22, 1809, in which Napoleon suffered his first check, the whole campaign in Germany was a series of French victories. The Austrians were forced to evacuate Vienna, driven from Poland, and signally defeated at Wagram; the Hungarian nobles were dispersed, and a treaty of the Tyrolese in favor of Austria proved abortive. The peace of Schönbrunn (Oct. 14) cost Francis some rich provinces and more than 3,500,000 subjects. The resources of his empire were exhausted, and his treasury had long been bankrupt. In this situation he consented to give his daughter Maria Louisa in marriage to Napoleon, and soon saw the title of king of Rome, once his own, bestowed upon her child. In the disastrous Russian campaign of 1812 an auxiliary Austrian force occupied Poland in the French interest, but effected little. In 1818 Francis declared his neutrality, negotiated secretly with Great Britain and Russia, took part in the congress of Prague, and on Napoleon's refusal to accept his mediation with Russia joined the allies, and contributed largely to their victory at Leipzig. In the following year he entered France with his army, and remained two months in Paris after its occupation by the allies, March 31. In June the European congress assembled at Vienna, but the brilliant festivals with which Francis entertained his guests were interrupted in March, 1815, by the news of Napoleon's return from Elba. An Austrian army now crossed the Simplon and occupied Lyons, while another marched into Italy, overthrew Murat, and restored to the house of Austria the crown of Naples. On the restoration of peace after the battle of Waterloo, Francis, having ceded Belgium to the Netherlands, and acquired Lombardy and Venice, saw his empire greater than it had ever been before. He became a party to the "Holy Alliance" in 1816, and his policy, developed by Metternich, became the policy of Europe. Based on a horror of revolution and a reverence for hereditary right, it took the form of a thorough conservatism and centralization, supported by a large standing army, a secret police, strict subordination, a literary censorship, and other measures of repression. Austria was the centre of all the reactionary movements of the period following the French restoration. Monarchical congresses for the suppression of the revolutionary spirit of Germany, Spain, and Italy were held on its territory at Carlsbad in 1819, at Troppau in 1820, at Laybach in 1821, and at Verona in 1822; Austrian armies arrested a revolutionary movement in Piedmont and annulled the constitution of Naples, and Austrian influence prevailed in Spain, Portugal, and the German confederacy at Frankfort. Francis sanctioned even the despotic rule of Turkey over Greece, and imprisoned the Greek refugees in Nafplion. He was the first to counteract in Italy the influence of the French revolution of July, 1830, crushing the feeble revolutionary attempts of 1831, and was of aid to Czar Nicholas in repressing the Polish struggle for independence. It was nevertheless a constant though secret part of his policy to check the growing and threatening power of Russia. At home his chief embarrassments sprang from an exhausted treasury, enormous debts, and the meanness of the Italians, Hungarians, and Slavs. New loans and taxes relieved his finances; state prisons and rigorous punishments were used to crush the spirit of independence in Italy; while the diet of Presburg was appeased by reluctant concessions, and German officials kept order in Galicia and Bohemia. In the promotion of industry, commerce, and the arts in the German provinces, and the advancement of German influence, he showed a wiser policy. The courts of law were reorganized, and the ancient codes were revised and modified. Francis was economical, industrious, and correct in his personal habits, popular with the Germans, but little known and less liked by his other subjects. The antipathies inspired by the reactionary measures of his government, and the attacks of the liberal press in foreign countries (for there was none in Austria), and of the Hungarian patriots in their diets and county assemblies, were directed less against the emperor than against his minister Metternich. His private treasury was in an incomparably better condition than that of the state, and his family was large and prosperous. The lat-
ter part of his reign was undisturbed. Of his four wives, princesses of Württemberg, Sicily, Modena, and Bavaria, the eldest, Maria Theresa, was the mother of 13 children, among whom were Maria Louisa, wife of Napoleon I.; Ferdinand, who succeeded to the throne; and Francis Charles, father of Francis Joseph.

**FRANCIS JOSEPH**, emperor of Austria, grandson of the preceding, eldest son of the archduke Francis Charles, and nephew of the emperor Ferdinand I., born Aug. 18, 1830. He was educated under the care of Count Bombelles, and was early inspired with ambition by his mother, the archduchess Sophia (died May 28, 1872), daughter of the king of Bavaria and sister of the queens of Prussia and Saxony, who possessed more influence and enterprise than either the emperor or his husband, the heir presumptive to the throne. Like his uncle Ferdinand, Francis Joseph was taught to speak the various languages of his polyglot empire, and also became a skilful rider, and fond of military displays. Sent to Pesth in 1847 to install his cousin Stephen as palatine of Hungary, he spoke Hungarian to the assembled nobles, and gained some popularity. The revolutions of 1848 brought the Austrian empire to the brink of dissolution. It seemed that the accession of a prince who had no unpopularity was a necessity, and the archduke who was the leading spirit of the counter-revolutionists, convinced that Francis Joseph, though only 18 years old, should be declared of age, Dec. 1, 1848; and on the following day his father resigned his right to the succession, and his uncle the emperor abdicated, in favor of the young prince. For the political and military events of the reign of Francis Joseph down to the close of 1872, see **AUSTRIA** (vol. ii., pp. 146-159). In November, 1856, Francis Joseph assisted at the formal inauguration of the Suez canal. On April 8, 1878, the emperor gave his sanction to a new electoral reform bill for Cisleithan Austria, of which the leading features are: The members of the lower house henceforth to be elected by all persons entitled to the suffrage; the number of members of the lower house to be increased to 120; each electoral district will elect one deputy; every one entitled to vote for a member of a provincial diet will also be entitled to vote for a member of the Reichsrath; the votes to be given in writing; an absolute majority will be necessary for the election of a candidate; those entitled to vote in any one province to be eligible in all the provinces; the period for which a member is elected is six years. Francis Joseph was married, April 24, 1854, to a daughter of Maximilian, duke of Bavaria. The heir apparent of the Austro-Hungarian crown is his son, the archduke Rudolph Francis Charles Joseph, born Aug. 21, 1858.

III. TWO SICILIES.

**FRANCIS I.,** king of the Two Sicilies, born in Naples, Aug. 19, 1777, died there, Nov. 8, 1830. He was the son of Ferdinand I. and Caroline Maria. The death of his elder brother in 1779 made him heir to the throne, and he married a daughter of the emperor Leopold II., who became the mother of the future duchess of Berry. After the death of his wife in 1801 he contracted a second marriage with the daughter of Charles IV. of Spain. His father appointed him regent of Naples in 1812, and on the advice of Lord Bentinck he proclaimed a constitutional form of government; but in November, 1818, Ferdinand dissolved the parliament and deposed his son. In 1815 Francis returned to Naples, and succeeded in making himself so popular that his father was obliged to appoint him governor of Sicily under the title of duke of Calabria; and on the outbreak of the revolution in 1820 he was obliged to reinstate him as regent at Naples. Francis, siding with the revolutionists, restored constitutional institutions; but subsequently, being informed of the projected Austrian intervention in favor of absolutism, he reconciled himself with his father, on whose death, Jan. 4, 1825, he succeeded to the throne. Contrary to his antecedents, his short reign became notorious for subserviency to Austria, mismanagement, corruption, and cruelty, and especially for the wholesale massacre of the revolted inhabitants of Bocca and the utter destruction of that little town. His second wife bore him seven daughters, one of whom, Maria Christina, became the wife of Ferdinand VII. of Spain and the mother of Queen Isabella, and five sons, the eldest of whom was his successor, Ferdinand II.

**FRANCIS II.,** son of Ferdinand II. and of the princess Christina of Savoy, born Jan. 16, 1836. His mother died two weeks after his birth, and his father, contracting a second marriage with the archduchess of Montmorency, paid greater attention to his children by the latter wife than to Francis, whose education was conducted by Jesuits. Soon after his marriage with a Bavarian princess, sister of the present empress of Austria, he succeeded to the throne, May 22, 1859. Rejecting the request of Victor Emmanuel to join him against Austria, he adhered to the system of his father, and marked his accession by arresting thousands of his subjects and banishing others. After the landing of Garibaldi at Marsala in May, 1860, and the capitulation of all Sicily excepting Messina, he endeavored in vain to obtain the assistance of foreign powers in his favor, especially of Napoleon III. He likewise failed to conciliate his subjects by a restoration of constitutional government (June 20), and by granting an amnesty. He was obliged to leave Naples on the eve of Garibaldi's entrance into the city, and retired to Capua, whence he sailed forth (Oct. 1) with a rather numerous army, but was routed by the Garibaldians, and after the arrival of the Sardinian army Capua was compelled to surrender (Nov. 2) with about 11,000 troops. He next shut
himself up with his remaining forces in the
citadel of Gaëta, which after a siege of a few
weeks surrendered to Cialdini, Feb. 13, 1861,
and Francis took refuge on a French frigate,
landing at Civitá Vecchia. His dominions
were merged in the kingdom of Italy, and he
afterward lived chiefly at Rome till it became
the capital of that kingdom.

FRANCIS, George, an American clergyman
and author, born at West Cambridge, Mass.,
Nov. 9, 1795, died at Cambridge, April 7,
1868. He graduated at Harvard college in
1815, and after completing his studies at the
divinity school became in 1819 minister of
the Unitarian church at Watertown, Mass. In
1842 he was appointed Parkman professor of
pulpit eloquence and the pastoral care in Har-
vard university. He published a number of
discourses and lectures, and wrote the lives
of John Eliot and Sebastian Rials for "Sparks's
American Biography," and memoirs of Dr.
John Allyn, Dr. Gamaliel Bradford, and Judge
John Davis for the "Massachusetts Historical
Collections."

FRANCIS, John Wakefield, an American physi-
cian and author, born in New York, Nov. 17,
1799, died there, Feb. 8, 1861. His father was
a German, and his mother of Swiss descent.
In his youth he was employed as a printer.
Subsequently he entered an advanced class at
Columbia college, and graduated A. B. in 1809,
and M. D. at the college of physicians and
surgeons in 1811, this being the first degree con-
ferred by the latter institution. He was a part-
ner of Dr. Hosack, with whom he had studied
medicine, until 1820. In 1813 he was ap-
pointed lecturer on the institutes of medicine
and materia medica at the college of physicians
and surgeons, and soon afterward, the medical
faculty of Columbia college having been con-
solidated with that institution, he received the
chair of materia medica in the united body.
He would accept no fees for his first course,
fearing lest some might be excluded from the
lectures by the expense. In 1816 he went
to Europe, and completed his studies under
Abernethy. On his return to New York he
was appointed professor of the institutes of
medicine, and in 1817 of medical jurispru-
dence. From 1819 he was professor of ob-
stetrics, in addition to his other duties, until
1836, when the whole faculty resigned, and a
majority of them founded the Rutgers med-
cal school, Dr. Francis filling the chair of ob-
stetrics and forensic medicine four years, until
the institution was closed by the legislature.
Subsequently he devoted himself to practice
and the pursuit of literature. In 1810, while
yet a student, he prepared with Dr. Hosack
the prospectus of the "American Medical
and Philosophical Register." In 1822-4 he was
one of the editors of the "New York Medical
and Physical Journal." He actively promoted
the objects of the New York historical so-
ciety, the woman's hospital, the state inebriate
asylum, the cause of natural history, the typo-
ographical guild, and the fine arts. He was the
author of biographical sketches of many dis-
tinguished men of his time, and articles in
medical periodicals, and published "The Use of
Mercury" (1811), "Cases of Morbid Anatomy"
(1814), "Febrile Contagion" (1816 ), "Notice
of Thomas Eddy the Philanthropist" (1828),
"Denman's Practice of Midwifery" (1835),
"Letter on Cholera Asphyxia" (1839), "The
Anatomy of Drunkenness" (1841), "A Me-
moire of Christoper Colles" (1850), and "Old
New York, or Reminiscences of the past Sixty
Years" (1857; republished, with a memoir of
the author, by H. T. Tuckerman, 1865). He
was the first president of the New York acad-
emy of medicine in 1847.

FRANCIS, Joseph. See supplement.

FRANCIS, Sir Philip, a British politician and
pamphleteer, born in Dublin, Oct. 22, 1740,
died in London, Dec. 22, 1818. He was the
son of the Rev. Philip Francis, author of an
elegant and popular translation of Horace, and
also of several tragedies and some liberal poli-
tical pamphlets. The son removed with his
father to England in 1760, and was placed on
the foundation of St. Paul's school, where he
remained about three years. Here Woodfall,
afterward the printer of the "Public Adver-
tiser" and publisher of the "Letters of Ju-
lius," was his fellow pupil. In 1756 he was ap-
pointed to a place in the office of his father's
patron, Henry Fox, then secretary of state, which
he continued to retain under the secretaryship
of Mr. Pitt. In 1768 he went as private sec-
retary to Gen. Bligh in an expedition against
the French coast, and was present in a battle
near Cherbourg. In 1760 he was secretary to
the earl of Innisoul, ambassador to Portugal,
and on his return to England in 1768 received
an appointment in the war office. Here he
remained till March, 1772, when he resigned
in consequence of a quarrel with Lord Barrin-
ton, the new secretary at war. The remainder
of that year he passed in travelling through
Flanders, Germany, Italy, and France. In
June, 1773, soon after his return, he was ap-
pointed one of the council of Bengal, with a
salary of £10,000. He went to India in the
summer of 1774, and remained there till De-
cember, 1780, when he resigned on account of
a quarrel with Warren Hastings. This quarrel
led to a duel, in which Francis was shot through
the body. His active and somewhat austere
disposition had brought him into constant op-
position to Hastings, and for a time he con-
trolled the majority in the council. Two of
the members having died, Hastings obtained
the mastery; and after their duel Francis re-
turned to England in disappointment and an-
ger. To revenge himself upon Hastings seems
to have been the ruling motive of his later
life. In 1784 he became member of parliament
for Yarmouth in the Isle of Wight. He was
a bold, severe, and frequent speaker, but he
never became distinguished as an orator. His
politics were always extremely liberal. When the prosecution of Hastings began in 1786, its leaders would have committed the management to Francis. The house of commons, however, because of his personal quarrel with Hastings, refused twice, by large majorities, to permit this appointment, and Burke, Fox, and Windham labored in vain to change this determination. Francis, however, consented to a written request of the committee of managers inviting him to aid them in their labors, and passed many years in this occupation. When others tired, he never flagged. He embittered the existence of his enemy, and no doubt destroyed his own peace in the effort. Hastings, however, finally triumphed and was acquitted. When the French revolution broke out, Francis was its firm friend, and became an active member of the revolutionary association of “Friends of the People.” He was defeated at the election of 1786, when he stood for Tewkesbury, but in 1802 was returned by Lord Thanet for the borough of Abergavenny, and continued to sit for that borough while he remained in parliament. He sustained Fox and Grey in their plans of reform, and advocated the abolition of the slave trade with unfailing ardor. In October, 1806, on the formation of the Grenville ministry, Francis was made a knight of the bath. It is believed that it was also designed to send him to India as governor general, but this appointment never took place. He retired from parliament in 1807, and afterward wrote pamphlets and political articles in the newspapers. From the obscurity of old age he was suddenly recalled to the attention of the public. In 1816 John Taylor published his “Junius identified with a Distinguished Living Character,” viz., Sir Philip Francis. The argument is ingenious, the coincidences are remarkable, and his authorship has since been maintained by several other writers, but none of Francis’s acknowledged writings equal the fierce eloquence of Junius. The representations of what Francis himself said on the subject are contradictory. (See Junius.) He was the author of about 25 political pamphlets.

**Francis of Assisi**, a saint of the Roman Catholic church, and founder of the order of Francisca, born in Assisi in 1182, died near that city, Oct. 4, 1226. His father was Pietro Bernardone, a wealthy merchant, and his mother Pica Moriconi. Bernardone was travelling in France when the child was born, and the mother had him baptized under the name of Giovanni. On his return the father added the surname of Francesco, in remembrance of the country where he had made his fortune; and as the boy while growing up spoke French with ease, he was exclusively known as Francesco. He led a gay life until he was captured in a civil conflict of Assisi with Perugia, and kept for a year prisoner in the city of his enemies. During his detention he formed the design of renouncing the world; and fancying that he heard one day while praying in a church a voice from the crucifix, bidding him repair the falling walls of Christ’s house, he gave the proceeds of some goods he had sold to the priest of the church, offering himself as an assistant. This act brought upon him the displeasure of his father, who threatened if he persisted to deprive him of his inheritance. But neither this threat nor the popular ridicule which saluted his seeming insanity could turn him from his purpose. He formally renounced his right of heirship, emptied his pockets, and even stripped himself of his clothing, putting on the cloak of a laborer. He was then (1206) 24 years old. From this time he gave himself exclusively to works of piety and charity. He begged in the streets for money to repair the church, and assisted the masons by carrying the stones with his own hands. He frequented the hospitals, washing the feet and kissing the ulcers of the lepers. Sometimes he was stripped of his coarse raiment by robbers, and sometimes he gave it to the poor whom he met by the way. His exceeding humility and dress and demeanor began after a time to win sympathy for him. Prominent men desired to imitate him, and to become his companions. The rich merchant Bernardino de Quintavalle, in whose house Francis had been a guest, sold all his estate, distributed it to the poor, and came to pray with his friend. To him was soon joined a canon of the cathedral, Pietro di Catana. These brethren received the dress of Francis, a coarse robe of serge girded with a cord, Aug. 16, 1206, from which day the foundation of the Franciscan order properly dates. At the beginning Francis and his companions occupied a little cottage just outside the walls of the city; but as their number increased they removed to the premises of the Portuncula, which had been offered them by the Benedictines, refusing, however, to accept this as a gift. He slept upon the ground, with a block of wood or stone for his pillow, ate his scanty food cold, with ashes strewn upon it, sewed his garments with packthread to make them coarser, rolled himself in snow to extinguish the fires of sensual desire, obeyed the orders of his novices, fasted long and rigorously, and shed tears so freely that he became nearly blind. He preached wherever he could find hearers, yet he would never take priest’s orders, and contented himself with the humble place of a deacon. He abhorred disputes and controversies, held up the spirit of peace as the only Christian spirit, and, amid the fierce and bloody contentions which desolated Italy in the 13th century, made his followers act everywhere as peace-makers. He was a zealous missionary, and made long journeys in behalf of the Catholic faith. His cherished design was to lay down his life in the Holy Land in behalf of Christ’s religion. His first attempt to reach Syria proved ineffectual; contrary winds hindered his vessel. But the plan was not relinquished, and after a brief sojourn in Acre, he joined the camp of the crusaders at Damietta in 1219.
He arrived only to witness the failure of the Christian army, but he was gratified in his desire for an interview with the Saracen chief, and was permitted to testify in presence of the infidels concerning Christ and the Christian faith. On the occasion of the formal approbation of his order in 1228, he preached a sermon before the sacred college, which seems to have been the last of his important public performances. His failing health and growing blindness confined him more and more to that favorite seclusion of the hill of Alverno, on which a nobleman had built a church and convent for the Franciscan brethren. In this solitude he gave himself more ardently to prayer and religious exercises. His enthusiasm became rapture. His visions were multiplied. The Saviour and the saints seemed to appear, and the legend tells of the stigmata, the print of nails in the hands and feet, and of a wound in the side, corresponding to similar marks on the person of the Saviour, which Francis brought away with him from one of these interviews. It was even affirmed that blood continued to flow from his wounds; and portions of this blood were long after exhibited for the reverence of the faithful. He was canonized July 16, 1228. The literary remains of St. Francis are neither numerous nor especially remarkable. They consist of letters, monastic confreres, parables, and poems in the Italian tongue. The best edition is that of 1641 (folio, Paris). The life of the saint has been many times written by brethren of the various branches into which his order has been divided; by Thomas de Celano, his disciple; by St. Bonaventura; by Helyot; by Chalippe (4to, 1729, and 2 vols. 12mo, 1786); by Chavin (9vo, Paris, 1841); by Böhringer; and by Frédéric Morin (16mo, Paris, 1858).

Francis of Paula, Saint, founder of the order of Minims, born at Paula or Paola, Calabria, in 1146, died at Plessis-les-Tours, France, April 2, 1207. His family name has been variously given as Martorello, Martillio, and Re- tortillo. Comynes, who gives all the details of his stay in France, constantly calls him Frère Robert. This may have been his first name, to which that of Francis was added at a later date. He was devoted by his parents to St. Francis of Assisi, to whose intercession they ascribed his birth, after their marriage had been long childless. He was early placed in an unreformed convent of Franciscans in Calabria, where he surpassed all the monks in the strict observance of the rule. In 1248 he returned to Paula, resigned his right of inheritance, and retired to a grotto to lead the life of a hermit. He was hardly 20 years old when he found many followers, who built themselves cells near his grotto. He received from the archbishop of Cosenza permission to build a church and convent, which were completed in 1496. From this year dates the establishment of the order of Minims, which adopted the name of hermits of St. Francis. To the usual three monastic vows (poverty, chastity, obedience) St. Francis added as a fourth perpetual abstinence, not only from meat, but also from eggs and milk, except in sickness. He himself was still more ascetic. He slept on the bare ground, took no food before sunset, often contented himself with bread and water, and sometimes ate only every other day. The fame of miracles reported of him induced Pope Paul II. in 1469 to send his chamberlain to investigate the facts. The report was very favorable. Pope Sixtus IV. confirmed the new order, appointed the founder superior general, and permitted him to establish as many convents as he could. King Louis XI. of France, attacked by a fatal disease, sent for him in the hope of being cured; but Francis waited until, in 1469, the pope ordered him to go. He met the sick king in Tours, and exhorted him to leave the hospital and fast, and to revere the will of God, and to prepare himself for death. The successor of Louis, Charles VIII., retained the saint in France, and consulted him in cases of conscience as well as in state affairs, and built for him two convents in France and one in Rome. Francis was canonized by Leo X. in 1619.

Francis de Sales, a saint and bishop of the Roman Catholic church, born at the château de Sales, near Annecy, Savoy, Aug. 21, 1567, died in Lyons, Dec. 28, 1622. Both his parents were of noble birth. Francis, their eldest son, was sent successively to the college of Annecy, to the Jesuits' school in Paris, and to Padua, where he studied law, and at the age of 20 received the degree of doctor of laws. His inclination, nevertheless, was toward the ecclesiastical life. He refused repeatedly the offered dignity of senator, and finally obtained his father's permission to accept the place of proctor in the cathedral of Geneva. On being ordained deacon, he gave the first proofs of his eloquence as a preacher. His earnest manner, and the spiritual elevation and beauty of his thought, gave him a powerful hold on his audiences. He was raised to the priesthood in 1588, and immediately gave himself up to the impulses of his zeal. He went on foot through the neighboring villages, visited the prisons, and became everywhere known as the friend of the sick and the poor. Accompanied by his cousin, Louis de Sales, he went on a mission among the Protestants of the province of Chablais. All sorts of difficulties were thrown in his way, and nearly four years passed by without any considerable impression upon the masses. At last, however, conversations multiplied; new missionaries came to his aid, and in 1596 the Catholic religion was publicly restored and the reformed faith was suppressed throughout the province. Repeated conferences were held with distinguished Protestant leaders, and the brilliant success of Francis in the argument with La Faye led the pope to select him to deal with Theodore Beza; but in this case he was not able to report a version. In 1599 he was chosen coadjutor to
the bishop of Geneva, whose death in 1602
left to Francis the full charge of the diocese.
His episcopal life was characterized by the
same zeal, vigor, and devotion which had
marked his missionary career. He went first
to Paris, where he preached before Henry IV.
in the chapel of the Louvre, and the most
tempting offers of wealth and position were
made to retain him in France. But he pre-
ferred to return, and after assigning the cardinal
de Bérulle in the establishment of the Carme-
lite order and the congregation of the Oratory,
he went back to Switzerland. He established
new and stricter rules, not only for the clergy
and laity of his diocese, but for his own per-
sonal conduct. He renounced all luxuries,
multiplied fasts, discouraged lawsuits, and re-
formed the lax discipline of the monasteries.
His fame as a preacher led various cities to
solicit his aid in the services of the Lenten
season. He was more than once chosen, from
his moderate and peaceable temper, to reconcile
dissenting parties and orders in the church.
A still wider renown was given to his name
by the publication (in 1608) of L’Introduction
da la vie dévote. It was translated into many
languages, and in less than 50 years 40 editions
of it were published. Francis was far from
undervaluing monastic institutions. He not
only established convents of existing orders,
but in conjunction with the widowed baroness
de Chantal, founded the order of the Visit-
ation. Having become acquainted with that
lady during a visit to Paris in 1604, he com-
municated to her his plan of a new order of
nuns. In 1610, at Annecy, he gave the habit
of the new society to her and two other ladies.
In 1616 he published his Traité de l’amour
de Dieu, a lit sequel to his ‘Introduction.’
The appointment of a younger brother as as-
sistant bishop enabled him to give himself
more fully to the work of conversion. The
famous Calvinistic leader Ledigüitères became
one of his converts. In 1619 he visited Paris
as one of the embassy sent to secure the hand
of the princess Christine for the young prince
of Piedmont. His preaching in this visit re-
vived the impression which it had made in
the previous reign. On his return to his own
diocese he applied himself more resolutely than
ever to the ministration of alms, the suppres-
sion of scandals, and exercises of personal
discipline. In 1622 he accompanied Louis XIII.
of France from Avignon to Lyons, where on
Christmas day, after preaching, he was attacked
with apoplexy, and died. The works of St.
Francis have been often published. The best
editions are those of Louis Vivès (14 vols. 8vo,
Paris, 1857–9), and that of Périsse frères (6
vols. 8vo, Lyons, 1865 and 1864).

FRANCISCANS, Gray Friars, or Minorites (Lat.
Fratres Minorum), a religious order in the Roman
Catholic church, founded in 1209 by St. Francis
of Assisi. When the number of his disciples
had increased to ten, he gave them in 1210 a
rule, in which strict poverty and a union of the
active and contemplative life are the principal
points. The order was orally confirmed by
Innocent III. in 1210, and again in 1215, and
spread with such rapidity that 5,000 brethren
were assembled at the general chapter in 1219.
In 1223 Honorius III. by a bull confirmed
the order as the first among the mendicant orders,
gave them the right of collecting alms, con-
firmed to the church of Portincula the cele-
brated indulgence which was afterward extend-
ed to all the churches of the Franciscans, and
granted them several other privileges. The
vow of poverty made the Franciscans favorites
with all classes of the people, and thus secured
them large numbers of novices. Forty-two
years after the death of the founder the num-ber of Franciscans was estimated at about 200,-
000, with 8,000 convents in 23 provinces. At
the head of each convent was a guardian; the
Guardians of a province chose a provincial,
who was assisted by definitores; the general
assembly of all the provincials (general chap-
ter) elected a general, and likewise definitores.
The simplicity of the rule left room for the
greatest variety of opinions. This showed it-
self during the lifetime of the founder, one
party wishing to have the vow of poverty mitigated, the other strenuously opposing any
such change. The strife continued from 1219,
when Elias of Cortona, the first leader of the
milder party, was made by St. Francis himself
viceger general of the order, till 1517, when Leo
X. divided them into two separate organiza-
tions. At the election of almost every new gen-
eral we find the two parties in competition, the
popes themselves sometimes siding with the
one, sometimes with the other. The milder
party, when in a minority, submitted; but the
rigorous party, when prevented from upholding
the whole rule of St. Francis, preferred to
form separate branches. In several cases they
went so far as to appeal from a decision of the
pope to a general council. As early as 1236,
when Elias of Cortona, after having been once
expelled, was re-elected general of the order,
Cassarius of Spire left it, followed by 72 others,
called after him the Cassarines or Cassarians;
but they were reconciled with their brethren
in 1256, at the restoration of a stricter observ-
bance by St. Bonaventura. The lax govern-
ment of the general Matteo da Aquas Spartas
caused in 1394 the foundation of the Minorite Cles-
tines, who after the death of their protector,
Celestine V., were in 1397 condemned as here-
tics and suppressed. Some of them who fled
to France established in 1388 the Minorites
of Narbonne and the Spirituals, who were like-
wise condemned in 1518. Another offshoot of
Celestines, the Minorite Clarences, founded in
1502 by Angelo di Cortona, was tolerated till
1506, when they united with the Observants.
Much more successful than these secessions
was the undertaking of Paolotto di Foligno
in 1668 to restore the strict observance of the
rule. His followers were called Observants,
and those who adhered to the milder rule
Conventuals. Henceforth these two names distinguished the two great parties. By the 16th century the number of new congregations had thrown the order into great confusion. Leo X. made an attempt in 1517 to reunite them, but succeeded only with the various congregations of Observants, on whom he therefore conferred the right of electing the general (minister generalis), while the Conventuals could only elect a magister general (magister generalis), whose election had to be confirmed by the general. From that time the quarrels between the Observants and Conventuals were less violent. The Conventuals made several attempts to regain the ascendancy, but in 1681 Urban VIII. commanded them to abandon their claims for ever. Notwithstanding the desire of the pope that no further separations should occur, several congregations arose, mostly for the purpose of still surpassing the strict observance of the Observants. These communities were suspected of the stricter observance, and, though forming separate provinces from the main body of the regular Observants, were always under the same general. They were called Alcantarines in Spain from St. Peter of Alcantara, Reformed in Italy and Germany, and Recollects in France, England, Ireland, Belgium, and Holland. The Capuchins, originally a congregation of reformed Franciscans, became afterward an independent order. (See Capuchins.)

The number of Franciscans has been greatly reduced by political revolutions since 1789. In the 18th century the order, including the Capuchins, still counted nearly 200,000 members with about 26,000 convents; in 1848 the number of the Observants, the most numerous branch, was estimated at about 50,000. Since 1848 the number of the order has been gradually increasing in the British empire, the United States, Belgium, Holland, France, and Germany; in the Italian and Spanish peninsulas they have now completely ceased to exist as religious corporations; while in Mexico a law has recently been passed abolishing all religious orders, secularizing their members, and sequestrating their property. In Asia they have a province in Palestine, whose members are the guardians of the holy sepulchre and other Christian sanctuaries, and are celebrated for their hospitality to pilgrims and travellers. In China they have charge of two apostolic vicariates. The Franciscans were the earliest missionaries to America, having come over with Columbus on his second voyage in 1493. Their first formal establishment in the new world was in 1602, when 13 friars, with a prior named Antonio de Espinal, accompanied Orlando to Santo Domingo. They went to Florida with Pamfilo de Narvaez in 1528, one of their number, Juan Juarez, bearing the rank of bishop; but of this band of missionaries we know little; they seem to have effected no establishment, and all perished. An Italian Franciscan, Mark of Nice, penetrated into New Mexico and California in 1539, and gave the name San Francisco to the country which he visited. The exaggerated reports of what he had seen and heard led adventurers to those regions, and with them came a number of Franciscans, some of whom remained behind after the return of the expedition and were martyred. Father Andres de Olmos founded a successful mission in Texas in 1644. Subsequently priests of this order established themselves permanently in Florida, California, Mexico, and other parts of the south and west, and were among the first to plant Christianity in Canada, and in what are now the northern and northwestern states of the Union. Their labors in Canada date from 1616, when four Recollects (three priests and one lay brother) came over from France and took charge of the Huron, Algonquin, and Montagnais missions, which they and their brethren conducted alone until the Jesuits came to aid them in 1625. The Recollects figured largely in the missionary history of Canada for many years. The celebrated explorer Hennepin was a Franciscan missionary. The foundations of the order in California, notwithstanding the numbers who were put to death by the Indians, still remain, and have recently been reinforced by ascensions from Europe. They are numerous in all parts of Central and South America. Their present houses in the United States, except those in California, have been founded very recently, chiefly by Italians and Germans. In 1873 the following establishments existed in the United States, having altogether 80 priests: two convents in New York city; a college and convent in Alleghany, N. Y.; a convent in Buffalo; a college and convent in Teutopolis, III.; besides convents in Winsted, Conn., Cleveland, Detroit, Cincinnati, St. Louis, Louisville, Nashville, Oldenburg, Ind., and Quincy, III. The Conventuals have convents in Austria, Bavaria, Switzerland, Malta, Poland, and Turkey.—We find Franciscans soon after the death of St. Francis as professors of theology at the university of Paris, which in 1244 was commanded by Pope Innocent IV. to admit Franciscans and Dominicans to academic dignities. In union with the Dominicans they strive for several centuries to extend in the theological schools the influence of the monastic orders at the expense of the secular clergy. With the Dominicans they maintained various philosophical and theological controversies, the Franciscans being realists, anti-Augustinians, and defenders of the immaculate conception, while the Dominicans are nominalists and Augustinians, and were formerly opponents of the immaculate conception. Among the celebrated men produced by the order are Anthony of Padua, Bonaventure, Alexander of Hales, Duns Scotus, Roger Bacon, Nicholas of Myra, Oecum, Cardinal Ximenes, and the popes Nicholas IV., Alexander V., Sixtus IV., Sixtus V., and Clement XIV. In the first period of their history they had a considerable number of mystical
FRANKE. August Hermann, a German preacher, founder of the orphan house in Halle, born in Lübeck, March 28, 1663, died June 8, 1727. He studied at the universities of Erfurt, Kiel, Gotha, and Leipsic, and founded in Leipsic a school for the interpretation of the Scriptures, which attracted a great number of students. Accused of pietism, he was obliged to renounce this employment in 1691, and passed to Halle, where he taught the Greek and oriental languages in the university, and also became pastor of the church of St. George. Here he founded a charitable institution for the education of poor children and orphans, which soon became one of the most considerable in Germany. A chemist, whom he had visited on his deathbed, bequeathed to him the recipe for compounding certain medicines, which afterward yielded an annual income of more than $20,000, and made the institution independent. It consists of an orphan asylum, a pedagogium, a Latin school, a German school, and a printing press for issuing cheap copies of the Bible. It now contains 800 inmates.

FRANÇOIS. I. Jean Charles, a French engraver, born in Nancy in 1717, died in Paris in 1769. He was among the first to introduce engravings representing crayon and chalk drawings, and was pensioned by Louis XV., who employed him extensively. His best known works represent that king and his queen, Bayle, Erasmus, Locke, and Malebranche. II. Charles Remy Jules, a French engraver, born in Paris, Dec. 24, 1809. He early produced, after the manner of his master Henrique Dupont, admirable engravings of pictures by Vandyke and Raphael, and subsequently was exclusively employed in reproducing the paintings of Delacroix. He has resided in Brussels since 1858.

—His brother Augustus, born in Paris in 1811, excels in the same branch of art.

FRANCOIN, a gallinaceous bird of the grouse family, subfamily perdicinae or partridges, and genus francoinus (Steph.). There are about 30 species found in the warm parts of the eastern hemisphere, especially in Africa; some prefer open plains, where they roost in trees, and others woody places; when alarmed, they conceal themselves in the brushwood, or run with considerable speed, taking wing only when hard pressed; their food consists of bulbous roots, grains, and insects, and they feed in early morning and at evening. The bill is longer than in the common partridge; the wings are moderate and rounded, the third, fourth, and fifth quills the longest; the tarsi are strong and spurred; the feet four-toed. The francoin of Europe (F. vulgaris, Steph.), in the male, has the plumage of a general yellowish brown color, each feather with a dark centre; the ear coverts white; circle round the eyes, cheeks, and sides of head, and the throat, deep black, below which is a broad chestnut collar extending around the neck; the rump and tail white barred with black, the outer feather of the latter entirely black; breast and lower parts...
black; sides blotched with black and white; under tail covers chestnut; bill black. The female is without the black markings and chestnut collar, and her bill is brown. This is the only species indigenous in Europe, where it is found in the southern parts; it also occurs in northern Africa and the greater part of Asia. The flesh is delicate, and much esteemed in India. According to Gould, this genus seems to form a connecting link between the brilliant pheasants and tragopans of the East and the sober-colored partridges of Europe; to the splendid colors of the former it unites the form and habits of the latter.

**Franconia** (Ger. Franken, or Frankenland, land of the Franks), an old duchy and afterward a circle of the German empire. In the 6th century it formed a part of the Thuringian kingdom, on its dismemberment fell to the Franks, and on the breaking up of the Carolingian empire to Germany. In the latter empire it rose to foremost importance, and five Franconian dukes were elected emperors (Conrad I. and II., Henry III., IV., and V.). It then embraced extensive lands, chiefly between the Rhine and the Bohemian mountains, but subsequently was weakened by divisions, was broken up into small territories, and disappeared as a duchy. In 1512 Maximilian I. erected a part of it into a circle of the empire, including the ecclesiastical dominions of Würzburg, Bamberg, and Eichstätt, the principalities of Baireuth and Anspach, and the imperial cities of Nuremberg, Schweinfurt, Rothenburg, Weissenburg, and Windheim. During and after the Napoleonic wars it was partitioned among Würtemberg, Baden, Hesse-Cassel, Saxony, and Bavaria, the last named state receiving the largest portion, and still retaining the name in the three districts of Upper, Middle, and Lower Franconia.—**Upper Franconia** (Ger. Oberfranken) nearly corresponds with the former circle of Upper Main, and lies in the N. E. part of the kingdom, bordering on Bohemia and Saxony; area, 2,702 sq. m.; pop. in 1872, 540,983. It is a mountain region, occupied in the east by a portion of the Fichtelgebirge, and rich in gypseum, marble, gold, silver, lead, and iron. Agriculture and cattle raising are carried on with success. Capital, Baireuth.—**Middle Franconia** (Ger. Mittelfranken) comprises that portion of territory anciently known as the circle of Rezat, and includes the former margraviate of Anspach, the bishopric of Eichstätt, and part of Baireuth; area, 2,918 sq. m.; pop. in 1672, 583,417. It touches Württemberg on the west. It is intersected by branches of the Franconian Jura, and a small portion of the mountainous district is too rough for tillage, but three fourths of the circle is in a high state of cultivation, producing the grape, tobacco, pasturage, and hops. There are few minerals, but important manufactures are carried on in most of the towns. Capital, Nuremberg.—**Lower Franconia** (Ger. Unterfranken), nearly identical with the former circle of Lower Main, comprises the old bishopric of Würzburg and part of that of Fulda, with several smaller territories; area, 3,842 sq. m.; pop. in 1872, 588,122. It is bounded N. E. by the Saxe duchies, E. by Upper and Middle Franconia, S. by Württemberg and Baden, W. by Darmstadt, and N. W. by Prussia. The N. part is traversed by the Rhône mountains, and the S. W. by the Spessart. There are several extensive forests, but the plains and river bottoms are well cultivated, producing grain, potatoes, hops, and the grape. Capital, Würzburg.

**Franconia Notch.** See White Mountains.

**Franeker,** a town of the Netherlands, in the province of Friesland, on the Trekschuyten canal, between Harlingen and Leeuwarden, 10 m. W. of the latter; pop. in 1867, 6,298. In 1685 a university was established here, which long occupied a high position among the learned institutions of Europe, and counted among its professors such men as Schultens, Humsterhuis, and Valckenera. Napoleon I. abolished it in 1811; in 1816 an atheism was established in its place, which was subsequently changed into a gymnasium, with which a physiological cabinet, a botanical garden, &c., are connected. The university buildings have been appropriated for an insane asylum.

**Frank.** I. Johann Peter, a German physician, born at Rothenburg, Baden, March 19, 1745, died in Vienna, April 24, 1821. He first studied theology, then medicine, taking his degree at Heidelberg in 1766, and after practising at Bruchsal and elsewhere, became physician to the prince-bishop of Spire. Acquiring prominence as a lecturer and in the training of mistresses, he was appointed professor of physiology and medical police at Göttingen in 1784; but on account of his health he went to Italy the next year, succeeded Tissot in the chair of clinics at Pavia, was appointed sanitary inspector general of Lombardy, and introduced reforms in medical instruction and practice. The rank of councillor was conferred on him by the king of England, and later by the emperor of Austria, who employed him in 1795 for the regulation of the sanitary service of the army.
and as director general of the principal hospital of Vienna. In 1804 he went to Wilna as professor of clinical medicine, and afterward first medical adviser of the czar and professor at the medical and surgical academy of St. Petersburg, and returned to Vienna in 1808. Napoleon consulted him in respect to Marshal Lannes, and offered him a brilliant post in France; but he remained in Germany. His advice was sought in 1814 for Maria Louisa. Among his principal works are: *System einer vollständigen medicinischen Polizei* (2 vols., including supplement, 1784–1827), and the unfinished *Epitome de Curandiis Hominum Morbis* (6 parts, 1793–1800; 7th part, by Eyeler, 1831). His autobiography appeared in 1821, and his *Opuscula Posthuma* were published in 1824 by his son. *II. Joseph,* a German physician, son of the preceding, born at Rastadt, Dec. 28, 1771, died at Como, Dec. 18, 1842. He was assistant of his father in Pavia and Vienna, and became in 1806 professor of pathology at Wiirttemburg, and in 1816 on account of a disease of the eyes. He was one of the most influential advocates of the Brunonian system of physie, and published *Grundriss der Pathologie nach den Gesetzen der Erregungstheorie* (Vienna, 1808). His *Phraeae Medicis Universa Proecepta* (Leipsic, 2d ed., 1836–43) has been translated into German (9 vols., 1835–43) and French.

FRANKEL, Zacharias, a German rabbi and author, born in Prague, Oct. 18, 1801, died Feb. 18, 1875. He studied in Pothits, became rabbi at Leitmeritz in 1882, and chief rabbi for Dresden and Leipsic in 1886. He contributed greatly to improve the civil status of the Jews in Saxony, and indirectly in other parts of Germany. In 1854 he became director of the Jewish seminary at Breslau, which was opened in that year, and which has become through his influence a celebrated seat of Hebrew learning. His principal writings are: *Die Eidesleistung der Juden* (Dresden, 1840), which led to a liberal modification of the oath required from Jews in Saxony, Prussia, and other German courts of law; *Bedeutungen in Mischnam* (Leipsic, 1859, with additions in 1865); *Grundlinien des mosaiis-chalmaidischen B先前* (Breslau, 1860); *Entwurf einer Geschichte der Literatur der nachttalmudischen Prophecien* (1865); and *Einleitung in den Jerusalemischen Talmud* (1870). He was also editor of the *Monatschrift für Geschichte und Wissenschaft des Judenthums*, begun in 1851.

FRANKENHAUSEN, a town of Germany, capital of one of the two sections of the principality of Schwarzburg-Sondershausen, on a branch of the Wupper, 10 m. E. of Sondershausen; pop. in 1871, about 4,900. It has salt works which furnish about 20,000 tons annually, and several manufactures.

FRANKENSTEIN, a town of Prussian Silesia, capital of a circle of the same name, 86 m. S. W. of Breslau; pop. in 1871, 7,926. It has manufactures of stockings, saltpetre, and aquafortis, and a trade in flax, yarn, and grain.

FRANKFORT, a city of Franklin co., Kentucky, capital of the county and state, situated on both banks of the Kentucky river, here 250 yards wide and spanned by two bridges, 62 m. above its mouth, and on the Louisville, Cincinnati, and Lexington railroad, 24 m. W. N. W. of Lexington, and 45 m. E. of Louisville; pop. in 1850, 3,808; in 1860, 3,703; in 1870, 5,396, of whom 2,385 were colored. It is built on a high plain lying between the river and a bluff 160 or 200 ft. high, and is regularly laid out, with neat-looking houses. The portion on the S. side is called South Frankfort. The surrounding country is remarkable for its picturesque scenery. On one of the hills which overlook the city is a handsome cemetery, in which are buried several of the governors and other state officers, and also the remains of Daniel Boone, the pioneer in the settlement of Kentucky. The state monument to those who fell in the war of 1812 and the Mexican war is of white Italian marble. The principal public buildings are the state house, built in 1825 of a light-colored marble quarried from the hills near by, with a handsome Ionic portico; a new structure known as the fire-proof public offices, adapted for the wing of a new capitol; the state institution for the training of feeble-minded children; the state penitentiary, with 650 convicts; a county court house, and a handsome public school building. The river is navigable by means of locks and dams for steamboats 40 m. above the city, and for flat boats 100 m. higher. Frankfort has an important trade in poplar, cherry, walnut, ash, and oak lumber, the logs being rafted down the river and shipped by rail to the east. There are two flouring mills, a cotton mill, six saw mills, five distilleries, three banks with an aggregate capital of $1,725,000, a tri-weekly and two weekly newspapers, and six churches. The city was laid out in 1787, and became the seat of government in 1792. It was occupied by the Confederates for about a month in 1862.

FRANKFORT-ON-THE-MAIN (Ger. Frankfurt am Main), a city of Germany, in the Prussian province of Hesse-Nassau, formerly a free city and the seat of the Germanic diet, situated in a fertile valley on the right bank of the river Main, 20 m. above its confluence with the Rhine, near the Taunus mountains, 285 m. S. W. of Berlin; pop. in 1871, 90,922, of whom about 12,000 were Roman Catholics, 7,500 Jews, and the remainder Protestants. The finest street is the Zeil, united in 1856 with the Neue Kräme, and also through the new Liebfrauenbrücke with one of the principal squares, the Liebfrauenberg. The other remarkable public squares are the Rossmarkt, with a monument in honor of the art of printing inaugurated in 1857, the Goethe square, with Schwantaler's statue of Goethe, who was born here, the Schiller square, with Schiller's statue, and the Römerberg. In the latter is the Römer, or council house, where the German emperors were elected and entertained in
the Kaisersaal, the walls of which are covered with portraits of the emperors. The golden bull of Charles IV., which regulated the election of the emperors, is preserved in the building. The founder of the house of Rothschild and his children were born in the Judenstrasse, but almost the whole W. part of this street has since been pulled down. The streets which command most traffic are the Fahrgasse and Schürgasse, and among the fine streets are the avenues near the city gates and the Schöne Aussicht along the quay. Frankfort is surrounded by a belt of promenades (Anlagen) connecting the gates of the city, which are among the finest pleasure grounds in Europe. Delightful villages, as Bockenheim, Bornheim, Ober- rad, &c., are within a short distance of the city, as well as several watering places, such as Homburg, Soden, and Wiesbaden. There are several private and public picture galleries. The Städel museum, so called after its founder, who bequeathed to it $400,000 besides valuable art collections, contains a library and a school of art. Bethmann’s garden contains Dannecker’s “Ariadne” and his colossal bust of Schiller. In the public library are about 100,000 volumes and many important MSS. The museum of the Senckenberg society of naturalists contains among its principal collections that of Dr. Rüppel, the Abyssinian traveller. Besides a gymnasium, there are many public and private schools. The city is divided into 90 alms districts for the relief of the poor, and there are more than 80 charitable institutions and hospitals. There are four Catholic, six Lutheran, and two Reformed churches, four Lutheran chapels, an English chapel, and two new synagogues. The principal of the Catholic churches is the cathedral or church of St. Bartholomew, a Gothic structure, in which from 1711 the German emperors were crowned. The tower of the church had in 1512 attained 287 ft., when the work was discontinued. The interior of the tower was destroyed by fire in 1867, but by the aid of the Prussian government it is to be restored and to be finished according to the original plan. The most celebrated Lutheran churches are the Katharinen Kirche, where the first Lutheran sermon was preached in 1522, and that of St. Paul (formerly Barfüsserkirche), where the German parliament was held in 1848 and 1849. The theatre of Frankfort is among the best in Germany. The post office on the Zeil is a stately building, as well as the exchange. The once famous fairs have declined in importance since the opening of railways, and while the quantity of goods brought to them in 1842 amounted to 102,000 quintals, it was only 84,000 quintals in 1870. The horse fairs, however, are still active. Frankfort continues to be a good market for wine, cider, beer, breadstuffs, and meats. The amount of duties paid on imports during the year ending Sept. 30, 1873, was about $775,000. Many diamond dealers having removed from Paris to Frankfort during the Franco-German war, the export of jewelry has increased from only about $6,000 in previous years to upward of $200,000 in 1871. The export of human hair and hair work has also increased from about $400 to over $70,000, and nearly half of it goes to the United States. The total exports to the United States from Oct. 1, 1871, to Oct. 1, 1872, amounted to $1,443,925, being chiefly leather, hides, skins, hatter’s fur, jewelry and precious stones, and linen, woolen, and cotton goods. There are many banking houses, foremost among which are those of Rothschild and Bethmann. The number of houses, chiefly Jewish, engaged in the stock and exchange business amounts to at least 200. The magnitude of this business is due partly to the great wealth of the city, and partly to its geographical situation, which makes it a convenient medium of exchange; and it is the most important continental market for American securities. The chief local manufactures are carpets, table covers, jewelry, playing cards, oilcloth, tobacco, snuff, and Frankfort black. The extensive manufactories at Offenbach and in other neighboring localities are mainly conducted by Frankfort houses. Since the annexation of the city to Prussia, a great impulse has been given to its industry; and in particular, extensive type foundries and manufactories of sewing
machines and chemicals have been established. The suburb of Sachsenhausen, on the left bank of the Main, and united to Frankfort by a fine stone bridge, is an important market for fruits and vegetables. Leipsic has taken from Frankfort the supremacy which it once possessed in the book trade, but there are 40 booksellers in the city, and several important publishing and engraving establishments. There are about 20 daily and periodical publications. Seven railways proceed from Frankfort, two only for a short distance. The trade on the Main was in 1870 carried on by 728 vessels.—Frankfort is mentioned in 794, under the name of Palatium Francovenford, as the place selected by Charlemagne for the seat of an imperial convention and religious council. The independence of the city dates to some extent from the 13th century. Many privileges were conferred upon it in the next century, and it acquired still greater importance by the elections and subsequently by the coronations of the German emperors which took place here. Frankfort was captured by the French in 1759, 1792, and 1796. In 1806 it became the residence of the prince-primate of the confederation of the Rhine, and in 1810, under the same, the capital of a grand duchy, with an area of about 2,000 sq. m., and a population of 300,000. In 1815 it was recognized as one of the free cities of Germany, and in 1816 as the seat of the Germanic diet. From 1848 to 1856 it was governed by a senate of 21 members elected for life, who annually chose a senior and a junior burgomaster, and a legislative assembly of 88 members, elected from all classes and religious denominations. The financial affairs were mainly controlled by a standing committee of 51 citizens, who were elected for life. Changes in the constitution could not be made without the consent of the whole body of citizens. The city had together with the other three free cities the 17th vote in the narrower council of the diet, and was entitled to a full vote in the plenum. On April 3, 1838, the city was the theatre of a political outbreak, for which many students were arrested. In 1838 it joined the Zollverein. In 1848 and 1849 it derived political importance from the German parliament held there. A riot broke out during the excitement about the Schleswig-Holstein war (Sept. 19, 1848), in which the Prussian major general Anerswald and Prince Felix Lichnowsky were killed by the mob. In the German war of 1866 Frankfort sided with Austria, and was on that account annexed to Prussia. On May 10, 1871, a treaty of peace between Germany and France was concluded here.

Frankfort-on-the-Oder, a city of Brandenburg, Prussia, capital of a district of the same name, on the left bank of the river Oder, 45 m. E. S. E. of Berlin; pop. in 1871, 48,211. The prosperity of the town is due to its situation on the railway between Berlin and Breslau, to its navigable river, which is connected by canals with the Vistula and the Elbe, and to its three annual fairs, at which large quantities of cotton, woolen, silk, and other goods are sold, though to a less extent than formerly. The city has three suburbs, fine streets, public squares, and gardens, a theatre, many charitable institutions, a Roman Catholic church, a synagogue, and several Protestant churches. The university was removed to Breslau in 1810; a gymnasium still remains. Beyond the wooden bridge which connects the old town on the left bank of the Oder with the suburb on the right bank is a monument to Prince Leopold of Brunswick, who was drowned here in 1785, while attempting to rescue a family during an inundation. The battle of Kunersdorf was fought within 3 m. of the town in 1759, and there is in Frankfort a monument of the poet Kleist, who died from a wound received in this battle.

**Frankincense**, a designation of resinous substances which when burned give out an agreeable odor, and are used in the ceremonies of the Roman Catholic church. The common frankincense of commerce, also called gum thus, is an exudation of the Norway spruce (abies excelsa). The turpentine from our southern pine forests, also called white turpentine, when old and hard, is often sold as a substitute for the European.—The true frankincense of the ancients is the fragrant gum resin known in medicine as olibanum, the product of the tree Boswellia serrata, which grows among the mountains of central India and upon the Coromandel coast. It is imported from Calcutta in the form of roundish lumps or tears, which have a pale yellow color, are somewhat translucent, and are covered with a whitish powder produced by friction. It has an agreeable balsamic odor, but its taste is acid and bitter; it softens when chewed, adheres to the teeth, and whitens the saliva. It readily inflames, and imparts in burning a fragrant odor. This is the property which rendered it so highly

![](https://via.placeholder.com/150)

**Olibanum (Boswellia serrata).**
esteeemed with the ancients, by whom it was intro-
duced as one of the ingredients in their in-
cense, which was burned (incensum), according to
Maimonides, to conceal the smell arising
from the slaughtered animals of the sacrifices.
According to others, the smoke of its burning
was regarded as in itself an acceptable offering,
because it was symbolical of prayer and of
inferior worship. Olibanum is but imperfectly
soluble in water. Alcohol takes up about three
fourths of it, forming a transparent solution.
Braconnier obtained 8 parts of volatile oil, 56 of
resin, 30 of gum, and 5 of insoluble glutinous
matter; loss 0.4. The article finds but little use
in medicine except for fumigations, and rarely
as an ingredient of plasters.—Another variety of
frankincense, the source of which is not well
ascertained, is brought from Arabia.

FRANKL, Ludwig August, a German poet of
Jewish parentage, born at Breslau, Bohemia, Feb.
8, 1810. He received a diploma as physi-
cian in Italy in 1837, but devoted himself to
poetry and journalism, was secretary and archi-
vist of the Hebrew community in Vienna, and
became in 1851 professor of aesthetics. In
1856 he founded a school in Jerusalem, and de-
scribed the condition of the Jews in the East
in Nach Jerusalem (Leipsic, 1856) and Aus
Aegypten (Vienna, 1860), having sketched that
of his Viennese co-religionists in a previous
work, Zur Geschichte der Juden in Wien (2
vols., 1847–53). Of his little poem Die Uni-
versität, 500,000 copies were sold in Austria in
1848, owing to its being the first publication
issued after the abolition of the censorship. His
anonymous Magyarskönig made him popular
among the Hungarians, the work having been
publicly destroyed by the Austrian authorities
in Pesth (1850). His Ahnentafel (3d ed., Leip-
sic, 1864), and his Libanon (4th ed., Vienna,
1867), include poems suggested by his travels
in the East. His Heldentum und Liederbuch (2d
ed., Prague, 1863) contains his shorter pieces.
His finest productions are his epic poems, Cri-
toforo Colombo (Stuttgart, 1836), Don Juan
da' Austria (Leipsic, 1846), and Der Primator
(3d ed., 1864). He has also translated several
of Moore's and Byron's poems and Servian bal-
lads, the latter under the title of Gute.

FRANKLIN, the name of counties in 22 of
the United States. 1. A. W. county of Maine,
bordering on Canada, and drained by Dead
and Sandy rivers, branches of the Kennebec;
area, 1,600 sq. m.; pop. in 1870, 35,886. It
has no navigable streams, but there are several
mill creeks and small ponds. The Androsoc-
gin railroad terminates at Farmington. The
surface is undulating, with a few mountainous
elevations, the chief of which are Mt. Blue, Mt.
Abraham, and Saddleback. The chief produc-
tions in 1870 were 25,407 bushels of
wheat, 64,287 of Indian corn, 161,032 of oats,
325,518 of potatoes, 71,211 tons of hay, 101,007
lbs. of cheese, 562,470 of butter, and 287,369
of wool. There were 4,096 horses, 7,108 milch
cows, 13,901 other cattle, 97,092 sheep, and
1,604 swine; 5 manufactories of agricultural
implements, 6 of boots and shoes, 3 of boxes,
30 of carriages and wagons, 3 of sashes, doors,
and blinds, 1 of shoe pegs, 4 of wood turned
and carved, 1 of woollen goods, 12 saw mills,
5 tanneries, and 4 currying establishments.
Capital, Farmington. II. A N. W. county of
Vermont, bordering on Canada and Lake
Champlain, and drained by Missisquoi and La-
molle rivers; area, 80 sq. m.; pop. in 1870,
30,291. The surface is irregular, and the soil
fertile. There are marble quarries and iron
mines. The commerce of the county is carried
on through Lake Champlain, which is naviga-
ble here for vessels of 90 tons, and over the
Vermont Central railroad. The chief produc-
tions in 1870 were 42,481 bushels of wheat,
110,826 of Indian corn, 800,587 of oats, 335,-
129 of potatoes, 104,075 tons of hay, 510,226
lbs. of cheese, 2,964,820 of butter, 92,178 of
wool, and 890,344 of maple sugar. There were
6,055 horses, 27,624 milch cows, 12,012
other cattle, 20,054 sheep, and 4,564 swine;
19 manufactories of carriages and wagons, 3
of agricultural implements, 1 of cars, 5 of
cheese, 1 of confectionery, 4 of barrels and
casks, 2 of drugs and chemicals, 1 of iron
castings, 8 of lime, 1 of engines and boilers,
11 of saddlery and harness, 6 of sashes, doors,
and blinds, 11 of tin, copper, and sheet-iron
ware, 5 of woolen goods, 16 tanneries, 15
currying establishments, 14 saw mills, and 3
flour mills. Capital, St. Albans. III. A N.
W. county of Massachusetts, bordering on Ver-
mont and New Hampshire, intersected by the
Connecticut and drained by Miller's and Deer-
field rivers; area about 650 sq. m.; pop. in
1870, 32,685. The surface is hilly and in some
places mountainous, and the soil is good. The
principal channels of transportation are the
Connecticut River railroad, the Vermont and
Massachusetts, the New London Northern, the
Rutland division of the Vermont Central, and
the Troy and Greenfield railroads. The Con-
necticut river has been made navigable here for
boats. The chief productions in 1870 were
9,966 bushels of wheat, 33,327 of rye, 159,558
of Indian corn, 76,568 of oats, 8,980 of bar-
ley, 221,663 of potatoes, 63,486 tons of hay,
996,545 lbs. of butter, 70,882 of wool, 2,475,-
250 of tobacco, and 137,265 of maple sugar.
There were 4,245 horses, 8,779 milch cows,
14,850 other cattle, 15,965 sheep, and 8,652
swine; 20 flour and 46 saw mills, 7 tanneries,
4 currying establishments, 6 manufactories
of agricultural implements, 2 of bricks, 2 of
children's carriages and sleds, 12 of wagons,
4 of cotton goods, 2 of cutlery, 13 of fur-
ture, 5 of hardware, 4 of iron castings, 3 of
machinery, 1 of pianos, 1 of printing paper,
7 of pocketbooks, 1 of sewing machines, 8 of
wooden ware, and 3 of woolen goods. Cap-
ital, Greenfield. IV. A N. E. county of New
York, bordering on Canada, drained by Sara-
nac, Chateaugay, St. Regis, and Raquette rivers;
area, 1,784 sq. m.; pop. in 1870, 30,271. The
St. Lawrence touches its N. W. corner. It has an uneven surface, diversified by a great number of small lakes. The S. E. portion is occupied by the Adirondack mountains, the highest peak of which in this county is Mt. Seward, which, according to the survey of 1872, is 4,411 ft. high. Bog iron is found in considerable quantities. Much of the soil consists of rich sandy loam. The Ogdenburgh and Lake Champain railroad passes through the county. The chief productions in 1870 were 85,049 bushels of wheat, 20,249 of rye, 69,008 of Indian corn, 365,540 of oats, 15,521 of barley, 47,548 of buckwheat, 1,085,008 of potatoes, 66,388 tons of hay, 1,285,945 lbs. of butter, 106,270 of wool, 351,580 of maple sugar, 41,100 of dax, and 753,408 of hops. There were 6,816 horses, 17,138 milk cows, 10,514 other cattle, 25,130 sheep, and 4,628 swine; 3 manufactories of pot and pearl ashes, 4 of boots and shoes, 22 of carriages and wagons, 18 of clothing, 2 of stoves, &c., 1 of engines and boilers, 12 of saddlery and harness, 30 of starch, 3 of woolen goods, 5 planing and 57 saw mills, 9 tanneries, 6 currying establishments, and 12 flour mills. Capital, Malone.

V. A S. county of Pennsylvania, bordering on Maryland, bounded E. by South mountain, N. W. by Tuscarora or Cove mountain, and drained by several creeks; area, 740 sq. m.; pop. in 1870, 45,385. Most of it consists of a rich limestone valley, well watered, and abounding in slate, marble, and iron. In the N. part rises Parnell's Knob, a lofty peak forming the S. W. termination of the Kittatinnny range. The county is traversed by the Cumberland Valley railroad. The chief productions in 1870 were 888,727 bushels of wheat, 47,047 of rye, 946,610 of Indian corn, 731,911 of oats, 146,785 of potatoes, 155,489 tons of hay, and 900,710 lbs. of butter. There were 11,278 horses, 10,808 milk cows, 18,704 other cattle, 9,081 sheep, and 28,577 swine; 11 manufactories of manufactured goods, and 1 currying establishment, 12 of clothing, 19 of barrels and caissons, 18 of furniture, 12 of iron and iron castings, 4 of engines and boilers, 3 of printing paper, 23 of saddlery and harness, 5 of sashes, doors, and blinds, 19 of tin, copper, and sheet-iron ware, 6 of woollen goods, 38 flour mills, 20 tanneries, 15 currying establishments, 4 distilleries, 3 breweries, 1 planing and 10 saw mills. Capital, Chambersburg.

VI. A S. W. county of Virginia, bounded N. E. by Staunton river, and N. W. by the Blue Ridge; area, 864 sq. m.; pop. in 1870, 18,264, of whom 5,996 were colored. The surface is undulating or moderately uneven; the principal mineral is iron; the soil is fertile. The chief productions in 1870 were 77,722 bushels of wheat, 241,319 of Indian corn, 178,231 of oats, 23,213 of Irish and 10,056 of sweet potatoes, 165,499 lbs. of butter, 14,959 of wool, 27,500 of maple sugar, 2,410 horses, 3,550 milk cows, 5,787 other cattle, 8,848 sheep, and 18,308 swine, and 4 tobacco factories. Capital, Rocky Mount.

A N. E. county of North Carolina, intersected by Tar river; area about 450 sq. m.; pop. in 1870, 14,154, of whom 7,501 were colored. The surface is level and the soil fertile. The Raleigh and Gaston railroad passes along or near the W. border of the county. The chief productions in 1870 were 53,241 bushels of wheat, 241,485 of Indian corn, 31,659 of oats, 30,135 of sweet potatoes, 2,522 tons of hay, 36,248 lbs. of tobacco, and 8,356 bales of cotton. There were 1,442 horses, 2,593 milk cows, 4,224 other cattle, 3,021 sheep, 4,500 swine, and 2 flour mills. Capital, Louisburg.

VIII. A N. E. county of Georgia, bordering on South Carolina, drained by North and Hudson's forks of Broad river; area, 450 sq. m.; pop. in 1870, 7,893, of whom 1,859 were colored. It has a hilly surface and a productive soil, the river bottoms being particularly fertile. Gold has been found in small quantities, and iron is abundant. The chief productions in 1870 were 18,868 bushels of wheat, 173,007 of Indian corn, 14,151 of oats, 12,333 of sweet potatoes, and 687 bales of cotton. There were 1,025 horses, 1,650 milk cows, 2,590 other cattle, 4,963 sheep, and 6,922 swine. Capital, Oarnesville.

IX. A N. W. county of Florida, bounded S. by the gulf of Mexico; area, 475 sq. m., including the islands of St. George and St. Vincent; pop. in 1870, 1,256, of whom 475 were colored. The Appalachicola river, here navigable by steamboats, flows for some distance along its W. border, and then traverses its centre. Its valley is very fertile, but the soil elsewhere is sandy and little cultivated. The surface is low, and much of it covered with swamps and ponds. In 1870 there were only 237 acres of improved land. There was one saw mill. Capital, Appalachicola.

X. A N. W. county of Alabama, bordering on Mississippi; area about 700 sq. m.; pop. in 1870, 8,006, of whom 1,313 were colored. It has a fertile soil, and a hilly surface partly covered with oak woods and timber. The chief productions in 1870 were 9,070 bushels of wheat, 364,136 of Indian corn, 7,055 of oats, 10,584 of sweet potatoes, and 2,073 bales of cotton. There were 1,382 horses, 2,156 milk cows, 3,386 other cattle, 3,705 sheep, and 8,608 swine. Capital, Russellville.

XI. A S. W. county of Mississippi, watered by Homochito river; area about 600 sq. m.; pop. in 1870, 7,498, of whom 5,800 were colored. Its surface is uneven, and its soil fertile near the rivers, but the land elsewhere consists chiefly of pine barrens. The chief productions in 1870 were 124,846 bushels of Indian corn, 28,035 of sweet potatoes, and 5,079 bales of cotton. There were 977 horses, 2,297 milk cows, 4,940 other cattle, and 8,088 swine. Capital, Neeville.

XII. A N. E. parish of Louisiana, watered by Bœuf and Macon bayous, the former of which is navigable for steamboats. The area about 500 sq. m.; pop. in 1870, 5,078, of whom 2,844 were colored. Its surface is hilly and its soil fertile. The chief produc-
tions in 1870 were 35,794 bushels of Indian corn, 6,804 of sweet potatoes, and 3,498 bales of cotton. There were 4,932 cattle, and 4,105 swine. Capital, Winnborough. XII. A N. W. county of Arkansas, bounded S. by the Arkansas river; area about 450 sq. m.; pop. in 1870, 9,627, of whom 651 were colored. The surface is hilly and the soil fertile. The chief productions in 1870 were 18,085 bushels of wheat, 329,444 of Indian corn, 13,920 of Irish and 20,889 of sweet potatoes, and 4,798 bales of cotton. There were 2,561 horses, 3,113 milch cows, 6,323 other cattle, and 27,528 swine; 6 flour and 5 saw mills. Capital, Ozark. XIV. A S. county of Tennessee, bordering on Alabama, and intersected by Elk river; area, 780 sq. m.; pop. in 1870, 14,970, of whom 2,972 were colored. The surface is mountainous, especially in the S. E. part. The soil is fertile. The county is traversed by the Nashville and Chattanooga and the Winchester and Alabama railroads. The chief productions in 1870 were 94,357 bushels of wheat, 447,787 of Indian corn, 68,371 of oats, 127,580 lbs. of butter, and 289 bales of cotton. There were 3,945 horses, 8,043 milch cows, 4,778 other cattle, 8,820 sheep, and 24,074 swine; 3 flour and 4 saw mills, 8 tanners, 3 currying establishments, 3 for wool-carding and cloth-dressing, and 2 cotton factories. Capital, Winchester. XV. A N. county of Kentucky, intersected by the Kentucky river, which is here navigable; area, 212 sq. m.; pop. in 1870, 15,300, of whom 4,663 were colored. The surface is diversified and the soil productive. The Louisville, Cincinnati, and Lexington railroad passes through it. The chief productions in 1870 were 28,961 bushels of wheat, 19,837 of rye, 429,295 of Indian corn, 53,698 of oats, 16,472 of potatoes, and 123,260 lbs. of tobacco. There were 2,651 horses, 1,042 milch cows, 2,598 other cattle, 4,170 sheep, and 11,583 swine; 8 manufactories of carriages and wagons, 1 of bagging, 3 of clothing, 3 of barrels and casks, 1 of cotton goods, 1 of malt, 1 of wrapping paper, 1 book-printing establishment, 8 saw mills, 8 distilleries, and 3 flour mills. Capital, Frankfort, which is also the state capital. XVI. A central county of Ohio, watered by Scioto and Olentangy rivers; area, 580 sq. m.; pop. in 1870, 63,010. It has a level surface and a rich and generally well cultivated soil. Several railroads centre at Columbus. The chief productions in 1870 were 428,166 bushels of wheat, 1,845,318 of Indian corn, 246,217 of oats, 382,525 of potatoes, 29,484 tons of hay, 688,319 lbs. of butter, and 144,018 of wool. There were 10,565 horses, 7,841 milch cows, 12,271 other cattle, 40,588 sheep, and 43,233 swine; 525 manufactoring establishments, of which the most important were 2 of agriculture implements, 2 of boots and shoes, 12 of bread, &c., 7 of brooms and wisp brushes, 2 of brushes, 32 of carriages and wagons, 1 of cars, 40 of clothing, 1 of rectified coal oil, 2 of vegetable food preparations, 11 of furniture, 1 of gas, 2 of hardware, 1 of saddlery hardware, 1 of hucks and wagon material, 1 of forged and rolled iron, 7 of iron castings, 10 of machinery, 1 of saws, 25 of tin, copper, and sheet iron ware, 1 of wire, 50 of woolen goods, 8 printing and publishing establishments, 1 distillery, 5 breweries, 6 flour mills, and 4 bookbinderies. Capital, Columbus, which is also the capital of the state. XVII. A S. E. county of Indiana, bordering on Ohio, and drained by Whitewater river; area, 380 sq. m.; pop. in 1870, 20,232. The surface is diversified and the soil fertile. Blue limestone is found. The Whitewater canal and the Whitewater Valley railroad pass through the county. The chief productions in 1870 were 396,774 bushels of wheat, 771,074 of Indian corn, 148,148 of oats, 21,727 of barley, 59,562 of potatoes, 9,267 tons of hay, 369,005 lbs. of butter, and 40,833 of wool. There were 6,049 horses, 6,092 milch cows, 7,517 other cattle, 11,384 sheep, and 22,489 swine; 8 manufactories of carriages and wagons, 7 of bricks, 10 of barrels and casks, 2 of furniture, 5 of machinery, 2 of printing paper, 10 of saddlery and harness, 1 of woolen goods, 7 flour and 19 saw mills, and 2 distilleries. Capital, Brookville. XVIII. A S. county of Illinois, watered by Big Muddy river; area about 400 sq. m.; pop. in 1870, 12,053. The county is heavily timbered; the soil is fertile. The chief productions in 1870 were 111,689 bushels of wheat, 583,299 of Indian corn, 232,426 of oats, 27,968 of potatoes, 28,885 of peas and beans, 4,835 tons of hay, 48,956 lbs. of butter, and 397,382 of tobacco. There were 4,306 horses, 3,280 milch cows, 6,210 other cattle, 18,196 sheep, 25,490 swine, and 8 flour mills. Capital, Benton. XIX. A N. central county of Iowa, drained by Iowa river and branches of the Red Cedar; area, 576 sq. m.; pop. in 1870, 4,738. The chief productions in 1870 were 266,251 bushels of wheat, 189,133 of Indian corn, 149,810 of oats, 26,812 of potatoes, 12,068 tons of hay, and 130,892 lbs. of butter. There were 2,370 horses, 1,863 milch cows, 2,383 other cattle, and 3,488 swine. Capital, Hampton. XX. A E. county of Missouri, bounded N. by the Missouri river; area, 874 sq. m.; pop. in 1870, 80,098, of whom 2,178 were colored. It is drained by Maramee river, which is navigable by small steamboats. Rich mines of copper, lead, and coal are found on its banks and in other parts of the county. The surface is uneven and well timbered. It is traversed by the Pacific railroad of Missouri and the Atlantic and Pacific railroad. The chief productions in 1870 were 536,921 bushels of wheat, 663,297 of Indian corn, 351,340 of oats, 114,984 of potatoes, 18,917 tons of hay, 278,789 of butter, 62,988 of wool, 307 of baco, and 73,544 gallons of wine. There were 6,804 horses, 2,175 mules and asses, 7,477 milch cows, 10,841 other cattle, 16,792 sheep, and 48,708 swine; 80 manufactories of carriages and wagons, 1 of cars, 18 of barrels and
casks, 7 of furniture, 1 of pig iron, 2 of pig lead, 185 of wine, 1 railroad repair shop, 2 pork-pack ing establishments, 1 planing, 13 saw, and 11 flour mills, 1 box factory, and 8 brick kilns. Capital, Union. XXI. An E. county of Kansas, intersected by the Osage river; area, 576 sq. m.; pop. in 1870, 10,885. The surface is undulating and the soil fertile. The Leavenworth, Lawrence, and Galveston railroad passes through the county. The chief productions in 1870 were 44,471 bushels of wheat, 618,840 of Indian corn, 181,515 of oats, 54,618 of potatoes, 17,644 tons of hay, 185,640 lbs. of butter, and 20,498 of wool. There were 3,706 horses, 3,818 milch cows, 7,108 other cattle, 5,182 sheep, and 6,636 swine; 2 manufactories of boots and shoes, 1 of brooms, 3 of saddlery and harness, 1 flour and 8 saw mills. Capital, Ottawa. XXII. A S. county of Nebraska, bordering on Kansas, intersected by Republican river; area, 576 sq. m.; pop. in 1870, 26.

FRANKLIN. I. A borough and the capital of Venango co., Pennsylvania, on French creek or Venango river, just above its entrance into the Alleghany, 53 m. S. by E. of Erie, and 64 m. N. of Pittsburgh; pop. in 1870, 3,908. Small steamers run to Pittsburgh, and railroad communication is furnished by the Franklin branch of the Atlantic and Great Western, the Franklin division of the Lake Shore and Michigan Southern, and the Alleghany Valley line. It owes its prosperity mainly to the trade in petroleum, of which there are many wells in the vicinity. It has two weekly newspapers, a national bank, several oil refineries, a number of schools, and six or seven churches. II. A town and the capital of Williamson co., Tennessee, on the Harpeth river, 18 m. S. of Nashville; pop. in 1870, 1,553. A severe battle was fought here, Nov. 30, 1864, between the Union forces under Gen. Schofield and the confederates under Gen. Hood, brought on by the latter to prevent the former from reaching Nashville. After a determined attack the confederates were repulsed. The confederate loss is stated at from 4,500 to 6,000; that of the Union army at 2,926. The result was that Nashville remained in the possession of the Unionists during the remainder of the war. III. A town and the capital of St. Mary parish, Louisiana, port of entry of the district of Teche, situated on the right bank of Bayou Teche, 65 m. by water from the gulf of Mexico, and 88 m. W. by S. of New Orleans; pop. in 1870, 1,285, of whom 683 were colored. It is the shipping point for large quantities of cotton, sugar, and corn produced in the neighborhood, and is accessible by large steamboats. In 1872 there were belonging to the port 52 vessels with an aggregate tonnage of 3,585. IV. A city and the capital of Johnson co., Indiana, situated on Young's creek, and on the Cincinnati and Martinsville, and the Jeffersonville, Madison, and Indianapolis railroads, 20 m. S. by E. of Indianapolis; pop. in 1870, 2,707. It is the seat of Franklin college (Baptist), founded in 1835, which in 1873 had 5 professors and instructors, 38 students, and a library of 1,000 volumes. It also contains two national banks, two weekly newspapers, ten public schools, and several churches.

FRANKLIN, Benjamin, an American philosopher and statesman, born in Boston, Jan. 17, 1706, died in Philadelphia, April 17, 1790. He was the youngest, except two daughters, of a family of 17 children. His father, a nonconformist, emigrated to New England in 1682 in search of religious freedom; his mother, his father's second wife, was Abiah Folger, daughter of a distinguished colonist, Peter Folger, author of a poem in defence of liberty of conscience. Franklin's father, originally a dyer, became in Boston a tallow chandler and soap boiler. Having bound out his elder sons apprentices to trades, he designed the youngest "as a tithe of his sons" for the church. The child was placed at school at the age of eight, and manifested an aptitude for study; but narrow circumstances compelled his early withdrawal, and at the age of ten he was employed in cutting wicks and attending to the shop. This was so distasteful to Benjamin that he began to talk of going to sea, to prevent which his father bound him apprentice to his brother James, a printer. The boy, always fond of reading, now sat up nights engaged in study. His earliest favorites were Defoe's "Essay on Projects," Mather's "Essays to do Good," Bunyan's works, Plutarch, and Burton's historical collections. He conceived also a fancy for poetry, and wrote ballads, the "Lighthouse Tragedy," and the "Pratto Teach, or Blackbeard." These were published, but his father looked discouragingly upon this proceeding, and "thus," humorously says Franklin in his autobiography, "I escaped being a poet." Meeting with an odd volume of the "Spectator," he was so much delighted that he contrived ingenious methods of mastering the style and acquiring an ability in composition which he considered a principal means of his subsequent advancement. At the age of 16 he mastered arithmetic without assistance, and studied navigation. He read also at this period "Locke on the Human Understanding," the "Port Royal Logic," and a translation of Xenophon's "Memorabilia." He had read Shaftesbury and Collins, and becoming a skeptic, applied himself to skilful devices of argumentation gathered from the "Memorabilia," practiced them as exercises in conversation, and often defeated antagonists whose cause and understanding were, as he afterward confessed, deserving of the victory. When about 16 years of age he met with a book by "one Tryon," recommending vegetable diet, which he adopted; it proved economical, and he gained thus an additional fund for purchasing books. Meantime he wrote a paper in a disguised hand for the "New England Courant," published by his brother; it was printed anonymously, met with approba-
tion, and excited curiosity. Other communications followed in the same manner, and at length the author was discovered. The brother took it amiss, the circumstance was a first occasion of hard words, and the young apprentice was beaten. Exception was taken by the general court to the political character of Franklin's newspaper. The elder brother was imprisoned, and the future publication of the journal by James Franklin was forbidden. The younger Franklin undertook to elude the indictment by consenting to be nominal printer. This required the cancelling of his indentures as apprentice, but the brother required new and secret indentures. The paper reappeared, and was continued for several months, nominally printed and published by Benjamin Franklin. A fresh difference soon arose between the brothers, and the apprentice, supposing his master would not produce the secret stock of agreement, asserted his liberty. His brother's influence, however, prevented him from getting employment at any of the printing offices in Boston, and he resolved to go to New York in search of work. He accordingly induced the captain of a trading vessel to take him secretly on board, on pretence of escaping the consequences of an unfortunate intrigue. He sold his books, and in three days was in New York, at the age of 17, friendless, almost penniless, and without recommendations. Disappointed there, he went to Philadelphia. His voyage from New York to Perth Amboy in an open boat was eventful; he saved the life of a drunken Dutchman, who fell overboard; and after being 30 hours without food or water, he landed at Amboy, suffering from fever, which he says he cured by drinking plentifully of cold water. He walked thence to Burlington, and took boat to Philadelphia, arriving after some difficulty and danger at the foot of Market street at 9 o'clock on a Sunday morning. He had one dollar, and about a shilling in copper coin; the latter he gave to the boatmen. He bought three rolls of bread, and ate one as he walked up the street with the others under his arm, and his pockets stuffed with stockings and shirts. Thus equipped he passed by the house of his future father-in-law; his future wife was at the door, and remarked the awkward and ridiculous appearance of the passer-by. He gave his rolls to a poor woman, and walked idly into a Quaker meeting house, where he fell into a comfortable sleep; it was the first house and the first repose of which he had the benefit in Philadelphia. He found employment with an unskilful printer named Keimer, and obtained lodging at Mr. Read's, the father of the young lady who had noticed him eating his roll. The governor of the province, Sir William Keith, accidentally saw one of his letters, and was struck with evidences of the writer's superiority. To the amazement of Franklin, Sir William sought him out, proposed to him to set up business for himself, and promised him the public printing. He was induced by these promises to agree to go to England to purchase types and material; and previously to doing so, to return to Boston to obtain his father's consent. This was withheld, and Franklin returning to Philadelphia remained some time longer with his first employer. In the mean time he had made progress in his courtship of Miss Read. The governor invited him often to his house, and adhered apparently to his original intention of setting him up in independent business. Arrangements were completed for the voyage to London. His father's permission was no longer withheld. Miss Read consented to an engagement, and he embarked, being just 18. On arriving in London he discovered that he had been grossly deceived by the governor. Sir William Keith, "a good governor for the people, planned many excellent laws," but having "nothing else to give, had given expectations." Franklin was in want, assumed a foreman countenance, without credit or acquaintance, and almost penniless. He promptly sought a printer, and took service for nearly a year. He fell into some extravagance, and committed follies of which he became ashamed, and from which he returned self-rebuked to industry and temperance. He wrote and published a metaphysical criticism upon Wollaston's "Religion of Nature;" his employer saw his talent and ingenuity, but expostulated against the principles advanced in his essay. The pamphlet was an introduction to some literary acquaintances. He had altercations with his fellow journeymen on the subject of temperance; they were beer-drinking sots, and many of them he reformed altogether; he was strong and athletic, while they could carry less and did less work. His skill in swimming attracted observation, and he gave exhibitions of the art at Chelsea and Blackfriars, which excited so much attention that he meditated opening a swimming school, and wrote two essays upon swimming; but in the mean time he entered into engagements with a good man, Mr. Denham, to return to Philadelphia and be his clerk in a dry-goods shop. They sailed from Gravesend July 23, 1726, and landed at Philadelphia Oct. 11. He kept an interesting journal of the voyage. He had been 18 months in London, had profited by advantages of acquaintance and books, but was unimproved in his fortunes. Sir William Keith had been superseded as governor; Franklin met him in the street, but seeing that he looked ashamed, passed on without remark. To Miss Read he had written but once during his absence, and that was to say that she was not likely to see him soon. She had been persuaded to marry another, but her husband had absconded in debt, and under suspicion of bigamy. Franklin attributed her misfortunes to his own conduct, and resolved to repair his error. It was doubtful whether a marriage with her would be valid; it had not been clearly ascertained that his "predecessor," as he styles him, had had a previous wife, and Frank-
lin, whom Mr. Tuckerman calls the incarnated common sense of his time, did not forget that he might be called upon to pay his predecessor's debts. "We ventured, however," he adds, "for all the difficulties, and I took her to wife on the 1st of September, 1780." She proved a good and faithful helpmate. Some time before his marriage he suffered a serious illness; a similar illness carried off his employer; and Franklin, forming a connection shortly afterward with a person who had money, established the "Pennsylvania Gazette," which was managed with great ability. He had already written the "Busybody," a series of amusing papers, for another journal, and was the leading member of a club called the Junto, in which questions of morals, politics, and philosophy were discussed. He very soon became a man of mark; his great intelligence and industry, his ingenuity in devising better systems of economy, education, and improvement, now establishing a subscription and circulating library, now publishing a popular pamphlet on the necessity of paper currency (having previously invented a copper-plate press, and engraved and printed the New Jersey paper money), and presently also his valuable municipal services, rapidly won for him the respect and admiration of the colonies. In 1782 he first published his almanac, under the name of Richard Saunders. It took the name of "Poor Richard's Almanac," and was continued profitably about 25 years. The wise saws, the aphorisms, and encouragement to virtue and prosperity through the excellent proverbial sentences with which he filled the corners and spaces, became very popular, and they were at length spread over England and France in reprint and translations. In 1783, at the age of 27, he began to study the French, Italian, Spanish, and Latin languages; and after ten years' absence from Boston, he revisited the scenes of his early life, healing family differences, and consolation the deathbed of his brother with promises of provision for his son. Returning to Philadelphia, he was elected clerk to the assembly. Soon afterward he was appointed postmaster, and turning his hand upon municipal affairs, wrote papers and effected improvements in the city watch, and established a fire company. He became the founder of the university of Pennsylvania and of the American philosophical society (1744), took an active part in providing for defence against a threatened Spanish and French invasion, and invented the economical stove which bears his name; he declined to profit pecuniarily from this invention, although invited to do so by the offer of a patent. While in Boston in 1748, he witnessed some imperfect experiments in electricity; and having now made himself sufficiently conversant in this branch of knowledge, he purchased philosophical apparatus and began his investigations (for an account of which see ELECTRO-MAGNETISM, and LIGHTNING). The invention of the lightning rod was a practical application of discoveries the most brilliant which had yet been made in natural philosophy. But he was not allowed to proceed immediately with his scientific pursuits. He was elected to the assembly in 1760; was appointed commissioner for making an Indian treaty, and in 1758 deputy postmaster general for America; and was presented with the degree of master of arts by Harvard and Yale colleges. In 1754, the French war impending, he was named a deputy to the general congress at Albany. He proposed a plan of union for the colonies, which was unanimously adopted by the convention, but rejected by the board of trade in England as too democratic. He was ever afterward actively and zealously engaged in national affairs. We find him in Boston in 1754; and the French war having begun, he assisted Mr. Quincy in procuring a loan in Philadelphia for New England. He visited Braddock in Maryland, and modestly demonstrated against that general's expedition which resulted so disastrously. As postmaster general he was called upon to facilitate the march of the army, and labored faithfully and even to his own pecuniary disadvantage, in the service. After the defeat of Braddock, he was the means of establishing a volunteer militia, and took the field as military commander. After a laborious campaign it was proposed to commission Franklin as general in command of a distant expedition; but he distrusted his military capacities and waived the proposal. He resumed his electrical researches, and wrote accounts of experiments, which were read before the royal society of London, and procured for him the honor of membership and the Copley gold medal, and were published in England and France. Sir Humphry Davy says of these papers that their style and manner are almost as admirable as the doctrine they advance. Franklin, he said subsequently, seeks rather to make philosophy a useful inmate and servant in the common habitations of man, than to preserve her merely as an object of admiration in temples and palaces. Though it has been said of him by English historians that he had usually a keen eye to his own interests, they are forced to add that he had ever a benevolent concern for the public good. While an active member of the Pennsylvania assembly, he was indefatigable with his pen. The propriety persisted in measures conflicting with the privileges of the inhabitants and with the public good; in consequence of which the deputies resolved to petition the home government for redress, and appointed Franklin their commissioner for the purpose. He published afterward (1759) the "Historical Review," which contained his papers in aid of the cause of his constituents, and had meanwhile obtained so much reputation that Massachusetts, Maryland, and Georgia intrusted him with the agency of their affairs also. On making the English coast, the ship in which he had embarked narrowly escaped the rocks.
In describing the circumstances to his wife he said: "Were I a Roman Catholic, I should perhaps vow to build a church in gratitude for this escape; but as I am not, if I were to vow at all, it should be to build a lighthouse." He arrived in London July 27, 1757. Honors and compliments in abundance awaited him. Oxford and Edinburgh conferred upon him their highest academical degrees. He made personal acquaintance with the most distinguished men of the day, but never failed to bestow his principal attention upon the object of his mission. An illness of eight weeks retarded progress, and great difficulties followed from many circumstances.

Three years elapsed, and at length he succeeded in the principal objects of his mission, to the entire satisfaction of his constituents. He suggested to the ministry the conquest of Canada, and his scheme was adopted. With Lord Kames and others in Scotland he passed six weeks of the "densest happiness," as he called it, of his life. He gave Lord Kames the famous "Parable against Persecution." He made further experiments in electricity, invented a musical instrument, the armonica (musical glassess), and received from the ministry the appointment of his son to the government of New Jersey. At the end of five years he embarked for home, reached Philadelphia Nov. 1, 1762, and received the official thanks of the assembly. New difficulties arising between the province and the proprietaries, he was again appointed agent to the English government, to petition that the king take Pennsylvania affairs into his own hands. He reached London early in December, 1764. The revolution was imminent. The project of taxing the colonies had been announced, and Franklin was the bearer of a remonstrance against it on the part of the provincial government of Pennsylvania. He was indefatigable in his exertions to prove the unconstitutionality and impolicy of the stamp act; and when the repeal of this obnoxious measure was attempted he underwent an examination before the house of commons (Feb. 8, 1766). His conduct made it an everlasting record of his firm and patriotic spirit, of his wise and prompt foresight, the semblance of an almost inspired sagacity. The repeal of the stamp act was an inevitable consequence. He subsequently travelled in Holland and Germany with his friend Sir John Pringle, and visited Paris, where he met with much attention. Temporary tranquility in America after the repeal of the stamp act was followed by commotions in Boston occasioned by the equally offensive revenue act, and others subversive of colonial rights. In 1772 a member of parliament, to convince Franklin that every grievance complained of by the Americans originated not with the British government, but with tories in America, gave him a number of letters written from Massachusetts by Gov. Hutchinson and Lieut. Gov. Oliver, warmly urging coercive measures against the colonies. Franklin immediately sent these letters to the speaker of the Massachusetts house of representatives. Their publication caused great indignation in America, and was of invaluable service to the popular cause. The Massachusetts house petitioned the king that he would remove Hutchinson and Oliver from the government. Franklin appeared before the privy council, Jan. 29, 1774, to present their petition and advocate the removal. "He was now," says Bancroft, "thrice venerable, from genius, fame in the world of science, and age, being already nearly three score years and ten." He was grossly reviled and shamefully insulted by Wedderburn, the solicitor general, who made against him a long personal harangue, amid the applauding laughter and cheering of the lords in council. Franklin bore this contumely with his accustomed patience and dignified equanimity. The petition was rejected, and the next day he was dismissed from the office of deputy postmaster general. Meanwhile he found time for further research in science, for journeys again to Paris, Scotland, and Wales, and a visit to Ireland. He had determined to await in England the result of the continental congress. In the mean time Mrs. Franklin died. His parents and 16 of his sisters and brothers had long been dead. A daughter alone was to remain to his solitude, his cherished son being about to sacrifice the ties of kindred to loyalty or political ambition. Franklin embarked for home in March, and arrived May 5, 1776, 16 days after the battle of Lexington. He had labored faithfully in England to prevent the final outbreak, and now repaired as faithfully to his duties in the congress. As a member of the committees of safety and foreign correspondence he performed most valuable services, exerting all his influence for a declaration of independence. That instrument he had the honor to assist in drafting, and to sign, July 4, 1776. He was sent soon after to Paris as commissioner plenipotentiary, together with Silas Deane and Arthur Lee. During the voyage he continued some interesting experiments which he had begun in the spring of the same year in relation to the Gulf stream. He was the first to make observations of this current; and his chart of it, published 90 years ago, still forms the basis of charts now in use. On arriving in France Franklin established himself almost immediately at Passy. A French writer, LaCretelle, says that "by the effect which Franklin produced, he appears to have fulfilled his mission, not with a court, but with a free people." He was not at first received officially, but soon gained influence with the ministry; and after the news of Burgoyne's disaster he concluded the treaty of Feb. 6, 1778. English emissaries came to Paris thereupon to sound Franklin on the subject of reconciliation, of which they discovered that independence was to be the sole basis. His prudence and sagacious firmness defeated every attempt of the British
government to sow discord between America and her ally. He was now accredited to the French king as minister plenipotentiary (1778), and subsequently one of the commissioners for negotiating peace with the mother country. His diplomatic career forms a chief chapter in the history of his country. He signed the peace Nov. 30, 1783, and now longed to return, but was not able to do so till 1785, when, after 53 years in the service of his country, he retired to private reposes. Before leaving Paris he concluded the treaties with Sweden and Prussia, embodying many of his great international principles. He had been throughout the whole period of his mission an object of marked enthusiasm. His venerable age, his plain deportment, his fame as a philosopher and statesman, the charm of his conversation, his wit, his vast information, his varied aptitudes and discoveries, all secured for him not only the enthusiastic admiration of Europe, but a circle of ardent friends, embracing the very widest range of human characters. His simple costume and address, and dignified aspect, among a splendidly embroidered court, commanded the respect of all. "His virtues and renown," says Lacretelle, "negotiated for him; and before the second year of his mission had expired, no one conceived it possible to refuse fleets and armies to the countrymen of Franklin." On his return to Philadelphia (Sept. 14, 1785), he was elected "president of Pennsylvania." Washington, with whom he enjoyed an uninterrupted friendship, was among the first to welcome him. At the age of 82 he was a delegate to the convention for forming the federal constitution, and entered actively and heartily into the business of that body. He served also as president of the society for political inquiries, and wrote interesting and vigorous papers upon many important subjects. In his 84th year he wrote to Washington: "For my personal ease I should have died two years ago; but though those years have been spent in excruciating pain, I am glad to have lived them, since I can look upon our present situation." His faculties and affections were unimpaired to the last. At his funeral 20,000 persons assembled to do honor to his remains. He was interred by the side of his wife in the cemetery of Christ church. Throughout the country every species of respect was manifested to his memory; and in Europe extraordinary public testimonials are on record of honors to one of the greatest benefactors of mankind. Fault has been found with his religious character. He confesses that for a time before the age of 21 he had been a thorough deist; and it has been said that five weeks before his death he expressed a "cold approbation" of the "system of morals" of "Jesus of Nazareth." Whatever his faith and doctrine may have been, his reverence for religion and Christian institutions was constantly manifest. It was Franklin who brought forward a motion for daily prayers in the Philadel-

Franklin was strong and well formed. His stature was 5 ft. 9 or 10 in. His complexion was light, his eyes gray. His manners were extremely winning and affable. His daughter Sarah married Richard Bache.—The last of his race who bore his name was his grandson, William Temple Franklin, who died in Paris, May 26, 1828, and who published in London and Philadelphia, between 1816 and 1819, editions of his grandfather's works. The complete edition of the works of Franklin, edited by Jared Sparks, appeared in Boston in 12 vols. 8vo in 1838-'40, with notes and a life of the author. A new edition was published in Philadelphia in 1858. Franklin's autobiography, one of the most interesting works of the kind ever written, was first published in Paris in 1791, in a French translation made from a copy of the author's manuscript. This version was retranslated into English and published in London in 1793. This English version was again translated into French and published in Paris in 1798. The copy of the original autograph from which the first French version was made was published in Temple Franklin's collection of Franklin's writings in 1817. A new edition of the work, edited by John Bigelow from an original autograph which he had obtained in France, was published in Philadelphia in 1868.—See Parton's "Life and Times of Franklin" (2 vols. New York, 1864).
mar school of Lonth. But he soon showed a decided predilection for the sea; and his father, hoping that his inclination for the life of a sailor would be removed by an experience of its discomforts, permitted him to make a voyage to Lisbon in a small merchant vessel. As he returned with his enthusiasm increased, his father yielded, and procured him admission to the navy as a midshipman at the age of 14. He served on board the Polyphemus at the battle of Copenhagen, April 2, 1801. In the ensuing summer he joined the Investigator, which was commanded by his cousin, Capt. Flinders, and was commissioned by the English government to explore the coasts of Australia. After nearly two years spent in this service, the Investigator proving unsatisfactory, her officers sailed for home in the ship Porpoise; but that vessel was wrecked Aug. 18, 1803, on a reef about 200 m. from the coast of Australia, and Franklin and his companions remained on it a sand bank 600 ft. long for 50 days, when relief arrived from Port Jackson. Franklin was carried to Canton, where he obtained passage to England in a vessel of the China fleet of Indiamen, commanded by Sir Nathaniel Dance. On reaching England he joined the ship of the line Bellerophon, and in 1805 took part in the battle of Trafalgar as signal midshipman, performing his functions with distinguished courage. Of 40 persons who stood round him on the poop, only seven escaped unhurt. For several years afterward he served in the Bedford on various stations, the last of which was the coast of the United States during the war of 1812-15. He commanded the boats of the Bedford in a fight with the American gunboats at New Orleans, one of which he boarded and captured; he was wounded, and for his gallantry was made a lieutenant. In 1818, the British government having fitted out an expedition to attempt the passage to India by crossing the polar sea to the north of Spitzbergen, Franklin was appointed to the command of the Trent, one of the two vessels of the expedition; the other, the Dorothea, being commanded by Capt. Buchan. After passing lat. 80° N. the Dorothea received so much damage from the ice that her immediate return to England was decided on. Franklin begged to be permitted to continue the voyage with the Trent alone, but Capt. Buchan would not consent. Franklin's conduct on this occasion gave him a high reputation as a bold and thorough seaman and a competent surveyor and scientific observer. In 1819 he was appointed to the command of an expedition to travel overland from Hudson bay to the Arctic ocean, and explore the coast of America eastward from the Coppermine river. (For an account of this and his other arctic expeditions, see Arctic Discovery.) Franklin returned to England in 1822. Shortly after his arrival he was made a post captain and elected a fellow of the royal society. In 1823 he published "Narrative of a Journey to the Shores of the Polar Sea in 1819-22;" and in August of the same year he married Eleanor Porden. In 1825 he was appointed to the command of another overland expedition to the Arctic ocean. When the day assigned for his departure arrived, his wife was lying at the point of death. She, however, insisted that he should not delay his voyage on her account, and gave him a silk flag, which she requested him to hoist when he reached the polar sea. She died the day after he left England. He returned home by way of New York, arriving at Liverpool, Sept. 24, 1827; and on March 8, 1828, he married Jane Griffin, the present Lady Franklin. In the same year he published his "Narrative of a Second Expedition to the Shores of the Polar Sea in 1825-7." In 1829 he was knighted, and received the degree of D. C. L. from Oxford university and the gold medal of the geographical society of Paris. In 1830 he was sent to the Mediterranean in command of the Rebecca. While on this station he was noted for his attention to the comfort of his crew, and the sailors expressed their sense of his kindness by calling his vessel the "Celestial Rainbow" and "Franklin's Paradise." In 1836 he was made governor of Tasmania or Van Diemen's Land, in which office he continued till 1845. He was a very popular governor, and originated and carried out many measures of great importance to the colony. He founded a college and gave it large endowments from his own funds, and exerted himself to have it conducted without regard to distinctions of sect. In 1838 he founded the scientific association now known as the royal society of Hobarton; during his administration its papers were printed at his expense. When the colonial legislature voted an increase to the governor's salary, Sir John refused to accept it for himself, but secured it for the benefit of his successor. Long after his departure from the colony the remembrance of his virtues drew from the inhabitants of Tasmania a contribution of £1,700, which was sent to Lady Franklin to assist in paying the expenses of the search for her missing husband. In 1845 Sir John was appointed to the command of a new expedition to discover the northwest passage. It consisted of the ships Erebus and Terror, which were fitted out in the strongest and most complete manner, and manned by picked crews, amounting, officers and men, to 188 persons. They sailed from Sheerness May 19, 1845. Franklin's orders were to return in 1847. He was last seen by a whaler in Baffin bay, July 28, 1845. In 1846, no tidings of the expedition having reached England, the anxiety of the public led to the fitting out of several expeditions in search of him. (See Arctic Discovery.) After long and persistent endeavors on the part of Lady Franklin, of the British government, and of private explorers, the mystery was finally solved by the expedition of McClintock in 1859. A record then discovered made it certain that Franklin died on June 11, 1847, and that his men, some of whom long survived
FRANKLIN

hnm, perished one by one in their journey southward. He had reached the rank of rear admiral. In 1860 parliament voted £2,000 for a statue of Franklin, to be erected in London.—See Capt. F. L. McIlvstock, "Narrative of the Discovery of the Fate of Sir John Franklin" (London and Boston, 1860); Capt. S. Osborn, "The Career, Last Voyage, and Fate of Sir John Franklin" (London, 1860); also the works of Kane, Richardson, Inglefield, &c.

II. Eleanor Ann, an English poetess, first wife of the preceding, born in July, 1795. Her father, William Porden, was the architect of Eaton hall, and of other noted buildings. Almost unassisted she taught herself Greek and Latin when only 11 or 12 years old. She soon acquired several other languages, and a general knowledge of all the principal sciences, especially of botany, chemistry, and geology. At the age of 15 she began to write, and in her 17th year she produced a poem in 6 cantos, "The Veils, or the Triumphs of Constancy," which attracted considerable attention on its publication in 1815. Her next publication, "The Arctic Expedition, a Poem" (1818), led to her acquaintance with Capt. Franklin, and to their marriage in August, 1823. In 1829 her longest and best poem, "Cœur de Lion, or the Third Crusade," in 16 cantos, was published. She died of consumption, Feb. 22, 1825, the day after her husband sailed on his second expedition to the Arctic shores. Her poems, with the exception of "Cœur de Lion," were collected and published in London in 1827.

II. Lady Jane, second wife of Sir John Franklin, distinguished for the devoted perseverance with which she labored for the rescue of her husband, and for the discovery of his fate, born about 1805, died July 18, 1875. She was the second daughter of John Griffin, and was of French Huguenot descent on her mother's side. While in Tasmania she paid out of her private purse a bounty of 10 shillings each for the discovery of her husband's fate. In 1819, the name of John Franklin was extirpated. She expended nearly all her fortune in the search for her husband, and after the certain news of his death she continued to be identified with philanthropic and scientific plans, having been a promoter of many of the most useful public charities in England, while taking a keen interest in all schemes of foreign exploration. In February, 1872, she bought Franklin house, in Lincolnshire, intending to collect there the relics of Sir John's expeditions.

FRANKLIN, William, the last royal governor of New Jersey, an illegitimate son of Benjamin Franklin, born in Philadelphia in 1729, died in England, Nov. 17, 1818. It is not known who his mother was. About a year after his birth his father married, took the child into his home, and reared him as his son. In childhood he was remarkably fond of books, and of an adventurous disposition. During the French war (1744-8) he obtained a commission in the Pennsylvania forces, with which he served in one or two campaigns on the Canadian frontier, and rose to be captain before he was of age. From 1754 to 1756 he was comptroller of the general post office, and during part of the same period was clerk of the provincial assembly. In 1757 he accompanied his father to London, where he was admitted to the bar in 1758. In 1769 he was appointed governor of New Jersey, to which province he returned the next year. In the revolutionary contest he remained loyal to Great Britain, and some of his letters containing strong expressions of Tory sentiments having been intercepted, a guard was put over him in January, 1776, to prevent his escape from Perth Amboy. He gave his parole that he would not leave the province, but in June he issued a proclamation as governor of New Jersey summoning a meeting of the abrogated legislative assembly. For this he was arrested by order of the provincial congress of New Jersey and removed to Burlington. He was soon after sent to Connecticut, where he was strictly guarded for upward of two years, till in November, 1778, he was exchanged for Mr. McKinely, president of Delaware, who had fallen into the hands of the enemy. Gov. Franklin after his liberation remained in New York till August, 1782, when he sailed for England, in which country he continued to reside till his death. The English government granted him £1,800 in remuneration of his losses, and a pension of £800 per annum. William Franklin's adhesion to the royal cause led to an estrangement between him and his father, which continued after the revolutionary contest was over. Dr. Franklin bequeathed to William his lands in Nova Scotia, and released him from all debts that his executors might find to be due from him, and added this clause: "The part he acted against me in the late war, which is of public notoriety, will account for my leaving him no more of an estate he endeavored to deprive me of."

FRANKLIN, William, a Revolutionary soldier, born in York, Penn., Feb. 27, 1828. He graduated first in his class at West Point in 1848, and was stationed on the survey of the northern lakes. In the summer of 1845 he accompanied an expedition to the South pass of the Rocky mountains under command of Brig. Gen. Kearny, and in the following year was engaged in the survey of Ossabaw sound, Georgia. He served on the staff of Gen. Taylor at the battle of Buena Vista, and was brevetted first lieutenant for his part in it. In June, 1848, he was ordered to West Point as assistant professor of natural and experimental philosophy; and in February, 1852, he was appointed professor of natural and experimental philosophy and civil engineering at the New York city free academy. During the next eight years he was continually employed as consulting engineer and inspector of various public works, particularly harbors and lighthouses, having been engineer secretary of the lighthouse board, and superintendent of the capitol extension and
other government buildings at Washington. On May 14, 1861, he was appointed colonel of the 12th (new) regiment of infantry, and in July was assigned a brigade in Heintzelman's division of the army of N. E. Virginia. At the battle of Bull Run he was "in the hottest of the fight," according to the official report of Gen. McDowell. In August he received the commission of brigadier general of volunteers, to date from May 17, 1861. In September he was appointed to the command of a division in the army of the Potomac. Sent to reinforce Gen. McClellan after the evacuation of Yorktown, he transported his division by water to West Point on York river, and repulsed the enemy under Gens. Whiting and G. W. Smith, who attempted to prevent his landing, May 7, 1862. On the 15th he was appointed to the command of the 6th provisional army corps. During the movement to the James river, which began June 27, he was charged with covering the rear, and repulsed the enemy on the right bank of the Chickahominy, June 27 and 28, and again in conjunction with the corps of Gen. Sumner at Savage's Station, June 29. He commanded at the battle of White Oak swamp bridge on the 30th, and the next day joined the main body of the army on the banks of the James. He was promoted to the rank of major general of volunteers July 4, and brevet brigadier general in the regular army, June 80. In the battle of South mountain, Sept. 14, he distinguished himself by storming Crampton's gap. He was in the battle of Antietam, Sept. 17, and in November was placed in command of the left grand division of the army of the Potomac, including the 1st and 6th corps, which he commanded in the battle of Fredericksburg, Dec. 13. The next year he was transferred to the department of the gulf, commanded the expedition to Sabine pass, September, 1863, and was second in command in Banks's Red river expedition, April, 1864, being wounded in the battle of Sabine cross roads. He was brevetted major general in the United States army March 18, 1865, and resigned March 18, 1868. He is now (1874) vice president and general agent of the Colt firearms manufacturing company, at Hartford, Conn., and consulting engineer of the commission for the erection of a new state house.

FRANKLINITE, a mineral composed of peroxide of iron, oxide of zinc, and oxide of manganese, in appearance much like the magnetic oxide of iron. It is found in considerable quantity only in Sussex co., N. J., although it is also mentioned as accompanying ores of zinc in amorphous masses at the mines of Altenberg (Vieille-Montagne), near Aix-la-Chapelle. The composition of the franklinite of New Jersey is:

Its hardness is 5.5–6.5; specific gravity, 5.5–5.9. It occurs in large veins or beds at the mines of the New Jersey zinc company at Stirling hill and Mine hill in Sussex co., accompanied by the red oxide of zinc, lying between the crystalline limestone and the gneiss rocks. At Stirling hill it constitutes the main substance of two beds of considerable magnitude, lying in immediate contact with each other, divided only by a parting seam, running S. W. and N. E., and dipping S. W. about 40° from the hill against which the beds seem to repose, toward and under the bed of the Walkill river. The upper of these beds, lying immediately under the crystalline limestone, is composed chiefly of the red oxide of zinc with the franklinite interspersed in granular masses, often assuming the appearance of imperfect crystals. It presents a thickness varying from 3 to 8 ft., and is traced with great uniformity of structure. At times almost perfect crystals of franklinite are found, particularly where the bed comes in contact with the superincumbent limestone; these crystals are of the regular octahedral form with the edges replaced. The franklinite constitutes about 46 per cent. of the mineral contents, the rest being mainly red oxide of zinc. This bed is extensively worked for the manufacture of white oxide of zinc, which is used for paint; the residuum, after the oxide of zinc is driven off, being franklinite, is smelted into iron. The underlying bed appears on the surface or outcrop to be almost a pure massive franklinite, amorphous in structure, although occasionally also exhibiting very large and nearly perfect crystals of the franklinite; it contains no red oxide of zinc, which fact is the distinctive feature between this and the overlying bed, which is generally known as the bed of red zinc. The other locality where the franklinite is found in large masses is on Mine hill, about 1¾ m. N. E. of Stirling hill, following the course of the Walkill to the village of Franklin. Here there are also found two distinct beds in immediate juxtaposition; but their relative position, as compared with that at Stirling hill, is reversed, the franklinite being the easternmost and uppermost, and the zinc being the underlying and westernmost.

FRANKS, a confederacy of German tribes, which first appeared under this name near the lower Rhine about the middle of the 3d century. It is now generally believed that the tribes which constituted the bulk of the Frankish confederacy were the same which were known to the Romans in the time of the first emperors under the names of Sigambri, Chamaevi, Ampsivarii, Bructeri, Cassi, &c. The first mentioned were the most powerful. A part of these tribes had passed the Rhine as early as the first half of the 1st century. In the 3d and 4th larger bodies successively passed into the N. E. part of Gaul, which country they finally wrested from the Romans in the 5th century. Under Probus they appear as dangerous enemies of the Romans. Caesarius,
who was appointed to defend the province against them both by land and sea, having betrayed his master and assumed the purple in Britain, made them his allies, surrendering to them the islands of the Batavi and the country on the Scheldt. Constantine I. and Constan-
tine the Great expelled them from this territ-
ory, but they soon invaded it again, and were finally left in its possession by Julian. From that period they appear to have formed two separate groups, the Sallian (from the old Ger-
man saxa, sea, or from Sela, the ancient name of the river Yssel), and Ripuarian (from the Latin ripa, bank of a river). The former con-
tinued the attacks on Gaul during the 6th cen-
tury, and established an empire under Clovis and his successors (see FRANO); the latter spread southward on both sides of the Rhine, extending their conquests W. as far as the Meuse, and E. as far as the head of the Main. From them the country adjacent to the Main derives its modern name of Franconia. The Franks form an element in the modern popula-
tion of France, which received its name from them, as well as of S. W. Germany. Their two divisions had separate laws, which were after-
ward collected in two codes, known as Les Saites and Les Ripariorum.

FRANZ, Robert, a German composer, born at Halle, June 28, 1815. His parents were in mod-
erate circumstances, and having themselves no love for music discouraged it in their son. It was not till his 14th year that he ob-
tained even elementary instruction in music, and that of the most imperfect kind and under every disadvantage. His passion was however so great that he was unable to follow his studies at college to any good purpose, and at last his parents were obliged to yield, and sent him for musical tuition to Schneider at Dessau. Here he learned but little, and returning to Halle was left to grope his own way. He ob-
tained the works of Bach, Handel, and Schu-
bart, and studied them. He now began to com-
pose, and Schumann obtained for him a pub-
lisher for his early songs. It was at once seen that he possessed individuality of style, elevated feeling, and a happy gift of melody. His songs are several hundred in number, and in merit they rank next after Schubert's. They have obtained a great popularity in the United States as well as in Germany. He has written
very valuable accompaniments for many of the arias from Handel's Italian operas that other-
wise would have become obsolete; also new accompaniments to the Matthäus passion mu-
ic of Bach; and so thoroughly has he imbued himself with the spirit and forms of these old masters that the new work adapts itself per-
factly to the old, and restores to the world some most valuable works. Franz has always lived at Halle, and is professor of music; the observatory of which he is professor. He is blind.

FRASCATI, a town of central Italy, in the province and 8 m. E. S. E. of the city of Rome, on the N. W. declivity of the Tusculum mount;

pop. about 6,000, chiefly engaged in agriculture. It was the favorite summer residence of the Roman nobility and cardinals for some cen-
turies; and many of their magnificent villas re-
main. Of these the most celebrated is the villa Aldobrandini, which is adorned with numerous fountains, water works, and paintings. The villa Rufinella was once the property and abode of Lucien Bonaparte. On the summit of the mountain, 2,000 ft. above the sea, and about 2 m. from Frascati, are the ruins of Tusculum, round which clustered in the days of republic-
can and imperial Rome the villas of her patri-
cians, orators, and emperors.

FRASER, Alexander Campbell, a Scottish meta-
physician, born at Ardchattan, Argyllshire, in September, 1816. He was educated at the uni-
versity of Edinburgh, and in 1846 was appoint-
ed lecturer on mental philosophy in New col-
lege, Edinburgh. He was editor of the "North British Review" from 1850 to 1857, when he succeeded Sir William Hamilton as professor of logic and metaphysics in the university of Edinburgh, which chair he still retains (1874). He has published "Essays in Philosophy" (1859); "Rational Philosophy" (1859); "Collected Edition of the Works of Bishop Berkeley, with Dissertations and Annotations" (Ox-
ford, 1871); and "Life and Letters of Bishop Berkeley" (Oxford, 1871). The last named work contains many of Bishop Berkeley's writings hitherto unpublished, and an account of his philosophy. Prof. Fraser has been a frequent contributor of educational, philosophi-
cal, and miscellaneous papers to the "North British Review," "Macmillan's Magazine," and other periodicals.

FRASER, Charles, an American artist, born in Charleston, S. C., Aug. 20, 1782, died there, Oct. 5, 1860. At 12 or 14 years of age he was in the habit of sketching the scenery of Charle-
ton and its neighborhood. At the age of 16 he became a student of law. Three years later he commenced the study of art, but becoming dis-
couraged resumed his legal studies, and in 1807 was admitted to practice. He retired at the end of 11 years with a competency, and in 1818 resumed his art, giving his attention chiefly to miniature painting, in which he attained eminent success. He painted portraits of Lafay-
ette (1825) and of a large number of distin-
guished Carolinians, and also produced land-
scapes, interiors, historical pieces, and pictures of genre and still life, the greatest number of which are owned in South Carolina. In 1857 an ex-
hibition of his collected works was opened in Charleston, numbering 818 miniatures and 139 landscapes and other pieces in oil. He was
FRAUD

Few principles of law are oftener or more emphatically asserted than that fraud avoids every contract tainted with it, and annuls every transaction. It is seldom that this is not true; but there are certain rules and qualifications which must be known for the understanding of the practical application of the principle. Thus, fraud does not so much make the contract tainted with it void, as voidable. This is an important practical distinction, for a void contract has, and can have, no efficacy whatever, being simply nothing; whereas he who is defrauded in a contract or transaction may still be on the whole benefited by it, and he may certainly waive his right to avoid it for the fraud; and if he does so, the fraudulent party cannot insist that his own fraud has liberated him from his own engagements, and annulled his obligations. It is very difficult to give a legal definition of fraud; but it may be said to be any deception by which another person is injured. This definition leaves it necessary to explain how far such deception may be carried, and what its character must be, before the law recognizes it as fraud, and will permit a party injured by it to find legal redress, either by annulling his engagements or otherwise. For it is certain that not all deception is fraud in law. The Roman civil law used the phrase dolus malus, evil deceit, to express the fraud which the law dealt with. We have no similar phrase in our law, but we have an exactly similar distinction, although it is difficult to define or even to illustrate it. The law of morality and of religion is plain and simple: "Do unto others as you would have them do unto you;" and any craft or cunning, any concealment or prevarication, or consent to self-deception, by which one may make gain over another, is clearly a violation of this law. But it is certain that there is a large amount of craft, and a very cunning kind of deception, active or passive, of which the law takes no cognizance, and which characterize a very large proportion of the common transactions of society. Somewhere the law draws a line between that measure and that manner of deception against which it directs men to protect themselves by their own caution, under the penalty of suffering without remedy any mischiefs which may result from their want of skill or care, and that larger or deeper or more important kind of deception which it considers it unreasonable to require that men should guard themselves from without its aid. But where this line is drawn it would be impossible to declare by any formula. Indeed, there are whole classes of cases in which it may be considered as not yet settled what the law is in this respect. Thus, the law of warranty has been expressly founded in England and the United States upon the rule caveat emptor, or let the buyer beware; and it was once applied almost to the extent of holding that if a buyer did not choose to obtain an express warranty of the thing sold, he was remediless, whatever might be the amount of deception practised upon him, or rather whatever might be the degree or the way in which he was permitted to deceive himself. But in the article Warranty we shall show that there has been an important modification of the law in this respect. While it is impossible to state precisely by definition what frauds the law will recognize and treat as such, and what it will not, some leading principles run through the adjudication on this subject, and may help to a just understanding of the matter. One is, that the fraud must be material to the contract or transaction, and as it were enter into its very essence and substance; and the best test of this may be found in the question, would the transaction have taken place if the fraud had not been practised? For if it would not, the fraud was material. Another is, that the fraud must work an actual and substantial injury, for mere intention or expectation is not enough. Another is, that the defrauded party must not only have believed in point of fact the false statement, but must have had a rational right to believe it, because he cannot call upon the law to protect him from the consequences of his own neglect or folly. Here the law looks carefully at the injured person's ability to protect himself; and it is far more liberal in its suppression of fraud, or in remedying its consequences, when that fraud was practised against one who from age, infirmity of mind or body, or the confidence arising from a fiduciary relation, has a right to call on the law for its protection. Another distinction which the law makes is founded on practical reasons, which amount indeed to a necessity, but is scarcely sustained by principles of morality; it is that between concealment and misrepresentation. In some branches of the law, as that of insurance, the distinction is of little value, but generally it has much force. Thus, if one buys goods on credit who is at the time insolvent, but says nothing about his affairs, the sale is valid, and the property passes to the buyer, leaving the seller only his claim for the price. But if the buyer, being insolvent, falsely represents himself to the seller as having sufficient resources to justify the sale or credit, this is a fraud which permits the seller to avoid the sale, and to reclaim the goods. (See FAKE PARTNERS.) The question how far one is bound to communicate to another any special facts which he knows, or indeed any information which he possesses, has often passed under adjudication. That a sale is not voidable merely because one party knew what the other did not, and bought or sold because of his better knowledge, is both certain and obvious; and perhaps it is equally certain and obvious that if the law annulled all
transactions of this kind, a very large proportion of all the buying and selling, of all that goes under the name of speculation, must come to an end. The courts of the United States have held that a buyer is not bound to communicate to a seller extrinsic circumstances which were very material to the price, and were known to the buyer alone. Still, while the law is so in general, there are cases in which the concealment of special knowledge invalidates a transaction founded upon that concealment. If one injures another by such fraud as the law recognizes, he is responsible although not interested in the transaction, and not himself gaining by the fraud; as, for example, when one knowingly gives false recommendations of a person seeking employment.—It may be proper to mention the doctrine of constructive fraud, or that by which the law treats as fraudulent certain acts which have, or which are adapted to have, the effect of fraud, although none be intended; as, for example, if one buys a chattel, and leaves it, however honestly, in the possession of the seller, this is a void sale as against a third party who buys of the seller not knowing the previous sale. This not taking away what one buys is held in some courts to be conclusive evidence of constructive fraud, and in others to be only what is called a badge of fraud, or a very suspicious circumstance indicating fraud, but open to explanation. (See Sale.)

Frauds, Statute of. This is a very peculiar law, and in its extent and systematic form is quite unknown out of the British empire and the United States. It originated, nearly two centuries ago, in the earnest desire of eminent English jurists to prevent the numerous frauds which were perpetrated by means of suborned and perjured witnesses; and it was thought that the more effectual way of doing this would be a provision that a large number of the most common contracts should be incapable of legal enforcement unless they were reduced to writing and signed by the party whom it was sought to cheat. For this purpose, in the 29th year of Charles II. (1676), the “statute for the prevention of frauds and perjuries” was enacted; and it is commonly known by the shorter name of the “statute of frauds.” It has always been doubted by wise lawyers and judges whether this statute has not caused and protected as many frauds as it has prevented. But the same reasons which led to its enactment have always produced a prevailing belief that on the whole it was useful. Hence, its provisions have been enacted more or less entirely, or declared to be law by adoption, in nearly if not quite all the states of the Union. In no one of them is the English statute verbally copied; and perhaps the provisions are not precisely the same in any two states. But they all copy parts of the original statute, and most of them enact its most material parts, and the difference between the enactments of different states is, generally speaking, not important. The reason why so many have deemed the statute useless or worse is, that it has been found impossible to make all its provisions, or even its more important ones, universally known. Hence, while by its requirement of written evidence it tends strongly to suppress that large class of frauds which was founded upon mere perjury, it tends also to expose innocent parties to grievous fraud through their ignorance of this requirement. They make, and perhaps with much care, important bargains, with all the details well adjusted; but they do not take the precaution to have their agreements reduced to writing and verified by signature; and after complying with their part of the bargain in good faith, they learn for the first time in court, or from their counsel, that their bargain gives them no legal right or remedy, because of the omission of that which they had never supposed to be requisite. We shall proceed to give the most general rules in regard to the provisions of this statute (meaning thereby both those which are most widely adopted, and those of the most important and frequent application) which have been sanctioned by the jurisprudence of the United States; without, however, attempting to go into a close consideration of the details and diversities of state enactment or adjudication.—By the fourth section of the English statute, which is the one that our statutes copy most frequently, no action can be brought upon an agreement not reduced to writing and signed by the party to be charged therewith, or by some person by him authorized, if by the action: 1, any executor or administrator is to be charged to answer damages for the deceased out of his own estate; 2, or if any person is to answer for the debt, default, or miscarriage of another; 3, or upon any agreement in consideration of marriage; 4, or upon any contract for the sale of lands, or any interest in or concerning them; 5, or any agreement not to be performed within one year from the making thereof. In reference to all these, it is held that a signing is sufficient if substantial, although not literal and formal: as if in a letter signed by the party he alludes to and recognizes the agreement; or if the party writes his name at the beginning or in any part of the agreement, with the intention that it shall verify the instrument as his own; or if a broker, for both parties or either party, writes their or his name in his book, they or he assenting. But where, as in some of our statutes, the word used is not “signed” but “subscribed,” there it has been said, but may not be certain, that the name must be written at the bottom of the agreement. So the name may be printed, or written in pencil. An agent may sign, and may sign sufficiently although he write only his own name; and any ratification of his signature would be equivalent to a previous authority. But one of the contracting parties cannot sign as the agent of the other. An auctioneer or his clerk, or a broker,
may be agent for either party or both; and his entry of the name of a seller or purcharser, at the time of the sale, satisfies the requirement of the statute, unless there be some agreement or condition to the contrary. The written agreement need not be in any precise or regular form, but must contain all the substantial elements of the bargain. In England, and in some of our states, it must recite the consideration of the contract, while in others, if the promise be in writing and signed, the consideration may be proved by other evidence. The agreement may be contained in letters, and written on several pieces of paper, if they are such that they can be read together consistently with their purpose and character. And if a contract be severable in its own nature, and in some of its parts the statutory requirement is satisfied and in some not, the contract is still enforceable for those parts which comply with the statute. If a written contract be sued, it may be shown in defence that it has been altered. But if a plaintiff rests upon his written contract, but can maintain his action by it only by showing that it was orally altered, it is no longer the written contract on which he rests, and the action is defeated. Of the special clauses, the second, relating to a promise "to answer for the debt, default, or miscarriage of another" makes the statute cover all guaranties; and it is of great importance in respect to them. But it will be more convenient to state the law in this behalf under the title GUARANTY. The third clause, which relates to promises "in consideration of marriage," is held not to apply to a promise or contract to marry, but to all promises of settlement, advancement, or other provision in view of marriage, and therefore all these must be in writing and signed. And it must be a promise to the other party; thus a promise of an advancement made to a daughter, in writing, not known to the intended husband until after the marriage, is not a promise to him and cannot be enforced by him. The fourth clause relates to any promise or contract for "the sale of lands, tenements, or hereditaments, or any interest in or concerning them." The very broad scope of this phraseology has been considerably curtailed by adjudication. Thus, a contract for the sale of growing crops may be within the requirement of the statute or without it, according to circumstances. If the crop is already reaped, it is certainly severed from the land, and is of course a mere chattel; but even if it be still growing, if the intention of the parties be to reap it when grown and remove it at once from the land, this is not held to be a contract for a sale of an interest in lands; and the same rule was applied to a sale of mulberry trees in a nursery. While there is some uncertainty in the cases, we think the same rule of construction applies to growing grass, trees, or fruits, making writing unnecessary for the enforcement of a contract respecting them; at least, if the seller himself is to sever and deliver them. A mere license to use land for some special purpose, as to stack hay, or leave a wagon on it for a short time, is not a bargain for an interest in lands. But a contract to convey lands for certain services is within the statute; and if it be not in writing, and the services be rendered, the party rendering them cannot enforce the contract or have the lands; but he may sue for the value of his services, and in determining that value the value of the lands may be taken into consideration. The fifth clause relates to an agreement "that is not to be performed within one year from the making thereof." Here the important principle has become well settled that a contract or agreement is not within the statute, and therefore need not be in writing, if it be in reality and in good faith capable of a full and substantial performance within one year, unless extraordinary circumstances interfere to prevent it; and this principle is applied even where the parties themselves do not contemplate any performance of the contract within a year from the making of it. Thus, if one agrees to work for another "for one year," no time for the beginning of the service being fixed, he has a right to begin instantly, and then all his service will be rendered within the year, and the contract need not be in writing. It is important to remember, that if a contract which should have been in writing, but is not, is wholly performed on one side, and is such that nothing remains but the payment of the consideration money, there are many cases in which an action may be maintained in some form for the money due.—Another section (the 17th of the English statute) enacts that "no contract for the sale of any goods, wares, or merchandises, for the price of £10 or upward, shall be good, except the buyer shall accept part of the goods so sold and actually receive the same, or give something by way of earnest to bind the bargain, or in part payment," or that some note or memorandum be signed as before. This provision, in some form or other, is very common in the United States. The sum is variously fixed, in different states, at about $50 to $500, rarely less or more. The principal questions which have arisen under this clause are, what delivery and acceptance, or what earnest, or what part payment, will satisfy the statute, so as to make the writing unnecessary. In the first place, there must be both delivery and acceptance. A meets B, and they agree orally that A shall buy 100 bales of cotton which B has for sale for $25,000. B sends the cotton forthwith to A's store. This, according to common law, completes the sale and B's right to demand the price. But by the statute of frauds, if there be no note or memorandum in writing signed by A, he may instantly, and without assigning any reason, send all the cotton back to B. As to what is a delivery, it may be said, in general, that it is any transfer of possession and control, made by the seller, for the purpose and with the effect of
FRAUDS (Statute of) putting the goods out of his hands and into the hands of the buyer. It may be an actual delivery; or it may be constructive, as by the delivery of the key of a warehouse, or making an entry in the books of the warehouse keeper, or the delivery of an indorsed bill of lading, or even pointing out as the buyer's own massy goods that are difficult of removal, as timber in a dock, or a large stack of hay. So a part may be delivered for the whole, and carry with it constructively the delivery of the whole. On the other hand, as to what constitutes acceptance, we must look mainly at the intention of the party; for if he so acts as to manifest his assent to the delivery, and his intention to accept and retain the goods, or so as to justify the seller in believing that the buyer so assents and intends, this will have the effect of fixing his liability for the price, whatever be the way in which his acts show the article as an intention. Hence mere delay, or holding the goods for a considerable time in silence, is an assent and acceptance. But as he has a right to examine the goods and see whether he chooses to accept them, he must be allowed time enough for this purpose; and his silence during a period of time that is not more than sufficient for this is not evidence of acceptance. It has been much questioned whether the sale of shares of stocks in incorporated companies, as, for example, in corporations for manufacturing purposes, for railroads, and the like, is a sale of "goods, wares, and merchandises," within the meaning and operation of the statute. In England the prevailing authority is that these shares are not "goods, wares, or merchandises" within the statute, and therefore the bargain need not be in writing. Perhaps the prevailing rule in the United States is the other way. But the authorities are to some extent conflicting, and the question may not be considered settled. As to giving something by way of earnest (the exact words of the English statute are "in earnest"), almost anything which has an actual value, though a small one, may suffice. Thus, a dimes, or even a cent, might be sufficient, but not a straw or a chip, though it were called "earnest money;" it would be safe, however, if earnest were relied upon as clinching the bargain (to use an old phrase), to give money of some real and considerable value. So, part payment has the same effect as earnest money; but it must be an actual part payment. Therefore, if the seller owes the buyer, and it is a part of the bargain that the debt shall be discharged and be considered as a part of the price to be paid, the contract must nevertheless be in writing, because this is not a part payment within the meaning and requirement of the statute. If, however, the debt were certainly and irrevocably discharged, as by the giving up of a note of hand, the decision might be otherwise. The difficult question has been much considered whether a bargain that A should make and sell a certain article to B is a contract for the sale of the thing, which must be in writing, or a mere bargain whereby B hires A to work for him in a certain way, which need not be in writing. Perhaps no better rule or principle for deciding this question can be found than the following: A contract to buy a thing presently, which the seller has not now, is just as much within the requirement of the statute as a bargain for a present sale; and if by the bargain the seller may himself buy, or make, or procure in any way he likes, the thing he agrees to sell, this is only a contract for the sale of the goods, and must be in writing. But if the seller, and he alone, is by the bargain to manufacture these, and in a certain way, and of certain materials, or after a certain model, or if in any way it appears that the seller is to make certain things and charge therefor a price for his labor, skill, and material, although all these are included in the mere sale price of the article, then it is a contract for the manufacture of the goods, and not merely a contract for their sale, and it need not be in writing. The statute itself, both in England and the United States, speaks of part payment only; but courts of equity, both there and here, have strongly inclined to the rule that part performance of any of the contracts within the statute of frauds shall have the same effect that part payment has upon a contract of sale by the statute. Some doubt has been expressed as to the expediency of the rule; but it may now be considered settled that courts of equity, or courts of law having equity powers (as most American courts of law now have), will enforce an oral contract which should have been in writing, provided there has been an actual and substantial part performance of it by the party sought to be charged. In regard to other sections of the English and some of the American statutes of frauds, or analogous statutes, see Leases, Trustees, and Will.

FRAUNEBURG, a town of Prussia, in the province of East Prussia, 41 m. S. W. of Königsberg, on the Frische Ifaff, and at the mouth of the Baude; pop. about 4,000. It is the seat of the Catholic bishop of Ermland. The cathedral, which is on an elevation, has six towers, and with its surroundings constitutes a kind of fortress; it contains the tomb of Copernicus, who in 1543 died here.

FRAUENFELD, a town of Switzerland, capital of the canton of Thurgau, on the Murg, an affluent of the Thur, 28 m. N. E. of Zürich; pop. in 1870, 5,138, most of whom belong to the Reformed church. It has a cantonal school, which was founded in 1563, and consists of a gymnasium and an industrial establishment.

FRAUENSTÄDT, Christian Martin Julius, a German philosopher, born at Bojanowo, in Posen, April 17, 1813. He studied in Berlin, was tutor in the family of Baron Meyendorff in 1841-44, and next in that of Prince Sayn-Wittgenstein in Russia till 1846. Since 1848 he has resided in Berlin. He was at first to some extent an adherent of Hegel, the influence of whose doctrines is apparent in his works Uder
FRAUNHOFER, Joseph von, a German optician, born in Straubing, Bavaria, March 6, 1787, died June 7, 1826. The son of a glazier, he exercised in boyhood the trade of his father. In the intervals of labor he studied the laws of optics, made himself familiar with mathematics and astronomy, and in 1806 became technical director of the mathematical institute at Munich. He afterward united with Reichenbach and Utschneider in founding at Benedict-Beuren an establishment for the fabrication of dioptric instruments, which was transferred to Munich in 1819. He manufactured the finest crown glass, much superior to the English, for achromatic telescopes and prisms, and invented a machine for polishing surfaces in parabolic segments, a heliometer, a microscope, and the celebrated parallactic telescope of the observatory of Dorpat. By using fine prisms that were free from veins he discovered about 590 black lines crossing the solar spectrum, and projected the most important of these in a drawing of the spectrum. Similar lines he found in the spectra of the moon and of some of the planets and fixed stars, but none in artificial white lights. (See Spectrum Analysis.)

FRAUSTADT, a town of Prussia, in the province of Posen, 7 m. from the frontier of Silesia, and 14 N. E. of Glogau; pop. in 1871, 6,515. It has a convent, an orphan house, a Realgymnasium of the first class, and manufactures chiefly of woollen and linen cloth. In 1708 the Swedes, under Charles XII.'s general Rentskofli, obtained here a victory over the united Saxons and Russians.

FRAYSSINOUS, Denis Lac, a French prelate and statesman, born at Cuirères, in the district of Rouergue, May 9, 1766, died at St. Génez, Dec. 12, 1841. He studied theology at Paris, was admitted to orders in 1789, retired to Rouergue during the revolutionary persecution, and began at Paris in 1800 the public lectures upon the proofs of Christianity which were the basis of his reputation. His eloquence and genius attracted the cultivated youth of the capital, and operated effectively against the reigning philosophy. When in 1809 the French empire came into collision with the holy see, his lectures were interrupted, and in 1811 he again retired to Rouergue, and returned only with the Bourbons. In October, 1814, he resumed his conferences, and was made successively royal preacher, bishop of Hermopoli in partibus, grand master of the university (1822), member of the French academy, peer of France, and minister of ecclesiastical affairs and public instruction (1824). He recalled the Jesuits into the schools and churches. In 1830 he was intrusted by Charles X. with the education of the duke of Bordeaux, whom he soon after accompanied into exile. He returned to France in 1836, after which he lived in retirement. His principal works are funeral orations on the prince of Condé, Cardinal Talleyrand, and Louis XVIII.; Les vrais principes de l'Eglise gallicane, &c. (1818); and a collection of his conferences under the title of Défense du Christianisme (3 vols.), of which 15 editions appeared between 1822 and 1845, and which was translated into many languages.

FREDERICK, a Frankish queen, the rival of the famous Brunehaut, born about 545, died in 627. She was maid of honor to Audovera, queen of Chilperic I. of Neustria, and the king being captivated by her beauty made her his concubine. She contrived by a trick the repudiation of the queen, but was disappointed by the marriage of Chilperic with Galsinda, a Visigoth princess and sister of Brunehaut, or Brunehilde, who had been married to his brother Sigebert, king of Austrasia. Attending this marriage to the influence of the Austrasian queen, Fredericunda vowed deadly hatred to both sisters. She removed Galsinda by assassination, became her successor, and brought about a war of the two brothers, in which Sigebert was victorious, but soon fell by the hands of her assassins (575). Brunehaut, who became her captive, escaped death and returned to her own country; but Meroveus, the son of Chilperic by his first wife, who had been secretly married to her, fell a victim to the revenge of his stepmother. A series of atrocious crimes followed. Pretexatus was treacherously murdered; Clovia, the brother of Meroveus, was executed on the false accusation of having caused the death of Fredericunda's three children; the mother of the princes was strangled, their sister outraged and confined in a convent. Finally, she contrived the assassination of her husband, and assumed the government in the name of her son Clotaire. She now successfully resumed the war against Austrasia, and remained in power till her death.

FREDERICA. See Fredericia.

FREDERICK. I. A N. county of Maryland, bordering on Pennsylvania, and separated from Virginia on the S. W. by the Potomac river; area about 770 sq. m.; pop. in 1870, 47,572, of whom 7,572 were colored. A branch of the Blue Ridge of Virginia, called South mountain, runs along its W. border, but most of the land in the central and E. parts is undulating. The soil is fertile and well watered by the Monocacy river, Cotocin, Pipe, Linganore, and Bennett's creeks. Copper, iron, manganese, excellent limestone, and fine white marble are among the mineral products. The county is traversed by the Baltimore and
and the Western Maryland railroads, and has on its S. W. border the Potomac river and the Ohio and Chesapeake canal. The chief productions in 1870 were 1,138,828 bushels of wheat, 54,926 of rye, 1,360,420 of corn, 360,069 of oats, 138,484 of potatoes, 32,999 tons of hay, 877,784 lbs. of butter, 34,533 of wool, and 274,389 of tobacco. There were 11,860 horses, 11,907 milch cows, 10,188 other cattle, 9,817 sheep, and 29,989 swine; 16 manufactories of carriages and wagons, 1 of charcoal, 15 of clothing, 25 of barrels and casks, 2 of fertilizers, 15 of furniture, 6 of lime, 16 of saddlery and harness, 3 of saddles, doors, and blinds, 11 of tin, copper, and sheet-iron ware, 10 of cigars, 8 of woolen goods, 4 of bricks, 47 flour mills, 4 iron works, 21 tanneries, 10 currying establishments, and 2 distilleries. Capital, Frederick. II. A N. county of Virginia, bounded N. E. and W. by West Virginia; area, 878 sq. m.; pop. in 1870, 18,696, of whom 2,733 were colored. It occupies part of the great valley of Virginia, is highly productive, and abounds in the mountain scenery. Two or three small affluents of the Potomac supply it with good water power. The Winchester, Potomac, and Strasburg railroad passes through the county. The chief productions in 1870 were 289,698 bushels of wheat, 182,672 of Indian corn, 78,743 of oats, 23,661 of potatoes, 8,725 tons of hay, 280,179 lbs. of butter, and 26,928 of wool. There were 3,990 horses, 3,405 milch cows, 4,122 other cattle, 6,641 sheep, and 6,702 swine; 7 manufactories of carriages and wagons, 3 of gloves, 2 of stoves, &c., 1 of ground sumach, 7 of woolen goods, and 19 flour mills. Capital, Winchester.

FREDERICK, a city and the capital of Frederick co., Maryland, situated on Carroll's creek, 2 m. from its mouth in Monocacy river, about 40 m. W. by N. of Baltimore; pop. in 1850, 6,088; in 1860, 6,143; in 1870, 8,326, of whom 1,182 were colored. It is a well built city, with wide regular streets, lined with houses of brick or stone. A branch railroad 3 m. long connects it with the Baltimore and Ohio railroad. It has an extensive trade, and important manufactories of iron, wool, paper, flour, leather, &c. There are four national banks, with an aggregate capital of $357,000; a savings bank, with $217,231 capital; three weekly newspapers, and 10 or 12 churches. The city is the seat of several important educational and religious institutions. Frederick college, established by the state in 1797, in 1872 had 3 professors, 109 students, and a library of 2,800 volumes. Frederick female seminary, established in 1842, had 8 instructors, 81 students, and a library of 1,000 volumes. The convent of the Visitation nuns has an asylum for the education of the daughters of the clergy, and a library for novices of the society of Jesus 1,100 volumes. A state institution for the education of the deaf and dumb was organized here in 1867, which in 1872 had 9 instructors, 97 pupils, and a library of 2,000 volumes.

FREDERICK, the name of several monarchs and princes, arranged below under their respective countries in alphabetical order:

I. BADEN.

FREDERICK I, grand duke, born Sept. 9, 1826. The second son of the grand duke Leopold, he became regent for his brother, who was bodily and intellectually infirm, April 24, 1852, succeeded as grand duke Sept. 5, 1856, and married in the same year a daughter of the present emperor of Germany. He is distinguished by his enlightened views of civil and religious government. At the gathering of princes at Frankfort in 1868 he opposed the plans of Austria, and urged the supremacy of Prussia. He was nevertheless constrained, together with the other states of south Germany, to side with Austria in the war of 1866, but subsequently he readily and closely allied himself with the North German confederation. During the Franco-German war he went to Versailles, and strenuously exerted himself in favor of the formation of the German empire and the imperial constitution.

II. BOHEMIA.

FREDERICK, elector palatine (V.) and king of Bohemia, born in Amberg in 1596, died in Mentz, Nov. 19, 1632. He was the son of the elector Frederick IV., and by his mother grandson of William I. of Orange. He received a careful education, succeeded his father in the palatinate in 1610 as a minor, married Elizabeth, daughter of James I. of England, became the leader of the Protestant union, and in the second year of the thirty years' war (1619) was elected king of Bohemia by the revolted people. Induced by his ambitious wife, he accepted the regal crown, which he soon after lost through the battle of Prague (Nov. 8, 1620), rapidly won by his cousin Maximilian of Bavaria, the head of the Catholic league. Frederick hastily escaped to Holland, and lived in exile, under the ban of the empire and persecuted by ridicule.

III. DENMARK.

FREDERICK VI., king of Denmark, son of Christian VII. and the princess Caroline Matilda, born Jan. 28, 1768, died Dec. 3, 1839. He was declared regent at the age of 16. His education had been much neglected, but he had great natural intelligence, firmness, and a capacity for observation. With the help of his minister Count Bernstorff he applied himself to the abolition of feudal serfdom in Denmark (which in 1804 he also effected in Schleswig-Holstein), the reformation of the criminal code, the breaking up of monopolies, the establishment of a better financial system, the removal of the disabilities of the Jews, and the earliest prohibition of the slave trade. March 16, 1792, was the date of the edict against the slave trade, providing for its enforcement on and after Jan. 1, 1804. Bernstorff, who died in 1797, had recommended to the regent to observe a strict
neutrality in the wars of the epoch, but this soon became impossible. In 1800 the regent concluded a convention with England, whose claim of right to search Danish merchantmen for goods contraband of war had led to much retribution, and even some acts of open hostility. But in December, 1800, Denmark having signed the maritime confederacy with Russia, Sweden, and Prussia, on terms similar to the armed neutrality of 1780, war broke out afresh. Every Danish vessel in English ports was seized on Jan. 14, 1801. On March 20 Sir Hyde Parker, with Nelson second in command, entered the Oostegat with a fleet of 47 vessels, 18 of which were line-of-battle ships. The regent was summoned to withdraw from the neutral convention, and to open his ports to the English. The demand was rejected, and a furious engagement followed, in which the Danish fleet was almost annihilated (April 2). An armistice was now concluded for 14 weeks, and this was soon followed by a peace, the confederacy having been broken up in consequence of the assassination of the czar Paul. Frederick, however, persisted in the policy of neutrality, and on Aug. 8, 1807, a British fleet appeared off Copenhagen. The prince was summoned to an alliance with England, and to surrender his fleet, his capital, and his castle at Elsinore. On his refusal, the capital was bombarded for three days (Sept. 2–5). A capitulation was then made, the fleet was transferred to a British admiral, the arsenal and docks were destroyed, and every ship and boat, as well as every available piece of timber, rope, or shipwright's tool, was carried to England. Denmark threw herself at once into the arms of France, and sent forth a fleet of privateers which preyed incessantly upon British commerce. The father of the Danish regent, the unhappy Christian VII., died March 13, 1808, and Frederick ascended the throne. He had married in 1790 the daughter of the landgrave of Hesse-Cassel. On Dec. 10, 1809, Sweden signed away Finland to Russia; and in the course of the following month a treaty was concluded by Denmark with Sweden which was designed to re-establish the good relations of the two countries. Both were exhausted by the wars of their great neighbors, and both soon became subject to the will of Napoleon. Denmark remained his faithful ally, and suffered accordingly. In 1814 she was robbed of Norway, in exchange for which she received Pomerania, which she afterward ceded to Prussia. Frederick was at last compelled to send 10,000 men to the allied army against the French emperor. The kingdom had become bankrupt in 1813. The peace brought with it an immense fall in the price of provisions; and real estate remained at a great depreciation of value. The wisdom and devotion of the king gradually brought about improvement in general affairs. A national bank was re-established. The farmers were allowed to pay their taxes in kind. Order was restored to the finances, and confidence returned. The last part of Frederick's reign is remarkable for the establishment of a representative council as a popular branch of the government (May 28, 1811), which was received by his subjects with every demonstration of joy.

FREDERICK VII., king of Denmark, son and successor of Christian VIII., born in Copenhagen, Oct. 6, 1808, ascended the throne Jan. 20, 1848, died at Glücksburg, Nov. 15, 1863. His mother was the princess Charlotte Frederike of Mecklenburg-Schwerin. From 1826 to 1828 he travelled in various parts of Europe, and studied in Geneva. He married on Nov. 1, 1828, the princess Wilhelmina Maria of Denmark, whom he divorced in 1837; and in the same year he was removed by royal order to Fredericia in Jutland. His exile ended with his father's accession to the throne in 1839, when he was appointed governor of Fünen and member of the council of state. In June, 1841, he married the princess Caroline Charlotte Marianne of Mecklenburg-Strelitz, whom he also put away in September, 1846; and in August, 1850, he contracted amorganatic marriage with a milliner of Copenhagen whom he had created Countess Danner in 1848. The principal events of his reign are the revolt of Schleswig-Holstein in 1848, and the subsequent war, and the abolition of the Sound dues in 1857, for an account of which see Denmark. After the restoration of peace he left the control of the government in the hands of the ministry, and devoted himself to his favorite study of archaeology. While yet crown prince he was president of the royal archaeological society, which place he held till his death. He published a number of works on that subject, among them Uber den Bau der Riesenbeter der Vorseit (1867.) With his death the elder line of the royal house of Oldenburg became extinct. His equestrian statue was unveiled at Copenhagen on Oct. 7, 1873.

IV. GERMANY.

FREDERICK I., emperor of Germany, surname Barborossa (Redbeard), son of Duke Frederick II. of Swabia, and Judith, daughter of Henry the Black, duke of Bavaria, born in 1191, drowned in Asia Minor, June 10, 1190. His uncle, Conrad III., the first German emperor of the house of Swabia (Hohenstaufen), had so entirely won the confidence of the princes and nobles of both Italy and Germany, that upon his recommendation Frederick, then duke of Swabia, was unanimously elected his successor (1152). After reducing several revolted Italian cities and receiving the crown of Italy at Pavia, he went to Rome, reestablished the pope's supremacy there, which had been shaken by Arnold of Brescia, and was crowned emperor, but not until the pope (A.1155.) had obliged him to perform several humiliating ceremonies. His next care was to pacify the empire by settling the disputes between the archbishop of Mentz and the count palatine of the Rhine, and the difficulties concerning the
duchy of Bavaria. He reduced Boleslas of Poland to vassalage, and in six years had restored the empire to the prosperity which it enjoyed under Henry III. He now turned his attention again to Italy, where the smaller towns were oppressed by Milan, and in 1168 he appeared before that city with 115,000 troops and forced it to submission. Crema was destroyed after a terrible siege (1160). Milan soon rebelled again, and its fortifications were destroyed and its inhabitants exiled. Meanwhile Pope Adrian had died (1159), and Alexander III. been chosen to succeed him. Frederick supported an antipope, Victor V. (or IV.), and Alexander fled to France. Victor died in 1164, and the emperor thereupon set up another antipope, who took the name of Pascal III., and crowned the emperor and his consort a second time in the church of St. Peter at Rome in 1167. The Lombard cities had formed a powerful league against Frederick, and a terrible pestilence which broke out in his army forced him to return to Germany in disguise, with only a few followers. The defences of Milan were then restored, and a new city sprung up in a beautiful and naturally fortified spot, which in honor of the pope and in defiance of the emperor was called Alexandria or Alessandria. During this time Frederick was busily engaged in regulating the affairs of Germany and strengthening his own power. In the autumn of 1174 he invested Alessandria, and besieged it for five months, during which his army suffered greatly. The Lombards came to the relief of the city, and on May 29, 1176, a decisive battle was fought near Legnano, in the vicinity of the lake of Como, in which Frederick was defeated with great loss, and was supposed for some days to have been killed. He reappeared at Pavia, where the.empress had already put on mourning, acknowledged Alexander as pope, and in July, 1177, held an interview with him at Venice, in which a complete reconciliation was effected, Frederick humbling himself again at the pope's feet, and receiving from him the kiss of peace. The cities of Lombardy obtained a truce for six years. New troubles were now raised in Germany by the ambitious duke Henry the Lion. He was finally subdued, and banished for three years. The Lombard truce was followed in 1189 by a definitive treaty of peace on terms honorable to all parties, and when Frederic made a journey to Italy soon afterward he was received with acclamations of joy. Tranquillity reigned in all his dominions when the news of the fall of Jerusalem in 1187 caused Pope Clement III. to proclaim the third crusade. The old emperor took the cross, and in the spring of 1189 put himself at the head of 150,000 warriors, crossed Hungary, severely punished the Greeks, whom he suspected of treachery, penetrated into Asia Minor, defeated the Moslems in several engagements, and took Iconium (Konieh). The army reached the banks of the Seleph or Calycadnus in Cilicia, June 10, 1190. The vanguard had crossed by a bridge, when the emperor, impatient to join his son, Duke Frederick of Swabia, who led the advance, plunged with his war horse and heavy armor into the stream, was overtaken by the current, and was borne away. Some historians have preferred a less well authenticated account that he lost his life in consequence of bathing, like Alexander, in the Cydnus. Frederick was a man of noble qualities, of great mental endowments, and of spirit equal alike in reverses and prosperity, though somewhat arrogant and not seldom cruel in the heat of war. He was a patron of letters and a man of learned accomplishments, and remarkable for elegance and majesty of aspect. He wrote memoirs of some parts of his life, which he left to Otho, bishop of Freising. After divorcing his first wife (1156), he married Beatrice of Burgundy. His son Frederick, founder of the Teutonic knights, lost his life in the third crusade, and another son, Henry VI., succeeded to the empire.

FREDERICK II., a German emperor and king of Naples and Sicily, grandson of the preceding and son of Henry VI. and Constantia of Sicily, born at Jesi, near Ancona, Dec. 26, 1194, died at Fiorentino or at Fiorenzuola, Dec. 13, 1250. He was carefully educated by his mother under the guardianship of Pope Innocent III., acquired an extensive knowledge of ancient and modern languages, and of different sciences, including philosophy, which he learned from a Saracen teacher, and poetry, which he cultivated himself, and soon developed those chivalric and royal talents, that active, energetic, and buoyant spirit, which made him one of the most distinguished monarchs of the middle ages. He was hereditary duke of Swabia and other dominions in Germany, but for his investiture and coronation as king of Naples and Sicily his mother sacrificed to Innocent III. (1209) some of the most essential rights of the state. His uncle, Philip of Swabia, who disputed the throne of Germany after the death of Henry VI. with Otho IV., having fallen in battle, Frederick was assisted by the pope to reestablish the imperial dignity of his house. He went to Germany in 1212, was joyfully received by the Ghibellines, compelled Otho to retire, was crowned at Aix-la-Chapelle in 1215, and generally acknowledged in 1218. Leaving his son Henry, whom he caused to be declared king of the Romans, in Germany, he started in 1220 for Italy, hastened to Rome, where he was crowned as emperor, and thence to his hereditary kingdom, whose affairs he arranged while preparing for a crusade, according to a solemn promise given to the see of Rome. Men of science, poets, and artists flocked to his court, the university of Naples was founded, the medical school of Salerno became flourishing, collections of art were procured, and Peter de Vinea prepared an extensive code of laws to suit all the classes and nations of Germany and Italy, which Frederick was scheming to unite into one hereditary empire. These
schemes were checked by the independent spirit of the Lombard cities, and by the opposition of the popes Honorius III. and Gregory IX., who finally compelled the emperor by threats of excommunication, to start upon his long delayed crusade (1297). But a pestilential disease which broke out on board the fleet obliged him to land at Otranto, where the greater part of the pilgrims dispersed. The expedition only reached the Morea, and Gregory punished the emperor with excommunication and interdict. It was in vain that Frederick started again the next year, reached the Holy Land, and fought successfully against the Mussulmans; the policy of the pope, who declared him unworthy before absolution to battle for the cross, roused against him the patriarch of Jerusalem and the three orders of knights in the East, and also induced his father-in-law, John of Brienne, titular king of Jerusalem and emperor of Constantinople, to invade the Italian kingdom. Having concluded a truce of ten years with the sultan of Egypt, which brought into his possession the holy cities and the whole coast of Judea, he returned as crowned king of Jerusalem, reconquered his kingdom, defeated the intrigues of his enemies, and finally gained his absolution (1230). The Lombard cities still maintained their league, being now supported by the rebellion of Henry, the son of the emperor. Frederick returned to Germany after an absence of 15 years, restored his imperial dignity, and pardoned his son. But a new rebellion drew upon the prince the punishment of imprisonment for life, in the seventh year of which he died. His younger brother Conrad was made king of the Romans in his stead, and Frederick marched against the Lombards, and defeated them at Cortenova (Nov. 26–27, 1237); all the cities surrendered except Milan, Brescia, Piacenza, and Bologna, whose resistance was again encouraged by Gregory IX. Irritated by Frederick's having made his natural son Enzio king of Sardinia, the pope again excommunicated the emperor on Palm Sunday, 1239. Frederick marched against Rome, took Ravenna, and had the Genoese fleet, which was conveying 100 prelates to Rome, intercepted by Enzio (1241). Gregory IX. did not long survive these reverses. The short papacy of Celestine IV. and a long interregnum followed, which was terminated by the election of Innocent IV. The new pope, once the friend of the emperor, became his bitterest enemy, confirmed his excommunication, fled to Lyons in France, where he convoked a council, cited Frederick before this tribunal, rejected his defender Thaddæus of Sessa, declared the throne of Germany vacant, and subsequently recognized two new emperors, Henry Raspe of Thuringen, who was defeated by Conrad, and William of Holland. The emperor, deserted by many of his allies, lost a battle before Parma, and another near Bologna, in which Enzio was made prisoner. But he continued the struggle until he died.

FREDERICK III., king of Germany. See Louis IV., the Bavarian. FREDERICK III., surnamed the Pacific, fourth emperor of Germany, by the name of Hapsburg (Frederick IV. as king of Germany, and V. as archduke of Austria), son of Duke Ernest of Styria and a Polish princess, born in Innsbruck, Sept. 21, 1415, died in Linz, Aug. 19, 1493. He began his reign over Styria, Carinthia, and Carniola, together with his brother Albert the Prodigal, in 1435, became after the death of the emperor Albert II. (1489) guardian of his son Ladislas the Posthumous, and was unanimously elected to the throne of Germany in 1440, and crowned at Aix-la-Chapelle in 1442. Possessed of many private virtues, he was nevertheless inadequate to the task of ruling the German empire in that period of anarchical turbulence, or even of defending the interests of his house against the attacks of the warlike and ambitious Matthias Corvinus, king of Hungary, George Podiebrad of Bohemia, and Charles the Bold of Burgundy. As the only weapon he seems to have wielded with dexterity was diplomacy, but this, too, served only the private purposes of the house of Austria, of which he may be regarded as the second founder. Wars, however, in which his part was generally passive, filled nearly the whole reign of this peace-loving monarch, which was the longest of any German emperor's, lasting for 58 years. His brother Albert, duke of Upper Austria, repeatedly attacked him; the Hungarians under John Hunyady invaded Austria (1445–52); the Armagnacs, whom the emperor had called to aid him against the Swiss, committed depredations (1445); Matthias Corvinus and George Podiebrad defeated the imperial forces; the Turks ravaged Carniola (1468); hostilities broke out with Charles the Bold of Burgundy, and a war was carried on in the Netherlands, which Maximilian, the son of Frederick, had received after the death of Charles the Bold (1477) with the hand of his daughter Mary, and where he was made captive in 1488. Frederick was also humiliated by the usurpation of Sforza at Milan (1447), after the death of the last Visconti; by the Swiss, who routed the Armagnacs, and compelled him to an unfavorable treaty (1449); in the quarrel of the succession of the Palatinate (1449), which threatened to cost him his throne; by continual lawlessness in Germany, where he was once cited before the secret tribunal of the Vehme; and by the successive encroachments of the pope, particularly of Pius II. (once his secretary as Aeneas Sylvius). His chief efforts to avert the invasion of the Turks were a journey to Rome for a conference with the pope (1468), and the convening of a diet at Ratisbon (1471), both without result. In 1485 Frederick had a new quarrel with Matthias, who wrested from him Vienna and all Lower Austria. On the death of Matthias (1490), Frederick regained these possessions, and his last years were cheered by the successes of his son.
Maximilian, whom he had made king of Rome (1486), and finally intrusted with all the cares of his dominion (1490), himself retiring to Linz, where he engaged in his favorite studies of astrology, alchemy, and botany till the end of his life. He was the last king of Germany who was crowned emperor of Rome and king of the Lombards. Having inherited Lower Austria on the death of Ladislas, and Upper Austria on that of his brother Albert, he raised these united provinces to the dignity of an archduchy. The crown of Germany became nearly hereditary in his house, the next successor being his son Maximilian I. His device is said to have been A. E. I. O. U.: Austria est imperare orbis universo. A collection of his sayings was published under the title of Margarita Facetiarum (Strasburg, 1609).

V. HESSE-CASSEL.

FREDERICK WILLIAM, elector of Hesse-Cassel, born Aug. 20, 1802, died Jan. 8, 1875. He succeeded to the electorate Nov. 20, 1847. Although his mother was a daughter of King Frederick William II. of Prussia, he joined Austria in 1866; and as he declined to remain neutral in the war between that state and Prussia, or to accept the proposals of the latter for a reform of the German diet, a Prussian army invaded his territory (June 16), and he was arrested (June 28) and detained in the castle of Stettin. Despite the annexation of his electorate to Prussia with the consent of Austria, he would not relinquish his rights as a sovereign prince until Sept. 17, 1867, when he agreed to abdicate, on condition of receiving a life interest in the electoral crown domain, besides a sum of 600,000 thalers and the privileges of inhabiting the palaces in the province of Hanau. After his release he resided on his estates in Hanau and in the palace of Prince Windischgrätz, which he purchased, in Prague. In September, 1873, he renounced all his rights and personal property, on condition of Prussia's paying him an annuity of 200,000 thalers during his life.

VI. MECKLENBURG-SCHWERIN.

FREDERICK FRANCIS II., grand duke of Mecklenburg-Schwerin, a German soldier, born Feb. 28, 1829. He became grand duke in 1842, was in the same year made a general in the Prussian army, and participated in 1864 in the war against Denmark, and in 1866 against Austria. He joined in 1867 the North German confederation, and on the outbreak of the Franco-German war (July, 1870) he was made commander-in-chief of the 13th army corps. He captured Laon (Sept. 9), Toul (Sept. 23), and Soissons (Oct. 16), and was placed at the head of a new corps in the operations against Paris. He defeated Kératry at Drezn (Nov. 17), and after joining in various engagements near Orleans under Prince Frederick Charles, he took possession of Blois (Dec. 18) and contributed to the defeat of Gen. Chanté near Vendôme (Dec. 15) and Le Mans (Jan. 12, 1871), and captured Ailéron. His grand duchy had in the mean while been made a member of the German empire. On the entrance of the German army into Berlin (June 10, 1871) the emperor William appointed him chief of the second inspection of the army.

VII. PRUSSIA (INCLUDING BRANDENBURG).

FREDERICK WILLIAM, elector of Brandenburg, usually styled the Great Elector, and the founder of the Prussian monarchy, born in 1620, died in Potsdam, April 29, 1688. He came to the electoral power at the age of 20 (1640), on the death of his father, George William, the 10th elector. The father had been a feeble prince, with a traitorous minister. His estates had for many years been ravaged by the contending parties in the thirty years' war. The cities lay almost in ruins, the villages had been for the most part burned and depopulated, and a part of his paternal inheritance had been confiscated by the Swedes. The young prince began his reign by dismissing his father's unworthy council, regulating his finances, and negotiating with so much address as to regain his lost provinces, which were guaranteed to him by the peace of Westphalia eight years later. A year after his accession he concluded a treaty of neutrality with the Swedish queen Christina, and three years after, by an armistice with Hesse-Cassel, the strong outpost city of Cleves and the county of Mark in Westphalia were added to his domains. Under the treaty of Westphalia (1648) the elector, who had just claims to the whole of Pomerania, received only the eastern portion of that country; but as an indemnification for the loss of the western division and the island of Rügen, he obtained the country of Hohenstein, the bishoprics of Minden, Halberstadt, and Kamine, as lay principalities, and the reversion of the archbishopric of Magdeburg. After the conclusion of the peace, Frederick William directed his attention to the organization of a standing army, and after a few years he had an army of 25,000, disciplined according to the Swedish system. He formed an alliance with Charles X. of Sweden in 1655 against Poland. The sequel was the fall of Warsaw, and Frederick's achievement of the independence of his Prussian duchy, formerly under enfeoffment to Poland. Louis XIV. at this time was pursuing his project of a Rhine frontier and the conquest of the Spanish Netherlands. He seized a line of frontier towns, and invaded Holland (1672). Of the German princes, the elector of Brandenburg alone seemed conscious of the danger, and after arming his exposed Westphalian dominions he appealed successfully to the emperor Leopold I., to Denmark, to Hesse-Cassel, and other German states. A joint army was placed under the command of an imperial general; but the imperial cooperation was crippled through the machinations of Leopold's privy councilor, Lobkowitz, who
became a secret tool of the French ministers. Frederick William was compelled thus to come to terms with France, with the loss of Wesel and Reeze (1673). Immediately after this event, Leopold resuming operations against the French, the elector again took up arms, and Louis, in order to keep the electoral forces occupied in their own country, engaged the king of Sweden to advance upon Berlin. The Swedes accordingly entered Brandenburg by a rapid forced march. Frederick William arrived suddenly from the Rhine at Magdeburg, and hurrying across the Elbe at the head of his cavalry (only 8,000 in number), surprised the Swedes at Fehrbellin. His infantry (11,000) were many miles in the rear, but he attacked the enemy without delay, June 18, 1675. The rout was complete. Frederick pursued the flying enemy into Pomerania, and reduced the greater portion of the province. By the treaty of St. Germain, June 29, 1679, the elector restored nearly all his conquests, and received from France 300,000 crowns. He now devoted himself to the prosperity of his dominions and the extension of their area. He founded universities, welcomed 20,000 Protestant exiles whom Louis XIV. banished from France, and made it the aim of his life to oppose French aggression and to protect the liberties of Germany.

FREDERICK I., first king of Prussia, son of the preceding, born in Königsberg, July 22, 1657, died Feb. 25, 1713. He became heir apparent on the death of his elder brother. Deformed by having been dropped from the arms of his nurse, and of weak constitution, his education was neglected, and thus his stepmother could the more easily persuade the old elector to bequeath a part of his possessions to her children. But Frederick, who was no less ambitious than his father, and was assured of the favor of the emperor Leopold I., on his accession as elector in 1688 under the name of Frederick III., took immediate possession of the whole inheritance, declaring the will null, and satisfying his step-brothers with offices and pensions. While vying in brilliance with the court of Louis XIV., he also strenuously continued his father's policy of aggrandizement. Seeking the alliance of influential princes, he sent several of them his troops, on condition of mutual support or payment in money. Thus 6,000 of his soldiers aided William of Orange to secure the throne of England, and fought in the great battle of the Boyne; 20,000 fought successfully against the French, who had ravaged the Palatinate (1689); 15,000 joined the quadruple alliance of the Empire, Spain, Holland, and England, and fought on the Rhine (1690); 6,000 were sent (1691) to assist the emperor in his Hungarian war against the Turks, and contributed to the victory at Leobendorf, and Zenta, and Vienna. But all these services procured Frederick in the peace of Ryswick (1697) politically only the confirmation of the stipulations granted to his father by the treaties of Westphalia and St. Germain. Private negotiations, however, with several reigning houses gave him in part the immediate possession of, and in part hereditary claims to, various territories, which greatly enlarged the limits of his dominions. He gained the royal crown only after long negotiations by a treaty with the emperor, concluded Nov. 14, 1700, and based on the humiliating obligation to aid the emperor with 10,000 troops in the threatening war of the Spanish succession, to support the house of Austria in every debate in the diet, and to vote for its princes at every imperial election. Hastening to Königsberg in the midst of winter, Frederick placed the crown on his own head and on that of his wife, the sister of George I. of England, Jan. 18, 1701. On this occasion he founded the order of the black eagle. In the wars of Charles XII. of Sweden Frederick took no part, being actively engaged in the support of his ally the emperor in the long struggle against Louis XIV. He sent to the army on the Danube 20,000 men, who took part in the battle of Blenheim (1704), and to Italy 6,000, who greatly contributed to Eugene's victory at Turin (1706). Frederick is praised for his natural kindness, love of his subjects, and loyalty to his allies; but his vanity, love of pomp, and extravagance led to ruinous extortions. He founded the university of Halle, the Berlin academies of science and of sculpture and painting, and the supreme court of appeal. Like his father he defended Protestantism in Germany.

FREDERICK WILLIAM I., second king of Prussia, son of the preceding and Sophia Charlotte of Hanover, born in 1688, died May 81, 1740. He served in the allied army against France, and distinguished himself at the siege of Menin and the battle of Malplaquet. The new monarchy (dating from 1701) had been ungraciously recognized by the crowned heads of Europe, and the crown prince early conceived the design of making for Prussia a conspicuous place among the powers by means of an army. He ascended the throne Feb. 25, 1713, and by strict economy was enabled to maintain a peace establishment of 60,000, and at length of 72,000 men, being 4 of his subjects. His ruling mania was to form a corps of giant soldiers; and for this purpose his envoys rasnaked the world. An Irishman measuring seven feet was induced to enlist by a cash bounty equivalent to $5,200, a sum much greater than a year's salary of the Prussian ambassador who found him in the streets of London. During a reign of 27 years Frederick William preserved uninterrupted peace for Prussia, with the exception of a short misunderstanding with Charles XII., and a little idle soldiering under Prince Eugene. In 1718 he had concluded with Sweden, during Charles's engagement with Turkey, a treaty, the object of which was to preserve Swedish Pomerania from Russia and Saxony. In consideration of 400,000 thalers, Frederick received the cities of Stettin and Wismar, and was to mediate between the belligerents. Charles, return-
ing from Turkey, insisted on the restoration of Steetin, but refused to refund the money. Frederick promptly declared war, and took the field in person; and the result was the acquisition of Pomerania as far as the river Peene, with Steetin, and the islands at the mouth of the Oder, on payment of 2,000,000 thalers. The following characteristic speech was addressed by the king to his privy council when about to take the field for this war: "As I am a man, and may therefore die of a shot, I command you to take good care of Fritz [the crown prince Frederick, then three years old]; and I give all of you, my wife to begin with, my curse, if you do not bury me at Potsdam in the church vault there, without feasting and without ceremony." The wife of this amiable husband, Sophia Dorothea of Hanover, bore ten children; among whom the eldest son (afterward Frederick the Great) and a daughter, Wilhelmina, incurred the ferocious hatred of the father. His son wrote of him: "He had an industrious spirit in a robust body, with perhaps more capacity for minute details than any man that ever lived; and if he occupied himself with little things, it was that great results might be the consequence." His character was singularly full of contradictions. He was at once just and cruel; parsimonious and liberal; a careful and a brutal father; a defender of Lutheranism and protector of Protestant refugees, yet punishing metaphysicians with exile. But he liberally rewarded all who introduced any new art, and many of the greatest manufactories in Prussia owe their foundation to him. He also founded the medico-chirurgical college and two charitable institutions at Berlin, and an orphanage at Potsdam. He left to his son $6,000,000 surplus money, 72,000 soldiers, 2,240,000 subjects, and a territory of 45,000 square miles.—See Droysen's Friedrich Wilhelm I. (9 vols., Leipzig, 1869).

FREDERICK II, third king of Prussia, known as Frederick the Great, eldest son of the preceding and the princess Sophia Dorothea, daughter of George I. of England, born in Berlin, Jan. 24, 1713, died at the chateau ofSans Souci, near Potsdam, Aug. 17, 1786. Up to the age of 29 he was subjected to a cruel paternal tyranny. Educated chiefly by French refugees, he conceived a strong passion for French literature, and knew nothing of any other foreign language. Latin his father positively forbade. He was passionately fond of music, attained a high perfection as a player on the flute, and gave concerts at which his own compositions were performed, and to which he invited eminent musicians, who admired his masterly performance in adagio. He gave employment to Graun in his chapel at Rheinsberg, and finding a great inclination of his throne appointed him chapel master and sent him to Italy to engage vocalists for the projected new opera at Berlin, the establishment of which was thus due to Frederick. He was also very fond of poetry, but, ignorant of Dante or Shakespeare, Virgil or Homer, surrendered himself to Voltaire and the Henriade. "My royal titles," he wrote to his French idol, "shall run thus: 'By the grace of God, king of Prussia, elector of Brandenburg, possessor of Voltaire,' &c." Within a week he wrote to Algarotti that he knew Voltaire was a second F. R., but that he could make use of him. "Je veux savoir son français; que m'importe sa morale?" After narrowly escaping death from his father's hand, he determined to seek safety in England with his uncle George II. He was overtaken, brought a prisoner to Kustrin, compelled to witness the execution of Katt, a young officer who had been privy to his flight (1730), was himself condemned as a deserter, and was only saved by the intercession of the emperor of Germany, the kings of Sweden and Poland, and the states of Holland. His father caused him to be informed that if he would renounce the throne he might study, travel, or do whatever he pleased. "I accept," said Frederick, "if my father will declare that I am not his son." After a long imprisonment, he was appointed a councillor of war, and charged with duties which virtually banished him from court. In 1738 his father required him to marry Elizabeth Christina, daughter of the duke of Brunswick-Bevern, and in 1734 permitted him to take up his residence at the castle of Rheinsberg, where he could pursue his favorite amusements unmolested. Here he wrote many of his works, including the Anti-Machiavel (the Hague, 1740). Meanwhile the heart of the old king grew softer; a reconciliation followed; and the father, pressing his son to his heart, sobbed forth with almost his latest breath (1740): "My God, my God, I die content, since I have such a noble son and successor." Frederick's character had been wholly misconceived by his subjects and by the world. One class thought him a mere sensualist, a rhetorical voluptuary; others looked forward to a reign of moderation, peace, and universal benevolence. Both of these classes of judges, with Anti-Machiavel before them, and a knowledge of the epicurean abode at Rheinsberg, might find ground for their predictions; and both were equally confounded at the almost instantaneous transformation effected by the crown. A military despot, listening to no council, confiding in no friend, bent upon the single purpose of enlarging his monarchy, he regarded himself as an instrument appointed to elevate Prussia, and embody in the parvenu title of Prussian king that substantial possession of royal power which could only come from enlarged dominion. The pragmatic sanction of Charles VI., guaranteed solemnly by Europe, and by no member of the Austrian house, ensured more surely than by Prussia, had, it was supposed, secured the peaceful inheritance of the Austrian dominions to the young Maria Theresa as archduchess of Austria and queen of Hungary.
and Bohemia. Frederick, immediately on her father's death, sent her an offer of pecuniary aid, and she married Francis as emperor of Germany, on condition of the cession of the duchies of Glogau and Sagan, to which, as well as the greater part of Silesia, the house of Hohenzollern laid claim. This being rejected, in December he entered Lower Silesia at the head of his army, routed the handful of Austrians who were quartered on the frontier, and overran the province. In six weeks he returned to Berlin in triumph. Frederick officially pretended to justify himself, but privately acknowledged that "ambition, interest, the desire to make people talk about me, carried the day; and I decided to make war." He had inherited from his father a splendid army of 70,000 men, formed by his general Leopold of Dessau, at that period the finest troops in the world. There was in the treasury a surplus of $6,000,000. He felt that a bold stroke might be made, and that by means of a strong military organization he could obtain for his two and a quarter million subjects a foremost place among the great nations around him. Hastening in the spring (1741) to rejoin his troops, he fought his first battle at Mollwitz. His army was victorious, but its leader had fled. He had beheld real war for the first time, and so completely lost his self-command as to gallop miles from the field. His personal courage had been previously well established, when a volunteer under Prince Eugene against the French; but he saw during that campaign nothing of the fury and carnage of war. The battle of Mollwitz (April 10, 1741) decided the fate of Silesia. It was, however, the signal for a general war in Europe, known as that of the Austrian succession. Bavaria, with France, now took up arms. A French, Saxon, and Bavarian army invaded Bohemia, while Frederick marched into Moravia. The fortunes of the youthful queen grew darker still when England, her last ally, determined upon neutrality. Frederick gained a second victory at Chotuszitz, near Czaslu, May 17, 1742, and at once effaced by personal prowess the blot upon his victory at Mollwitz. Accepting English mediation, Maria Theresa made peace with Prussia by a treaty concluded at Breslau, June 11, and ceded Silesia and the county of Glatz. Frederick withdrew from Moravia, while the Austrians everywhere triumphed against France and Bavaria. He profited by this interval of peace to strengthen his army and organize new conquests. England meanwhile declared for Austria, and British troops fought at Dettingen. On the death of the last count of East Friesland, in 1744, Frederick took possession of that country, which by the grant of the emperor Leopold in 1694 was to revert to the house of Brandenburg. He grew anxious in the midst of ceaseless Austrian victories, and fearing to be dispossessed of Silesia, in August, 1744, he marched into Bohemia at the head of 100,000 men, took Prague, and threatened Vienna. He confesses that this campaign was filled with blunders; that no general ever committed graver faults; and it appears that during this year he first learned to be a general. He retreated rapidly, but only to retrieve the past. In the next campaign, at Hohenfriedberg, he defeated a joint army of Austrians and Saxons (June 4, 1745), in a manner which placed him at the head of contemporary commanders. This victory was followed by those of Sorr (Sept. 80) and Kesselsdorf (Dec. 15), and the fall of Dresden; and having no longer reason to fear that Maria Theresa could avenge herself, he deserted his French ally, and made peace with Austria and Saxony by the treaty of Dresden (Dec. 26), by which he acknowledged Francis as emperor, and was confirmed in the possession of Silesia. Frederick by this time had doubled the number of his subjects, and had succeeded so well in humbling Austria and her allies, that he appeared to hold in his hand the balance of power in Germany. His people now enjoyed 11 years of peace, during which he devoted himself to the organization of his states and his army, the advancement of the arts, agriculture, manufactures, commerce, and education, the amelioration of the laws, and the increase of the public revenues. He also wrote his Mémoires pour servir à l'Histoire de Blandenburg (2 vols., Berlin, 1751), his poem L'Art de guerre, and many other productions in prose and verse. This was a period, nevertheless, of constant anxiety and insecurity; and learning in 1756 that a new coalition, including Russia and his former ally France, was forming against him, Frederick at once prepared for the encounter, suddenly allied himself with England, and the whole face of affairs was changed. Sweden, the tool of France, followed the French leading; and Frederick, with scarcely 5,000,000 subjects, including the conquered SileSIans, found himself alone on the continent against nearly 100,000,000. It was resolved to crush him; but he had foreseen this design, detected all the secret intrigues, and resolved to strike the first blow. In August, 1756, with 70,000 men, he entered Saxony, and commenced the famous seven years' war. His army had grown to 160,000 men, but his enemies could bring 600,000 troops into the field, and there was not a politician in Europe who did not look upon his destruction as certain. He himself thought it probable; but he had an overflowing treasury at home, and plenty of money from England, and he hoped that genius, judgment, and resolution, with ordinary good fortune, might at least sustain him until his enemies should quarrel among themselves. At Dresden he seized some state papers which exposed the designs of the coalition. They were published, and the world saw that this time he had right on his side. He defeated the Austrian general Braun at Lowositz (Oct. 1); the Saxony army under Rutowski surrendered a
fortnight later, and the whole of Saxony was reduced, and became virtually a part of Frederick's dominions. He levied troops and supplies; and thus, within a few weeks, one of the confederates was made to turn his weapons against the others. The next campaign opened with the great battle of Prague, May 6, 1757. Frederick was victorious, but lost 12,000 men, and among them his general Schwerin. A second battle was fought and lost against Daun at Kolin, June 18. Frederick abandoned Bohemia. French troops invaded Prussia, and his army lost confidence. French, Swedish, and Russians were marching upon Berlin; and Frederick, mourning the death of his mother, whom he tenderly loved, provided himself with poison, and meditated suicide. He marched from Bohemia against the French, and with half their numbers defeated them at Rossbach, and took 7,000 prisoners (Nov. 5). He now turned against the Austrians, who had entered Berlin, and captured Schweidnitz and Breslau. On Dec. 5, at Leuthen, with 80,000 men, he attacked 90,000, killed or captured 27,000, and took 130 guns, 50 standards, and 4,000 wagons. Early in 1758, having previously recovered Breslau, he was again ready for action, recaptured Schweidnitz, and with 37,000 troops fought almost hand to hand with 60,000 Russians at Zorndorf (Aug. 25). It was the fiercest and bloodiest battle of the war. Frederick ordered that no quarter should be given, so enraged was he with the devastations committed by the invaders; and 19,000 Russians and 11,000 Prussians lay upon the field, dead or wounded, at the close of this fearful day. The Russians abandoned Prussia, and Frederick marched into Saxony. He had beaten French, Austrian, and Russian armies in turn, each with more than double his force; but close upon these triumphs followed a chain of disasters which would have overthrown any other commander. At dead of night he was surprised and terribly defeated by Daun at Hochkirch (Oct. 14), but rallying in an incredibly short time he rescued Dresden from an overwhelming army of Austrians, and went into winter quarters at Breslau. The year 1759 saw the Austrians overrunning Saxony, Russians victorious upon the Oder, Frederick utterly routed by Seliskoff and Laudon at Kunersdorf, Aug. 13 (where he lost two thirds of his troops), and Berlin saved only by the king's miraculous energy. Dresden was taken by the troops of the empire, and near it Gen. Fink surrendered 12,000 Prussians. The fifth year saw the capital in the hands of the Russians, while Frederick won great battles at Liegnitz, Aug. 15, 1760, and Torgau, Nov. 3, the one over Laudon, and the other over Daun. The sixth year opened so secure; speech and song glutted his ears, and he grew savage with despair. England, after the death of George II., deserted him, but Russia, on the death of Elizabeth (1762), withdrew from the coalition. Frederick broke into Silesia and defeated the Austrians at Burkersdorf, and his brother Henry was successful at Freiberg. France withdrew her armies, desiring future neutrality; and Prussians and Austrians stood alone against each other. The empress now gave way, and in February, 1763, peace was signed at Hubertusburg, leaving Frederick in possession of Silesia, the sole object, short of saving Prussia itself, for which he had fought. After an absence of eight years he reentered Berlin in triumph. He had proved himself the greatest commander of his age, though he owed many a defeat to his own rashness, and many a victory to such generals as Ferdinand of Brunswick, Schwerin, Seydlitz, Zieten, and Prince Henry. But his capital had been more than once plundered; the population had suffered frightfully. He found the number of his subjects diminished by one tenth; a sixth of the male able-bodied adults had died on the field of battle. Cossacks and Croats had slaughtered young and old, women and children. Fields were unknown; villages and hamlets were deserts. But, say historians, Frederick did not owe a dollar. His first object was the thorough restoration and reorganization of the army. During every moment of the 28 remaining years of his life, he was armed at all points. His energies meanwhile were employed with equal devotion in the restoration of his country. The corn which had been provided for the next campaign was bestowed upon the destitute. In Silesia taxes were remitted for six months; in Pomerania and New Brandenburg for two years. Immense sums of money were expended in agricultural and industrial improvements; in all, during the remainder of his reign, 24,000,000 thalers. To meet these and other similar ends, the most rigid economy was practised. The royal household was so frugal that the king saved annually from the sum appropriated to his court nearly 1,000,000 thalers. His envosys in England and France had salaries less than $5,000 a year. The king himself had but one fine dress during the remainder of his life. Shabby old garments and smelly yellow waistcoats were his daily wear; and when it was found at his death that he did not possess a single decent shirt, he was buried in one belonging to his solet de chambre. The only exception to his economy was caused by his love of building. He was himself singularly industrious. He spent 20 hours out of the 24 in some active bodily or mental employment. He rose at four, and retired at midnight. Dinner was the scene of intellectual activity, a school of wit and discussion. Religious persecution was unknown in his dominions; perfect order reigned throughout; property was secure; speech and song glutted his ears, and he grew savage with despair. England, after the death of George II., deserted him, but Russia, on the death of Elizabeth (1762), withdrew from the coalition. Fred-
FREDERICK (PRUSSIA)

cial policy and international law he was in advance of his time. Devoted as he was to letters, he never allowed the passion for literature to divert him from duty. He had no knowledge of the force of the German language, and spoke of it with contempt; yet he never wrote French correctly. Though respectable as a historian, and voluminous as a versifier, he never learned to speak the language which he idolized. In the year 1772 was concerted the dismemberment of Poland. It originated between Frederick and Catharine of Russia; a most unwilling consent was wrung from Maria Theresa. Frederick took possession of his share without delay. Later important public acts of his life were his successful opposition in 1778 to the claim of the emperor Joseph II. to the Bavarian succession; the establishment in 1786 of the so-called confederation of princes (Fürstenbund); and a treaty with the United States of America, embodying the most exalted principles of international rights. Without much community of political sentiment, he was friendly to the American patriots, and gave evidence of his dislike of British policy in employing Russian troops beyond the Atlantic, by levying the same toll per head upon the recruits which passed through his dominions as was charged upon "bought and sold cattle." Washington commanded his admiration, and Mount Vernon received among its treasures a Prussian sword of honor, forwarded from Potsdam with the words: "From the oldest general in the world to the greatest." Frederick died after a severe attack of dropsy, at the age of 74; he left no children by his wife, with whom he never cohabited, and was therefore succeeded by a nephew, Frederick William II., to whom he left a surplus of about 69,000,000, an army of 220,000 men, a territory increased by nearly 80,000 sq. m., and an industrious, intelligent, and happy population of 6,000,000. His collected works have been published by order of the king of Prussia, under the auspices of the royal academy of sciences (80 vols., Berlin, 1846–57). Extensive works on Frederick have been written by Kolb and Frenzel. See also Carlyle's "History of Frederick the Second" (6 vols., London and New York, 1858–64); Friedrich der Grosse und Katharina II., by K. von Schloëser (Berlin, 1859); Geschichte Friedrich's des Großen, by F. Kugler (7th ed., Leipzig, 1870); and Friedrich der Große, by Droysen (1st vol., 1873).

FREDERICK WILLIAM II., king of Prussia, born Sept. 25, 1744, died Nov. 16, 1797. He was the grandson of Frederick William I., nephew of Frederick the Great, and son of the prince Augustus William, who, having incurred the resentment of his brother the king by an unsuccessful retreat after the disastrous battle of Kolin (1757), shortly after died. Frederick William, having become heir presumptive to his uncle, received from him but rare marks of cordiality or affection, was rather austere educated, and often exposed to all the dangers of the war during the last period of the seven years' struggle. He enjoyed little freedom in the second and peaceful half of Frederick's reign, was obliged to repudiate his first wife, Elizabeth of Brunswick, because of ill conduct, and lived in a circle of his own, in which some visionaries of the then powerfully organized sect of illuminati were particularly conspicuous, who maintained their influence over him even after his accession to the throne. This took place on Aug. 17, 1786. Freed from long restraint, the new king gave himself up without moderation to his voluptuous inclinations. Mistresses and favorites reigned in the court and squandered the treasures of the state. He sought to gain the favor of the people by ostentatious mildness; even the discipline of the army was relaxed. The first important act of his policy abroad, which was but slightly influenced by the eccentric minister Herzberg, was to reinstate in power his brother-in-law, the stadtholder of the Netherlands, who had been deposed by the anti-Orange party. A Prussian army under the duke of Brunswick entered Holland, occupied Amsterdam, and restored the ancient order of things, which was confirmed by a treaty concluded in 1788, at the Hague, by Prussia, England, and Holland. Alarmed by the alliance of the emperor Joseph II. with Catharine II. of Russia, and by the successes of the Russians in the war against Turkey, he concluded a treaty with the latter power guaranteeing all its possessions. An army was assembled in Silesia, near the Bohemian frontier. Before the outbreak of the war, however, Frederick William wavered, and finally restored his good understanding with Austria by the treaty of Reichenbach (1790), which concluded with the successor of Joseph, Leopold II., who soon also made peace with the Porte. Russia, however, was allowed to continue her operations undisturbed. Herzberg resigned. The interview at Pilnitz with the emperor (1791) prepared the first coalition against the French revolution. The hostile operations began in the spring of 1792. The duke of Brunswick entered France in the summer; the king and the crown prince, the son of his second wife, Louisa of Hesse-Darmstadt, joined him there. Want of harmony and repeated blunders on the part of the allies, revolutionary fanaticism and the skill of the commanders on the side of the French, soon turned the scale in favor of the latter, compelling Frederick William to keep the defensive, and finally to conclude the treaty of Basel (1795) with the republic, in which he ceded his territories beyond the Rhine, contracting for future indemnities and a kind of protectorate over northern Germany. His participation in the affairs of Poland was productive of more advantageous results. Having encouraged the so-called long Polish diet in its efforts to regenerate the state and to make it independent of
Russia, by a treaty in which he guaranteed its integrity (1790), he afterward, when engaged in the war with France, found it more convenient and profitable to share the prey with Russia and Austria. He marched his army into Poland, and actively promoted the second and third dismemberments of the unhappy republic (1793–95). His share was large, extending to the Niemen, and including the capital, Warsaw. These wars and the extravagance of the court exhausted the resources of Prussia. Intolerant edicts and severe restrictions of the press contributed to make his reign unpopular; but it was not without merit in developing the resources of the state and the welfare of the people by useful internal improvements. The judicial organization of Prussia was also greatly improved under Frederick William. He completed and introduced the code of laws prepared by Frederick the Great.

FREDERICK WILLIAM III., eldest son and successor of the preceding, born Aug. 3, 1770, died June 7, 1840. Educated with care by his virtuous mother, Louisa of Hesse-Darmstadt, he had ample opportunity of comparing, at the courts of Frederick the Great and of his father, the opposite influence of royal virtues and vices upon the affairs of his state; and he early contracted the love of order, discipline, economy, and labor, which in after time contributed no little to the prosperity of his people. He accompanied his father to the conference of Plüßeit, and to the army of the first coalition against France, and in 1798 married the beautiful and accomplished princess Louisa of Mecklenburg-Strelitz, the most popular queen of Prussia. After his accession (Nov. 16, 1797) the court and the administration were purged of the creatures and abuses of the preceding reign. The unpopular edicts restricting the press and the freedom of religious instruction were abrogated, and economy and order restored. In his foreign policy the young king maintained the neutrality imposed by the treaty of Basel, the temporary stipulations of which were made definitive by the treaty of Lunéville (1801). For its cessions on the left bank of the Rhine, Prussia soon after received ample compensations in small territories deprived of their independence as members of the empire by decree of the Germanic diet. Satisfied with his acquisitions and political influence in the north of Germany, Frederick William refused to join the third coalition against France which was formed by England, Russia, and Austria. But when the French armies had infringed the neutrality of the Prussian territories, he secretly allied himself with Alexander of Russia, during a sudden visit of the latter at Berlin. Hesitation, however, spoiled the effect of this alliance, and the battle of Austerlitz was fought (Dec. 2, 1805) near (and before) Napoleon (Dec. 5). Ceding Ansbach, Cleves, and Neuwiedtal, Prussia received Hanover from the conqueror. The consequence of this exchange was what Napoleon wanted, a declaration of war by England against Prussia. The latter was also embroiled with Sweden. Having made peace with these enemies, Frederick William made peremptory demands on Napoleon in behalf of the neutrality of his state and its allies in northern Germany. Napoleon answered with prompt hostilities, and the battles of Jena and Auerstädt were both fought on Oct. 14, 1806. The powerful Prussian army was broken, Berlin was occupied by the enemy, and the fortresses surrendered at the first summons. The aid of Alexander was of little avail. After a winter campaign in Prussian Poland and the indecisive battles of Pultusk (Dec. 26) and Eylau (Feb. 7–8, 1807), Napoleon conquered peace by the battle of Friedland, won on the anniversary of Marengo (June 14). The treaty of Tilsit (July) sacrificed one half of Prussia, parts of which were transformed into the duchy of Warsaw, and others attached to the kingdom of Westphalia. The other half remained for years in the hands of the conqueror, and was treated as a subdued province. The treaty further provided for the reduction of the Prussian army to 40,000 men, and the payment of an indemnity of 146,000,000 francs to France. French troops were to occupy Berlin and other important Prussian fortresses till the payment of the debt. The king, who paid a visit with the queen to Alexander, could not return to his capital before 1809. But this gloomy period became one of the most successful in the history of the state, by a series of salutary and energetic reforms, undertaken and executed particularly under the celebrated ministers Stein and Hardenberg. Serfdom was abolished, the towns obtained some independence in the management of their affairs, the royal domains were sold, convents and ecclesiastical foundations were converted into state property, public instruction was organized, and the new university of Berlin founded. The new system of military organization of Prussia had its origin in that period. In July, 1810, the king lost his wife. In 1812 he was compelled to aid Napoleon with an army against Russia. Forming the left of the great French army of invasion, it was saved on the retreat by a special arrangement between its commander, York, and Diebitsch. Frederick in January, 1813, transferred his residence to Breslau, where he was visited in March by the emperor Alexander, and the treaty of Kalin, which had been concluded the preceding month between Russia and Prussia, was made public. He now issued a proclamation, which was answered by a general rising of the nation against France. The capital alone is said to have contributed 10,000 men. Prudent measures had been adopted in secret to prepare for the struggle. The young men, meeting privately, had been drilled in the use of arms. Napoleon, thus the power of the people answered to their will. The militia having been summoned, war against France was declared on March 17. The situation had its dangers. The French still
held the fortresses of Prussia and Poland; their army in the dominions of the king still amounted to 60,000. But Napoleon's hour of success had passed. The continual desertion of his allies served to strengthen the phalanx of the coalition after every defeat of his armies. His enormous new levies were not sufficient to cover the extraordinary losses, and to face so many enemies. The Prussians fought bravely in various engagements in 1813 and 1814 (see Bu-lonza), and the king often gave proofs of personal activity and courage. He entered Paris with his allies, accompanied Alexander on his visit to England, made a triumphal entry into his capital in August, 1814, and repaired to the congress of Vienna. The stipulations of this congress conferred on Prussia greater power than it possessed before the wars, enlarging it particularly with parts of Saxony, one of the last allies of Napoleon. The sudden return of the captive of Elba called the Prussians again to arms, and Blücher, after his previous defeat, appeared at Waterloo in time to finish the great struggle. The last 25 years of the reign of Frederick William form a period of undisturbed peace and prosperity for Prussia. Closely allied with the czar Alexander, and afterward with Nicholas, the king pursued a policy of strict conservatism. Much was done for internal improvements, little for political reform. He, however, formed the great German commercial league, the Zollverein. Revolutionary agitations, wherever they manifested themselves, were suppressed with severity. The last years of his reign were agitated by a strife with the Roman Catholic clergy. The eldest of his four sons succeeded him. One of his daughters was married to the emperor Nicholas. In 1824 he had formed a morganatic marriage with the countess Augusta of Harrach, whom he made princess of Liegnitz. She died in Hamburg, June 8, 1873, aged 73.

FREDERICK WILLIAM IV., son and successor of the preceding, born Oct. 15, 1795, died at the château of Sans Souci, near Potsdam, Jan. 2, 1861. He received a careful scientific education, though his boyhood was passed in the most disastrous period of Prussian history, and his youth in that of the great struggle against Napoleon. He was often present on the scene of action during the last campaign against that emperor, became familiarly acquainted with many distinguished men of his age, and developed his taste for the fine arts while residing in Paris after its occupation by the allies, and on a journey to Italy in 1828. Admitted to the councils of his father, he evinced a marked independence of opinion with much administrative ability. As military governor of Pomerania, his affability gained him general popularity. He acceded to the throne on June 7, 1840. His first solemn declaration at Königsberg, a limited political amnesty, the reinstating of Arndt, the old liberal poet, the reappointment to office of the popular lieutenant general Von Boyen, and the conciliatory termination of a difficulty between the state and the Roman Catholic clergy, were hailed with applause; but the appointment to office of Hassenpflug and Eichhorn, and various other conservative measures, soon destroyed the hopes of the liberal part of the nation. The development given to the representation by provincial estates, which had been introduced under the preceding reign, by the convocation of their standing committees in 1842, and by the convocation of the united provincial estates of the kingdom in February, 1847, was made less significant by the distinct declaration of the king that the representatives, far from becoming legislators, would be allowed only to give advice to the unlimited sovereign, and that he would never consent to bind his inherited authority by a written compact. Periodical meetings of the united assembly were asked for in vain. The government, though granting general toleration, declared against the separation of the church from the state and the emancipation of the Jews, and avowedly sought to rule the kingdom in conformity with the views of the school generally known as pietists. Much more was done for the material interests of the state through internal improvements, commercial union with foreign states, and the extension of the Zollverein, which also augmented the political influence of Prussia. A bank with a capital of 10,000,000 thalers was established at Berlin. The Polish conspiracy of 1846, which threatened the eastern possessions of the king, was detected in time in the duchy of Posen; the outbreak in the same province was easily suppressed; the insurgents of Cracow, who laid down their arms on Prussian territory, were treated with rigor. The people were already politically agitated by the lively discussions of the diet (from April 11 to June 26, 1847), and of its standing committees, assembled Jan. 18, 1848, and also by the trial of the insurrectionists of Posen, and of Mieroslawski, the destined leader of the Polish movement, as well as by the victory of the liberals in Switzerland over the Sonderbund, the constitutional movements in Italy, and the revolution in Sicily, when the news of the French revolution of Feb. 24 involved the whole of Germany in a flame. The popular movement was victorious all over the southwest and south of the confederation, before Frederick William was forced to yield to it. Even after the fall of Metternich in Vienna (March 18), he was determined to maintain his royal authority, and to grant liberties only as free gifts. Threatening popular gatherings in Berlin were dispersed by his soldiery before he proclaimed the freedom of the press and the promise of a change in the form of government. These concessions were received with enthusiasm, but the people still demanded the removal of the troops from the capital, and for this purpose a deputation of citizens visited the palace (March 18), while a crowd assembled before it. The deputation
was refused admittance, and soldiers advanced from the court of the palace to clear the place. Some shots were fired, and the people dispersed in every direction with cries of "Treason! they are murdering us! revenge!" Hundreds of barricades were erected in a few hours, the arsenal was stormed, and a furious fight ensued, which raged till the morning of the next day, when the king commanded the retreat of the troops and their removal from the city. The corpses of the fallen combatants were carried into the courtyard of the palace, and the king was compelled to appear before them with uncovered head; the palace of his then very unpopular brother William, prince of Prussia, was declared national property. The ministry was dismissed, a civic guard organized, and a general amnesty granted. Mieroslawski, who had been sentenced to death, was carried in triumph through the streets of Berlin, and 250 of his associates left the prison with him, and hastened to Posen to commence the restoration of Poland, the new ministry promising its assistance. The king now openly and ostentatiously declared his purpose to take the lead in Germany; the diet was again assembled (April 2), to elaborate a new election law. It was dissolved after the passage of that law on April 5, and a constituent assembly was convened in Berlin (May 22), while the delegates of Prussia also appeared in the national German parliament which in Frankfort had superseded the diet of the princes (Bundestag). Prussian troops were sent to Schleswig-Holstein to assist the German inhabitants in their revolt against the king of Denmark. In Posen, however, where the Poles had risen in a bloody insurrection, the troops restored order after furious contests with the half-armed bands under Mieroslawski (April and May). This was the first reactionary victory. Others followed. While the revolution was losing its time in endless speechmaking, framing of constitutions, and scheming on the reorganization of Germany as a united empire, in the assemblies of Frankfort, Berlin, Vienna, and elsewhere, the governments, which had maintained their armies, paved the way for a complete restoration of their power by mutual understanding, skilful counter-revolutionary manoeuvres, continually changing ministries, and varying programmes. Emboldened by the fidelity of the army and the growing desire for order among the wealthier classes, by the reaction in France, and the successes of the Austrian government in Prague, Lombardy, and Vienna, Frederick William prorogued the Prussian constituent assembly, transferring it to the town of Brandenburg, closed its sessions by an armed force under Wrangel (November), and finally dissolved it simultaneously in Brandenburg (Dec. 5), promulgating a liberal constitution, of his own. The new elections took place according to the king's constitution, and the two chambers were convened in Berlin (Feb. 26, 1849), which remained in a state of siege. Of these the lower house was still too revolutionary, and both were dissolved (April 27). In the mean time the king had not only abandoned the cause of Schleswig-Holstein by the armistice of Malmö, but had also declined the hereditary imperial crown of Germany offered him (March 28) by the Frankfort parliament. The Prussian army suppressed the revolution in Dresden, after a bloody struggle of three days (May), and in the Palatinate and Baden (June), while it was hardly more than a spectator in the renewed struggle in Schleswig-Holstein. A confederation of Prussia with Saxony and Hanover (Dreikönigsgesellschaft), and some minor northern states, formed March 26, was hailed by the so-called party of Gotha (Hagen, Dahlmann, &c.) as the last hope for a union of Germany. It ended in failure. Opposed by Austria and its southern allies, it was given up by Saxony, Hanover, and others; its parliament of Erfurt assembled in vain (March 20, 1850). Frederick William, who had convoked a new Prussian assembly and confirmed a new constitution with his royal oath (Feb. 6), followed for some time a more popular course in the affairs of Hesse-Cassel (October), but soon yielded to the threats of Austria and her allies (November). Order was restored in Hesse and in Schleswig-Holstein, and the ancient Germanic diet was once more established in Frankfort. The revolution was over. Chevalier Bunsen, who had lost his former liberal influence over the king, was obliged to sign the protocol of London in the Danish question (1852), which sealed Prussia's final surrender to the general reaction. Only Neufchatel remained with Switzerland as a conquest of the revolutionary movement, and after some threats of war in 1857 it was ceded to that republic. The policy of the government was peaceful, and Prussia took no part in the Crimean war, though it participated in the peace of Paris (1856). The constitution was modified and remodeled; the revolutionary members of the assembly of 1848, Jacoby and others, were persecuted; the nobility (die Junker) and the Pietists received new influence; the freedom of the press and of religion was circumscribed. In 1857 the king was seized by a malady connected with temporary insanity, which compelled him (Oct. 23, 1858) to give up the personal management of affairs, and travel in Italy and the Tyrol for his health. His marriage with Elizabeth, princess of Bavaria, being without issue, his brother William (present emperor of Germany) became regent, and succeeded to the throne in January, 1861. **FREDERICK CHARLES NICHOLAS**, prince of Prussia, a German general, born in Berlin, March 20, 1828. He is the only son of Prince Charles, younger brother of the emperor William. He studied at Bonn, where he met Roon, the future minister of war, was his intimate companion. He took part in the Schleswig-Holstein war of 1848, and acquired a high reputation by his thorough knowledge of military
science. During the Franco-Italian war against Austria (1809) he applied himself particularly to the study of the organization of the French army. His *Militäutsche Denkschrift* was published in 1860 without his knowledge, showing how the Prussians could beat the French; and his comments elicited replies from French writers and attracted general attention in military circles. He greatly distinguished himself in the Schleswig-Holstein war of 1864: in the war against Austria in 1866; and most conspicuously as commander of the second army in the Franco-German war of 1870–71, compelling the surrender of Metz, Oct. 27, for which he was made general field marshal. His next victories were achieved over the army of the Loire, and he entered the city of Orleans Dec. 5, repeatedly defeated Gen. Chanzy, and captured Le Mans, Jan. 12. He is represented in the war songs of the period as an iron prince, a valiant soldier, a bold artillery officer, a game sportsman, and a man whose word can be depended upon.

**FREDERICK WILLIAM NICHOLAS CHARLES**, a German general, crown prince of Prussia and of the German empire, born in the new royal palace near Potsdam, Oct. 18, 1831. He received a thorough scientific education and the doctor's diploma from the university of Königsberg, of which he is rector. On Jan. 25, 1858, he married Victoria Adelaide, princess royal of Great Britain, who has borne him six children, the eldest of whom, Prince Frederick William Victor Albert, was born in Berlin, Jan. 27, 1859. In 1866 he was commander-in-chief of the second Prussian army, and essentially contributed to the decisive victory of Sadowa by his timely appearance at Chlum. In the Franco-German war of 1870–71 he was at the head of the South German forces as commander-in-chief of the third army. The first victory of the war, that of Weissenburg (Aug. 4), and the greater one over MacMahon at Wörth (Aug. 6), were achieved under his generalship; he took an equally brilliant part, together with the crown prince (now king) Albert of Saxony, in the great triumph culminating in Napoleon's surrender with his army at Sedan, Sept. 2: won additional laurels during the siege of Paris, and was made general field marshal Oct. 28, although it had not been customary for royal princes to receive that title.

**VIII. SAXONY.**

**FREDERICK III.,** surnamed the Wise, elector of Saxony, born in Torgau, Jan. 17, 1463, died May 6, 1525. He succeeded his father Ernest in 1486, in a part of his possessions, governing the rest in common with his brother John the Constant, who became his successor. He founded the university of Wittenberg, and, though not an avowed adherent of the reformation, greatly promoted it by his protection, procuring safety for Luther during the diet of Worms (1521), and subsequently sheltering him in the castle of Wartburg. After the death of Maximilian I. (1519) he declined the crown of Germany, which was conferred, according to his advice, upon Charles V. The peasants' war embittered the last days of his life.

**FREDERICK AUGUSTUS I.,** first king of Saxony, eldest son of the elector Frederick Christian, born Dec. 23, 1750, died May 5, 1827. He succeeded his father in December, 1763, under the tutelage of Prince Xavier, was declared of age Sept. 15, 1768, and in the following year married Maria Amalia, princess of Zweibrücken. The only fruit of this marriage was a daughter, the princess Augusta. He abolished the heavy taxes on foreign merchandise, consolidated the several departments for the management of the finances, encouraged industry, and improved navigation with canals and sluices. Paper money soon rose above par. He abolished torture and the farming of judicial offices, and reorganized the court of appeals. The claims of his mother to the possessions of her deceased brother, the elector Maximilian Joseph of Bavaria, induced him to ally himself with Frederick the Great against Austria in the short war of the Bavarian succession. Subsequently he joined the league of princes (Fürstenbund) formed under the protectorate of the Prussian monarch. In 1791 he declined the succession to the throne of Poland, offered him in the name of that country by Prince Adam Casimir Czartoryski. He also rejected the overtures of a conference of the emperors Leopold II. and Frederick William II. of Prussia, held at Piltitz (1791), to join as an independent sovereign the first coalition against the French revolution, though he did not withhold his contingent as a member of the German empire when the war had been declared. In 1796 he took part in the treaty of peace and neutrality concluded with the French republic by his brother, king of Upper Saxon. He maintained his neutrality during the war of 1805, but in the following year joined Prussia in the unhappy contest decided by the battle of Jena. Saxony, which fell into the hands of the French conqueror, was severely punished, and Frederick Augustus was compelled to ally himself with Napoleon. He assumed the title of king, and joined the Rhineish confederation. For the cession of several districts of western Saxony annexed to the new kingdom of Westphalia he was scantily compensated by a part of Lusatia, and after the peace of Tilsit (1807) more liberally by the duchy of Warsaw. He was a faithful vassal of the French emperor during the wars of 1809 against Austria and 1812 against Russia, and in 1813, when Saxony became the chief scene of the conflict. Having personally joined Napoleon shortly before the battle of Leipsic, he was declared after its bloody issue a prisoner of war by the emperor Alexander, was sent to Berlin, and afterward to the castle of Friederichsfeld, but was allowed to reside at Potsdam during the deliberations of the congress of Vienna. That congress restored to him half
of his German possessions, the other half being annexed to Prussia; the duchy of Warsaw was made a dependence of Russia as the kingdom of Poland. Returning to his capital in June, 1815, Frederick Augustus spent the last 12 years of his life in healing the wounds of his diminished country by promoting its agricultural, commercial, and mining interests, by establishing or developing institutions of art and science, and particularly by a strict administration of justice. His subjects bestowed upon him the surname of the Just. His brother Anthony succeeded him.

FREDERICK AUGUSTUS II., king of Saxony, born May 18, 1797, died Aug. 9, 1854. He was the eldest son of Maximilian, brother of the kings Frederick Augustus I. and Anthony. Having lost his mother, Carolina Maria Theresa, princess of Parma, at the age of seven, he was educated principally under the care of Forell, a distinguished Swiss, and of Gen. Watzdorf. Though often compelled to leave the capital of his uncle during the later campaigns of Napoleon in Germany, and frequently to change his abode, he eagerly pursued his studies, which included political economy, law, and military science; but botany became his favorite pursuit. When, in September, 1830, Dresden became a scene of political commotions, Frederick Augustus was placed by the old king Anthony at the head of the committee for public tranquility. As the prince was very popular, this measure greatly contributed to quiet the agitation. On June 6, 1836, Frederick Augustus succeeded to the throne. As he was but partially occupied with political affairs, he made botanical tours and journeys to Istria, Dalmatia, and Montenegro (1838), to England and Belgium (1844), to Vienna and Hungary (1845), and to the Tyrol (1846). The movements of 1848, beginning in Saxony, as everywhere else in Germany, with great enthusiasm for liberty and German union, were followed in May, 1849, by a revolutionary outbreak in Dresden. This having been suppressed through the intervention of Prussia, things soon returned to their ancient order, and the reactionary movement continued to the death of the king, which was occasioned by a fall from his carriage on a new tour in the Tyrol. He was twice married, first to Carolina, daughter of the emperor Francis, and, after her death in 1833, to Maria, daughter of Maximilian I. of Bavaria. Both marriages being without issue, he was succeeded by his brother John.

IX. WÜRTTEMBERG.

FREDERICK I. (Wilhelm Karl), first king of Württemberg, son of the duke Frederick Eugen, born at Tesse, in Pomerania, Nov. 8, 1754, died Oct. 10, 1816. He received his first instruction from his accomplished mother, a princess of Brandenburg-Schwedt, and completed his education at Leusanne, after the French fashion of that period, served in the bloody war of the Bavarian succession, accompanied his brother-in-law, the future Russian emperor Paul, on a journey to Italy in 1789, was made governor general of Russian Finland, and after having left it in 1787 lived for some time in retirement. In 1790 he was a spectator of the sessions of the French national assembly; in 1796 he fought against the French on the Rhine, and in the following year he succeeded his father on the ducal throne. He shared in the war of 1799, received by the treaty of Lunéville ample indemnity for territories lost on the left bank of the Rhine, and was allowed to assume the electoral dignity. In 1806 he made an alliance with Napoleon, joined the Rhenish confederation, and received from its protector the title of king. He deserted Napoleon after his disasters. The treaty of Vienna left him in possession of his kingdom. To conciliate his people after ten years of despotic sway, he gave them a charter, which was rejected by the estates. A new constitution was drawn up, but he died before it could be discussed. His first wife was a princess of Brunswick-Wolfenbüttel, who bore him two sons, William, his successor, and Paul, and a daughter, Catharine, afterward princess of Montfort. His second wife was the princess Charlotte Augusta Matilda of England, who died in 1828.

FREDERICKSBURG, a city of Spottsylvania co., Virginia, pleasantly situated in a fertile valley on the right bank of the Rappahannock river, at the head of tide water, about 50 m. N. of Richmond, and 110 m. above Chesapeake bay; pop. in 1870, 4,046, of whom 1,381 were colored. The Rappahannock, besides supplying it with good water, which is distributed in pipes, is valuable for its motive power, available at the falls just above. A canal extending to a point 40 m. further up the stream affords means of transportation for the products of a rich farming country, and the Richmond, Fredericksburg, and Potomac railroad connects the city with the state and federal capitals. Marble and freestone abound in the vicinity. The city has considerable trade in grain, flour, tobacco, &c., and contains a national bank, an orphan asylum, four semi-weekly newspapers, six public schools, and Baptist, Episcopal, Methodist, and Presbyterian churches. Just beyond the limits of the city an unfinished monument, begun in 1838, marks the tomb of the mother of Washington, who died here in 1789.

FREDERICKSBURG, Battle of, fought Dec. 13, 1862, between the Union forces under Gen. Burnside and the Confederates under Gen. Lee. After the battle of Antietam (Sept. 16 and 17, 1862), the Union army, under Gen. McClellan, made no forward movement until late in October when he moved to the Potomac. The Confederates meanwhile moved up the valley of the Shenandoah and into that of the Rappahannock. By Nov. 7 the two armies were within striking distance, the
federals being concentrated near Warrenton, and the bulk of the confederates near Culpeper, 20 m. S., the remainder being three days distant. The Union force was about 120,000, that of the confederates about 70,000. McClellan appears to have been disposed to attack the enemy; but the resolution came too late. On Nov. 7 he was removed from the command, which was given to Burnside, much against his wish. The capture of Richmond being considered the main object of the campaign, McClellan had proposed to make Alexandria his base of supply, and to move by the circuitous lines of railway. He indeed still preferred his former line of movement, making West Point his base; but as this plan would have again uncovered Washington, he forbore to urge it. Burnside proposed a plan between the two, making Aquia Creek, near Fredericksburg, his base, and moving upon Richmond by the line of the Fredericksburg railroad. If it was to be assumed that the capture of Richmond, and not the destruction of the confederate army, was the immediate object, and also that the Union army must always be interposed between the confederates and Washington, then Burnside's plan was undoubtedly the best of the three. The president, who clearly perceived that the defeat of Lee's army was the main thing to be aimed at, gave a somewhat reluctant assent to Burnside's plan. He said: "I think it will succeed if you move rapidly; otherwise not." But the movement was not rapidly made. It was not fairly commenced until Nov. 15, by which time Lee had concentrated his whole army. The army of the Potomac had been organized into three grand divisions; the right under Sumner, the centre under Hooker, the left under Franklin. Sumner reached Falmouth, opposite Fredericksburg, on the 17th. The intention was to cross the Rappahannock and seize the heights of Fredericksburg; but the pontoons had not been provided, and the army could not cross in force. So a fortnight passed, and Lee had come up and occupied the heights. On purely military considerations no further attempt would now have been made by Burnside; but public opinion demanded an onward movement. The Rappahannock, with a general course from N. W. to S. E., makes a sharp bend southward a mile above Fredericksburg, and for some distance runs between heights on either side. Those on the east fall steeply down to the river bank; on the west the hills in the rear of the town rise about a mile from the river, and then trend away until they sink into the valley of the Massaponax, 6 m. below, leaving an irregular plain about two miles wide in its broadest part. Westward the hills rise by a succession of low wooded ridges until they are lost in the region known as the Wilderness. On the crests of these ridges lay half of Lee's army, under Longstreet; D. H. Hill was posted at Port Royal, 20 m. down the river; between them lay Jackson, ready to support either wing. Burnside resolved to cross at and near Fredericksburg, and Dec. 11 was fixed upon for the attempt. The plan was to throw three bridges across at Fredericksburg, and three more at a point about 8 m. below. Sumner's division was to cross by the upper bridges, Franklin's and a part of Hooker's at the lower, the remainder of Hooker's being held in reserve. The attempt to lay the upper bridges was opposed by a body of confederate sharpshooters, but toward evening Burnside sent over a detachment in boats, who drove out the riflemen, and the bridges were completed during the night. No serious attempt was made to prevent the construction of Franklin's bridges; they were completed by noon, and he was ready to cross, but was held back until the other bridges were built. The whole of the 12th was spent in crossing, and in preparations for the battle of the following day; a delay which gave Lee time to bring up Jackson's corps. It was no part of Lee's plan to dispute the passage of the river, as he preferred to receive the attack in his strong position. The extreme confederate left above Fredericksburg was protected by a mill pond, sluiceway, and canal, the bridges over which had been destroyed; and here the attack could be made only upon Marye's hill, which rises steeply a little behind Fredericksburg.—The morning of Saturday, Dec. 13, broke with a heavy fog enveloping in the valley the entire army from the sight of the other. All told, Lee had now about 80,000 men, and Burn-
The bulk of Lee's artillery was posted on the ridges in the rear, and out of action. Lee himself does not seem to have been aware of the existence of this sunken road, which actually formed the strength of his position here. He seems to have assumed that the enemy would gain the crest of the hill, and that first-rate battle would be fought on the plateau beyond; while Burnside assumed that when the crests were gained the battle would be won. The attack was made here by the two divisions of French and Hancock, French in the advance. His men moved across the narrow plain, galled by a fire from the Confederate batteries. Half way across they came within range of the men in the sunken road, who poured in a solid sheet of musketry fire, before which the heads of the columns melted away, and the whole fell back, leaving half of their numbers behind. Hancock now advanced, until he came within range of the musketry from the sunken road. The front was so narrow that only a single brigade could be put in at once. Brigade after brigade took the places of those which had been driven back, so rapidly that this action, which lasted three hours, as seen from the heights of Falmouth, looked like a single continuous assault. French and Hancock brought 10,000 men into action, of whom 4,000 were cut down. Burnside had watched this action from the heights across the Rappahannock, and had seen the troops which were to carry the hill swept back from its base. Still he was determined that the heights should be carried, and he ordered Hooker to renew the attempt. Hooker crossed the river, examined the position, consulted with the officers who had been engaged, and returning remonstrated against the order. But Burnside was inflexible. Of his six divisions Hooker had but two with him. It was nearly night when he opened fire with all his artillery, hoping to make a breach; but this sunken road was not to be touched by any fire. At sunset he ordered the division of Humphreys to charge with unloaded muskets, for there was no time to load and fire. As it happened, the Confederate battery on the hill had exhausted its ammunition and gone to the rear to replenish, so that Humphreys was not exposed to the artillery fire by which French and Hancock had been so sorely galled, and his men went a few yards further than the others had gone. But they also met a solid sheet of fire from the sunken road, which drove them back. The assault lasted only a quarter of an hour, but in those few minutes, out of 4,000 men, nearly half fell, while it is doubtful whether the enemy lost a man. Hooker forbore to press the unsurviving assault. "Having," he said, "lost as many men as my orders required me to lose, I suspended the attack, and directed that the men should hold for the advance line a ditch which would afford some protection. The Confederates lay upon their arms all that night, fully expecting another attack in the morning; for, says Lee, "the attack had been so easily re-
pulsed, and by so small a part of our army, that it was not supposed the enemy would limit his efforts to one attempt, which, in view of the magnitude of his preparations and the extent of his forces, seemed to be comparatively insignificant; but we were necessarily ignorant of the extent of his losses.” Burnside was indeed inclined to renew the action on the following day, but finally forbore, yielding to the representations of the majority of his generals. He was still uncertain whether to hold Fredericksburg or to recross the river, and all through Sunday and the greater part of Monday the two armies lay in sight of each other, each expecting and wishing to be attacked, but neither choosing to venture upon the offensive. Towards night of the 15th Burnside decided to recross, and under cover of a storm which had set in the troops went over, the pontoons were swung back, and the river again separated the two armies.—According to official reports, the confederate loss was 595 killed, 4,061 wounded, 653 missing; in all, 5,809. The Union loss was reported by the medical inspector general just after the battle to have been 1,152 killed, 9,101 wounded, 3,284 missing; in all, 18,487. But, he adds, “the return of killed may be too small.” About 1,200 of those originally reported as missing came back to their commands, reducing the number of missing to about 2,000. Lee asserts that he took about 900 prisoners, leaving about 1,100 of the federal missing to be accounted for. Of these probably about 350 should be added to the number reported as killed; so that in round numbers the Union loss was 1,500 killed, 9,100 wounded, 900 prisoners, and 750 stragglers; 12,250 in all, almost two and a half times that of the confederates. The great disparity of loss was in the action on the right, at the foot of Marye’s hill. In proportion to the numbers engaged, the losses in this battle were unusually large. Of Burnside’s 100,000 men who crossed the river, only about 32,000 were fairly brought into action; of the confederate 80,000, only about 25,000.

FREDERICTON, a city and port of entry of New Brunswick, Canada, capital of the province and of the county of York, on the right bank of St. John river, 84 m. from the bay of Fundy, and 54 m. N. N. W. of St. John; lat. 45° 25’ N., lon. 66° 32’ W.; pop. in 1871, 6,006. The city stands on a low point of land formed by a bend in the river, and is nearly encircled in the rear by a range of hills. It has broad streets crossing each other at right angles, adorned with many fine gardens and shade trees, and with several elegant public buildings. Queen street is the chief business thoroughfare, and contains the principal government buildings. At the E. end is the province building, a large wooden structure, in which the Supreme court meets, containing a fine library. Near by are the various public offices. At the W. end is the government house, a fine stone structure, the residence of the lieutenant governor. On the N. side of the street are the county court house and city hall, large brick buildings, and the barracks, of stone, capable of accommodating a regiment of infantry. In York street are the depot of the Fredericton railroad and the skating rink, and in Westmoreland street the exhibition building, of wood, covering nearly an acre. Other public buildings worthy of mention are the county jail, the custom house, and Christ church, cathedral (Episcopal), of stone, a fine specimen of church architecture. The river is here three fourths of a mile wide, and is naturally navigable to this point by vessels of 120 tons; light steamers can ascend to Grand Falls, 140 m. above Fredericton. The city became a port of entry in 1848, was incorporated in 1849, and is now the chief entrepot of commerce with the interior and an important station of passenger travel. Merchandise is principally brought up the river by steamers and schooners during the summer, but in winter there is a large traffic on the railways. In the vicinity are several large saw mills, and great quantities of lumber of various kinds are collected at Fredericton and thence exported to foreign ports. The lumber business is one of the principal sources of the wealth of the city. The Fredericton railroad connects with the European and North American railroad at Fredericton junction, 23 m. distant; and the city is also the terminus of the River du Loup or New Brunswick railway company’s line. The city is lighted with gas, and contains two banks, a reading room, a telegraph office, eight churches, and four weekly newspapers. The university
of New Brunswick, a well endowed institution, with five professors, occupies a large stone building on a hill in the rear of the city. The other principal educational institutions are the provincial training and model school, and a collegiate school.—Fredricton was formerly called St. Ann’s, and was made the seat of government by Sir Guy Carleton in 1785. It has suffered at times from terrible conflagrations, one of which in 1825 laid one third of the town in ashes, while another in November, 1850, was still more disastrous.

Fredriksborg, a royal palace built by Christian IV. of Denmark in 1606-20, after a plan by Inigo Jones, near the town of Hille-rød, on the island of Seeland, 23 m. N. W. of Copenhagen. It is a Gothic castle of red brick, covering three small islands in a little lake. The Riddersal, or Knight’s hall, has a ceiling elaborately decorated with carvings, gildings, and paintings. The windows are said to have worked for seven years. It also has a collection of portraits, and a richly ornamented chapel, in which all the late kings of Denmark have been crowned. The pulpit and altar in the last are of ebony and silver, exquisitely wrought, and containing more than 600 lbs. of the precious metal.

Fredriksdal, or Fredriksdal (formerly Halden), a seaport of Norway, in the province of Christiania, on the Iddeford near its junction with the gulf of Svinneound, Skager Raek, 57 m. S. E. of Christiania, near the frontier of Sweden; pop. in 1866, 9,219. The harbor is excellent, and is accessible to the largest class of shipping. The great fire of 1769 nearly destroyed the town, but it has been handsomely rebuilt. It stands around the base of a gigantic rock, on the summit of which, 400 ft. perpendicularly over the sea, is the historic fortress of Frederikstean, formerly of great strength. Charles XII. was killed here, Dec. 11, 1718. On the only accessible side, close under the outer walls, a monument marks the spot where the king fell. The castle was invested in 1814 by the Swedish crown prince Bernadotte, and its hopeless defense was a prelude to the almost immediate conquest of the kingdom and its union with Sweden, Nov. 4, 1814. About 8 m. E. of the town is a lake, the Fem So, the stream from which flows into the fiord near Fredriksdal. Its waterfalls are the most picturesque in S. Norway.

Fredrikshamn (Finnish, Hamina), a town and fortress of Finland, Russia, in the government of Viborg, on the gulf of Finland, 118 m. N. W. of St. Petersberg; pop. in 1867, 8,275. Here, on Sept. 17, 1808, the treaty between Sweden and Russia was signed by which Finland became Russian.

Fredriksstad, a town and fortress of Norway, in the province of Christiania, at the mouth of the Glimmen, 48 m. S. E. of Christiania; pop. in 1866, 6,883. It has manufactories of nails, buckles, fish hooks, pottery, tiles, and brandy; and the harbor is large and good.

FREDONIA, a village in the town of Pomfret, Chautauqua co., New York, on the Dunkirk, Allegany Valley, and Pittsburgh railroad, about 3 m. from Dunkirk; pop. in 1870, 2,646. There is a spring of natural gas in the vicinity, which is used to light the village. It is the seat of a state normal school, which has a model school attached, and in 1870 had 16 instructors, 179 students, and a library of 2,026 volumes. There are 4 flour mills, a saw and turning mill, a planing mill, a foundry, 3 manufactories of carriages, 1 of patent medicines, a national bank, 3 hotels, 2 weekly newspapers, and 5 churches.

Freeborn, a S. county of Minnesota, bordering on Iowa, drained by Shell Rock river; area, 720 sq. m.; pop. in 1870, 10,578. The surface is diversified and has a number of small lakes, and the soil is fertile. It is intersected by the Southern Minnesota railroad. The chief products in 1870 were 588,896 bushels of wheat, 134,638 of Indian corn, 826,766 of oats, 53,814 of potatoes, 35,712 tons of hay, and 380,652 lbs. of butter. There were 8,186 horses, 4,468 milch cows, 7,173 other cattle, 5,067 sheep, and 55,023 swine. Capital, Albert Lea.

Free Church of Scotland, an ecclesiastical body originally formed by a separation from the national establishment in the year 1848. On May 18 the general assembly of the established church of Scotland met as usual in Edinburgh, the Rev. David Welsh, D. D., being the moderator, and the marquis of Bute being the representative of the queen. After prayer the moderator read a solemn protest on the part of the church of Scotland against the wrongs inflicted on her by the civil power, which protest was signed by 308 members of the assembly. He then laid the protest on the table, and bowing respectfully to the representative of royalty left the house, followed immediately by Dr. Thomas Chalmers, Dr. Robert Gordon, Dr. Patrick McFarlane, Dr. John McDonald, Dr. Thomas Brown, and rank after rank of the country ministers. The protesters withdrew to a large hall at Canon mills, preceded and followed by sympathizing crowds, and then organized the Free Protestant church of Scotland, under the moderatorship of Dr. Thomas Chalmers. It was then found that 475 ministers had separated from the national church. The amount of capital surrendered that day by the protesting brethren, in relinquishing their stipends from the establishment, was said to be at least £2,000,000.—The French revolution had considerably affected the standing both in the church and in society of the evangelical party in the church of Scotland. Their doctrines had been looked upon as tainted with fanaticism, but the general horror of infidelity awakened by the events in France caused them to be regarded with greater favor, while their impressive preaching, exemplary lives, and solid learning began to give character to the cause with which they
were identified; and though as yet a mere handful in the church, they were every day increasing in numbers and power. Under the leadership successively of Erskine, Sir Henry Moncrieff, Andrew Thomson, and Chalmers, the evangelical party became stronger and stronger, until a fair opportunity for testing the power of parties in the church occurred in 1834. In 1707 the treaty of union between England and Scotland was consummated. It contained a special guarantee for the integrity of the church of Scotland as established in 1689 under the reign of William and Mary, free from prelacy, from the royal supremacy in things spiritual, and from the law of patronage. But in 1711, four years after the consummation of the treaty of union, the British parliament violated its pledge, and under the leadership of Bolingbroke lay patronage was reimposed upon the Scottish church. Such was the sense of the wrong inflicted by this act, that the Scottish church for a long period annually renewed her protest against it; and during several years after it was passed no patron was found to appropriate the powers which it conferred upon him. Toward the close of the century, however, forced settlements of ministers upon parishes became frequent, and multitudes of the best people were driven from the church. Against such proceedings it was in vain that the evangelical party earnestly and frequently protested; their protests were those of a small minority, whose principles the majority despised and hated. But that minority grew in numbers and in power, especially from the beginning of the present century, and under such leaders as Thomson and Chalmers one abuse after another was rooted out; and at last an act was passed by the general assembly in 1834 designed to be a corrective of the evils of lay patronage, which gave to the male heads of families in every parish the right of objecting to any person whom the patron might wish indubitably into the pastoral over them. This act, commonly called the "veto act," though proposed by Lord Moncrieff, one of the senators of the college of justice, and though believed by the church to be entirely within her power as a church established by law to enact, very soon brought her into conflict with the patrons, and through the patrons with the civil courts. On a vacancy occurring in a certain parish the patron presented his protégé, who was vetoed by almost the entire body of inhabitants. The presentee appealed to the civil courts, which at once commanded the presbytery to proceed to his settlement. The presbytery refused. The civil courts of course stood mainly on the interpretation of the law of 1711-12. The evangelical party, now the majority in the general assembly, believing the law unconstitutional and contrary to the word of God, resolved to abide by the decision to which they had come in 1834, viz.: that the Christian people had a right by law and by warrant of God’s word to be heard in regard to the appointment of a minister over them; and that the acts of ordaining to the ministry and of inducting into a pastoral charge were spiritual acts, in regard to which the church alone had jurisdiction. The supreme civil court of Scotland also interposed its authority against the ordination and induction of a minister. The assembly, when appealed to for advice, by a large majority authorized the presbytery to proceed with the settlement. The presbytery were threatened by the civil court with imprisonment and fine should they dare to set its interdict at defiance. The ordination and induction of the presentee were consummated, and immediately a complaint was laid against the presbytery before the civil court. They were summoned to appear before the bar of the court, June 14, 1839, which they did. The judges heard their reply, and took four days to consider the case, during which it was understood that five of the judges voted for a sentence of imprisonment, and six for a rebuke. The rebuke was accordingly pronounced, and the presbytery were dismissed from the bar with the intimation that a sentence of imprisonment would certainly be pronounced against any presbytery that should afterward be found chargeable with a similar offence. Other cases involving the same principles rapidly arose, and elements of a still more deplorable character were brought into the arena of strife. The civil court required a presbytery to take a clergyman on trial, admit him to the office of the ministry in a particular charge, and intrude him on the congregation contrary to the will of the people. It also interdicted the establishment of additional ministers to meet the wants of an increasing population. It interdicted the preaching of the gospel and all ministration of ordinances throughout a whole district by any minister of the church under authority of the church courts, as well as execution of the sentence of a church judicatori prohibiting a minister from preaching or administering ordinances within a particular parish, pending the discussion of a cause in the church courts as to the validity of his settlement there-in. It also interdicted the general assembly and lower judicatories of the church from inflicting church censures: in one case where the minister was accused of theft and pleaded guilty; in another where a minister was found guilty of fraud and swindling; and in another where a licentiate was accused of drunkenness, obscenity, and profane swearing. It suspended church censures when pronounced by the church courts in the exercise of discipline, and took upon itself to restore the suspended ministers to the power of preaching and the administration of ordinances. It assumed to judge of the right of individuals elected members of the general assembly to sit therein. As a last resource, the church appealed to the parliament of Great Britain. Her "claim of
FREEDMEN

of manumitted slaves increased to an alarming extent, and some of the emperors passed laws restricting manumission. (See Slavery.)—In the United States the term denotes the colored people emancipated by the civil war. Soon after its commencement, and especially after the issuing of the proclamation of emancipation by President Lincoln, Jan. 1, 1863, large numbers of slaves abandoned by or escaping from their masters came within the federal lines. The duty of caring for these helpless people was devolved first upon the war department, and afterward upon the treasury department. They were supplied with food and clothing, and were largely employed in the work of fortification, and in other labor in aid of the army. Plantations abandoned by their owners were also set apart for the use of freedmen, which they occupied in some cases on their own account, but generally as employees of the government or of individuals to whom the abandoned lands were leased. Enlisted in the federal army to the number of 186,097 during the war, the colored soldiers proved themselves unsurpassed in bravery and aptitude for military life. Various charitable and religious organizations at the north did much for the education of the freedmen, for which they manifested an intense desire, by organizing schools and employing teachers. At the close of the war the late slaves flocked to the cities and principal towns, and large numbers were dependent upon the government for transportation to points where work could be obtained, while an active supervision was necessary to protect their rights from the encroachments of their former masters, and to prepare them for a life of freedom. To enable the government to fulfil these duties, the act of congress of March 3, 1866, was passed, organizing in the war department the “bureau of refugees, freedmen, and abandoned lands,” popularly known as the “freedmen’s bureau,” which, with powers enlarged by subsequent acts, remained in operation until Jan. 1, 1869, when its functions ceased, with the exception of the educational department, which continued till July 1, 1870, and that for the collection of claims, which is still in operation. It was placed in charge of Maj. Gen. O. O. Howard as commissioner, with 10 assistant commissioners, aided by various subordinates, in the late insurrectionary states. It exercised a general supervision over the freedmen as well as over loyal refugees, protecting them in their rights, deciding their disputes, aiding them in obtaining work, extending to them facilities of education, and furnishing them with medical treatment. The collection of the claims of colored soldiers and sailors for pay, bounty, prize money, &c., by which they were protected from fraud, was an important function of the bureau. The number of day and night schools making regular reports in operation at the close of the school year (June 30), with the number of teachers and pupils, is shown in the following table, besides which

rights,” carefully prepared, was presented to the house of commons, March 7, 1843, by the Hon. Fox Maule (now earl of Dalhousie, and a ruling elder and a member of the general assembly of the Free church); but it was refused by a majority of 211 against 78. Of 37 Scottish members present at the division, 25 voted for Mr. Maule's motion. The question now was: Will the church retire from her declared principles, or will she, to preserve her liberties, relinquish her connection with the state? Without hesitation the decision was made, and 475 ministers left the establishment, including most of those who had acted openly with the evangelical party. Many of the congregations also left it whose ministers remained in it; and hence, as well as from the continued accession of numbers in every district of the country, the number of churches now exceeds 900. The missionaries belonging to the establishment in 1843 to a man threw in their lot with the Free Protesting church. Her ministers are supported out of a common fund, to which every member of the church is expected to contribute according to his ability, and the dividend accruing from this fund every congregation is at liberty to supplement at its pleasure. In 1873 the church had 16 synods, 71 presbyteries, 948 congregations, and 957 ministers. The sum of £432,628 was in the same year raised for the various purposes of the church, including missions. Although beginning with nothing in 1843, and undertaking the untired work of supporting the ministry, the Free church has built or purchased all its churches throughout Scotland, with the manse, and the parish school houses, the missionary buildings in India, Africa, and elsewhere, the buildings of the two normal schools in Edinburgh and Glasgow, the three colleges at Edinburgh, Aberdeen, and Glasgow, and the new assembly hall in Edinburgh, erected in 1858–59 at a cost of £26,000. For the education fund she raised in 1843–44 £2,642, and in 1869–70 £3,094. The average salary of the ministers is £205, besides manse and glebe.

FREEDMEN (liberti, libertini), the designation of manumitted slaves in Roman antiquity. They were called liberti with reference to their masters, and libertini with reference to their new rank or condition. According to various circumstances, defined by law, the freedmen became Roman citizens, Junian Latins (from the Junian law which gave them freedom, and the similarity of their status to that of Latin colonists), or deditchii. The last were neither citizens (Roman or Latin) nor slaves. The Junian Latins suffered great disabilities as to property, but could in various ways rise to citizenship. But even the freedmen of the first class were not genuine (ingenui) citizens, and remained under certain obligations to their masters. The freedmen wore a cap as a sign of inclusion, and took their names from their previous owners. The sons of freedmen became genuine citizens. In later times the number
there were Sunday schools, industrial schools, and many day and night schools making only occasional reports to the bureau:

Of the number reported in 1867, 438 were night schools, 655 were wholly and 501 partly sustained by freedmen, who owned 891 school buildings, and 471, including 21 high and normal schools, were graded. Of the teachers 1,868 were white and 699 colored. The whole number of schools of all kinds was 8,675, including 1,468 Sunday schools with 105,786 pupils, and 35 industrial schools with 2,124 pupils. The total expenses for the six months ending June 30 were $537,566, of which $57,332 were paid by freedmen and $220,583 by the bureau. Of the number reported in 1870, 1,924 were sustained wholly or partly by freedmen, who owned 992 school buildings, and 74, with 8,147 pupils, were high or normal schools. Of the teachers 1,951 were white and 1,312 colored. The whole number of schools of all kinds was 4,239, with 9,807 teachers, including 1,563 Sunday schools with 6,007 teachers and 97,762 pupils, and 61 industrial schools with 1,760 pupils. The whole amount expended for schools for the six months ending June 30 was $1,002,896, of which $300,000 were paid by freedmen and $442,896 by the bureau. The total expenditure of the bureau for educational purposes to Aug. 31, 1871, was $8,711,364, the greater portion of which was for the erection and renting of school buildings. The bureau aided in establishing a large number of institutions for the higher education of the freedmen, many of which have continued in operation to the present time. Among these may be mentioned Howard university, at Washington; Atlanta university, at Atlanta, Ga.; Claflin university, at Orangeburg, S. C.; Straight university, at New Orleans, La.; Fisk university and the Central Tennessee college, at Nashville, Tenn.; Wayland seminary (theological), at Washington; and the Hampton normal and agricultural institute, at Hampton, Va. Nearly 800,000 acres of farming land and 5,000 pieces of town property, afterward restored to the owners, were at various times under the charge of the bureau, and the rent collected amounted to $400,000. The number of rations issued to freedmen was over 15,000,000; number of freedmen furnished with transportation, about 30,000; number of sick, including refugees, treated, 590,000. The amount of claims collected and paid over to Aug. 31, 1871, was $8,418,081. The bureau was supported mainly by congressional appropriations, though the receipts from certain miscellaneous sources, including the sale and rental of Confederate property, fines, marriage certificates, donations, &c., known as the freedmen's and school funds, were set apart for its benefit. The total expenditure to Aug. 31, 1871, including accounts in favor of the freedmen from Jan. 1, 1865, was $14,900,480, of which $1,910,556 were derived from the freedmen's and school funds.

FREEMASONRY

FREEMASONRY, the system of secrets, ceremonies, and principles peculiar to the order or society of freemasons. This order, as it now exists, is a secret association organized for the purpose of social intercourse and mutual assistance. A very ancient origin is often claimed for it, some of its writers maintaining that it derived its origin from the "Dionysiac fraternity," an association which was formed in Asia Minor by the architects and builders engaged in the construction of temples and theatres at the time when the Greeks migrated from Attica thither. The association is supposed to have been in existence in Tyre when Solomon undertook the building of the temple, and the story runs that the fraternity sent a band of workmen from Tyre to assist Solomon in that work. Freemasonry, according to this account,
is said to have been originally organized by the leader of the band, who was a widow's son; and in this way is explained the great prominence which is given to Solomon's temple in the ritual and symbols of the order. But as there is no trace of these legends in authentic history, well informed masons content themselves with supposing that the order originated in the associations which were formed during the middle ages by masons and builders, as well as by workmen belonging to other crafts. In those times, when a church or other great edifice was in process of construction, workmen were collected from all quarters and encamped in huts around it. They established a regular government with a master at their head, and appointed every tenth man a warden to oversee the others. They ranged from country to country, and established themselves wherever they found churches to build. It thus became important for them to be able to make themselves known to each other in strange countries, and hence they devised a system of secret signs and symbols. Whether these associations were also in possession of secret knowledge which was essential in architecture, and was transmitted from one generation to another, is a disputed point. It is certain that the finest monuments of Gothic architecture both in France and England were reared by architects who were not members of the order. The building of churches, however, was the great work of the times, and the masonic associations were held in high esteem because of the importance of their services in this work. They enjoyed the especial favor and protection of the pope, and bulls were issued by which peculiar privileges were granted to them. They were exempted from burdens imposed upon other workmen, and hence were styled "free" masons. Men of eminence, both ecclesiastics and laymen, who were not actually employed in building, either as architects or as masons, became members of the order. Henry VI., king of England, joined it, and Henry VII. was grand master.—Freemasonry, as organized at the present day, has no connection whatever with the art of practical building. It is called by masonic writers speculative masonry, to distinguish it from practical building, which is called operative masonry. According to these writers, as the number of persons not practical builders who were admitted to the order increased, operative masonry was gradually transformed into speculative. They refer to the initiation in 1646 of the English antiquary Elias Ashmole, of which a description is found in his diary, as evidence that at that time the operative character of freemasonry was fast giving way to the speculative. On the other hand, writers who do not belong to the order maintain that modern freemasonry never had any connection whatever with the freemasonry of the middle ages, but was originally founded by Ashmole and some of his friends, as a piece of mystification, its symbols and signs having been borrowed partly from the knights templars and partly from the Rosicrucians. However this may be, it is certain that an order of freemasons was in existence in London after the great fire of 1666, and that Sir Christopher Wren was appointed grand master of it. The interest in it afterward declined, perhaps because it was neglected by Wren as he became old and infirm; so much so that at the beginning of the 18th century St. Paul's lodge was the only one, or almost the only one, in existence in England. In 1702 this lodge adopted a regulation by which it was provided that the privileges of masonry should be extended to men of various professions, provided they were regularly approved and initiated into the order. The four lodges in existence in 1717 assembled at the Apple Tree tavern, in Covent Garden, and constituted themselves the grand lodge of England. The union was formed on the basis of the regulation of 1702. Since that time freemasonry has been, as it is called, a purely speculative system of symbolism. In 1729 the grand lodge adopted a constitution framed by Anderson, which became the organic law of the order. As thus organized, it was transplanted from England into France in 1735, into Ireland in 1739, and within the next ten years into Holland, Russia, Spain, Italy, Scotland, and Germany. An attempt was made in 1790 to introduce the organization into America by the appointment of a provincial grand master of New Jersey, but we have no record of the incumbent having established any lodge under the authority of his deputation. In 1738, however, a lodge was opened at Boston, which was speedily followed by the organization of other lodges in the different colonies. After the assumption of independence by the United States, the lodges of America, all of which derived their warrants of authority originally from the grand lodge of England or that of Scotland, availed themselves of the privileges possessed by such bodies in all independent countries, and organized grand lodges in their respective states. In no country in the world has freemasonry flourished with more vigor than in the United States; and notwithstanding a severe but ineffectual opposition to it, which commenced in 1859 by the organization of an anti-masonic party (see Anti-Masonry), it has increased in numerical extent with such steady progress that at the present day it numbers, in all parts of the republic, several thousand lodges, and more than half a million members. In the whole world there were in January, 1878, upward of 10,000 lodges, and probably a million freemasons, including in that term not merely active members of lodges, but all who have attained the degree of master mason. In spite of many attempts to suppress it by both church and state in various countries of Europe, it is firmly planted in every part of that continent, and many lodges have been established in Africa and Asia. In May, 1878, a lodge was established by Americans in the
city of Jerusalem; and in the preceding year the grand lodge of Italy was opened in Rome itself. Its organization in Europe has been frequently used for political purposes, and especially as a cloak to conspirators against the governments. Such employment of it, however, is a violation of its constitution, which prohibits political, partisan, or sectarian discussions in the lodges. The primary organization of the masonic fraternity is into lodges, which must each be composed of at least seven master masons in good standing. The first and lowest degree of masonry is that of entered apprentice, the second of fellow craft, the third of master mason. The officers of a lodge in the United States are: worshipful master, senior warden, junior warden, treasurer, secretary, senior deacon, junior deacon, tiler, and chaplain. There are also two stewards. The master, the warden, and the tiler are essential to any lodge organization. The tiler keeps the door and guards against intrusion. The officers are elected annually by ballot. In each state of the Union there is a grand lodge composed of the representatives of the subordinate lodges, over which it exercises a certain jurisdiction. Its officers are styled grand and deputy grand masters, grand warden, grand treasurer, grand secretary, grand chaplain, grand deacons, grand marshal, grand pursuivant, grand sword-bearer, grand stewards, and grand tiler. There is also a still higher degree of masonry, the members of which are termed royal arch masons, and form royal arch lodges; and beyond this there is still a long series of degrees bearing various titles. The literature of freemasonry is extensive, especially in the German and French languages, the latest bibliographia masonica containing titles of quite 4,000 books upon the history, rituals, and belles-lettres of the order. Among the American works best known are Mackey's "Lexicon" (Philadelphia, 1880); Morris's "Lights and Shadows" (1852), "Poems" (1864), and "Dictionary" (1867); and Mac- coy's "Cyclopedia" (1866); Webb's "Freemason's Monitor" (1796), in numerous editions, is still the favorite text book of the craft. "Freemasonry in the Holy Land" (1872) describes the masonic mission which led to the organization of the lodge in Jerusalem.

FREEPORTE, a city and the capital of Stephenson co., Illinois, on the Pekatonia river and at the intersection of the Western Union railroad with the Galena division of the Chicago and Northwestern, and the Northern division of the Illinois Central line, 108 m. W. N. W. of Chicago; pop. in 1850, 1,486; in 1860, 5,876; in 1870, 7,889. It is situated on a fertile and undulating tract of land, and contains one of the finest court houses in the state. The principal manufactories are one of reapers and wagons, one of churms, one of carpets and coverlets, a machine shop and foundry, a plow manufactory and a woolen mill, a turning shop, and a tannery. There are two national banks, with a capital of $200,000, three weekly newspapers (one German), two monthly periodicals, 18 churches, and 20 public schools in (1872), including a high school, with 25 teachers and 1,400 pupils. Freeport college (Presbyterian) was organized in 1872, with 10 professors and instructors and 50 students. Freeport was first settled in 1836, with the political agitation following, for a time gave great prominence to the platform and princi-
ples of the freesoil party. It formed the nucleus of the republican party, which was founded in 1856 chiefly from the dissolving Whig party. The adoption by the republicans of the freesoil platform in respect to slavery ended the freesoilers as a distinctive party.

FREESTONE, an E. central county of Texas, bounded E. by Trinity river and intersected by Pearl creek; area, 1,198 sq. m.; pop. in 1890, 8,199, of whom 3,886 were colored. It is heavily timbered. The soil is fertile and well watered. Mineral springs exist. The chief productions in 1870 were 197,481 bushels of Indian corn, 26,015 of sweet potatoes, and 6,465 bales of cotton. There were 8,640 horses, 4,981 milk cows, 14,559 other cattle, and 18,438 swine. Capital, Fairfield.

FREE THINKERS, a name applied to the opponents of Christianity in England in the 17th and 18th centuries. Lord Herbert of Cherbury, Hobbes, Toland, Tindal, Woolston, Chubb, and Anthony Collins were among their most noted writers. Bolingbroke, Shaftesbury, and David Hume were counted among their ablest representatives. They were never an organized sect. The French writers, including Voltaire, D'Alembert, Diderot, and Helvétius, who labored for the overthrow of Christianity, and who called themselves *apres forte*, were in England called free thinkers.

FREETOWN, a town of W. Africa, capital of the British colony of Sierra Leone, on the left bank of Sierra Leone river, about 5 m. from the sea; lat. 8° 29' N., lon. 13° 9' W.; pop. estimated at 18,000. It is on an inclined plane, 50 ft. above sea level at high-water mark. The streets are wide, well laid out, and ornamented with rows of oranges, lime, banana, or cocoanut trees. Several of the houses are commodious and substantial stone buildings. The principal public edifices are St. George's church, the church missionary and Wesleyan missionary institutions, the grammar school, market house, custom house, jail, and lunatic asylum. The governor's residence, barracks, and government offices are on hills above the town. The navigable entrance of the Sierra Leone river is narrow, there being a large shoal called the Bullom shoal in its centre.

FREEWILL BAPTISTS, or Free Baptists, a denomination of evangelical Christians in the United States and Canada. Its founder was Benjamin Randall (1749–1808), who was one of Whitefield's hearers at Portsmouth, N. H., Sept. 26, 1770. The impression made by the sermon, and more especially by the tidings of the preacher's death two days later, resulted in his conversion. At first a Congregationalist, he connected himself in 1776 with the Baptist church in South Berwick, Me., and soon after entered the ministry, but was called to account for preaching a doctrine different from that of his brethren. In 1780 he organized in New Durham, N. H., a church holding views similar to his own, which was the nucleus of the new denomination. The distinctive tenets of Randall and his coadjutors were the doctrines of free salvation and open communion, as opposed to those of election and close communion held by the Calvinistic Baptists. They also insisted upon the freedom of the will, as essential to man as a subject of moral government, and therefore as inviolable by the divine sovereignty, and not to be contravened by any explanation of it. Their opponents styled them "General Provisioners," "Freewill Baptists," and "Free Baptists," by the second of which names they have usually been designated, though the last is now preferred in some of their own publications. In government they are congregational. The first church held a conference once a month, which was called a monthly meeting. When other churches were formed in neighboring localities, a general quarterly meeting by delegation was held. As Randall and his associates travelled and extended the denomination through New Hampshire and the adjacent states, numerous quarterly meetings were organized, and yearly meetings were instituted, consisting of delegates from associated quarterly meetings. The organization was completed by the institution in 1827 of the general conference, composed of delegates from all the yearly meetings, which convenes once in three years. To all these bodies the laity and clergy are alike eligible, and they all combine the services of public worship with the discussion and decision of questions of business and benevolence. In 1837 a correspondence was opened between the Freewill Baptists of New England and a few churches in North Carolina of similar sentiments, the result of which was that the latter in 1838 published their records as the "Minutes of the Freewill Baptist Annual Conference of North Carolina." They soon numbered 45 churches and about 3,000 members, and, though never formally united with the denomination in the north, maintained a constant correspondence with it. In 1839 Dr. William M. Housley of Kentucky, once a close communion Baptist clergyman, who for doctrinal reasons had taken a letter of dismission and condemnation from his former connection, attended the general conference of the Freewill Baptists at Conneaut, Ohio, and there applied for ordination to the ministry. He had already been admitted to the church in that place. There was a prospect of a large accession to the sect from Kentucky, and a council reported that Dr. Housley had approved himself qualified for the sacred office, excepting only that he was a slaveholder. But for this reason alone the council declined to "ordain him as a minister or fellowship him as a Christian," and the general conference after a spirited discussion voted without opposition "that the decision of the council is highly satisfactory." The connection of the denomination with slaveholding churches in North and South Carolina was brought before the same conference, and was entirely dissolved. From that
time the Freewill Baptists maintained the position then taken on the question of slavery, and the work of the denomination was confined mostly to the northern states until after the abolition of slavery. Since then much effort has been expended in educating the freed people and gathering them into churches. In Louisiana and in the Shenandoah and Mississippi valleys schools have been established and churches organized, and with the latter about 4,000 colored people have united. Some of the white churches in the south, holding similar views of doctrine and polity, have entered into correspondence that looks toward a formal union. There are several benevolent societies of denominational interest, supported and encouraged by all the churches. The principal of these are the foreign and home mission societies, and the educational society, and by all of them an aggregate sum averaging about $80,000 is raised annually. They celebrate anniversary meetings together in the autumn, which are numerously attended. The foreign mission society has several stations in Orissa, India. The Freewill Baptists have recently given special attention to the interests of education, and since 1847 have raised nearly $1,000,000 for educational purposes. They have a flourishing college at Lewiston, Me., and another at Hillsdale, Mich., to which pupils of both sexes and all colors are admitted, a theological department in each of these institutions, and seminaries of high grade and repute in eight or ten different states. The denominational printing establishment is at Dover, N. H., where are published the “Morning Star,” which for nearly 50 years has been the weekly organ, and a variety of denominational, Sunday school, and miscellaneous books. Biographies have been published of Randall, Colby, Marks, Phinney, Martin Cheney, and other clergymen, who throw light upon the history and spirit of the denomination. A history of the Freewill Baptists is in preparation under the direction of the general conference, one volume of which has been issued. In 1860 the whole number of communicants was less than 8,000. In 1889, when complete returns were for the first time obtained, there were 8 yearly meetings, 22 quarterly meetings, 311 churches, 268 ministers, and 12,860 communicants. There are now (1874) 35 yearly meetings, 181 quarterly meetings, 1,504 churches, 1,360 ministers, and 70,576 communicants. They are found in nearly all the states, but are most numerous in New England. There is also in New Brunswick and Nova Scotia a separate and rapidly increasing conference of Free Baptists, having about 9,000 members, who are not included in the above computation. They have a weekly newspaper, the “Religious Intelligencer,” published at St. John, N. B. The Freewill Baptists hold conferences conducted by laymen and delegations with the General Baptists of England, with whom they agree in doctrine.

**FREEZING**

**FREEZING, Artificial, the reduction of the temperature of fluids to such an extent as to render them solid. It is usually applied to the freezing of water and of articles of food. There are two general methods of effecting artificial freezing, viz., by liquefaction and by vaporization and expansion. The method by liquefaction is performed by freezing mixtures, which are formed by mixing together two or more bodies, one or all of which may be solid. They are generally used in vessels having three or four concentric apartments: an inner one, containing the article to be frozen; one eccentric to this, containing the freezing mixture, provided with some contrivance for agitation; one again outside of this, filled with a non-conductor of heat, as powdered charcoal, gypsum, or cotton wool; and sometimes one between them for holding water. The following table contains a list of the more important freezing mixtures, with the reduction of temperature each is capable of effecting:

The method of freezing by vaporization and expansion depends upon principles explained in the articles Boiling Point, Evaporation, and Heat. Among the most efficient apparatus for conducting the process is that of M. Carré of France. A strong galvanized wrought-iron boiler, capable of sustaining a pressure of eight or ten atmospheres, is connected by a tube with a freezer, also made of galvanized iron and of corresponding strength, consisting of two compartments, an outer annular one, connected with the boiler, and an inner one, for receiving the vessel which contains the water or liquid to be frozen. The connection between the boiler and freezer may be controlled either by stopcocks or by self-acting valves. A saturated solution of ammonia is introduced into the boiler, and the freezer is placed in a cold bath. Heat sufficient to produce a pressure of five or six atmospheres is applied to the boiler, which expels the gas from the water in which it is dissolved, and forces it into the annular compartment of the freezer, where it is condensed by its own pressure, aided by the cool bath, along with about one tenth its weight of water. When sufficient ammonia has been condensed, which is shown by the pressure indicated by a gauge, or approximately by a thermometer, the boiler itself is placed in a cold bath; the cylinder con-
taining the water to be frozen is placed in the inner compartment of the freezer, and to ensure contact the interstice is filled with alcohol. As the boiler cools, the pressure which had been produced by heat is gradually removed, and the liquid ammonia in the freezer becomes vaporized, producing an intense degree of cold. In a little more than an hour a block of ice may be frozen. An apparatus in use is said to be capable of producing 800 lbs. of ice in an hour.

**Freiberg**, or **Freiberg**, a walled town of Saxony, on the N. declivity of the Erzgebirge, and on the river Mähnach, 19 m. S. W. of Dresden; pop. in 1871, 21,673. It is a well built town, containing handsome monuments to Maurice of Saxony, and to Werner, the mineralogist, and a fine Gothic cathedral. The mining academy, founded in 1765, has a museum of model mining machines, and a library of about 20,000 volumes. It is one of the best mining schools in the world, and in 1873 had 86 students from nearly all countries, including 16 from the United States. The town has also a gymnasmum and a commercial school. The staple manufactures consist of gold and silver lace, brassware, white lead, gunpowder, shot, iron and copper ware, linens, woollens, ribbons, tape, leather, and beer. Freiberg is an ancient city, and was long the residence of the Saxon princes. It has mines of silver-bearing lead, which have been worked since the 12th century. The richest veins have been driven so deep that their productivity has diminished on account of the accumulation of water. For the purpose of draining them, a tunnel through the mountains to the Elbe at Meissen, distant 24 m., has been commenced. The district contains 150 mines, yielding silver, lead, copper, cobalt, and other minerals, employing in 1873 about 1,800 persons; the aggregate value of the products amounted in the same year to 4,000,000 thalers.

**Freiburg (Ger. Freiburg im Breisgau)**, a city of Germany, in the grand duchy of Baden, capital of the circle of the Upper Rhine, in the old district of Breisgau, on the Dreisam, 72 m. S. S. W. of Colmar, and 32 m. N. E. of Basel; pop. in 1871, 24,599. It is 940 ft. above the level of the sea, on the outskirts of the Black Forest, at the mouth of the Höltenthal. The town was several times captured by the French, who in 1744 destroyed its fortifications, and in their place public walks and vineyards have been laid out. The streets are in general open and well built, particularly the Kaiserstrasse, which is remarkable for its width and the excellence of its houses. Since 1827 the town has been the seat of the archbishop of the ecclesiastical province of the Upper Rhine. In 1454 a university was founded here, which has a library of more than 100,000 volumes, and in 1873 had 50 professors and 275 students. It has a faculty of Catholic theology. The principal public edifices are the arch-episcopal and ducal palaces; the cathedral, one of the most beautiful and perfect specimens of Gothic architecture in Germany; the government offices, courts of justice, town hall, museum, theatre, gymnasmum, orphan asylum, hospitals, and seminaries. The cornerstone of a new Protestant church was laid April 7, 1874. The manufactures include leather, paper, sugar, starch, tobacco, soap, bells, musical instruments, and chemicals. The Basel and Mannheim railway passes through Freiburg.

**Freiburg**, a town and a canton of Switzerland. See Freiburg.

**Freiburg unter dem Fürstenstein**, a town of Prussia, in the province of Silesia, on the Polssitz, 35 m. W. S. W. of Breslau; pop. in 1871, 6,792. The principal establishment is a flax spinnery, but there are also manufactories of woollen and cotton goods and tobacco, distilleries, lime kilns, and tile works. The town is surrounded by walls, with three gates, and has three suburbs. In the vicinity is the extensive domain of Fürstenstein, with the old and modern castles of that name, the latter built in mediaeval style and celebrated for its picturesque situation.

**Freight.** See Shipping.

**Freiligrath, Ferdinand**, a German poet, born in Detmold, June 17, 1810, died March 18, 1876. After leaving the gymnasium, he became a mercantile clerk at Soest, Amsterdam, and Barmen. His first productions were published in the *Museumsblat* in 1838. He brought out a volume of poems in 1888, which was so
favorably received that he gave up his situation, and removed to Darmstadt. In 1842 he received from the king of Prussia a pension of $300, and removed to St. Goar on the Rhine. The liberal party, with whom he was strongly allied in sentiment, being offended at his acceptance of a royal pension, he gave it up in 1844, and in that year his Glaubensbekennnis ("Confession of Faith") subjected him to political persecution which drove him abroad. He went to Belgium, to Switzerland, and finally to England, where German merchants gave him employment. In 1848, on the invitation of Longfellow, he had engaged a passage to the United States, when the revolutionary movement in Germany determined him to return to his own country. He settled in Düsseldorf, and by his popular lyrics greatly increased the enthusiasm of the democratic party. His poem Die Toten an die Lebenden ("The Dead to the Living") subjected him to indictment and prosecution by the government. He was defended by celebrated lawyers, and his trial produced an intense excitement. On his acquittal (Oct. 3, 1848) the poem was in immediate demand, numerous editions were issued, and it was circulated all over Germany. This is said to have been the first instance in Prussia of a jury trial for a political crime. Being still exposed to persecution by the government, Freiligrath returned to London in 1851, and was subjected to many trials until he became connected with the London branch of the bank of Switzerland; but the suspension of this institution in 1866 placed him again in difficulties, from which he was relieved by a national subscription taken up by his friends and admirers in Germany, which placed him in possession of a handsome income. From 1866 he resided in Canstatt. During the Franco-German war he wrote numerous patriotic songs which became popular. His principal works are: Gedichte (Stuttgart, 1859; 31st ed., 1871), Zwei Gedichte (Stuttgart, 1858), Neure politische und sociale Gedichte (Cologne, 1849). A complete edition of his works in 6 volumes appeared in New York in 1858-9, and in Stuttgart in 1870. Freiligrath was also an extensive compiler and translator. Among his most important translations are portions of Shakespeare, Mrs. Hemans, and Tennyson, the whole of Burns, and Longfellow’s "Hiawatha." A selection, by his daughter, from the English translations of his poems was published in the Tauchnitz "Collection of German Authors" (Leipsie, 1869).

FREISING, Freyning, or Freisingen, a town of Bavaria, in the district of Upper Bavaria, on the Isar, 20 m. N. E. of Munich; pop. in 1871, 7,778. It has a theological faculty, a gymnasium, a normal school, and five churches. Near it is the former abbey of Weihenstephan, now a school for boys. It is a normal agricultural establishment with a celebrated agricultural school. In 1724 a bishopric was established at Freising, which on the reorganization of the Catholic church in Bavaria in 1802 was united with the new archbishopric of Munich, whose occupant bears the title of archbishop of Munich and Freising.

FREULIS (anc. Forum Julii), a maritime town of S. France, in the department of Var, on an eminence overlooking the sea at the mouth of the Argens, 45 m. N. E. of Toulon; pop. in 1866, 2,887; with the suburb of St. Raphael, 3,050. It is the seat of a bishop and a commercial court, and has an episcopal seminary, a library, and a hospital. Its manufactures are corks, soap, oil, and wine. The town was founded by a colony from Massilia, and is supposed to have derived its name from Julius Caesar. Augustus made it a naval station, and kept there the ships taken at the battle of Actium. The ancient harbor is now entirely filled up by the deposits of the river, and the moles at its entrance are 8,000 ft. from the sea. Among the Roman remains are an aqueduct that can be traced more than 24 m. up the valley of the Siagnolle, an amphitheatre 650 ft. in circumference, a triumphal arch, and the pharos. Frejus was the birthplace of Julius Agricola and of the abbe Sieyès.

FREILINGHUYSEN. I. Frederick, an American statesman, born in New Jersey, April 18, 1758, died April 18, 1804. He graduated at Princeton college in 1770, and in 1775 was sent as a delegate from New Jersey to the continental congress. He served with distinction as captain of a volunteer corps of artillery at the battles of Trenton and Monmouth, and in the former, it is said, shot Col. Rahl, the commander of the Hessians. He was promoted to be colonel, and served during the remainder of the war. After the peace he filled various state and county offices, and in 1790, when the New Jersey and Pennsylvania troops were called to take part in the expedition against the western Indians, he was appointed major general by President Washington. In 1798 he was elected a senator to the 11th Congress, but did not occupy the post he had been distinguished as an eloquent advocate. During the war with Great Britain in 1812-15, he raised and commanded a company of volunteers. In 1817 he was elected attorney general of New Jersey by a legislature opposed to him in politics, and held the post till 1822, when he was chosen United States senator. In the senate Mr. Frelinghuysen acted with the whig party. He exerted himself in behalf of the abolition of the bill to suppress the carrying of mails on the sabbath, supported Mr. Clay's resolution for a national fast in the season of the cholera, spoke in favor
FREMONT, a city and the capital of Sandusky co., Ohio, on the W. bank of Sandusky river, which is crossed by a bridge, at the head of navigation, and at the intersection of the Lake Shore and the Lake Erie and Louisville railroads, 100 m. N. of Columbus; pop. in 1870, 5,455. The city has considerable trade, lines of steamers running to the principal ports of Lake Erie, and contains a national bank, three weekly newspapers, 17 public schools, including a high school, and manufactories of woolens, sashes and blinds, flour, and iron. It was formerly called Lower Sandusky.

FREMONT, John Charles, an American explorer and soldier, born in Savannah, Ga., Jan. 21, 1813. His father was a Frenchman who had settled in Norfolk, Va., where he supported himself by teaching his native language. He died in 1818. His widow, a Virginian, whose maiden name was Whiting, with three infant children settled in Charleston, S. C. At the age of 15 John Charles entered the junior class of Charleston college. For some time he stood high, and made remarkable attainments in mathematics; but his inattention and frequent absences at length caused his expulsion. After this he obtained employment as a private teacher of mathematics, and took charge at the same time of an evening school. In 1838 he became teacher of mathematics on board of the sloop of war Natchez, then in the port of Charleston, from which she sailed on a cruise to the coast of South America. Fremont was absent in her for more than two years, and on his return passed a rigorous examination at Baltimore for the post of professor of mathematics in the navy, and was appointed to the frigate Independence; but he soon resolved to quit the sea, and engaged as a surveyor and engineer on a railroad line between Charleston and Augusta, Ga. Subsequently he assisted in the survey of the railroad line from Charleston to Cincinnati, and particularly in the exploration of the mountain passes between North Carolina and Tennessee. This work being suspended in the autumn of 1837, he accompanied Capt. Williams of the army in a military reconnaissance of the mountainous Cherokee country in Georgia, North Carolina, and Tennessee. In anticipation of hostilities with the Indians, this survey was rapidly made in the depth of winter, and was Fremont's first experience of a campaign amid mountain snows. In 1838-39 he accompanied M. Nicollet in explorations of the country between the Missouri and the British line. While thus engaged in 1838, he received from President Van Buren, under date of July 7, a commission as second lieutenant in the corps of topographical engineers, and was ordered to proceed to Washington in 1840, employed in the prepar-
aration of the report of these expeditions, he became acquainted with Miss Jessie Benton, a daughter of Col. Thomas H. Benton, at that time a senator from Missouri. An engagement was formed, but as the lady was only 16 years of age, her parents objected to the match, and suddenly, probably through the potent influence of Col. Benton, the young officer received from the war department a peremptory order to make an examination of the river Des Moines on the western frontier. The survey was rapidly executed, and shortly after his return from this duty the lovers were secretly married, Oct. 19, 1841. In the following year Fremont projected a geographical survey of the entire territory of the United States from the Missouri river to the Pacific ocean. He applied to the war department for employment on this service, and received instructions to explore the Rocky mountains, and particularly to examine the South pass. He left Washington May 2, 1842, and accomplished his task successfully in the course of four months, having carefully examined the South pass, and explored the Wind River mountains, ascending their highest point, since known as Fremont’s peak (13,570 ft.).

His report of the expedition was laid before congress in the winter of 1842–3, and attracted great attention both at home and abroad. Immediately after its publication Fremont planned a second expedition, much more comprehensive than the first. He determined to extend his explorations across the continent, and to survey the then unknown region lying between the Rocky mountains and the Pacific ocean. In May, 1843, he commenced his journey with 36 men, and on Sept. 6, after travelling more than 1,700 miles, came in sight of the Great Salt lake, of which no accurate account had ever been given, and of which very vague and erroneous notions were entertained. His investigations effected important rectifications in our geographical knowledge of this portion of the continent, and had subsequently a powerful influence in promoting the settlement of Utah and of the Pacific states. From the Great Salt lake he proceeded to the upper tributaries of the Columbia, whose valley he descended till he reached Fort Vancouver, near the mouth of that river. On Nov. 10 he set out on his return to the states. He selected a S. E. route, leading from the lower part of the Columbia to the upper Colorado, through an almost unknown region, crossed by high and rugged mountain chains. He soon encountered deep snows, which forced him to descend into the great basin, and presently found himself in the depth of winter in a desert, with the prospect of death to his whole party from cold and hunger. By astronomical observation he found that he was in the latitude of the bay of San Francisco, but between him and the valleys of California was a range of mountains covered with snows which the Indians declared no man could cross, and over which no reward could induce them to attempt to guide him. Fremont undertook the passage without a guide, and accomplished it in 40 days, reaching Sutter’s Fort on the Sacramento early in the fall, with his men reduced almost to skeletons, and with only 83 out of 67 horses and mules remaining. He resumed his journey March 24, and proceeding southward, skirted the western base of the Sierra Nevada, crossed that range through a gap, entered the great basin, and again visited the Salt lake, from which through the South pass he returned to Kansas in July, 1844, after an absence of 14 months. The reports of this expedition occupied in their preparation the remainder of 1844. Fremont was brevetted captain in January, 1845, and in the spring of that year he set out on a third expedition to explore the great basin and the maritime region of Oregon and California. The summer was spent in examining the head waters of the rivers whose source is in the dividing ridge between the Pacific and the Mississippi valley, and in October he encamped on the shores of the Great Salt lake. Thence he proceeded to explore the Sierra Nevada, which he crossed again in the dead of winter with a few men to obtain supplies from California for his party, with whom he made his way into the valley of the San Joaquin, where he left his men to recruit, and went himself to Monterey, which was at that time the capital of California, to obtain from the Mexican authorities permission to proceed with his exploration. This was granted, but was almost immediately revoked, and Fremont was peremptorily ordered to leave the country without delay. He as peremptorily refused to comply. The Mexican governor, Gen. Castro, mustered the forces of the province and prepared to attack the Americans, who were only 63 in number. Fremont took up a strong position on the Hawk’s peak, a mountain 30 m. from Monterey, built a rude fort of felled trees, hoisted the American flag, and, having plenty of ammunition, resolved to defend himself. The Mexican general formed a camp with a large force in the plain immediately below the position held by the Americans, whom he hourly threatened to attack. On the evening of the fourth day of the siege Fremont withdrew with his party and proceeded toward the San Joaquin. The fires were still burning in his deserted camp when a messenger arrived from Gen. Castro to propose a cessation of hostilities. Without further molestation Fremont pursued his way northward through the valley of the Sacramento into Oregon. Near Tamath lake, on May 9, 1846, he met a party in search of him with despatches from Washington, directing him to watch over the interests of the United States in California, there being reason to apprehend that the province would be transferred to Great Britain, and also that Gen. Castro intended to destroy the American settlements on the Sacramento. Fremont promptly retraced his steps to California. Gen. Castro was already marching against the settlements. The settlers rose
in arms, flocked to Fremont's camp, and under his leadership the result was that in less than a month all northern California was freed from Mexican authority. On July 4, Fremont was elected governor of California by the American settlers. On the 10th of that month he learned that Commodore Sloat, who commanded the United States squadron on the coast, had taken possession of Monterey. Fremont proceeded to join the naval forces, and reached Monterey with 160 mounted riflemen on the 19th. Commodore Stockton about the same time arrived at Monterey with the frigate Congress, and took command of the squadron, with authority from Washington to conquer California. At his request Fremont, who had been promoted (May 27) to the rank of lieutenant colonel, organized a force of mounted men, known as the "California battalion," of which he was appointed major. He was also appointed by Com. Stockton military commandant and civil governor of the territory, the project of making California independent having been relinquished on receipt of intelligence that war had broken out between the United States and Mexico. On Jan. 13, 1847, he concluded with the Mexicans articles of capitulation which terminated the war in California, and left that country permanently in the possession of the United States. Meantime Gen. Kearny, with a small force of dragoons, had arrived in California. A quarrel soon broke out between him and Com. Stockton as to who should command. They each had instructions from Washington to conquer and organize a government in the country. Fremont had accepted a commission from Com. Stockton as commander of the battalion of volunteers, and had been appointed governor of the territory. Gen. Kearny, as Fremont's superior officer in the regular army, required him to obey his orders, which conflicted with those of Com. Stockton, whose authority Fremont had already fully recognized as commander-in-chief of the territory; an authority which had also been admitted by Gen. Kearny for a considerable period after his arrival. In this dilemma Fremont concluded to obey the orders of Com. Stockton. Despatches from Washington received in the spring of 1847 terminated this conflict of authorities by directing Com. Stockton to relinquish to Gen. Kearny the supreme command in California. Fremont hesitated no longer to place himself under Gen. Kearny's orders, who in June set out overland for the United States, ordering Fremont to accompany him, and treating him with deliberate disrespect throughout the journey, until at Fort Leavenworth, Aug. 22, he put him under arrest, and directed him to go to Washington and report himself to the adjutant general. He arrived at Washington Sept. 16, and immediately asked for a speedy trial on Gen. Kearny's charges. Accordingly a court martial was held, beginning Nov. 2, 1847, and ending Jan. 81, 1848, which found him guilty of "mutiny," "disobedience of the lawful command of a superior officer," and "conduct to the prejudice of good order and military discipline," and sentenced him to be dismissed from the service. A majority of the members of the court recommended him to the clemency of President Polk. The president refused to confirm the verdict of mutiny, but approved the rest of the verdict and the sentence, of which, however, he immediately remitted the penalty. Fremont declined to avail himself of the president's pardon, and forthwith resigned his commission as lieutenant colonel. On Oct. 14, 1848, Fremont started on a fourth expedition across the continent, at his own expense. With 33 men and 120 mules he made his way along the upper waters of the Rio Grande through the country of the Utes, Apaches, Comanches, and other Indian tribes, then at war with the United States. His object was to find a practicable passage by this route to California. In attempting to cross the great Sierra, covered with snow, his guide lost his way, and Fremont's party encountered horrible suffering from cold and hunger, a portion of them being driven to cannibalism. All of his animals and one third of his men perished, and he was forced to retrace his steps to Santa Fé. Undaunted by this disaster, he gathered another band of 80 men, and after a long search discovered a secure route, which conducted him eventually to the Sacramento in the spring of 1849. He now determined to settle in California, where in 1847 he had bought the Mariposa estate, a very large tract of land, containing rich gold mines. His title to this estate was contested, but after a long litigation it was decided in his favor in 1855 by the supreme court of the United States. In 1849 he received from President Taylor the appointment of commissioner to run the boundary line between the United States and Mexico. The legislature of California, which met in December, 1849, elected him on the first ballot one of the two senators to represent the new state in the senate of the United States. He consequently resigned his commissionership, and departed for Washington by way of the isthmus. He took his seat in the senate Sept. 10, 1850, the day after the admission of California as a state. In drawing lots for the terms of the respective senators, Fremont drew the short term, ending March 4, 1851. The senate remained in session but three weeks after the admission of California, and during that period Fremont devoted himself almost exclusively to measures relating to the interests of the state he represented. For this purpose he introduced and advocated a comprehensive series of bills, 18 or 20 in number, embracing almost every object of legislation demanded by the peculiar circumstances of California. In the state election of 1851 in California, the party which had opposed the introduction of slavery, and had placed the proviso against it in the
state constitution, was defeated. As Fremont was one of the leaders of this party, he failed of re-election to the senate, after 142 balloting.

The next two years he devoted to his private affairs, and visited Europe in 1852, where he spent a year, and was received with distinction by many eminent men of letters and of science. While in Europe he learned that congress had made an appropriation for the survey of three routes from the Mississippi valley to the Pacific. He immediately returned to the United States for the purpose of fitting out a fifth expedition on his own account to complete the survey of the route he had taken on his fourth expedition. He left Paris in June, 1853, and in September was on his march across the continent. He found passes through the mountains on the line of lat. 39° and 39°, and reached California in safety, after enduring great hardships. For 60 days his party lived on horse flesh, and for 48 hours at a time were without food of any kind. In the spring of 1855 Fremont with his family took up his residence in New York, for the purpose of preparing for publication the narrative of his last expedition. His name now began to be mentioned in connection with the presidency by those who were combining to act against the democratic party on the basis of opposition to the extension of slavery. The republican national convention, which met at Philadelphia, June 17, 1856, nominated him for the presidency by a vote of 859 to 198 for John McLean, on an informal ballot. On the first formal ballot Fremont was unanimously nominated. He accepted the nomination in a letter dated July 8, 1856, in which he expressed himself strongly against the extension of slavery and in favor of free labor. A few days after the Philadelphia convention adjourned, a national American convention at New York also nominated him for the presidency. He accepted their support in a letter dated June 30, in which he referred them for an exposition of his views to his forthcoming letter accepting the republican nomination. After a most spirited and exciting contest, the presidential election resulted in the choice of Mr. Buchanan by 174 electoral votes from 19 states, while Fremont received 114 votes from 11 states, including the six New England states, New York, Ohio, Michigan, Iowa, and Wisconsin. Maryland gave her eight electoral votes for Mr. Fillmore. The popular vote for Fremont was 1,841,000; for Buchanan, 1,898,000; for Fillmore, 974,000. In 1858 Fremont went to California, where he resided for some time. In 1860 he visited Europe. Soon after the breaking out of the civil war he was made a major general and assigned to the command of the western district. On Aug. 31, 1861, he issued an order emancipating the slaves of those in his district who were in arms against the United States, which was annulled by the president as unauthorized and premature, and he was relieved from his command, Nov. 2. Three months later he was appointed commander of the mountain district of Virginia, Kentucky, and Tennessee. He fought on June 8, 1862, an indecisive battle against Gen. Jackson at Cross Keys; and shortly afterward, on Pope being appointed to the command of the army of Virginia, Fremont declined to serve under an officer whom he ranked, and sent in his resignation, which was accepted by the president. He took no further part in the war. On May 31, 1864, a convention of republicans dissatisfied with Mr. Lincoln met at Cleveland and nominated Gen. Fremont for president. He accepted the nomination, but in September, finding that he had few followers, withdrew from the field. He has since taken no part in public affairs, but has been active in promoting a projected southern transcontinental railway. In connection with this he was accused of fraud in France, and in 1878 was found guilty in a trial in Paris, and in his absence was sentenced to fine and imprisonment. He resides in New York in winter and at Mount Desert, Me., in summer.

FREMONT, Edmond, a French chemist, born at Versailles in 1814. His father, a professor of chemistry, instructed him in that science, and he perfected his knowledge as assistant of J. J. Pelouze and of Gay-Lussac in various institutions; and he succeeded the former in 1843 in the chair of the museum of natural history, and the latter in 1850 at the polytechnical school, and became a member of the academy of sciences in 1857. He has made chemical discoveries and published many works. His joint productions with Pelouze include Abrié de chimie (1848; 6th ed., 1869), and Cours de chimie générale (1849), which subsequently appeared under the title Traité de chimie générals, analytique, industrielle et agricole (3d revised and illustrated edition, 7 vols., 1862-'96).—His brother Arnauld (born in 1809) is a well known journalist and prolific novelist.

FRENCH, a N. E. county of Dakota territory, recently formed and not included in the census of 1870; area about 1,480 sq. m. It is drained by the Shayanee river, and contains a portion of Minnewakan or Devil's lake.

FRENCH BROAD RIVER, a river of North Carolina and Tennessee, rising in Transylvania co. of the former state, near the foot of the Blue Ridge, flowing N. W. into Tennessee, bending toward the S. W., and discharging into Holston river 4 m. above Knoxville. It is about 200 m. long, and is navigable by steamboats as far as Dandridge, Jefferson co., Tenn. For about 40 m. from Asheville to the Tennessee line, it is remarkable for its beautiful scenery, flowing through deep mountain gorges, or overhung by cliffs. Nearly opposite the Warm Springs, in Madison co., N. C., are precipices known as the Chimneys and the Painted Rocks. The latter, which are between 200 and 600 ft. high, derive their name from some Indian pictures still to be seen on them.
FRENCH HORN. See Horn.

FRENAU, Philip, an American poet, born in New York, Jan. 18, 1752, died near Freehold, N. J., Dec. 18, 1892. He was educated at Nassau Hall, Princeton, N. J., where James Madison was his room mate, and where he wrote his "Poetical History of the Prophet Jonah." He intended to study law, but finally followed a seafaring life. During the revolution his political burlesques in verse and prose were very popular with the patriots. While on a voyage to the West Indies in 1780 he was captured by the British and confined for a long time in the Scorpion prison ship at New York, which he commemorated in his poem "The British Prison Ship." When Jefferson was secretary of state Freneau became French translator under him, and at the same time editor of the "National Gazette," a paper hostile to Washington's administration. It was discontinued in October, 1798, and in 1795 he began a newspaper near Middletown Point, N. J., which he continued for a year, and published there an edition of his poems. He next edited for a year in New York "The Time Piece," a tri-weekly, after which he again became master of a merchant vessel. During the second war with Great Britain he recorded in his work the triumphs of the American arms. The close of his life was spent in retirement. Many of his smaller poems possess great elegance of diction, and Scott and Campbell borrowed whole lines from him. Several editions of his poems were published during his life, and E. A. Duyckinck has edited his "Poems of the Revolution" (New York, 1865).

FRE. I. Charles Théodore, a French painter, born in Paris in 1815. He studied with Roqueplan, and exhibited but little talent until he visited the East. He has since won some reputation as a delineator of eastern subjects. Among his recent works are "The Island of Philoe;" "The Cafe of Galata;" "The Evening Prayer;" "A Caravan of Mecca;" "Ruins of Palmyra;" and "The Simoom." II. Pierre Édouard, a French painter, brother of the preceding, born in Paris, Jan. 10, 1819. He studied with Paul Delaroche, devoted himself to genre painting and to small pictures, and exhibited his first work in 1845. He has since acquired distinction, and many of his works have been photographed and lithographed. Some of his later pictures are: "The Workshop at Écouen," "Palm Sunday," and "The Benedictine," exhibited in 1866; "The First Steps," "The Prayer," "The Library," "The Little Woodcutters," "The Stove," and an "Interior at Royat," in 1867; and "Boys leaving School" and "Girls leaving School," in 1868.

FREÉ, John Hookham, an English poet and diplomatist, born in London, May 21, 1769, died in May, Jan. 7, 1817. At the age of 20 he entered Eton and Cambridge, and while a school boy translated the remarkable war song upon the victory of Athelstan at Brunenburg from the Anglo-Saxon of the 10th century into the Anglo-Norman of the 14th. It is found in the first volume of Ellis's "Specimens of the Early English Poets." When at Eton, in connection with Canning and Robert Smith, he started and carried on to 40 numbers a weekly paper called the "Microcosm." On leaving Cambridge, in 1795, he entered the foreign office under Lord Grenville, and in the following year he was returned to parliament. He succeeded Canning as under-secretary for foreign affairs in 1799, and subsequently served in various diplomatic missions. During his leisure he made exquisite translations from the Greek and Spanish. In 1817 he published an extravaganza of the Puleci and Casti school, under the title of "Whistlecraft's Prospectus and Specimen of an Intended National Poem" (also called "The Monks and the Giants"), which treated in a light and satirical way the adventures of King Arthur. Its peculiar stanza and sarcastic pleasantry formed the immediate exemplar of Byron's "Beppo" and "Don Juan." Frere was a contributor to the "Anti-Jacobin," and was one of the founders of the London "Quarterly Review." For many years before his death he resided in Malta, receiving from the government a liberal diplomatic pension. See his "Works in Verse and Prose," with memoir by his nephews (2 vols., London, 1872).—His nephew, Sir Henry Bartle Edward, born in 1815, was governor of Bombay from 1862 to 1867, and subsequently became vice president of the royal geographical society. In 1872 he negotiated a treaty with the sultan of Zanzibar for the suppression of the slave trade.

FREDET, Nicolas, a French scholar, born in Paris, Feb. 15, 1688, died there, March 8, 1749. Admitted in 1714 to the academy of inscriptions and belles-lettres, of which he was afterward perpetual secretary, he was imprisoned for his first memoir, which discussed the origin of the French. On recovering his liberty in 1715, he began to produce the long series of memoirs which gave him distinction as an antiquary, philosopher, and philologist. The annals of the Assyrians, Chaldeans, Egyptians, and Hindoos, the principal ancient and oriental cosmogonies and theogonies, and numerous questions of history and geography are among the objects of his research. He wrote on chronology against Newton. An incomplete collection of his works was made by Leclerc de Septchênes (20 vols., Paris, 1799-9). A more complete one was undertaken by Champollion-Figeac, but only the first volume was issued (Paris, 1835).

FRENÉRON, I. Elie Catherine, a French journalist, born in Quimper in 1719, died in Paris, March 10, 1776. He studied under the Jesuits in the college of Louis-le-Grand at Paris, in which he was for a short time. At the age of 20 he joined Desfontaines in conducting his journal of criticism, and in 1746, after the death of the latter, commenced a similar periodical, entitled Lettres à Madame la
Contessa de * * *. This was suppressed in 1749, but resumed under the title Lettres sur quelques écrits de ce temps, in which he was associated with the abbé de La Porte. This was succeeded in 1754 by L'Année littéraire, which Fréron conducted alone, and which was the chief foundation of his reputation. In this he showed himself an admirer of the age of Louis XIV., and a decided adversary of the new philosophical and literary doctrines. The severity of his criticisms produced against him the most violent hatred, and the rest of his life was a warfare with the encyclopaedists. Throughout the literary history of the time his name is inseparable from that of Voltaire, who was stung by the satire which appeared weekly in L'Année littéraire. Fréron never missed an opportunity to attack him, and Voltaire repaid him with equal malice. He stops in the midst of a grave historical discussion to insinuate into Fréron; he asails him in his most dignified tragedies, as well as in La pucelle and Candide; he hurls against him the libel of Le pauvre diable, and in the comedy of L'Écosaise calls his journal L'Année littéraire. Fréron sustained the conflict alone with considerable success, but was defeated at last and died in grief for the suppression of his journal. He is now remembered as a calm observer of the society of his time, and the founder of newspaper criticism in France.

II. Louis Stanislas, a French revolutionist, son of the preceding, born in Paris in 1765, died in Hayti in 1802. A schoolfellow of Robespierre and Camille Desmoulins, he became one of the most fervent of the revolutionary party, and published a ferocious newspaper, L'Orateur du Peuple. He was at the same time a member of the club of Cordeliers. He participated in the insurrection of Aug. 10, and in the slaughters of September, 1792, and was elected to the convention, where he took his seat among the Montagnards; he voted for the king's death, and contributed to the fall of the Girondists. Being appointed one of the commissioners sent with the army against Marseilles and Toulon, he signalized himself by such brutalities that he was censured even by the committee of public safety. After the death of Danton he sided with the Thermidorians against Robespierre, and in conjunction with Barras commanded the troops who arrested the dictator and his adherents at the hôtel de ville. He pursued unrelentingly the members of the committee of public safety, procured the condemnation of Fouquier-Tinville, became the chief of a reactionary band of young men known as la jeunesse dure, was instrumental in suppressing the Jacobins, and energetically opposed all attempts at insurrection. Under the directory he was sent to the south on a mission of peace; but his former cruelties were still remembered by the people. He accepted an appointment as subprefect in Hayti, and soon after his arrival there died of yellow fever.

Fresco Painting (Ital. fresco, fresh), a method of ornamenting the walls and ceilings of buildings by painting designs in colors ground in water and mixed with lime upon the freshly laid plaster. It was much practised by Italian masters during the three or four centuries immediately succeeding the revival of painting in modern times, and the walls of many Italian palaces, churches, and convents are still adorned with works executed by their hands. The outlines of the designs are first drawn upon thick paper attached to cloth, which is stretched upon a frame. These are called cartoons, from the Italian cartone, paste-board. An additional colored cartoon is also prepared to serve as a study of color, and a guide during the execution of the fresco. The famous cartoons of Raphael, now deposited in the South Kensington museum, London, are of this character, although made to be copied in tapestry. The cartoons serve to give copies upon tracing paper, and these being attached to the wall in portions of convenient size, the outline is transferred to the wet plaster by going over the lines with a sharp point. Another method is to prick the figures through the cartoon, or upon a separate sheet laid behind it, and then, placing either the cartoon itself or the duplicate sheet upon the plaster, to dust through the holes a black coloring matter, which attaches itself in the lines of the figures to the walls. Several great painters have worked immediately on the plaster, without the intervention of any guide whatever. The preparation of the walls is an object of especial care. All the mortar should be fresh work, and of clean sand and good lime. When the rough coat is perfectly dry and hard, the smoother layers are added of the most carefully prepared mortar. In Munich, where fresco painting has been revived with some success during the present century, the lime is sometimes slaked several years before it is used, and is kept, after thorough stirring and reduction to an impalpable consistency, in a pit covered with clean sand a foot or more in thickness, over which earth is laid. Pure rain or distilled water should be used in mixing it, and also perfectly clean sand. The rough coat being dampened till it will absorb no more water, the finer plaster is laid on, and when this begins to set a still finer coat, called by the Italians the intonaco, and containing a smaller proportion of sand, is applied. Before this dries, the design must be transferred to it and the painting completed; consequently only small portions of a fresco can be executed at one time. The drying may be checked by occasional sprinkling with water, or by keeping wet sheets pressed to the design, as it is attached to the wall. The joinings or lines between the work of one day and that of the next are made to coincide with lines in the composition, or take place in shadows. As any retouching is impracticable, the painter must work rapidly before the ground becomes too dry to take the colors. If others are afterward applied mixed with size, white of egg, or
Fresco Painting

483

gum, which is in effect only tempera painting, they do not long continue to harmonize with the rest of the work. The colors must be of substances not liable to be affected by contact with the lime, and those of a mineral nature are almost exclusively used. Lime, or the dust of white marble, makes a good white. Chrome, the lead, verditer, zaffir tolaunt, &c., furnish many of the colors. The brushes must be so soft as not to roughen the plaster surface.—In addition to the process above described, which was called by the Italians buon fresco, or the true fresco, the early masters had other methods of painting on lime or plaster, to which the general name of fresco is usually applied. The most important of these was that known as fresco secco, or dry fresco, so called because the plastering, having been allowed to dry thoroughly, was remodeled before the color was applied, whereby the artist was enabled to quit or resume his work at pleasure, and to avoid the joinings observable in the true fresco painting. This process was universal in Italy until the close of the 14th century, when buon fresco in a measure took its place. In this manner were probably executed the paintings in Pompeii and Herculaneum, and indeed, all the so-called ancient frescoes. Work done in this way will bear to be washed as well as real fresco, and is as durable; but it is considered, in every important respect, an inferior art.—A new method of preparing the wall and painting in fresco has been introduced in Germany by Prof. von Fuchs, called the stereoehrome. The wall is coated with a preparation of clean sand and mixed with the least possible quantity of lime; and after the application of this the surface is scraped to remove the outer coating in contact with the atmosphere. It is then washed with a solution of silica, prepared with silica 23-21 parts in 100, soda 8-90, potash 2-52, water 65-67. The wall is thus said to be fixed; and if too strongly fixed, it must be rubbed with pumice. As the painter applies his colors he moistens the work by squirting distilled water upon it. When finished it is washed over with the silica solution. The picture also, as it is in progress, is washed with the same solution, and the colors thus becoming incorporated in the flinty coating, the picture is rendered hard and durable as stone itself. In this process the artist may leave the work and return to it at any time, and he is also able to retouch and alter any portion of it. The new museum at Berlin has been adorned by this process by Kaulbach. The decorations are historical pictures, 21ft. in height by 244 in width, and single colossal figures, friezes, arabesques, &c. They have the brilliancy and vigor of oil paintings, with no dazzling effect of light from whatever direction they may be viewed.—Old paintings in fresco have been transferred to canvas from walls crumbling by decay, and thus preserved. Gum is applied to the face of the painting, covered with a kind of glue. The intonaco, or last coat of plaster, is then carefully detached from the wall with a knife. The rough surface at the back having been rubbed down with pumicestone, until the plaster is reduced to the thinnest state consistent with the preservation of the painting, canvas is fastened upon the back, and the cloth in front moistened and removed. The detached fresco may then almost be treated like a common oil picture. It is quite common in Italy to remove by this method frescoes of value, for sale, or for preservation in public museums. Such was the process successfully employed in removing and preserving the paintings on the old walls of the convent of Sta. Eufemia at Brescia in 1829.—The history of fresco painting during the first two centuries after the revival of art is a history of painting, as nearly every considerable work was executed by that process. As a means of conveying thoughts, ideas, and information, not then, as now, acquired through literature, it continued to subsist for useful purpose even after the invention of printing. Hence the early masters, laboring for the edification of men in general, and not for the gratification of individuals—or, to adopt the language of the ancient fraternity of the painters of Sienna, "being teachers to ignorant men, who know not how to read, of the miracles performed by virtue and in virtue of the holy faith"—rarely painted easel pictures, but lavished all their genius and thought upon mural decoration or fresco painting. As late as the latter half of the 16th century Vasari declares it to be "more masterly, noble, manly, secure, resolute, and durable than any other kind of painting;" and he records the opinion of Michel Angelo that fresco was fit for men, oil painting only for women, and the luxurious and idle. The abbey church of St. Francis in Assisi, near Perugia, witnessed the earliest development of fresco painting in modern times. About the middle of the 13th century Giunta of Pisa commenced a series of paintings on its walls, and during the next century and a half Cimabue, Giotto, Giottino, the Gaddi, Simone di Martino, and other painters of note were invited to add to its adornment. Neglect and exposure have injured these works, but as the earliest specimens of modern Christian art they are of surpassing value and interest. Next in date, and of even greater importance, are the decorations of the Campo Santo in Pisa, a burial ground begun toward the close of the 12th century, the walls of which employed some of the chief masters of fresco in the 14th and 15th. The early paintings, erroneously attributed to Buffalmacco and Giotto, have nearly disappeared, and time, neglect, and damp have seriously impaired the effect of the others; and such is the character of the walls on which the plaster is laid that it is considered hopeless to attempt to restore them, or to arrest the progress of decay. A fresco painted on a canvas, or according to the most recent authorities by the Sienese brothers the Lorenzetti, about
1835, representing the last judgment, hell, and the triumph of death, are considered among the grandest specimens of early art. To these succeeded Simone di Martino, Taddeo Gaddi, Francesco da Volterra, Antonio Veneziano, Pietro d’Orvieto, and others, whose labors extended to the close of the century. Pietro d’Orvieto’s designs, representing subjects from Genesis, were probably the earliest works in buon fresco, the joinings of the plaster being so frequent, as compared with earlier wall paintings, that the amount of work in each portion must have been finished at once. The wars and internal dissensions which distracted Pisa interrupted the decoration of the Campo Santo for many years; but tranquillity having been restored, Benozzo Gozzoli was invited in 1488 to complete the work. The whole of the north wall, upward of 400 ft. long, was assigned to him, and in the next 16 years he covered this immense space with a series of frescoes representing the principal events in the Old Testament, described by Vasari as \"opera terribilissima.\" Besides the works enumerated as belonging to the 14th century, we may mention Giotto’s celebrated series in the Arena chapel at Padua, representing scenes from the life of the Virgin, and the same master’s recently discovered portraits of Dante and other Florentine citizens in the chapel of the Bargello at Florence; the series by Taddeo Gaddi and Simone di Martino in the Spanish chapel in the church of Sta. Maria Novella, Florence, representing the \"Triumph of the Church;\" Spinello’s \"Overthrow of the Rebel Angels\" in the convent of S. Agnolo, at Arezzo; and the series representing the \"Fruits of Good Government and the Triumph of Peace,\" painted by Ambrosio Lorenzetti in the Palazzo Publico of Siena. In the 15th century, to the latter half of which belongs the so-called renaissance or new birth, when the study of the remains of ancient sculpture infused a new life into art, increased wealth and intelligence caused an increased demand for easel pictures, the value of which was greatly enhanced by the introduction of oil as a medium for mixing colors; but fresco painting still maintained its supremacy, and claimed for its function the religious and moral teaching of the people, by the representation of sacred history. The noblest achievements in art are therefore still those of the fresco painters. The great names of the century are Pietro della Francesca, whose frescoes in the church of S. Francesco in Arezzo, Vasari says, \"might be called too beautiful and excellent for the time in which they were painted;\" Masolino; Filippo Lippi, who painted the frescoes in the duomo at Prato; Fra Angelico da Fiesole; Masaccio, whose series of the life of St. Peter in the Brancacci chapel in the church of Sta. Maria del Carmine, in Florence, is considered one of the finest compositions ever made by Filippino Lippi, formed an epoch in art; and Ghirlandaio, the master of Michel Angelo, whose frescoes representing the histories of John the Baptist and the Virgin afforded models for Leonardo da Vinci, Raphael, and Michel Angelo. Luca Signorelli, Andrea Mantegna, the great founder of the Mantuan school, Francesco Francia, who decorated the church of St. Cecilia in Bologna, Ferrugine, the master of Raphael, Fra Bartolommeo, and some others, belong partly to this century and partly to the next, which witnessed at once the culmination of the art of fresco painting, and its corruption and decline. The three most illustrious painters of this latter era, Leonardo da Vinci, Raphael, and Michel Angelo, embodied their loftiest conceptions on the walls and ceilings of churches and palaces, and their numerous disciples filled Italy with imitations, degenerating toward the close of the century into lifeless mannerisms. Leonardo’s chief work is the well known \"Last Supper,\" executed for the refectory of the convent of Sta. Maria delle Grazie at Milan, of which only the mouldering remains are now visible. It has been called the most perfect work executed since the revival of painting. Of Michel Angelo’s frescoes, the most famous are the series on the ceiling of the Sistine chapel, representing the \"Creation\" and the \"Fall of Man,\" with the noble figures of the prophets and sibyls; and the \"Last Judgment,\" on the end wall of the chapel—the whole composing to a degree never since equalled grandeur of form and sublimity of expression. Raphael’s frescoes exhibit perhaps, in the aggregate, the highest development of Christian art. The most famous are those covering the walls and ceilings of the chambers in the Vatican, known as the \"Stanze of Raphael,\" although many of these works, as well as the decorations of the loggie or open colonnades of the Vatican, were painted by Giulio Romano and other scholars of Raphael from his designs. Raphael’s hand is seen chiefly in the series of \"Theology\" or the \"Dispute of the Sacrament,\" \"Philosophy\" or the \"Institute of Athens,\" \"Poetry\" or \"Farnasone,\" and \"Jurisprudence,\" in the Camera della Segnatura; and in the \"Expulsion of Heliodorus from the Temple,\" the \"Mass at Bolsena,\" \"Attilla,\" and the \"Delivery of St. Peter,\" in the stanza of Heliodorus. He also painted the four celebrated sibyls in the Chigi chapel in the church of Sta. Maria della Pace, and the \"Galatea\" in the villa Farnesina in Rome. The frescoes in the Vatican, having suffered by neglect, were skilfully restored by Carlo Maratti at the beginning of the 18th century. Giulio Romano also designed and partly executed the well known \"Fall of the Giants\" in the palazzo del Te at Mantua. Shortly after the completion of the works in the Vatican, Correggio painted in the church of S. Giovanni in Parma his fresco of the \"Assumption,\" and that of the \"Assumption\" in the duomo of the same city, in both of which the art of fresco in the most perfect relief is carried to perfection. Parmigiano, his pupil, left unfinished some frescoes in the Steccata at Parma, in which a figure of Moses...
has all the breadth and freedom of that method.—The erection of the new houses of parliament gave the first decided impulse to fresco painting in England, and in response to an invitation from a select committee of the British parliament the principal artists sent to exhibitions held in Westminster hall in 1848-5 cartoon specimens of fresco for the decoration of the building. Some of these designs, comprising abstract representations of religion, justice, &c., and passages from British history and mythology, were subsequently executed by Cope, Dyce, Ward, Maclae, Herbert, Watts, and others. A summer pavilion in the gardens of Buckingham palace, the hall of Lincoln's Inn, and several churches in London have also been painted with frescoes.—With respect to all frescoes, painted according to the method of the best Italian masters, it may generally be observed that in the climate of northern Europe they are soon affected by cold and dampness. Those in Munich executed on the exteriors of buildings are rapidly falling to pieces, and a similar fate has overtaken many in the British houses of parliament. The latter may in fact be considered a failure, both on account of the dampness and imperfect light of the building, and of the apparent inability of English artists to master the technical processes of fresco painting. In the opinion of eminent native artists the process is unsuited to the genius of the English school, and no completed works in fresco exist in England equal to those by the same painters executed in oil. The paintings executed according to the new stereochrome process, above described, are apparently more durable than the buon fresco, but it is impossible to conjecture how long they may remain in good condition.—Fresco painting has made little progress in America. The only examples of the process worthy of mention are to be found in the national capital at Washington, and they are of little artistic value.

FRESENIIUS, Kari Remigius, a German chemist, born in Frankfort, Dec. 28, 1818. He completed his studies at Bonn and at Giessen under Liebig, whose assistant he became. In 1845 he was appointed professor of chemistry, physical science, and technology at the agricultural institute in Wiesbaden, where he founded a chemical laboratory, which has acquired great celebrity, and to which a pharmaceutical school was added in 1862. In the same year he founded at Brunswick Die Zeit- schrift für analytische Chemie. He is a high authority on analytical chemistry, and has published a valuable series of works relating to the mineral springs of Wiesbaden, and of other German watering places. His principal works are Anleitung zur quantitativen chemischen Analyse (Bonn, 1841; 12th ed., 1870), and Anleitung zur qualitativen chemischen Analyse (Bonn, 1846; 2d ed., 1866; English translation, "System of Instruction in Quantitative Chemical Analysis," edited by S. W. Johnson, New York, 1869).
FRENSÉL, Augustin Jean, a French physicist, born at Broglie, in Normandy, May 10, 1788, died at Ville d’Avray, near Paris, July 14, 1827. At a very early age he exhibited a taste for mechanical and physical science. In his 17th year he entered the polytechnic school, where he gained the applause of Legendré by a peculiar solution of a question in geometry. He passed thence to the school of bridges and roads. After graduating, he superintended the engineering operations of the government in the department of Vendée for eight years. His first memoir (1814) was a demonstration of the phenomenon of the stellar aberration. He went to Paris in 1815, in which year his first experimental researches were made, and from this time until his death his discoveries and scientific memoirs followed each other rapidly. At the commencement of 1816 he did not know what was meant by the term polarization of light, and in less than a year he stood at the head of investigators of the subject. In 1819 he gained a prize offered by the French academy of sciences for an article on diffraction. In 1823 he was elected member of the academy by a unanimous vote. In 1825 he was made an associate of the royal society of London, and in 1827 that society awarded him the Rumford medal, which was presented to him upon his deathbed by his friend and collaborator Arago. In May, 1824, he was appointed secretary of the commission of light-houses. He was at the same time engineer of the pavements of Paris and one of the examiners of the polytechnic school. From the end of 1824 until his death his health was so bad from the effects of unceasing labor that he was obliged to give up all work. The true laws of the complicated phenomena of double refraction were demonstrated by Fresnél. It is now known that nearly all crystals possess the property of double refraction. Before Fresnél’s investigations it was supposed that it belonged only to Iceland spar and quartz. Fresnél in conjunction with Arago explained the interferences of polarized light, giving the phenomena and determining their laws. He proved that all the colors engendered in doubly refracting crystals are particular cases of the interference of polarized light, and also discovered the phenomena which are called circular polarization, and explained their laws. He was an able and enthusiastic advocate of the wave theory of light, against that of emission or material emanations. In 1811 a lighthouse board or commission of light-houses was formed in France. One of the duties of this commission was to determine whether the lighting apparatus might not be improved. In 1819 Arago volunteered to take charge of the experiments on the subject, provided Fresnél and Mathieu were joined with him. The proposition was accepted, and Fresnél devoted the whole strength of his mind to the subject. The result was the system of lens-lighting apparatus which has changed the mode of lighthouse illumination throughout the world, and is universally known as the Fresnél system. The most perfect system known before Fresnél’s was that of parabolic reflectors. In this, for a fixed light, the reflectors are arranged around one or more horizontal circles with their axes parallel to the horizon, and passing (produced) through the centres of the circles. In a revolving light the reflectors are arranged with their axes parallel to each other and to the horizon. By making the system revolve, a bright flash is produced by the combined action of all the reflectors, when the eye is in or near the axis of one of them. As the rays proceeding from a lamp at the focus of a parabolic reflector are parallel to the axis after deviation by the reflector, it is evident that systems arranged as above indicated will show a bright light in the horizon to an observer situated in or near the axis of any one of the reflectors, since the reflected beam does not lose its intensity except by atmospheric absorption. Therefore the greater the number of reflectors, the better will be the light; and to produce as nearly as possible a uniform light at the horizon, the number of reflectors in important fixed lights is sometimes very great, as many as 24 having been used. In all cases the reflectors are made of copper carefully shaped to the form of a paraboloid of revolution, and covered with a uniform coating of pure silver. The objections to the reflector system are: 1, the want of uniformity of the light; 2, the great expense, each lamp requiring 50 gallons of sperm oil per annum; 3, the rapid deterioration of the reflectors from the necessity of daily cleaning the silvered surface, the silvering requiring entire renewal at least once in ten years; 4, the great loss of light caused by the reflection and by the necessary imperfections in form in a parabolic reflecting surface. As soon as he began to study the subject, Fresnél conceived the idea of substituting lenses for the reflectors. A convex lens possesses the property of making all rays proceeding from its principal focus parallel after deviation. It produces the effect by refraction that parabolic reflectors produce by reflection. If therefore a plano-convex lens could be formed which would not much exceed in thickness ordinary plate glass, the loss of light by absorption in passing through such a lens would be much less than in the case of reflection. For the two refracting surfaces the loss is not much exceed 7, while by reflection it is about 4. But if the exterior surface of the lens is spherical, it is evident that, supposing the lens to embrace all rays which are contained in a belt 23° above and 23° below the horizon, and in a horizontal angle of 45°, the thickness would become so great for a large principal focal distance that much of the light would be absorbed, and the lens would become useless. The weight, too, would be so great, that it would be nearly impossible to make the apparatus revolve by machinery available at the top of a lighthouse. For these reasons a lens light which existed in
England when Fresnel made his experiments was considered a failure. If now a circular central part of the curv fifteen planes, a plane convex lens is moved parallel to itself until at its edges the glass is very thin, the diminution of thickness will not affect the parallelism of the rays after deviation, and the absorption will be very much lessened. If another part of the lens, of a convenient breadth and concentric with the first part, be moved as was the first part until its edges become very thin, the thickness of this will not much increase the absorption, and so of the whole surface of the lens; that is, it can be divided into thin concentric rings of convenient breadth and of nearly the same curvature as the lens, which will absorb but little light, and at the same time will send out the rays parallel to each other, and, if properly adjusted, parallel to the horizon.

Babbage first imagined this manner of constructing a lens. Condorcet in 1778 suggested that the rings might be made in separate pieces, and Sir David Brewster made the same suggestion in 1811. Fresnel, without knowing Condorcet's or Brewster's suggestions, conceived the idea of making the lenses in steps and in separate pieces, and, following it up, had the lenses manufactured and applied to lighthouses. The vertical central section of Fresnel's lens, instead of being that of a plano-convex lens, is a figure bounded on the side toward the lamp by a vertical straight line, and on the outside by a serrated line. This last line is a portion of the arc of a circle at its central part, and receding from the centre consists of portions of arcs of circles bounded by horizontal lines. The first lens apparatus made by Fresnel consisted of eight lenses like that above described, arranged in the form of an octagonal prism. It is evident that an eye situated in the horizon would perceive a bright flash whenever one of the lenses came in front of it; and supposing the octagonal prism to be revolved about its vertical axis, there will be eight flashes in one revolution. In Fresnel's first apparatus, and in all very large ones manufactured within 10 or 12 years after his invention, the rays in the portion of the sphere above the belt deviated by the lens were brought to the horizon by a combination of lenses and plane reflectors, and those below by the combination of curved glass reflectors similar to the slats of Venetian blinds, except that the reflectors are not precisely parallel, but are placed at such angles that all the light they receive shall be thrown to the horizon. The interval between the flashes is diminished by arranging the auxiliary mirrors so that they will reflect the light a little to one side of the beam refracted by the lenses. This makes the flash longer, and correspondingly diminishes the dark interval. In order to produce a fixed lens light which shall show uniformly entirely around the horizon, if the central vertical section of the lens (the section bounded by the serrated line above described) be revolved about the vertical line drawn through the principal focus of the lens, it will generate a solid of revolution, which when made of glass will revolve in a minute. For all rays $29^1$ above and $29^2$ below the horizon. Those above and below this zone are brought to the horizon by a combination of lenses and reflectors on the same principle as those described for a revolving lens. But Fresnel was not satisfied with the use of reflectors for bringing to the horizon the rays above and below the central belt of $45^0$. On account of the acuteness of the angles at which these rays must be incident upon any deviating surface, it was not practicable to bend them to the horizon merely by refraction at two surfaces. He therefore calculated the dimensions of a series of annular prisms, so arranged that the rays from the lamp incident upon the first surface of the prisms were refracted by it toward the horizon, were incident upon the second surface at an angle greater than that of total reflection, were reflected by it, and were so refracted by the third surface that they emerged from the prism horizontal. Thus all the rays proceeding from the lamp, except those obstructed by the glass chimney and the lamp itself, were utilized by the lens, forming the very perfection of a lighthouse apparatus. Fresnel did not live to see his idea of using the prisms instead of reflectors in the large lens apparatus carried out; but small apparaus were made on this principle for harbor lights with entire success. It is believed that the annular prisms were first used in an apparatus of the largest kind in one made at Paris under the direction of Alan Stevenson, engineer of the commission of northern lights of Scotland. The prismatic rings placed above and below the annular lens will with the lens throw all the rays to the horizon, and the combination will thus answer admirably for a focused light. The annular prisms to fulfill their object must be arranged in conical or beehive shape above and below the annular lens. For a revolving light, a vertical central section of the annular lens with a meridian section of the system of prisms was revolved around the horizontal line joining the centre of the annular lens and the principal focus of the combination. The revolution was continued far enough to generate a larger or smaller solid so that the interval between the flashes was greater or smaller, the dimensions at the top and bottom of the lens regulating the amplitude of the revolution. Thus a polygon of 8 sides answers for an interval of one minute, supposing the time of revolution to be 8 minutes, one of 16 sides to an interval of 30 seconds, and one of 24 sides to an interval of 15 seconds, supposing the time of revolution to be 8 minutes. In order to lengthen the flashes, the upper and lower systems of prisms were moved a little to one side of the central annular lenses. The flash from the prisms was therefore produced a little after that from the lens, but so soon after as to appear a part of it. Another dis-
tinction was formed by revolving a system of cylindrical vertical lenses around a fixed apparatus and outside of it. These lenses collected the rays incident upon them, and emitted them parallel to each other and to the horizon. When one of the lenses came opposite the observer, the eye received a bright flash preceded and followed by a short eclipse. Before and after the eclipses the fixed light was visible. This arrangement is called a "fixed light varied by flashes." Nearly the same appearance is given by using the upper and lower prismatic rings of the fixed light and the annular lenses of the revolving light. When the latter revolves, the eye perceives a flash from the annular lens, and in the interval between the flashes perceives the light from the fixed part of the apparatus. It will be seen that the variations which this system admits for the same order far surpass in number those of reflector lights. The latter can only be either fixed or revolving, and it has been found impossible in practice to diversify the intervals between the flashes to any extent. The radii of the spherical surfaces forming the lenses, and the radii and other dimensions of the prismatic rings, are calculated by known formulas from the index of refraction, the position of the exterior surfaces of the lens with reference to the source of light, and the distances of the various concentric rings and prismatic surfaces from the horizontal plane passed through the principal focus. The surfaces of the lenses are limited in breadth by the condition that the solid of revolution shall not be thick enough to absorb a material portion of the light. This condition makes their breadth about 1/5 in. Spherical aberration is nearly eliminated by a proper use of the formulas in calculating the radii of the surfaces. The index of refraction of the glass used is 1.51. In the large lenses the rings are ground in segments of circles, are fastened into brass armatures, and are put together at the lighthouse. The small lenses are placed in their armatures, and are put together, ready for erection, at the workshops. The material used is the flint glass of St. Gobain, which, although not as colorless as crown glass, was selected because it could be obtained more free from bubbles and strie than crown glass. It is cast in pieces, exceeding the intended size of the finished parts by about one eighth. There are six orders of lenses, arranged according to size. The three first and largest are used in seacoast lights, and the three last in harbor and river lights, and generally in those of lesser importance. Fresnel's invention has also been adapted to small lanterns used for steamers' signal lights, pier-head and ferry lights, &c., and many of this kind are now manufactured in the United States of pressed glass. The first order fixed lens apparatus is about 6 ft. in diameter and 9 ft. high. The central zone consists of the central plano-convex belt and 16 steps (échelons), arranged in equal numbers above and below it. The lower set of prisms is 6 in number, and the upper set 18. This last set is arranged in the form of a cone. In the revolving first order lens, having an interval of 10 seconds, there are 17 upper and 8 lower prisms. The sixth and smallest order of lens is 11/8 in. in diameter and 17/5 in. high. The central zone is composed of the plano-convex belt and four steps, two on each side of it. There are three prisms below and five above the central zone. As the lamps in use when Fresnel made his invention were entirely incompetent to supply enough light from one burner for the use of the higher orders of lens apparatus, he in conjunction with Arago made a thorough investigation of the subject of lamps. The result was that he adopted for the first order lens a burner about 3 1/4 in. in diameter, giving a flame about 4 1/2 in. high, and containing four concentric wicks. The intensity of the light of this lamp is about equal to that of 25 ordinary Carcel burners which have a diameter of about three fourths of an inch. The lamp is placed in the centre of the apparatus. As the heat evolved by such a lamp is very great, there might be danger of melting the burners, and of burning up the wicks. To avoid these difficulties, Fresnel adopted the Carcel lamp, which, by a system of clockwork, pumps up to the burner four times as much oil as is consumed. By this means the burners are always kept comparatively cool, and the wicks sometimes burn a whole night without requiring snuffing. For the second order lens apparatus a lamp with three concentric wicks was adopted; for the third and fourth orders, lamps with two concentric wicks are used; and for the fifth and sixth orders, ordinary Argand burners are used. Very slight changes in any of the details of the lamps have been made since they were first settled by Fresnel. The annual consumption of oil by the lenses of the different orders is as follows: first order, 684 gallons; second, 461; third, 221; fourth, 156 to 190, according as one wick or two are used; fifth, 70; sixth, 60. In the first order octagonal revolving lens the quantity of light sent to the horizon by one of the octagonal faces and its reflectors is between 3,000 and 4,000 times the light of a single Carcel burner, being eight times as much as that sent to the horizon by the best reflectors that are made. To get the useful effect of the whole lens, the above numbers must be multiplied by 8, that being the number of annular lenses doing the work of that number of burners at the same time. The useful effect of the lens light is to that of the reflector light as 4 to 1; that is, one gallon of oil burned in a lens light throws as much light to the horizon as four gallons burned in a reflector light. The brilliancy of a first order lens light as compared with the best reflector lights is as 83 to 16, or as 5 to 1. The first lens apparatus manufactured under the direction of Fresnel was erected in 1823 in the Cordouan lighthouse at the mouth of the Gironde, on the
coast of the bay of Biscay. The auxiliary lenses and reflectors for utilizing the rays above and below the central belt are now replaced by the prismatic rings. In 1825 the lens system was adopted for the coasts of France, and as early as 1838, 12 lighthouses on the coast were illuminated by the Fresnel system. In 1846 there were 151 lens lights on the French coast, and probably there is not a single reflector light in France at present. It was next adopted by the Dutch, and in 1884 the erection of a first order lens in Inchkeith (Scotland) lighthouse was authorized. The Trinity house corporation next adopted the Fresnel system in 1857, and it has since been used by all European maritime nations and their colonies, and by the United States. (See Lighthouse.)

**Fresnillo**, a city of Mexico, in the state of Zacatecas, 305 m. N. W. of Mexico; pop. about 15,000. It is 7,884 ft. above the sea, and is partially surrounded by eminences formed by a gradual rise of the country on three sides. The streets are laid out at right angles, and well kept. The plaza, once the site of an arena for bull fights, is now a beautiful promenade. The houses are scrupulously neat; and among the public buildings the most noteworthy are the parish and three other churches, all handsomely and solidly constructed, and a school of mines, founded in 1853. Maize, wheat, and other cereals are largely cultivated; and the city markets are provided with many of the European garden vegetables and fruits, and some of the tropical fruits. The adjacent silver mines of the same name were discovered in 1569, in which year the city was founded. They were long among the most productive in the country; in 1838 the yield was $2,810,933; in 1850 it was a quarter of a million more, and it has since increased still more.

**Fresno**, a S. central county of California, between the Sierra Nevada and the Coast range; area, 8,750 sq. m.; pop. in 1870, 6,886, of whom 427 were Chinese. It is watered by the San Joaquin river and its branches. The San Joaquin valley is very fertile. The mountain forests, containing very large trees, are very extensive. The W. part of the county consists of rush-covered marshes called tules. The celebrated New Iridia quicksilver mines are in this county, and gold is mined to some extent. The chief productions in 1870 were 19,765 bushels of wheat, 6,990 of Indian corn, 18,876 of barley, 1,746 tons of hay, and 191,994 lbs. of wool. There were 3,074 horses, 1,009 milch cows, 14,752 other cattle, 139,677 sheep, and 15,516 swine. Capital, Millerton.

**Freund, Wilhelm**, a German lexicographer, born of Hebrew parents at Kempen, Posen, Jan. 27, 1806. He studied philology in Berlin and Breslau, and in 1828 opened in the latter city a Jewish school, but abandoned this enterprise because of opposition from orthodox corregilionsists. Subsequently he was a teacher in Hirschberg, Silesia, and since 1855 he has been director of a Jewish school at Gleiwitz established according to his plan. His most important work is the *Wörterbuch der lateinischen Sprache* (4 vols., Leipzig, 1834–45), which is the basis of Andrews's *Latin and English Lexicon* (New York, 1850).

**Freycinet, Charles de la.** See supplement.

**Freycinet, Louis Claude Desfonts de, a French navigator, born in Montpellier, Aug. 7, 1774, died near Lorient, Aug. 18, 1842. In 1779 he served under Admiral Bruyas. In 1800 he accompanied Baudin's expedition to Australia, and being appointed to edit the nautical and geographical portion of the narrative, devoted ten years to this task. In 1817 he was intrusted with the command of a new expedition, the object of which was to study the figure of the globe, the elements of terrestrial magnetism, and certain meteorological phenomena in the southern hemisphere. He returned to Havre in 1820, having sailed round the earth, bringing a great number of observations, charts, and curious specimens for museums. His narrative of this voyage (18 vols. 4to, with four atlases, Paris, 1824–44) gained him admission into the academy of sciences.

**Freytag, Georg Wilhelm Friedrich, a German orientalist, born in Luneburg, Sept. 19, 1788, died in Bonn, Nov. 16, 1861.** He studied theology and philosophy at Göttingen, and in 1811 became tutor there, which office he renounced in 1818, through hatred of French domination, and was chaplain in the army of the conquerors which entered Paris in 1814. He resigned his office to study Arabic, Persian, and Turkish under Sylvestre de Sacy, and held the professorship of those languages in the university of Bonn from 1819 until his death. Besides Arabic text books, he published a translation of *Caabi ben Sohair Carmen in Laudem Muhammadie dictum* (Bonn, 1822), *Arabum Proverbia* (3 vols., 1833–44), an edition of the *Fakhat al-Kholafa* by Ibn Arabeshah (vol. i., Arabic text, Bonn, 1833; vol. ii., translation, 1856), and the great *Lexicon Arabico-Latinum* (4 vols., Halle, 1830–37), which was followed by an abridgment in 1887.

**Freytag, Gustav, a German novelist, born at Kreuzburg, Silesia, July 18, 1816.** He studied at the universities of Breslau and Berlin, and wrote poetry and plays, some of which were favorably received. A complete edition of them was published in Leipzig, in 3 vols. (1849–50). In 1845, jointly with Julian Schmidt, he succeeded Kurandza as editor of the *Grenzbote*, and in 1854 he was appointed councillor of the court and lecturer of the duke of Gotha. In 1855 appeared his novel *Soll und Haben* (16th ed., 1871), which gained for him a wide popularity. It was translated into many languages (English by Mrs. Malcolm. "Debit and Credit," 1866). At the close of 1870 he retired from the *Grenzbote*, to join the new established *Im neuen Reich*. His *Bilder aus der deutschen Vergangenheit* (3 vols., 1859; 4th ed., 1863), *Neue Bilder aus dem Leben des deut-
schen Volks (1889), Aus dem Mittelalter (1866), and Vom Mittelalter bis zur Neuzeit (1887) have been published collectively under the title of *Das Buch aus der deutschen Vergangenheit* (1st ed., 8th ed., Leipzig, 1871 et seq.), part of which has been translated into English.

**FRIBOURG** or Freyburg. 1. A canton of Switzerland, the 9th in extent and in the order of admission into the confederation, bordering on the cantons of Bern and Vaud and the lake of Neuchâtel; area, 648 sq. m.; pop. in 1870, 110,682, of whom 98,951 were Roman Catholics, the Protestants living almost exclusively in the district of Morat. Three detached portions are situated geographically in the canton of Vaud, the largest, with the town of Estavayer, lying on the lake of Neuchâtel; the two smaller ones, Surpierre and Vuissens, are a little south. The surface of the canton is mountainous, especially in the south and east. The principal peaks rise to an altitude of 7,000 ft. and upward. Coal, limestone, limestone slate, and gypsum are found. The principal rivers are the Sarine (Saane), Broye, and Sense. Half of the lake of Morat and a considerable part of the lake of Neuchâtel belong to this canton, which has also several smaller lakes; and there are several mineral springs, all of which are sulphurous. The climate is milder in the north than in the south. The productions in the basins of the rivers are hemp, flax, maize, and fruit; in the northwest, corn, wine, vegetables, and tobacco. In the higher regions cattle rearing and cultivation of the forests are the chief pursuits. The Gruyère (Greizer) cheese is made here, and the great milk establishments of this canton and St. Gall condense 20,000 quarts a day, four fifth of which goes direct to London. Horses, sheep, goats, hogs, chamois, roes, hares, lynxes, a few wild boars, and in the north numbers of wild fowl, are found. The chief articles of export are cheese, condensed milk, and timber. There are limited manufactures of straw hats, leather, tobacco, cotton goods, watches, and silk. The common language is a mixture of French and German in several dialects; the German prevails around the capital and in the district of Morat; the official language is French. In 1870, 28.6 per cent. of the population spoke German, and 73.3 French. All official acts are published in both French and German. The new constitution of March, 1848, revised in 1857, agrees in all essential points with the constitutions of the other cantons. The legislative assembly (the grand council) is chosen for four years by a direct vote of all citizens who are over 20 years old; but 10 additional members are elected by the grand council itself. The state council (executive) consists of seven members chosen by the grand council for eight years. Fribourg sends six members to the national council. There is a Protestant college at Morat. Chief towns, Fribourg, Romont, Rulle, and Morat.—The canton of Fribourg belonged in the middle ages, as a part of the Uechtland, to Franche-Comté. In 1481 the town of Fribourg with its territory joined the Swiss confederacy by the compact of Stanz. The reformation never got a foothold in Fribourg, and it has ever remained one of the strongholds of the Roman Catholic church in Switzerland. During the civil war of 1847, in which the canton joined the Sonderbund, it was occupied by Gen. Dufour without much opposition. II. A city, capital of the canton, on the Sarine, 16 m. S.W. of Bern; pop. in 1870, 10,904. It consists of the lower (German) town in the narrow valley of the river, and the upper (French) town, which rises like a terrace on a succession of sandstone rocks.

The great glory of the town is the suspension bridge over the Sarine, built in 1831-4, 870 ft. long, 28 ft. wide, and 174 ft. high. Another suspension bridge spans an adjoining gorge. The principal church, that of St. Nicholas, has the highest spire in Switzerland, and an organ with 64 stops and 7,800 pipes, reckoned one of the finest in Europe. Before the town hall stands the linden tree planted in 1490, on the fourth anniversary of the victory at Morat over Charles the Bold in 1476. Before the expulsion of the Jesuits from Switzerland, in 1847, Fribourg had a celebrated Jesuits' college, founded in 1584, restored to the Jesuits in 1818, and counting from 800 to 400 pupils. It was reopened as a Catholic college, Oct. 15, 1858. There are four public squares,
FRICION (Lat. friicare, to rub), in mechanics, the resistance caused by the moving of the surfaces of bodies over each other. It is usual to distinguish two kinds of friction, that which is produced when bodies slide one upon another, and that which takes place when they roll one upon another. The term rolling friction is not, however, regarded as strictly correct, and that of resistance to rolling is used instead. The first experiments upon the friction of sliding were made by Amontons, and are described in the memoirs of the academy of sciences, 1699; but his estimates were much higher than those which have since been made. Euler, Désaguliers, and Vincé also paid considerable attention to the subject, but the first complete set of experiments were made by Coulomb at Rochefort about 1780. His results, although in some respects since modified, have been of inestimable value to the science of engineering. He employed a bench made of two horizontal timbers 8 ft. long, upon which a loaded sledge was drawn by a weight acting by a cord running over a pulley. The resistance bodies offer to motion after they have been for some time in contact he called the friction of departure. The general conclusions at which he arrived are as follows: 1. Friction is greatest between rough bodies. 2. It is greater between the surfaces of like than of unlike material. 3. The rubbing surfaces remaining the same, friction is proportional to the pressure, and is not increased or diminished by increase or diminution of surface. 4. The uncertainties in the observations of Coulomb, and the introduction of many new materials in machinery, made it desirable to make a more extended series of experiments. Such were made at Metz in the years 1831, 2, 3, and 4, by M. Morin. The values obtained by him differed in some particulars from those of Coulomb, but the general conclusions at which he arrived were the same. He however established one important fact scarcely to be anticipated, viz., that friction is independent of the velocity of motion. The ratio which the resistance offered to sliding between two surfaces bears to the force with which they are pressed together is called the coefficient of friction, and has greatly differing values between different surfaces, and different conditions of surfaces as to whether they are highly or partially polished, moistened, or lubricated. It has various values between different kinds of wood, depending upon whether the motion is made across or with the fibres, and the condition of the wood; and also between different kinds of metals, and with those depends upon whether they are rolled, hammered, cast, or tempered. Thus the coefficient of friction of motion between oak and oak in a direction parallel with the fibres was found by M. Morin to be, without lubrication, about \( \frac{1}{3} \); lubricated with tallow, about \( \frac{1}{2} \); with lard, about \( \frac{1}{2} \). When the fibres of one surface were perpendicular to the line of motion, the coefficient was, without lubrication, about \( \frac{1}{4} \); lubricated with tallow, about \( \frac{1}{2} \); with lard, about \( \frac{1}{3} \); with water, about \( \frac{1}{4} \). The coefficient of friction between common wrought and cast iron is about \( \frac{1}{3} \) of iron on brass, \( \frac{1}{4} \); that of an iron axle in a brass box, lubricated, about \( \frac{1}{3} \). The least possible friction is found in the use of lubricated steel moving upon hard gems. Coulomb found: 1, that resistance to rolling varies in an inverse ratio with the diameter of the rolling body theoretically, but that in practice small rollers of wood caused more resistance, because of the greater indentation produced, the coefficient ranging from \( \frac{1}{3} \) to \( \frac{1}{4} \); 2, that it is less between heterogeneous than between homogeneous surfaces; 3, that it is directly proportional to pressure; 4, that it has no relation to surface. Upon this principle depends the advantage of using friction wheels and friction rollers in machinery. The application of friction wheels is said to have been first made by Henry Sully in 1716. The friction caused by water in moving over surfaces in conduits is called hydraulic friction. It has been found to be independent of the material of the surface of the conduit, provided it be smooth, but depends considerably on the viscosity of the liquid; thus, ice-cold water offers greater resistance to the passage of a body through it than warm water, and conversely, produces a correspondingly greater degree of friction in moving over surfaces. Friction always develops heat, and precisely in proportion to its amount, as has been established by the experiments of Count Rumford, Davy, Thomson, Mayer, and Joule. By rubbing two pieces of ice together in a vacuum, Sir Humphry Davy partially melted them. Count Rumford found the heat developed in boring a brass cannon sufficient in the course of 24 hours to raise 264 lbs. of water from zero to 212°F. At the Paris exhibition in 1865 MM. Beaumont and Mayer exhibited a machine in which a wooden cone covered with hemp made 400 revolutions per minute inside of a hollow copper cone immersed in a tightly closed boiler. With this apparatus 88 gallons of water were raised from 50°F. to 226°F. in a few hours. In all cases the quantity of heat evolved by friction is exactly sufficient to reproduce the energy expended in overcoming the friction; and although in mechanics friction is said to cause a loss of power, there is really no loss of energy, but simply its transformation. Another kind of energy is developed by friction, viz., electricity; and in this case also it has been found that the force produced is precisely proportional to that which was expended in producing it. FRIDAY, the sixth day of the week, called by the Saxons Frige daeg, or day of Frigga (the
FRIDERICIA, or Fredericia, a town and fortress of Denmark, in the S. E. part of the province of Jutland, on the Little Belt; pop. in 1870, 7,186. The town has several sugar refiners, iron foundries, and other industrial establishments, and owns about 25 vessels. Until 1857 the navigation dues were collected here from vessels passing the Little Belt. In 1857 Fredericia was captured by the Swedes. In 1848 it was occupied by the Prussians, subsequently reoccupied by the Danes, and besieged by the Schleswig-Holstein troops. The latter were surprised on July 6, 1849, by the besieged, and forced to a speedy retreat, with heavy loss. In the war of 1864 Fredericia was bombarded by the Germans in March, and hastily evacuated by the Danes in April.

FRIELAND. I. A town of Prussia, in the province of East Prussia, on the Alle, 27 m. S. E. of Königsberg; pop. in 1868, 2,478. It has manufactures of linen and woolen cloth and leather, and a trade in cattle. It is memorable for a victory won by Napoleon over the Russians under Benningsen, June 14, 1807, which led to the treaty of Tilsit. The French had between 70,000 and 80,000 men, and lost 8,000 men and two eagles; the Russians, who numbered about 65,000, lost 17,000 men and about 80 guns. Benningsen succeeded in crossing the river and fell back to Tilsit, on the Niemen, where the treaty between the French and Russians was concluded July 7. II. A town of Bohemia, on the Wichtitz, at its confluence with the Rasnitz, 68 m. N. N. E. of Prague; pop. in 1870, 4,531. It is a walled town, has manufactures of woolen, linen, and cotton cloth, and paper, and a considerable trade. The castle is situated on a conical hill in the S. part of the town, is a picturesque structure surrounded by a lofty wall and surmounted by a high tower. It belonged, with the accompanying lordship, to Wallenstein, who derived from it his title of duke of Frieland. It is now the property of Count Claus-Gallia.

FRIDRICH, Johann, a German theologian, born at Pfoedtorf, Bavaria, in 1836. He was ordained a Roman Catholic priest in 1859, became private teacher in 1862, in 1865 professor of theology at the university of Munich, and in 1869 member of the academy of sciences. He has published a number of works, including Kirchengeschichte Deutschlands (3 vols., Bamberg, 1867-9). A follower of Dollinger, he protested in 1870 against the doctrine of papal infallibility, was expelled from Rome as the reputed author of correspondence in the Allgemeine Zeitung adverse to the Vatican, received with Dollinger major excommunication (April 17, 1871), and was formally suspended two months afterward, for having administered the holy sacrament to Dr. Zenger, to whom it had been denied on account of his opposition to the decrees of the council of the Vatican. His publications on the subject of papal infallibility and the council comprise Das päpstlich gewährleistete Recht der deutschen Nation, nicht an die päpstliche Unfahigkeit zu glauben (Munich, 1870); Documenta ad illustrandum Concilium Vaticanum anni 1870 (2 vols., 1871); and Tagebuch geführt während des Vatikanischen Concils (Nörblingen, 1871).

FRIENDLY (or Tonga) ISLANDS, a group in the southern Pacific ocean, lying between lat. 19° and 28° S., and long. 174° and 175° 30' W. Tonga is the native name of the group. They were discovered by the Dutch navigator Abel Tasman in 1648, and visited and described in 1773 and 1777 by Cook, who gave them the name of Friendly from the apparently hospitable reception he met with from the inhabitants. It has since been ascertained that the character of the natives is no better than that of the other Polynesians, and that they were only deterred by fear from attacking Cook. They consist of about 32 greater and 150 smaller islands, about 30 of which are inhabited; pop. estimated from 25,000 to 50,000. The islands are mostly of coral formation, and are surrounded by dangerous coral reefs. A few are of volcanic origin, and in Tofooa there is an active volcano. They are divided into three groups, viz.: the Tonga at the south, the Hapai in the centre, and the Vavao at the north. The climate is healthy, but there is much rain, and none of the islands are destitute of fresh water. The mean temperature during the stay of the United States exploring expedition at Tongataboo (April, 1840) was 79-25°. The trade winds are by no means constant. Earthquakes are frequent, but not formidable; hurricanes both frequent and destructive. The natives cultivate yams, sweet potatoes, bananas, cacao-nut, broad fruit, sugar cane, shaddock, limes, and the ti (spondias dulcis); the pandanus is one of their most useful trees, of which they make their mats; a little corn is grown, and they have the papaw apple (papaya) and watermelon. The missionaries have successfully introduced the sweet orange from Tahiti, but many other imported fruits and vegetable seeds have failed. The flora resembles that of the Fidjee group. The hog, dog, and rat are the only native quadrupeds. Tongataboo, or Sacred isle, is the principal island. It is about 30 m. long and 12 broad; it is low and level, of coral formation, and rises nowhere more than 60 ft. above the sea. In pangan times it exercised a sort of religious supremacy over the other islands. The only important article of
export from the Friendly islands is cocoanut oil. Port Refuge in Vavao is the best harbor, and is much frequented by British and American whalers. The port of Boa on Tongataboo is celebrated as the place where in 1840 Capt. Croker, of H. B. M. sloop Favorite, was defeated by the pagan party. In this engagement, undertaken in behalf of the Christian missionaries and their native partisans, Croker and many of his officers and men were slain. The Friendly islanders contrast favorably with their neighbors, the Fesjesees, in appearance and disposition. The islands were formerly governed by several independent chiefs. The northern and middle groups afterward constituted the state of Vavao, under the sway of a native Protestant prince called King George, who is said to have since become the ruler of all the islands. When pagans, the natives were devoted to war; the women went nearly naked. They offered human sacrifices, and cut off their little fingers and toes as propitiatory offerings to their gods. Their mythology, like that of the other Polynesians, was a low type of polytheism. The spirits of all chiefs go to Bulotu; those of the poor people remain in this world to feed upon ants and lizards. They represent the island of Bulotu as not far distant, but do not attempt to settle its precise position. Nearly all the people are now Christian. They were first visited in 1797 by agents of the London missionary society, but in 1897 came under the charge of the Wesleyan society of Great Britain. The group is divided into three missionary stations, viz.: Tongataboo and Hapai, commenced in 1829, and Vavao, in 1830. The smaller islands are intrusted to the supervision of native teachers, and are visited occasionally by the missionaries. A printing press has been in operation at Vavao since 1832. Many of the women can sew, and a great number of the natives have learned to read and write, both in their native tongue and in English; a few have been taught arithmetic and geography. King George is a constant preacher, and is thus described by a missionary: "In the pulpit he was dressed in a black coat, and his manner was solemn and earnest. He held in his hand a small bound manuscript book, but seldom looked at it." Later, Catholic missionaries came to these islands from France, and firmly established themselves in the southern group, where a large portion of the natives have joined the Catholic church. Intercourse with the eastern islands of the Fesjee group is frequent, and many Tongese have emigrated thither.

**FRIENDS**, a sect of Christians commonly called Quakers, which was founded in England about the middle of the 17th century. At first they were known as the "Professors of the Light" or "Children of the Light," from "their fundamental principle," says William Penn, "which is as the corner stone of their fabric, and indeed, to speak eminently and properly, their characteristic or main distinguishing point or principle, viz., the light of Christ within, as God's gift for man's salvation; the root of the goodly tree of doctrine that grew and branched out of it." They soon adopted the name of "the Religious Society of Friends," by which they are always known among themselves. The origin of the name Quaker is not entirely certain. By some it is affirmed that it was given "in derision, because they often trembled under an awful sense of the infinite purity and majesty of God." By others it is said that it was first applied to them in 1650, when George Fox was brought before the magistrates of Derby, and he having told them to "quake at the name of the Lord," one of them, Gervase Bennet, an Independent, caught up the word, and, says Fox, "was the first that called us Quakers." However the name originated, it soon became the one by which they were generally known in all parts of the world. The sect was founded by George Fox, a native of Drayton, Leicestershire. He was apprenticed to a shoemaker, but in 1643, at the age of 19, he left his master and wandered about England, leading a solitary life and passing most of his time in meditation and in reading the Scriptures. In the latter part of 1647, under the conviction of a divine call, he began the life of an itinerant preacher, and went from place to place exhorting all who would hear to repentance and the commencement of a new life. He denounced the coldness and insufficiency of all existing forms and ceremonies of religion, and asserted that the office of a Christian teacher had become a mere trade, denied the necessity of any special education for it, and maintained that the only warrant for assuming it was the consciousness of a divine summons to enter upon its duties. He denounced a paid ministry, and declared it to be a sin to pay tithes. He denounced war even when waged in self-defence, and urged upon all to refuse to do military duty. He asserted the equality and brotherhood of all men, and used the second person singular in addressing all persons of whatever rank. He would not uncover his head in any
in the open air by their ruined meeting houses, they were driven away by soldiers, who beat them over the head with the butts of their muskets, and in this way many of them were killed. Constables and informers broke into their houses and carried off their food and their tools. On the Quakers of Bristol there were levied at one time fines amounting to £16,400, and the value of their property destroyed in England during this period of their tribulation amounted to more than £1,000,000. In 1666, when, partly through the influence of Penn, a proclamation was issued by the king and council releasing all persons imprisoned on account of religion, among those set at liberty were 1,490 Quakers. When brought before the magistrates, if all other charges failed, they were required to take the oath of allegiance and supremacy. To the matter of the oath they made no objection, but swear to it they would not. They resolutely refused to violate the divine command, “Swear not at all,” which they construed literally, and to which they believed there was no exception. Their goods were continually seized in consequence of their refusal to pay tithes, and their refusal to bear arms or enroll themselves in the military force of the country excited alike the hatred and the contempt of their fellow subjects. On the other hand, the purity of their lives, the patience with which they endured insult and persecution, never returning evil for evil, their zeal, their devotedness, and their love for each other, often compelled the admiration even of their opponents. To escape persecution many of them emigrated to the continent, to the West Indies, and to America. But in the two latter countries they immediately became the victims of persecution. In September, 1658, two Quaker women, Mary Fisher and Ann Austin, arrived in Boston from Barbadoes. Before landing their trunks were searched and their books taken and burned by the common hangman. They were thrown into prison, stripped, and their persons searched for signs of witchcraft. None were found, but after five weeks’ imprisonment they were convicted of horsey, and according to the law in such cases they were "thrust out of the jurisdiction;" in other words, expelled from Massachusetts. Nine others, men and women, who arrived soon after from London, were similarly treated. The severity of the laws against them was increased from year to year. From 1658 to 1661 three men and one woman were hanged. They had been banished from the colony on pain of death if they returned. They came back openly defying the courts, and were arrested to their great satisfaction. Many more were sentenced to death, but were not executed. In Rhode Island they were not interfered with in any manner, and very few of them went there at first; but from 1672 they increased rapidly, and in 1674 William Codington, who had become a Quaker after found-
ing the colony, was resented governor. In Virginia laws modelled after those of Massachusetts, though somewhat less severe, were enacted against them; and in Maryland, where religious toleration was professed, they were punished, not as heretics, but as "vagabonds who persuade the people from complying with military discipline, from holding offices, giving testimony, and serving as jurors." After the foundation of Pennsylvania by Penn in 1682 great numbers of Quakers under his patronage emigrated thither, and at the present time they are more numerous and influential in that than in any other of the United States. In England the persecutions of the Quakers were greatly mitigated by the passing of the toleration act in 1682, but more by the growing spirit of toleration among the people at large. In 1722 a statute was enacted allowing their affirmation to be taken instead of an oath in all legal proceedings. But they have never been exempted from the payment of tithes, and, as they refuse to pay voluntarily, they are annually collected by distraint. During all their persecutions the Quakers never showed any spirit of retaliation. When urged to denounce their enemies they invariably answered, "We leave them to the Lord." A majority of the early preachers of their sect died in prison, and the hardships endured in prison shortened the lives of many others, including Fox; but they bore all patiently and unflinchingly.—When we consider the age in which Quakerism took its rise and the nature of its principles, we can wonder neither at the treatment they received nor that they often acted in a manner which to others seemed extravagant and revolting. The civil war between the supporters of the crown and the supporters of the parliament was just drawing to a close. Men's passions were at fever heat, and their opinions in a perpetual ferment. New theories of government and new creeds in religion were constantly springing up, and all were supported with fanatical zeal. In the midst of all this George Fox appeared, denounced all war, all forms and ceremonies, disgraced the cavaliers by his invectives against worldly pleasures, and enraged the puritans by his denunciations of intolerance. Professing themselves to be guided by the "light, grace, and spirit of Christ, inwardly revealed," the Quakers yet asked for no privilege for themselves that they were not willing to concede to others. They advocated entire freedom of opinion and expression for Protestant and Catholic, for Christian and infidel. The nature of their doctrines and the persecutions inflicted upon them aroused in many a zeal and enthusiasm hardly distinguishable from insanity. Some entered churches during the hours of service, and called upon preacher and congregation to repent of their sins. Some went about clothed in sackcloth and with ashes upon their heads; others even appeased, in the streets or market, they meditated visions, and addressed warnings to magistrates and governments. Many believed themselves gifted with the spirit of prophecy. Fox, in his journal, records that, meeting Cromwell a few days before his death in Hampton Court park, he "perceived a waft of death go forth from him." The society still preserve the names of those who foretold the death of Cromwell, the great plague in London, the great fire, and other remarkable events. These were, however, exceptional cases, and generally the Quakers have been remarkable more than all other men for their quiet, staid, and sober demeanor. The peculiar dress of the Quakers is too well known to need description; but it is a mistake to suppose that it was originally adopted as a mark of distinction from other sects. In its essential characteristics it does not differ from the dress worn by large numbers of people at the time when Quakerism took its rise. But change in obedience to the dictates of fashion was in their estimation one of the vain follies of the world. While the fashions changed they adhered to their original garb, and thus by the force of contrast it has come to be regarded as an essential characteristic of the sect. But in their dress as in everything else they endeavored to carry out one of the main principles which they professed in regard to practical life. They believed in and inculcated the utmost plainness and simplicity; nothing for show, nothing for ornament, nothing for pleasure. The construction and interior arrangements of their meeting houses were the simplest possible. Believing that no one was authorized to speak in a religious assembly except as on each particular occasion he was moved thereto by an immediate divine impulse, they have no pulpits. A row of benches slightly elevated above the rest is appropriated to the more venerable members, and especially to those who oftimes feel this divine impulse to address their brethren. The men sit upon one side of the house, the women upon the other. They enter, and without uncovering their heads take their seats in silence. Men and women are alike entitled to speak if they feel impelled thereto. If no one feels this impulse, each, when he or she sees fit, arises and departs in silence. They have no ceremonies, no liturgy, no stated form of prayer, and no regular preaching. It is said that in some places they have thus met for several years in succession without any one speaking a word.—The founders of the society did not profess to have discovered new truth or to aim at the establishment of a new creed. They sought to effect a reform in manners rather than in belief. They desired to persuade men to live in the way in which they conceived that the primitive Christians lived. They professed their belief in the fundamental doctrines of Christianity as they were generally understood among Protestant Christians. Hence their members were not and are not required to subscribe to any article or confession of faith. The forms in which they prefer
to have the Christian doctrines stated must be sought in the writings of their most approved authors, and in the minutes and epistles of their yearly meetings. In the words of one of these documents, they believe that "every man coming into the world is ensnared with a measure of the light, grace, and spirit of Christ, by which, as it is attended to, he is enabled to distinguish good from evil, and to correct the disorderly passions and corrupt propensities of his nature; and that without the spirit inwardly revealed, man can do nothing to the glory of God, or to effect his own salvation." The following statement of their doctrines, discipline, and organization was prepared under the authority of the Philadelphia yearly meeting, and presents them as they are maintained by that portion of them who claim to be the orthodox representatives of the original founders: "They believe in one God, the creator and upholder of all things; and in his Son, the Lord Jesus Christ, by whom are all things; and in the Holy Spirit which proceedeth from the Father and the Son: one God, blessed for ever. In treating of the Three that bear record in heaven, they prefer keeping to the language of Holy Scripture, which sometimes induced their opponents to accuse them of unsoundness. This was the case in the controversy which led to the writing of William Penn's 'Sandy Foundation shaken.' He says the question between him and his opponent was, 'whether we owned one Godhead subsisting in three distinct and separate persons.' The latter words Penn argued against as unscriptural, but to prevent a misconstruction of his views, says: 'Mistake me not, we never have denied a Father, Word, and Spirit, which are one; but men's inventions;' and at different periods of his life he strenuously repelled the charge of Socinianism as regarded himself and the society. The same applies to his argument respecting the doctrine of Christ's suffering and death, which he strenuously repelled: 'The only argument used was that through a sacrifice such as he rejection of the schoolmen, in which his antagonist dressed it, he quotes numerous passages of Scripture proving that our Lord Jesus Christ, in his suffering and death, was a most acceptable sacrifice and propitiation for the sins of mankind. They own and believe in Jesus Christ, who was conceived of the Holy Ghost and born of the Virgin Mary, in whom we have redemption and pardon through his blood, even the remission of our sins; that he was a most satisfactory sacrifice for the sins of the world, being crucified without the gates of Jerusalem, rose from the dead the third day, ascended into heaven, and now sitteth at the right hand of God, our holy mediator, intercessor, and advocate with the Father. They have uniformly believed that he is true God and perfect man in wonderful union, and that the forgiveness of sins which any partake of is only by virtue of his sacrifice. That the Holy Spirit whom Christ said he would send leads and guides his followers into all truth; that a manifestation of this Spirit is given to every man to profit withal, which convicts of sin, and, as it is obeyed, gives power to overcome and forsake it; that it enables savingly to understand the Holy Scriptures, and gives the living experience of those things which belong to the soul's salvation. Man was created in the image of God, capable of understanding and obeying the divine law, and of holding communion with his Maker. Through transgression he fell and lost this heavenly state. His posterity come into the world in the image of the fallen earthly man, and until renewed by the regenerating power of Christ Jesus, they are dead to the spiritual life in which Adam originally stood, and subject to the power of Satan; and their imaginations, words, and deeds are evil. Man therefore in this state can know nothing aright respecting God; his thoughts and conceptions of spiritual things being unprofitable, until he is renewed and quickened by the Holy Spirit. What was lost in Adam is made up in Christ; and the guilt of Adam's sin is not imputed to any until they make it their own by transgression. There will be a resurrection of the righteous and the wicked, the one to eternal life and blessedness, the other to everlasting misery; and God will judge the world by Christ Jesus. That the Holy Scriptures were written by divine inspiration, and contain a declaration of all the fundamental doctrines and principles relating to eternal life and salvation; and that whatsoever doctrine or practice is contrary to them, is to be rejected as false. The society does not call them the Word of God, this term being peculiarly applied to them by the Lord Jesus; yet it believes them to be the words of God, written by holy men as they were moved by the Holy Ghost, and that they are able to make wise unto salvation through faith which is in Christ Jesus. It looks upon them as the only fit outward judge and test in controversies among Christians, and rejects the schools and terms in which his antagonist dressed it, he quotes numerous passages of Scripture proving that our Lord Jesus Christ, in his suffering and death, was a most acceptable sacrifice and propitiation for the sins of mankind. They own and believe in Jesus Christ, who was conceived of the Holy Ghost and born of the Virgin Mary, in whom we have redemption and pardon through his blood, even the remission of our sins; that he was a most satisfactory sacrifice for the sins of the world, being crucified without the gates of Jerusalem, rose from the dead the third day, ascended into heaven, and now sitteth at the right hand of God, our holy mediator, intercessor, and advocate with the Father. They have uniformly believed that he is true God and perfect man in wonderful union, and that the forgiveness of sins which any partake of is only by virtue of his sacrifice. That the Holy Spirit whom Christ said he would send leads and guides his followers into all truth; that a manifestation of
the book of Revelation: 'Behold I stand at the
door and knock; if any man hear my voice and
open the door, I will come in to him, and will
sup with him, and he with me.' Divine worship
must be performed immediately between the
soul and its Maker. No man can do it for an-
other. It is therefore the practice of Friends
to sit down in solemn silence to worship God,
that each one may strive to gather inward to
the gift of divine grace in order to receive
ability to worship the Father of spirits in spirit
and in truth, and offer to him, through Christ
Jesus our holy Mediator, an acceptable sacri-
cifice, whether in silent mental adoration, the
public ministry of the gospel, or vocal prayer
and thanksgiving. The call, authority, and
qualification for gospel ministry are from
Christ Jesus alone, who dispenses them to
both men and women, as he sees fit, without
regard to rank, learning, or human selection
and appointment; and they must be received
immediately from him through the revelation
of his Spirit in the heart. The command,
'Freely ye have received, freely give,' is of
lasting obligation, and the gospel is to be
preached without price; hence the society
has borne a constant testimony against a paid
ministry, which derives its authority from hu-
man learning and ordination, which does not
acknowledge a dependence for the perform-
ance of it upon the renewed motion and aid
of the Holy Spirit. War is wholly at variance
with the spirit of the gospel, which continually
breathes peace on earth and good will to all
men. When the reign of the Prince of Peace
is set up in the hearts of men, 'nation will not
lift up sword against nation, nor will men
learn war any more.' The words of Christ,
'Swear not at all,' and of the apostle James,
'Swear not, neither by heaven, nor earth, nor
by any other oath,' forbid all swearing of
every kind. The fast to which Christians are
called is not the observance of any particular
day set apart by man, but a continual fasting
from sin; and therefore Friends cannot con-
scienciously join in public fasts or holy days,
so called. They hold that under the gospel
there is no inherent holiness in one day more
than another, but that all are to be kept holy;
and they do not pay a superstitious reverence
to the first day of the week, but as it is neces-
sary that some time should be fixed to meet to
worship God, and that men should be free
from outward affairs, and that laborers and
beasts should have time for rest, and as the
primitive Christians used the first day for
these purposes, therefore Friends observe that
day as a time of rest, and for religious retire-
ment and waiting on God. The enslaving of
the human species is entirely opposed to the
commands of Christ and the spirit of his re-
ligion; and the society bears a testimony against
the system; also against the unnecessary use
of intoxicating drinks. It enjoins upon its
members plainness and simplicity in dress,
language, and behavior; moderation in the
pursuit of business; and that they discounte-
nance lotteries and games of chance, music,
dancing, stage plays, horse races, and all other
vain and pernicious amusements and prac-
tices.'—As all who regularly attend the meet-
ing of Friends, as well as their children,
are viewed as members, Fox saw that some
system of church government was necessary
by which their conduct might be regulated
and controlled. Hence he early began the es-
tablishment of meetings for discipline. The
first objects of attention of these meetings were
the care of the poor, the maintenance and
education of orphans and poor children, the
orderly accomplishment of marriages, the reg-
istry of births and deaths, the granting of
certificates of approval to ministers travelling
abroad, and preserving an account of the
sufferings of Friends in support of their re-
ligion. While it was to be expected that
offences would arise, it did not necessarily
follow that the erring one must be cut off;
and measures were adopted for extending
brotherly labor, in the spirit of love and meek-
ness, for the restoration of such. When
brought sincerely to condemn his error and
amend his way, a brother is gained; and if
this desirable result is not attained, the church
testifies against his misconduct and declares
that he is no longer a member of it. This is
the extent of the censure pronounced by the
society, and its proceedings are founded on the
directions given by our Lord in Matt. xviii.
15–20. The disciplinary care of the society
was also exercised to preserve its members
from denying or impugning its Christian
principles. At different periods persons have
been disowned for such errors as "denying the
divinity of our Lord and Saviour Jesus
Christ, the immediate revelation of the Holy
Spirit, or the authenticity of the Holy Scrip-
tures." There are four grades of meetings
for discipline: first, preparative, which prepare
business for the second or monthly meetings,
in which the executive power is chiefly lodged;
then the quarterly meetings, consisting of sev-
eral monthly meetings, and exercising a super-
visory care over them; and lastly the yearly
meetings, which include the whole society
within a prescribed district, possess exclusively
the legislative power, and annually investigate
the condition of their subordinate meetings.
In each preparative meeting there are usually
two or more Friends of each sex chosen as
overseers to take cognizance of any improper
conduct of the members, to admonish them in
love, and if necessary report the case to the
preparative meeting. From this it generally
goes to the monthly meeting, where a com-
mittee is appointed to endeavor to convince
and reclaim the offender. The women have
similar meetings and the like order and care
for the help and preservation of their mem-
bers, but take no part in the legislative pro-
ceedings of the society. There are also dis-
tinct meetings for the oversight and help of
the ministry, composed of ministers and elders, the latter being prudent religious Friends chosen especially to have the care of the ministry. To monthly meetings belong the requisites for the reception of persons into the society, the application for that purpose being first made to the overseers; also the granting of certificates of membership to Friends moving from their limits, the allowance and oversight of marriages, the free education of the children of the poor, and the maintenance of such members as are unable to support themselves. When a member believes himself or herself divinely called to speak in the religious meetings of Friends as a minister, after a sufficient time has been allowed to make proof of the call, if the preparative meeting of ministers and elders unite in the judgment that a gift of gospel ministry has been committed to the individual, it so reports to the monthly meeting; and if this comes to a like decision, it forwards the case to the quarterly meeting of ministers and elders; and when it also unites in the conclusion of the others, the person is recorded as an approved minister. In 1827 a rupture occurred in the society of Friends in the United States, caused principally by the preaching and influence of Elias Hicks, who had been a noted preacher in the society since the commencement of the revolutionary war. He was a man of great energy, purity of character, and natural eloquence. He travelled extensively in the United States and Canada, and everywhere his preaching, at first mainly practical and devotional, attracted a crowd. He gradually devoted more attention to the discussion of doctrinal points, and his views in regard to the divinity of Christ and the nature of the atonement were regarded by a large portion of the society as inconsistent with the doctrines of orthodox Christianity. His opinions became the subject of animated discussion. Parties were formed, pamphlets written, and persons both adherents and opponents, the former maintaining that his doctrines were in accordance with those of the early founders of the society, the latter that they were not only contrary to the original doctrines of the Friends, but to the generally admitted doctrines of orthodox Christianity, and tended to total unbelief. The opponents of Hicks charged him with "denying, or at least holding lightly, a belief in the true divinity of Christ while incarnate, and in the atoning, cleansing, saving efficacy of his blood which was shed for us." In the statements of their belief in regard to the nature of Christ there seems to be on the part of the supporters of Hicks a manifest leaning to Scinicinism; but they contended that they were in strict accordance with the teachings of Fox, Penn, and Barclay. In regard to the atonement Mr. Jenks, one of the most prominent men, says, "The doctrine that God cannot or will not forgive sins without a compensation or satisfaction, and that man not being able to make this satisfaction, it was made by Jesus Christ, who was appointed or given up to be killed for this purpose, is so inconsistent with the divine character that it cannot be reconciled with the teachings of the Son of God." After the discussion had lasted many years, the first separation took place in 1837, when Hicks was nearly 80 years old. Six of the ten yearly meetings then existing in the United States were rent asunder, the followers of Hicks, about one-third of the whole society, forming six new "meetings." Both parties claimed to be the true representatives of the society and continued to call themselves "Friends," but they are generally known by the names "Orthodox" and "Hicksite." The division never extended beyond the United States, and was greatly regretted by the members of the society in other countries. In England, of late years, there has been a growing tendency among the Quakers to relax the rigidity with which they adhered to mere outward peculiarities, and to conform more and more to the customs of the rest of the world in dress, language, and manners. Large numbers of them encourage the practice of vocal music, and even allow dancing in their families. Many favor the arts of painting and sculpture, purchasing such works as they have satisfied themselves are of a strictly moral tendency.—The Quakers have probably never at any one time exceeded 200,000 in number. But the purity of their lives and their constant outspoken testimony against all immorality, war, intemperance, and especially against slavery, have exercised an influence over the opinions and practice of the civilized world altogether greater than that of any other body of men of no greater numbers that has existed in modern times. The number of Quakers in the United States is probably at present about 100,000, and in all other countries about half as many. They are increasing in numbers, though not rapidly. They are well established in the schools, and pay especial attention to their first day schools. In 1868 a foreign missionary society was formed, and established missions in India and Madagascar. They have also been active in the establishment of schools among the freedmen and in their efforts to ameliorate the condition and infuse a more Christian spirit into the treatment of the American Indians.

FRIE, Elias Magnus, a Swedish botanist, born Aug. 15, 1794, died Feb. 8, 1878. He was appointed adjunct professor of botany at Lund in 1819, and professor in 1828. In 1834 he was called to the chair of economy at Upsal, to which in 1851 that of botany was attached, and in 1853 he was made rector of the university. As director of the museum and botanical garden of the university, he introduced important improvements. He was also distinguished as an orator, and twice represented the university of Upsal in the diet. His most valuable work is *Summa Vegetabilium Scandinavium* (2 vols., Upsal, 1840–18). He has also published
FRIES, a German painter, born in Heidelberg, June 22, 1801, died in Carslsruhe, Oct. 11, 1833. He studied at the academy of Munich, travelled through Germany, Tyrol, and Switzerland, and resided four years in Italy. Most of his landscapes depict Italian scenery, and have been compared to those of Poussin. Some of his finest pictures are in Hamburg and other German cities, but most of them are in foreign countries.—His brother Bernhard, born in Heidelberg, May 16, 1820, is also distinguished as a painter, especially of Italian and Alpine scenery.

FRIES, Jakob Friedrich, a German philosopher, born at Barby, near Magdeburg, Aug. 23, 1773, died in Jenæ, Aug. 10, 1813. He was educated in a Moravian school, and studied philosophy at Leipsic and Jenæ. He passed several years in Switzerland as a private teacher, and became professor of philosophy successively at Heidelberg and Jenæ. Being deprived of his professorship for having taken part in the democratic movement of 1819, he was in 1824 appointed to the chair of physics and mathematics in the latter university, which he held till his death. His works include Neue oder anthropologische Kritik der Vernunft (3d ed., 3 vols., 1829–31), and many other writings, chiefly upon problems of speculative philosophy. Proceeding from Kant, he inclines to the doctrine of faith as developed in the system of Jacobi. He maintains that there is only subjective certainty, that mental phenomena are the only objects of knowledge, but recognizes a principle which he names faith, by which we have a presentiment of the existence of outward things, and of the eternal existence of the idea: in pure reason.—See Jakob Friedrich Fries, by E. L. T. Henke (Leipsic, 1887).

FRIESLAND, or Friese land (anc. Friesia). I. A N. province of Holland, sometimes called West Friesland to distinguish it from East Friesland in Hanover, bounded N., W., and S. W. by the North sea and Zuyder Zee, E. by the provinces of Groningen and Drenthe, and S. by Drenthe and Overysel; area, 1,264 sq. m.; pop. in 1871, 296,931, of whom about 268,000 were Protestants and 24,000 Catholics. The surface is mostly flat, many parts of it being lower than the level of the sea, from the encroachments of which it is protected by dikes. It is intersected by numerous draining canals, the principal of which is the Great canal, extending from Harlingen on the W. coast, through Franeker, Leeuwarden, and Dokkum, to Groningen. The whole management of the canals, dikes, &c., is vested in a board, and the expense of keeping them in repair is met by a tax levied on the land owners. The only river worth mentioning is the Lauwers. There are many small lakes. Dairy farming is very extensively carried on. The chief manufactures are woolen stuffs, linen, sail cloth, salt, paper, starch, spirits, hardware, and tiles. A considerable portion of the people are employed in digging turf for fuel, and fishing. Capital, Leeuwarden. II. East, an old principality, now mainly comprised in the district of Aurich in the Prussian province of Hanover; pop. in 1871, 25,894. It was part of the territory of the ancient Frisians, and in the 18th century passed to Prussia. Napoleon I. took it from the latter in 1806, but it was restored after the peace of 1814, and a little later was ceded by Prussia to Hanover. In 1866 it was with the remainder of Hanover absorbed by Prussia. (See Frisians.)

Frigate Bird (Fregata magnificens), a tropical web-footed bird, belonging to the family pelecanida (Gray), and to the genus pelecanus (Vieillot). The bill is longer than the head, strong, hooked at the end, and sharp; wings long and pointed, the first two quills the longest; the tail lengthened, deeply forked, of 12 feathers; the tarsi short and strong, feathered for half their length; toes long, united by a deeply indented web; claws curved, small, and pectinated, the latter character (according to Audubon) enabling the bird to remove insects from parts of the body and head beyond the reach of the bill; at the base of the lower mandible is a small orange-colored sac, capable of distention. The neck is short and stout, and the body slender; the plumage is compact, the eyelids, sac, and front of the upper neck bare. The color of the adult male, in the fourth year, is brownish black, with green and purple reflections; the wings are tinged with gray and brown; the tail dark brown, the shafts white underneath; bill pale purplish blue, white in the middle, and dusky at the tip; iris dark brown; feet reddish above, orange below. In the female the sides of the neck and a broad space on the breast are white, the wings and tail more brown, and the plumage of the back less shining. The length to end of tail is 41 in., the extent of wings 7 ft. or more, and the weight about 8 lbs. Only two species are described by Gray, the T. aquilus (Vieill.), very generally distributed in the tropical regions of the globe,
and the Australian species, T. ariel (Gould). In proportion to their size, their wings are longer than in any other bird; their flight is so powerful that they are seen more than 1,000 m. from land, and so rapid that they descend upon their prey with a velocity surpassing that of the swiftest falcons; they can glide smoothly along like a kite, and breast the hurricane without apparent effort, rising with ease above the tempest clouds whenever they please; they often fly in flocks so high as to be scarcely visible. They move with great difficulty on land, and rarely alight on the water; by raising the wings perpendicularly and spreading the half-erect tail, they readily ascend from a level surface. They do not dive in search of food, but obtain it on the wing; the smallness of the webs prevents them from being good swimmers. The food consists principally of fish, which their acute sight enables them to detect from a great height; when one sees a shoal of fish, he swoops rapidly down, but does not plunge, quickly changing his course and swimming along the surface with the neck and feet stretched horizontally; then raising the wings above the back, and fixing them one against the other, the bird darts at its prey, which it rarely fails to seize. It follows the shoals of flying fishes, and catches them in the air; it also picks up dead fish and floating garbage like the gulls; during the nesting period young birds form a favorite article of food, its own nestlings suffering in like manner from the turkey buzzards. But its favorite way of providing for its wants, and that which has given it its warlike name, is that pursued by the bald eagle with the fish hawk; possessing great strength, and with superior power of wing, it pursues the terns and gulls which have secured a fish, and by beating them with wings and beak forces them to drop or disgorge it; then descending with great rapidity, it seizes the prey before it reaches the water. It is believed by some that frigate birds harass the pelicans and boobies in this manner, but Audubon and others say that this is not the case, as these large birds, with a single stroke of their powerful bills, could easily destroy their aggressors. They are very quarrelsome, and the robbers despise the original thief whenever opportunity offers. With all this strength of wing, Audubon says the keel of the sternum is no more developed than that of the short-flying gannet and prartride, showing the insufficiency of this bony crest as a means of indicating the power of flight. They are not shy; when shot at and wounded they disgorge the contents of the stomach, generally of the most fetid character; their only note is rough and croaking, and very seldom uttered; the flesh is totally unfit for food. They are rarely found further north than Charles Town, S. C., but are abundant in the south from Florida to Texas, and in California. These marine vultures, as they have been called, breed in great numbers on the Florida keys, generally making their nests of coarse sticks in mangrove trees, beginning about the middle of May; the eggs are two or three, about three inches long and two broad, of a greenish white color; the young grow slowly, and are fed by regurgitation.

FRIGA. See Oocean.

FRIGNE TREE (chionanthus Virginica, Linn.), a beautiful tree of 10 to 80 ft. in height, with somewhat oval, smooth, entire leaves, white, narrow-petalled flowers in drooping racemes, and oval, purple drupes, growing wild from Pennsylvania southward to the gulf of Mexico. It belongs to the Oleaceae, and is hence a relative of the olive and the ash. Its light and pure clusters of blossoms are not only suggestive of its English name, but of the generic title of chionanthus, blossoms of the snow. It is of rather slow growth, and is not hardy north of central New York; but where it will endure the climate it is well worthy of cultivation. Some of the nursery catalogues offer the varieties angustifolia, latifolia, and maritima, which differ somewhat from the type in size and shape of the leaves and flowers.

FRIOL, a S. W. county of Texas, intersected by the Rio Frio and Rio San Miguel; area, 1,060 sq. m.; pop. in 1870, 509, of whom 15 were colored. The surface is diversified; there is good farming land along the rivers, and considerable timber. Stock raising is the leading pursuit. The chief productions in 1870 were 8,080 bushels of Indian corn and 13,948 lbs. of wool. There were 1,278 horses, 60,834 cattle, 5,284 sheep, and 2,095 swine.

FRISIANS, a Germanic people, inhabiting the N. W. coasts of Germany, portions of Holland, and some adjacent islands. The Romans called them Frisi; Ptolemy, Fisserae; the ancient Norsemen, Friar; the Anglo-Saxons, Fresena cyn; the old High Germans, Friesen; and the ancient codes of the people, Fria or Fresa. Their name is believed to signify free. Caesar
makes no mention of them, but Pliny knew that they dwelt beyond the Batavians. They were conquered by Drausus, but soon regained their liberty as allies of the Batavians. The
name Frisian was subsequently extended to the Chauci, a kindred race living east of them, who ceased to be an independent and distinct people before the beginning of the 6th century. The advance of the Franks pushed the Frisians to the very coast of the North sea. They attempted many times to repel their aggressors; but centuries of feuds and an invasion of Britain in the 5th century diminished their number, and Pepin of Hérival gained a decisive victory over them in 699. A century later the empire of the Franks extended as far as the Weser. The Frisians were converted to Christianity; their rights and privileges were laid down by Charlemagne in the "Laws Frisianum," and to protect them against the inroads of the Norsemen a "dunca Frisia" was formed. The S. W. Frisians were the first to lose the characteristic features as well as the laws and the language of their race, and in the 9th century the name of Friesland belonged only to the district east of the Zuyder Zee, which the Lauwers divided again into East and West Friesland. The Frisians inhabiting the region between the Lauwers and the Vly oullet of the Zuyder Zee offered a firm resistance to the counts of Holland, and were finally amalgamated with the empire of Charles V. The Frisians between the Ems and the Jade became subject to the counts of Oldenburg in 924, after the battle of Altrerach. Those between the Jade and the Weser retained their independence much longer, but were subjugated by Oldenburg in 1614, with the aid of Brunswick-Lüneburg. - The small remnant of Frisians who still adhere to their ancient peculiarities and dialects are divided into three branches. The West Frisians inhabit the eastern coast land of Holland; the East Frisians live in the fens and morasses of Saterland and on the island of Wangergoor; the North Frisians occupy the western shore of Schleswig, and the adjacent islands of Sylt, Föhr, Amrum, and Heligoland. There is a wide difference among the dialects of these three branches; each village, in fact, has its own way of speaking. The North Frisian alone has ten distinct dialects, and an inhabitant of the island of Föhr is with difficulty understood by the Frisians on the mainland. The Frisian dialects are most closely related to Anglo-Saxon. Several Danish linguists maintain that the North Frisian dialect was transla
tional to the Norse language, and, mixing with Anglo-Saxon, became the parent of Danish. According to legends current among them, the North Frisians dwelt in Jutland at a time when the Danish and English languages were still in their infancy, and the other islands. Their dialect is con
cidered purest as spoken by the inhabitants of the Schleswig coast. As it is not used for literary purposes, it does not possess a strict grammatical structure. The definite article in
the singular is either de, je, or dát, according to the gender of the noun (masculine, feminine, or neuter), and in the plural always de; the in
definite article is án, án, or ân. Personal pro
nouns are: ik, jé, thon; he, ha; je, she; de, it; we, we; dé, we two; jat, you two; jám, you; jé, they; niämmen, nobody; hám, who, some one; ändán, ännin, such a one. Pos
sessive pronouns are: mánn, án, án, hárren, sín, ähsen, unken, junken, jårringe, järre, for my, thy, his, her, &, in the masculine singular; and min, sín, harr, sin, äh, un, junk, jårringe, järre for the feminine and neuter gen
ders in the singular, and for the three genders in the plural. Possessive pronouns agree in number and gender with the thing possessed. Nouns in the possessive case take an ß. The following is the conjugation of a regular verb: Present, ik rört, dô regtest, he, jé, hât, dát rôglet, I judge, &c.; sát, jat, we, jäm, jâ rôglet, we judge, &c.; past, ik rôglet, dô regtestet, he regtestet, I judged, &c.; sät, jat, we, sám, jâ rôgleten, we judged, &c. The past participle is formed by changing the ten
mination ß of the infinitive into ë, as rogate, to judge; rôglet, judged. The compound tenses are formed as in English. Auxiliary verbs are worden, to be or to become; wesen, to be; and hebben, to have. They are joined to the past participle as follows: ich hâve roglet, I have judged; ich hâve ógi reglet hâve haben, I shall have (had) judged; ich hâve régletet hâve habet, I had (had) judged, &c. The present participles terminate in end. The syntax of the North Frisian language (nordfrishe Sprá
dke) and its points of similarity with English may be gathered from the following example:
Jám skám de ëllo, noch ligge, unvât sich honte de Thûne má de Ansero.
You shall not steal, nor lie, nor shady deal the one with the other.

In the literature of the old Frisian are some of the most ancient sources of Germanic juris
prudence, as the Senarzcult ("Ecclesiastical Law"), edited by Winsheim (Franeker, 1629); Ost-Friese Landrecht, by Wicht (Aurich, 1746); Hunsinger Landrecht of 1252 (Grongen, 1778); Neuelenger und Oldamster Landrecht, by Wiarda (1784); and Emsinger Landrecht of 1312 (Hanover, 1824). Literary specimens of several North Frisian dialects are to be found in Hansen, Nahrung für Leser im nordfrischen der Sprache (Sonderburg, 1883 et seq.); Hettema, Friske, Hügelbanne en Nordfriske Rymken, samlede troeg (Dokkum, 1841); and Nissen, De friske Siësmat, in course of publication (1874). Trustworthy works on the language are: Lyndhy, Om Nordfrisisk i Bökk
kingog Heddling Herred (Copenhagen and Leipsic, 1868); and Benden, Die nordfri
sische Sprache (Kopenhagen, 1868). Consult also the articles on the language published by Clement in the recent volumes of Herrig's Archiv für das Studium der neueren Sprachen und Litera
turen, and by Strauss in Neues Jahrbuch der
berlinischen Gesellschaft für deutsche Sprache und Alterthumskunde.

FRITH, William Powell, an English artist, born at Stanley, near Histon, Yorkshire, in 1819. He is one of the most successful painters of genre of the modern English school, selecting his subjects from Shakespeare, Cervantes, Goldsmith, the "Spectator," and kindred sources. Of late years he has produced some striking representations of every-day life. Perhaps his greatest painting is the "Railway Station" (1852), for which he received £6,000; the painting, with the right of engraving, has since been sold for £28,000. He was elected an honorary member of the imperial academy of fine arts at Vienna in 1859, and of the royal academy of Belgium in 1871.

FRITZ, Samuel, a German Roman Catholic missionary, born in Bohemia in 1650, died in Jeberos, Ecuador, in 1730. Being sent as a missionary to the Omagua Indians of South America, he selected as his field of labor the district between the mouths of the Rio Napo and the Rio Negro on the upper Amazon, where in 1688 he had succeeded in attaching five other tribes to the Omaguas, among whom he had established 40 missions. The whole number of Indians to whom the gospel was thus preached was about 40,000. In 1710 the war of the Spanish succession which was occupying Europe seemed to the Portuguese of Pará sufficient reason for making an irruption into the country of the upper Amazon, and of the Indians in the district of Father Fritz more than 20,000 were carried captive to Pará, and most of the others fled to their native forests. Fritz made a large map of the river Amazon, which long maintained its authority.

FRIUL, (Ger. Friul; so named from the ancient town of Forum Julii, now Cividale del Friuli), an old province of N. Italy, formerly embracing some adjoining districts and divided between Austria and the republic of Venice, and afterward, under the dominion of Austria, forming the circle of Görz, part of Trieste, and the delegation of Friuli or Udine in Venetia. It was one of the most important duchies of the Lombard kingdom, and after the overthrow of that monarchy by Charlemagne, and even up to the 16th century, when it was conquered by Venice and its territories were dismembered, it retained a considerable degree of independence. The main or Venetian portion was ceded to Austria in 1797, was annexed to the kingdom of Italy in 1806, recovered by Austria in 1814, and in 1866 united to the kingdom of Italy, and is now called the province of Udine. (See Udine.) The Friuli are a tribe kindred to the Italians, but their language is largely mixed with Celtic elements.

FROEBEL. See FROEBEL.

FROEBER, Sir Martin, an English explorer, born near Doncaster, died in Plymouth, Nov. 7, 1594. After spending 15 years in fruitless endeavors to get up an expedition to find the northwest passage, he at length sailed with three barks from Deptford, June 8, 1578, going as far as Labrador and Greenland, discovering the bay now known by his name, and returning in October. Indications of gold were discovered, which led to the despatch of a large squadron in the following year; and the ore brought back being thought valuable, still a third expedition was fitted out with 15 ships in 1578, but the fleet, being scattered by storms on the coast of Greenland, was obliged to return early in the winter without having effected any settlement. Relics of these expeditions were discovered by Hall in 1600-02. In 1585 Froebier went with Sir Francis Drake to the West Indies; and in 1588, on the defeat of the Spanish armada, he was knighted for his services in the action. He afterward commanded a fleet on the Spanish coast, and in 1594 supported Henry IV. against the leaguers and Spaniards, and died of a wound received in an attack on Brest.

FROEBEHN, Ray, an arm of the sea in British North America, setting up westward from the Atlantic near the entrance to Davis strait, between Hudson strait and Northumberland inlet. It penetrates the region known as Meta Incognita, is 240 m. long, 30 m. in average breadth, and has rugged mountainous shores.

FROEBEL, J. Friedrich, a German educator, founder of the Kindergarten system of schools, born at Ober-Kissbach, April 21, 1782, died in Marienthal, June 21, 1852. In 1826 he published the first volume of his work on education (Die Menschenerziehung). In this, as well as in a weekly journal which he edited subsequently (Wochenschrift für alle Freunde der Menschenbildung), he advocated a full and harmonious development of the human faculties. In 1837 he founded a school or Kindergarten for little children at Blankenburg, Thuringia, which became a model of similar institutions in many parts of Germany and in foreign countries, especially in Switzerland. The dukes of Meiningen gave him the use of his mansion of Marienthal, near Liebenstein, for the establishment of a normal school, where female teachers were instructed. The great freedom which he allowed to the children was considered dangerous, and his schools were denounced as nurseries of socialism and atheism. His nephew, Karl Froebel (born in 1808), had founded a school for girls at Hamburg in 1850, the programme for which furnished a pretext to the Prussian government for prohibiting (Aug. 7, 1851) all Kindergärten in which the Froebel system of education prevailed. II. Julius, a German author and traveller, nephew of the preceding, born in Griesheim in 1806. He engaged successively in various scientific, literary, and statistical labors, and attended the universities of Jena, Munich, and Berlin. In 1885 he was appointed professor of geography, natural history, and history at Zürich, and was subsequently professor of mineralogy in the high school of that city. Having become a natu-
eralized citizen of Switzerland, he joined the extreme radical party, and edited the "Swiss Republican." He also founded a publishing house, and in 1844 relinquished his professorship. He issued several scientific works and political pamphlets; but many of them were suppressed in Germany. Having returned to Germany, he was expelled from the Prussian territory, and went to Dresden. In 1848 he became a popular leader of the democratic party and a member of the German parliament at Frankfurt. Accompanying Robert Blum to Vienna, he was arrested, and sentenced to death by the same court martial which sentenced Blum, but was pardoned. On the dissolution of the parliament he repaired to Switzerland, and afterward to the United States. He was editor of a German newspaper, and lectured in New York, went in 1850 to Nicaragua, and afterward to Santa Fe and Chihuahua. During this period he was a frequent correspondent of the "New York Tribune." In 1855 he edited a journal at San Francisco. In 1857, after his return to Germany, attempts were made to expel him from Frankfurt, the American consul protesting upon the ground that he had become a naturalized citizen of the United States. After residing some time in London, he went to Vienna in 1862 to become editor of the journal representing the liberal cabinet then in power. From this time he again took an active part in German politics as one of the leaders of the Gross-Deutsche or federalist party. After the fall of the cabinet he went to Stuttgart, and in 1867 to Munich, where he established the Süddeutsche Post. Among his works are: System der sozialen Politik (2 vols., Mannheim, 1847); Die Republikaner, a historical drama (Leipsic, 1848); Aus Amerika, Erfahrungen, Reisen und Studien (2 vols., Leipsic, 1858; English translation, "Seven Years' Travel in Central America, Northern Mexico, and the Far West of the United States," London, 1859); Théorie der Politik (2 vols., Vienna, 1861); Kleine politische Schriften (2 vols., Stuttgart, 1866); and Die Wirtschafter des Menschengeschlechts auf dem Standpunkte der Einheit idealer und realer Interessen (Leipsic, 1870). In 1873 he was appointed consul of the German empire at Smyrna, Asia Minor.

Frog, a batrachian reptile of the anurous or tailless order, embracing the group phaneroglossae (Dum. and Bib.), with the families ranidae or common frogs, and hylidae or tree frogs. The general characters of the class and of the order have been sufficiently given in the article AMPHIBIA, so that the principal families, genera, and species will only be mentioned here. The family of frogs or ranidae include those genera the free extremities of whose fingers and toes are not dilated into disks, and whose upper jaw is provided with teeth; among these may be mentioned toad (Bufo bufo) rather than of frogs; in addition to maxillary teeth, most have also teeth on the palate and vomer, whose groupings, together with the form of the tongue and the visibility of the tympanum, are characters distinctive of genera and species. Almost all have, in the males, the vocal vesicles in the throat, communicating with the mouth, by the entrance of air into which their remarkable and loud sounds are produced; the nostrils open laterally, near the end of the snout; they have four non-palmed fingers, with the rudiment of a thumb, and five webbed toes; the back is generally irregularly roughened by glandular and other eminences, while the under surface is smooth. Frogs pass most of their time in the water, being excellent swimmers; the length of their hind limbs enables them to make considerable leaps, and to travel over land in this way long distances in search of water; they are unable to climb trees, like the family hylidae or tree frogs. Some species prefer moist localities and damp woods, where they hide in the grass and under leaves; others dwell in subterranean hollows which they dig on the borders of marshes, coming forth at evening or on rainy days. All the species when adults are decidedly carnivorous, even the smaller eating mollusks, insects, and worms, and all are characterized by great voracity. The frog family is found throughout the globe, though most abundantly in America; indeed five of the eight genera admitted by Duméril and Bibron are peculiar to the new world; after America come Asia, Europe, Africa, and Polynesia, in the order of abundance of species. Of the numerous genera described, the genus rana (Linn.), which includes the common frogs, is the best known and the most interesting. The principal characters of the skeleton of the frog are the small number of vertebrae, the absence of true ribs, the development of the transverse processes of the sacrum, the mobility of the iliac bones, the length of the coccyx, the presence of occipital condyles and an arch of scapular bones constituting a shoulder, and the elongation of the bones of the lower extremities. The muscles of the thigh and leg resemble considerably those of man and mammals. When a frog is at rest, the articulations of the pelvis, thigh, leg, and foot form four great folds or levers, by the sudden opening of which at the same time its remarkable leaps are effected; the swimming of the frog, which has erroneously been taken as a model for man in this respect, consists in a series of horizontal leaps, the body being sustained by the water, and its general form offering little resistance, and the anterior limbs being folded against the trunk instead of acting as aids to the legs in locomotion; walking of course must be difficult and slow where there is such disparity in the length of the arms and legs. The skin is smooth, made up of the usual layers, and in many parts of the body separated from the muscles to such an extent that it is more or less detached at the will of the animal; the thin epidermis is frequently renewed; in the pigment layer
are seated various colors, especially bright in the season of fecundation. The sense of smell is very imperfect; the tongue is not an organ of taste but of prehension, soft and covered with a viscid mucous base attached to the concavity of the lower jaw, its bifurcated point extending backward, and the whole organ capable of being projected from the mouth in a reversed position for the seizure of its insect prey; the organ of hearing has a tympanum, and an arial cavity under it communicating with the throat. The mouth is very widely cleft, and some of the larger species have been known to swallow small mammals and birds; like other amphibians they cannot drink. The structure of the heart, gills, and lungs, and the phenomena of the circulation in the tadpole and adults, and of the branchial, pulmonary, and cutaneous respirations, have been described in the article Amphibia. The well known voice of the frog varies so much in intensity and tone as to render it difficult from the sound to ascertain the distance of the animal, far surpassing in this respect the efforts of the most skilled ventriloquist; it can make a dull sound even under water. Among the many authors who have attempted to imitate in words the sounds of the frog, one of the most successful is Aristophanes, in whose comedy of the "Frogs" a frequent verse in the chorus is brek rrek kae koaz koaz, whose night-long repetition in spring and summer sometimes renders sleep impossible to those unaccustomed to it. By their power of retarding or accelerating the respiratory movements, and of aerating the blood through the vessels distributed to the skin, frogs are able to resist considerable changes of cold and heat, and to sustain life during their winter torpidity; the absorption and exhalation performed through the skin explain their occurrence and prolonged existence under circumstances where ordinary animals would soon perish, as under water and in air-tight places. The sexes are separate, and the reproductive functions are performed in the same mechanical and passionless manner as in most fishes; the ova are fecundated at the moment of their exclusion. As the eggs are expelled they are enveloped in a glairy mass, in which the embryos are seen distributed like black dots; the development is very rapid under favorable circumstances of temperature, the head and tail becoming perceptible in the course of the second day, the gills on the third, and the tadpole at the temperature of 80° F. (as in Ruscioni's experiments) may leave the egg on the fourth or fifth day; but in the ordinary seasons of temperate Europe and America, the young are not hatched until about a month after the deposit of the eggs. The tadpole is half an inch long when hatched, the mouth distinct, but small and without lips; the gills rapidly enlarge, and when at their maximum development afford beautiful objects for displaying the circulation; the gills soon begin to decrease in size, and are finally withdrawn within the branchial cavity, as in fishes, and concealed by an opercular fold of integument; the eyes are perfectly formed; the mouth acquires movable lips, is placed nearer the end of the head, and is used for the introduction of vegetable food; the caudal fin increases in size, and serves for rapid locomotion. Without any great change in form, the size is rapidly increased; two small tubercles appear near the vent, the rudiments of the posterior legs, which are soon developed into the perfect limbs; the anterior limbs are afterward formed under the skin in a similar manner; as the legs are perfected the tail is gradually absorbed from the tip to the base, and progression is effected by the hind limbs. The lungs are now fitted for the respiration of air, and the little creatures come on land in search of worms and insects, and in such multitudes in damp weather as to give rise to the belief, still popularly adhered to in many places, that it has rained frogs. They grow rapidly during the summer and autumn, and in winter plunge into the mud to pass their stage of hibernation. In the tadpole state great numbers are devoured by fishes, other reptiles, and by each other; and the adults furnish food for all classes of vertebrata from fishes up to man himself. It is probable that not more than one in a thousand of those which come from the egg in the spring live to reach their winter retreat; if fortunate enough to escape from all enemies, frogs may live many years. Serpents among reptiles, pickerel among fishes, vultures, storks, herons, and cranes among birds, are the worst enemies of frogs; were it...
not for the storks of Egypt, that country would be overrun with frogs. When it is remembered that each female frog of the hundreds in a single locality may produce 1,000 young, which hide in crevices in the earth and under stones, ready to come forth to enjoy the genial summer showers, there is no necessity for any attempt to explain the appearance of the frog multitudes by supposing them to have fallen from the clouds, as has been believed even from the time of Aristotle, or by the supposition that they have been taken up from some marsh by a whirlwind and let fall during a rain; the latter occurrence, on a small scale, is not impossible, in exceptional cases. The frogs which thus appear bear marks of their recent metamorphosis, in the remnant of a tail and other organs; crawling as they naturally would into the ground, the swelling of the earth from rain would drive them out by compression. From facts recorded in the "Annals and Magazine of Natural History" (1858, pp. 481 and 492), it would seem that frogs and toads may be reproduced without passing through the intermediate stage of tadpole; it is only of late years that many common fishes have been ascertained to be viviparous, and it is not improbable that eggs laid in localities where water cannot be obtained, as in cellars and hot houses and beds, may produce frogs, whose larval form is very soon exchanged for the perfect state, the gills being prematurely cast to enable the animal to accommodate itself to its new circumstances; and it may be, as Mr. Jenyns remarks, that the frogs are hatched on land in the perfect state, the gills either never having existed or having disappeared immediately after birth. On the other hand, it has been ascertained that the larval or tadpole state may be unnaturally prolonged; Prof. J. Wyman (in the "Proceedings of the American Academy of Arts and Sciences," vol. iii. p. 35) experimented on the tadpoles of the common bullfrog, the greater number of which pass the winter without having undergone metamorphosis, not becoming perfect animals until the following spring; he found that the tadpole state, by the influence of darkness and low temperature, could be prolonged certainly from one to two years, and probably much longer; possibly some of the cases referred to by Mr. Jenyns and others may admit of explanation by prolongation rather than an absence of the larval condition, the young frogs having been the result of tadpoles which had passed their larval condition in some other locality, or in the same in a torpid state for a year.—The tenacity of life in frogs is very great; they survive the severest wounds, live a long time after the heart and entrails are removed, and display muscular contractility and the phenomena of circulation in various organs for many minutes and even hours after death has actually taken place. On this account the frog is often the experimental animal selected as a subject of experiment to ascertain and illustrate the most important phenomena of human physiology, and has in this way been of inestimable advantage to mankind. The change of a fish-like animal, breathing by means of gills in water, to a leaping, air-breathing creature, with the corresponding modifications of food and habits, is well calculated to excite the admiration of a thinking person. The air cells of the frog's lungs, the membrane of its foot, and the delicate fringe of the tadpole's gills, afford admirable and easily obtained tissues for demonstrating under the microscope the circulation in the capillary vessels, with their chains of moving blood globules. The structure of the lungs and the mechanism of their respiration furnished to the anatomists and physiologists proof of the changes which the blood undergoes under the influence of the oxygen of the air through the medium of a thin intervening vascular wall. The sensibility of their muscles to the galvanic currents led Galvani and Volta to most important discoveries in electricity and galvanism, whence flowed the great results obtained by Bell, Faraday, and Matteucci in the physiology of the nervous system, and by Davy and others in physics and the chemical constitution of bodies previously supposed simple. The phenomena of cutaneous absorption, exhalation, and respiration have derived their fullest illustration and explanation from experiments made on the soft and naked skin of the frog. Thus this despised creature has rendered the greatest services to anatomy, physiology, physics, and chemistry, and has thrown light which no other animal could on the functions of innervation, muscular contractility, circulation, respiration, absorption, and generation. The frog is not only a graceful and harmless animal, but is actually useful in destroying insects and slugs injurious to vegetation. Though in England and the United States frogs are rarely eaten by man, in France and southern Europe they are largely consumed as food; they are caught in various ways, and are preserved in large "froggeries" until wanted for the table; the flesh is most delicate and nutritious at the time when they are about to enter their winter quarters, yet great numbers are eaten in the spring, when they are more easily caught; the hind limbs are generally the only part eaten, and these are cooked in various modes, in all of which they are as much more delicate than chicken as that is superior to veal and pork. In the materia medica the flesh of frogs has long been used by continental physicians as the basis for anti-scorbutic and restorative broths. The largest species of the genus rana in the United States is the bullfrog (R. pipiens, Latr.), which often measures when extended 18 or 21 in.; the general color above is green in front, dusky olive behind, with irregular black blotches, and below yellowish white, with dusky marks; the limbs dusky, with black bars. The bullfrog, so called from its loud voice, is rather solitary in its habits, living about streams and ponds that are very abundant in one place except during the breeding season; it is the most aquatic of the frogs, and an excellent swimmer, often living
for years in wells, where it is allowed to remain under the supposition that it purifies the water; it is also an active leaper, taking to the water when alarmed. Its voracity is extreme; it devours young ducks, snakes, moles, mice, insects, worms, snails, its own tadpoles, and any small animal it can catch; it does not seize prey unless alive or in motion. The species is very generally distributed over the United States. The spring frog (*R. fontinalis*, Le Conte) is green above, with dusky spots behind; throat and abdomen yellow; hind limbs dark green, with dusky bars; a cutaneous fold or ridge from the orbit to the hind legs; the total length is about 8½ in.; it is fond of springs of cold water, and feeds on worms and insects; it is common from Maine to Virginia. The marsh frog (*R. palustris*, Le Conte) is pale brown above, with two longitudinal rows of dark brown square spots on the back and sides, yellowish white below, with the posterior half of the thighs bright yellow mottled with black; it is slender and delicately formed, about 8 in. in total length; it is found from Maine to Vir-

Virginia, on the borders of marshes and pools, and sometimes at a great distance from water; it has a peculiar strong and disagreeable odor; from its being a favorite bait for pike, it is often called the pickerel frog. The shad frog (*R. halecina*, Kalm) is one of the handsomest species, being green above, with ovate spots of dark brown margined with yellow, and yellowish white beneath; it is about 8½ in. in total length, active, and able to leap a distance of 8 to 10 ft. when alarmed; it is called shad frog from its appearing in the middle states in the spring with this fish; it is also called water and leopard frog; it is very widely distributed in the United States, and is the nearest representative here of the common frog of Europe, being like that sought after by epicures. The wood frog (*R. sylvatica*, Le Conte) is pale reddish brown above, and yellowish white below; the head has a dark brown stripe extending from the snout to the tympanum through the eye; the total length is a little over 6½ in.; it is found from
Michigan to the Carolinas, chiefly in thick woods, preferring those of oak; it is active, when pursued hiding itself under leaves; it rarely approaches water except in the breeding season. The crying frog (*R. clamitans*, Bosc.), a slender species, is olive-colored in front, dusky behind, and silvery white below; the total length is 8½ in.; it is very active, and when leaping frightened into the water utters a short loud cry; it is a southern species, taking the place of the spring frog of the north, and by some thought to be the same.—Like all other reptiles, the common frog of Europe (*R. temporaria*, Linn.) differs from all American species: the color is generally brown, inclining to reddish or yellowish above, with irregular spots of black or brown, and transverse bands on the legs, and yellowish white below with smaller and fewer spots; the most constant mark is an elongated brown patch behind the eye on each side; the total length is about 7 in.; it is found very generally over Europe. The green frog of Europe (*R. esculenta*, Linn.) is of a general greenish color above, with black or brownish marks, and sometimes with three yellow stripes on the back, and yellowish white below; the total length is about 8 in.; it is distributed over Europe, Asia, and northern Africa, and is the species most sought after for food.—There are several species of small frogs, principally American and subtropical, belonging to the genus *cystignathus* (Wagler), characterized by the almost entire absence of webs to the toes; for their description the reader is referred to the work of Dr. Holbrook (vol. i.), and of Duméril and Bibron (vol. viii.). The genus *seratophyra* (Boie) or *phrynoceros* (Tschudi) will be described under Horned Frog; the tree frogs (*hyla*, Laurenti) and the peeping frogs (*hylodes*, Fitz.) will be noticed under True Frog, belonging as they do to the family *hyla*.-The frogs are considered by Agassiz lower than the toads among anuranous batrachians, on account of their aquatic habits, the persistence of the embryonic webs between the toes, and the non-existence of glands developed in the substance of the skin. The family *ranidae* are the most numerously represented of the fossil anuranous batrachians, and their remains occur in the tertiary and diluvian formations, sometimes of large size. The gigantic *cheirotherium* or *labyrinthodon* is placed by Jäger, Fitzinger, and Owen among batrachians; this immense frog-like animal, with a head 3 or 8 ft. long and the body 10 or 12, first appeared in the carboniferous period, was abundant in the triassic, and probably disappeared before the Jurassic epoch. From the facts now ascertained it would appear that the muddy shores and flats of remote geological ages were inhabited by batrachoid forms as strange as the flying pterodactyl or the great *ichthyosaurus* and *pleiosaurs*, and that possibly frogs 12 ft. long (like *cheirotherium*) leaped and croaked in the ancient marshes.

**FROISSART, Jehan, or Jean,** a French chronicler, born in Valenciennes in 1387, died at Chimay about 1410. His father, a heraldic painter, destined him to the clerical profession. He was scarcely 20 years old when, upon the invitation of Robert of Namur, he undertook to write a history of the wars and adventures of his times. He compiled from the *Voyages chroniques* of Jehan le Bel, canon of St. Lambert in Liége, the first part of his own *Chronicles,* embracing the period from 1326 to 1340. When this was completed he went to England in 1380, and presented it to Philippa of Hainaut, the queen of Edward III. In 1382 he was made clerk of her chapel (having already taken holy orders), and also her secretary. In 1384 he visited Scotland, where he was kindly treated by King David Bruce, and enjoyed the hospitality of the Douglasses. After gathering ample materials in Great Britain, he returned to the continent, and in 1386 went to the English court at Bordeaux. Thence he returned for a short time to England, and in 1389 we find him accompanying Lionel, duke of Clarence, to Italy, and, with Chancer and Petrarch, witnessing in Milan the celebration of the marriage of that prince with the daughter of Galeazzo Visconti. In 1389 he repaired to his native country, where he obtained the living of Lestines. But the life of a country priest did not suit him, and he attached himself to Wenceslas of Luxemburg, duke of Brabant, who intrusted him with the care of collecting and writing down his romances, ballads, songs, and virelays. To these Froissart added some of his own compositions, and the collection formed a volume with the title of *Melyador,* or *The Knight of the Golden Sun.* But Wenceslas died before the work was completed, and Guy, count of Blois, made Froissart clerk of his chapel, and sent him with a letter of introduction and gifts to Gaston Phoebus, count of Foix. After sojournin a long while at Orthez he accompanied this prince’s niece, Jeanne de Boulogne, when she went to Rim to marry the duke of Berry. Thence he repaired to Paris, and afterward travelled again through Holland, Languedoc, and other countries. In 1390 he settled at Chimay, having been appointed canon and treasurer to the church there, and, with the exception of the time spent in a visit to England for the purpose of
presenting Richard II. with a collection of his poems, he there devoted his later years to the completion of his great work. His book is a living picture of his age. An admirer of heroic deeds, an instinctive courtier of every prince or lord, delighted with feasts and pageants, he vividly depicts all that interests him, and gives more prominence to individual exploits than to important events. He is devoid of patriotism, and shows no partiality to the French, narrating their defeats with as much gusto as their victories; he has no philosophical views nor political opinions; but he is incontrovertibly the most amusing and vivacious of chroniclers. He also wrote more than 80,000 verses, a few specimens of which have been occasionally published; but his fame rests exclusively upon his historical work. The finest copy of Froissart's chronicle is at Breslau; it comprises four volumes, most carefully written, and embellished with magnificent vignettes. The chronicle embraces the annals of the 14th century from 1326 to 1400, and was printed for the first time about 1498 at Paris by Antoine Véérard (4 vols. fol.), under the title of Chroniques de France, d'Angleterre, d'Écosse, d'Espagne, de Bretagne, de Gascoigne, Flandres et lieux d'Alemour. The reprints of 1514, 1518, and 1530 contain continuations to the year 1513 by unknown authors. The chronicle was translated into English by order of Henry VIII. and published under the title of "Chronicles of England" (2 vols. fol., London, 1522–3). The English versions are generally prepared on account of their retaining the original spelling of the proper names. The best French edition is by Buchon (15 vols. 8vo, Paris, 1824), reprinted with important additions and improvements in the Panthéon littéraire, under the title of Les chroniques de sire Jean Froissart, qui traitent des merveilleuses entreprises, nobles aventures et faits d'armes advenus en son temps en France, Angleterre, Bretagne, Bourgogne, Écosse, Espagne, Portugal, et les autres, nouvellement revues et augmentées d'après les manuscrits, avec notes, éclaircissements, tables, et glossaire (3 large vols. 8vo, Paris, 1835–8). A volume of extracts, containing the most interesting parts, was published in 1846. Sir Walter Scott was of opinion that for artlessness and vivacity of style the old version is to be preferred to the more exact and learned translation made by Thomas Johnes, under the title of "Sir John Froissart's Chronicles of England, France, and the adjoining Countries" (4 vols. 4to, Hafod press, 1805–6). The second edition of Johnes's translation (12 vols. 8vo, London, 1806) are prefixed a life of the author, an essay on his works, a criticism on his history, and a dissertation on his poetry. Another edition has been published by Henry Bohn (3 vols. 8vo, London, 1845).

Frome, a town and parliamentary borough of Somersetshire, England, 19 m. S. E. of Bristol; pop. in 1871, 11,846. It is pleasantly situated on an affluent of the Avon. The parish church, an ancient Gothic building, has a tower and spire 150 ft. high, and there are four new churches, of which St. Mary the Virgin, opened in 1864, is the finest. Schools and charitable institutions abound, and there are a literary and mechanics' institute and a church institute with library and reading rooms; a fine building for a museum and library was opened in 1867. There are extensive breweries, and manufactures of woollens, silks, hats, and carriage linings.

Froment, engine, a French painter and author, born in La Rochelle in December, 1820, died Aug. 27, 1876. He studied under Cabat, and exhibited in 1847 excellent pictures of Algerian scenery and public buildings. He was sent in 1852 on an archaeological mission to Algeria by the committee of historical monuments. After his return to Paris he produced many landscapes and genre pictures relating to Arab life and scenery, remarkable for their brilliant coloring and their delicacy of execution. His "Chase of Gazelles" was purchased by the government, as well as his "Falcon Chase" and "Arabian Falconer," which latter are in the Luxembourg. He published Visites artistiques (1852), Simples pêlerinages (1858), Une année dans le Sahel (1858), and a successful novel, Dominique (1868).

Fromes, a political faction in France which headed an insurrectionary movement during the latter part of the minority of Louis XIV. The name of fromeur, which means literally singer, was applied to its members in derision; in their sneering and flippancy attacks upon Cardinal Mazarin they were said to resemble boys throwing stones from slings. But the name, though given in derision, was soon accepted by those to whom it was applied. The long and powerful rule of Richelieu had completed the work of centralizing all the power of France in the hands of the royal government, and finally broken the might of the independent families in the kingdom. The spirit of opposition, which was crushed in its last conspiracies, revived under his feeble successor, Mazarin, who was hated by the nobles as a foreigner and friend of foreigners, and by the people for his extortions. The movement assumed a warlike aspect in 1648, when Mazarin declared the decree of parliament, which had acted as an independent political body, to be attempts upon the rights of the crown, and arrested the president and one of the members. The next day the people of Paris rose in arms, dispersed the Swiss guards, and erected barricades in the streets adjoining the royal palace. The frightened court repealed the recently imposed taxes and promised a better administration of justice. This still more encouraged the fromeurs of the parliament, whose continued opposition finally compelled the court to retire to St. Germain (Jan. 6, 1649). Paris was now in the hands of the insurgents, and Prince Louis Condé at the head of 7,000 men undertook to besiege it. The parliament
called the people of the city to arms; the prince of Conti, the dukes of Longueville, Beaumont, Orleans, Bouillon, Elbeuf, Vendome, and Nemours, the marshal de la Mothe, and the popular De Retz, came forward as their leaders; spirited and beautiful ladies, among whom the duchess of Longueville was the most conspicuous, inspired their courage; and foreign aid was expected from the Netherlands. But the leaders of the movement, having it in their power to change it into a complete revolution like that which had just been achieved in England, became afraid of the consequences of their own victory, and hastened to conclude (March 11) a treaty with the court at Rueil. The subsequent phases of the Fronde were composed of intrigues and contentions for power between the princes of the blood and the cardinal-minister. After the return of the court to the capital (Aug. 18), Mazarin again used violence, and had Longueville and the princes of Condé and Conti arrested (Jan. 18, 1650). This caused risings in the provinces, and Marshal Turenne hastened to the rescue of the princes; but after several advantages he was routed in the engagement of Rethel (Dec. 15). The triumphant minister could not long enjoy his success; the united opposition of all parties compelled Queen Anne to release the princes, and to sacrifice Mazarin, who withdrew to Cologne (February, 1651). Anne recalled her minister when the leaders of the insurrection, Condé and Conti, were quarrelling, and Condé fled, repaired to Bordeaux, armed his numerous adherents, and marched toward the capital; but Turenne now commanded against him, and Condé would have been routed near Paris (July 2, 1652) if the gates of the city had not been thrown open to him. Paris, however, tired of commotions, treated with the court, which had withdrawn, and Louis promised an amnesty and the dismissal of the hated minister. Condé, having received a reenforcement of 12,000 men from England, abandoned the propositions, and marched into Champagne; but finding no adherents, he went over to the Spaniards in the Netherlands. Louis XIV., having returned to his capital (Oct. 21), proscribed Condé, and forbade all political action on the part of the parliament. Mazarin also returned triumphantly (Feb. 3, 1668) to his post. Many who had distinguished themselves in the parliament or under Condé were temporarily banished, and the movement in the provinces soon subsided. It is noteworthy that a number of women were the leading spirits of this faction, and that everything was done with unparalleled frivolity, which gave to the whole war rather a ridiculous aspect. Count Saint-Aulaire undertakes in his Histoire de la Fronde (2 vols., Paris, 1861) to present it as a genuine attempt at a commercial reorganization; see also Barante, Le parlement et la Fronde (1859), and "The Great Condé and the Period of the Fronde," by Walter Fitzpatrick (2 vols., London, 1878).

FRONTENAC, an E. county of Ontario, Canada, bounded S. by the St. Lawrence river, near its head in Lake Ontario; area, 828 sq. m.; pop. in 1871, 28,717. It contains many small lakes, and is traversed by the Grand Trunk and the Kingston and Pembroke railways, and by the Rideau canal. Capital, Kingston.

FRONTENAC, Louis de Buade, count de, a French governor of Canada, born about 1620, died in Quebec in November, 1698. He entered the army at the age of 17, served in Italy, Flanders, and Germany, and in 1669 in Canada. He was appointed governor general of Canada by Louis XIV., and arrived in September, 1672. He was a man of ability and courage, active and full of resource, but apt to be arbitrary and prejudiced. One of his first steps was to build Fort Oataroco or Frontenac on Lake Ontario, to keep the Iroquois in check. He sent Marquette and Joliet to explore the Mississippi, and was the constant patron of La Salle; but he became involved with the intendant Duchesneau, and with the ecclesiastical authorities, who opposed the liquor trade among the Indians. He was accordingly recalled in 1689; but when Canada had been brought to the verge of ruin under the administrations of De la Barre and Denonville, Frontenac was again sent out in 1689. He took part in the proposed expedition against New England and New York, and set to work with energy to carry the war into the British colonies, attacking them at Hudson bay and by series of war parties, carrying Fort Pemaquid in Maine, Schenectady, Salmon Falls, Casco, and other frontier towns and posts. He completed his vigorous campaign by the repulse of the land and naval force under Sir William Phips before Quebec in 1690. He afterward sent a force into the Mohawk territory and humbled that tribe, restored Fort Frontenac, which had been abandoned and destroyed, and again revived the liquor trade with the Indian tribes. As this failed to bring the cantons to peace, he led an army in person in 1696 to the heart of New York, laying waste Onondaga and Oneida. Iberville at the same time reconquered most of Newfoundland, and then sailing to Hudson bay defeated an English fleet and reduced the English posts. Having thus restored the fallen fortunes of France in America, Frontenac died soon after, and was buried in the church of the Recollect fathers, to whom he was greatly attached. On the destruction of the church his body was removed to the cathedral of Quebec in 1796. His wife, a daughter of Lagrange Trianon, was one of the famous beauties of the court, and seems to have entertained a strong dislike to her husband, being reported to have used her influence to secure his reappointment to get him out of France. She died in 1767. Parkman devotes a volume of his "History of the French Dominion in America" to a full account of the career of Count Frontenac.
FRONTIER, a S. W. county of Nebraska, formed since the census of 1870, drained by affluents of Frenchman's fork of the Republican river; area, about 675 sq. m.

FROSINONE (anc. Frusino), a town of Italy, formerly capital of a papal legation of the same name, now in the province and 48 m. E. S. E. of the city of Rome; pop. about 8,000. It contains several churches and convents and an episcopal palace; and near it are remains of a Roman amphitheatre. It is a favorite resort for artists on account of the picturesque dress of the women. Good wine is produced in the vicinity, wool is manufactured, and there are two annual fairs. — The ancient Frusino was originally a town of the Hernici in Latium, and subsequently a Roman colony, and long retained some prosperity, mainly on account of its situation on the Via Latina. The legation of Frosinone was styled the Tyrol of the pope, on account of its mountainous character and the simple habits of the people.

FROSSARD, Charles Auguste, a French soldier, born April 26, 1807, died Sept. 1, 1875. He was educated at the polytechnic school in Paris and the military school in Metz. Participated in the Belgian campaign of 1831–32, was made a captain, went to Algeria in 1838, and returned to Paris in 1846 with the rank of major. In 1849–50 he commanded the corps of engineers in Rome. In 1858 he was director of the fortifications of Oran in Algeria. During the Crimean war he acted as chief of engineers of the army of the East. He returned again to Algeria, where he remained till 1869, when he was ordered to Italy with the rank of general. At the close of the war he was made grand officer of the legion of honor, and appointed governor of the imperial prince. At the beginning of the Franco-German war he obtained command of the 24th corps of the army of the Rhine, and opened the war by an attack upon Saarbrück, Aug. 2, 1870. Four days later he was defeated at the Spichern heights, between that town and Forbach, and withdrew to Metz, fought at Courcelles, Mars-la-Tour, and Gravelotte, was made a prisoner at the surrender of the fortress, and was detained in Frankfort till the close of the war. He published, in justification of himself, Rapport sur les opérations du 2e corps de l'armée du Rhin dans la campagne de 1870 (2 vols., Paris, 1872).

FROST (from the root of frees), in a general sense, the act or process of freezing, but more commonly used to signify crystals of frozen dew; in the latter case called also hoar frost. When the atmosphere contains so little aqueous vapor or it is itself already at so low a temperature that a reduction to a point below 32° F. is necessary before condensation can take place, the deposit will be frozen, and instead of being tortuous and forming the usual form of a film of frost. The process is precisely similar to the deposition of crystals of salts from their solution in water. In this latter case the operation must be conducted slowly and at a certain low temperature; if the water be evaporated by violent ebullition, we have an amorphous powder, but no true crystals. In a similar manner the atmosphere deposits its aqueous burden in crystals or liquid form according to the temperature. The most remarkable formations of frost are witnessed on the summit of Mount Washington during the autumn and winter, when crystals a foot or more in length attach themselves to every object. The conditions favorable to frost are but an exaggeration of those that facilitate the formation of dew. The destructive effects of frosts on tender vegetation, and their beneficial influences in a sanitary point of view, have caused much attention to be given to this phenomenon. In the Mississippi valley it is commonly said that the spread of the yellow fever is completely checked by a heavy frost. This however was notably not the case in 1873; and it may be fairly questioned whether some other agency, especially the dryness of the air, be not the true antagonistic element. Whatever hinders the deposition of dew acts also to mitigate the severity of a frost; to this end a thin or loose covering of cloth, straw, &c., is sufficient. In low flat regions it is found practicable to produce clouds of smoke, which, lying quiescent above the regions to be protected, serves to completely protect the ground from the radiation and consequent frost. — The word frost is somewhat loosely applied also to the action of winter's cold in freezing the solid ground and the water it may contain, when the frost is said to be in the ground; again, in the spring, the frost is said to come out of the ground. These expressions allude of course to the simple phenomenon of freezing, and not to the frost deposited on the surface of grass, plants, &c. The effect of cold in freezing the water within the earth and the crevices of wells is recognized as a powerful agent in the preparation of the earth, for cultivation and the growth of forests, and is sometimes called into requisition in the quarrying of rocks. The term frostwork is applied to the formation of ice crystals on the inside surface of the window panes of a warm room. During cold weather the glass panes are cooled to a temperature below the freezing point, and a coating of true dew is deposited upon them; this dew water is then cooled and frozen by the continued cold of the pane of glass. The phenomenon is that of the freezing of a thin film of water, not that of the direct deposition of ice crystals as in the true frost. A similar distinction is to be made in the case of the formation of snow and of hail. In the former the minute crystals are deposited at a temperature lower than the freezing point; but in the formation of hail the water is deposited first, and the water is changed into ice by the incident cold. Black frost is the effect produced when the moisture within a plant is frozen, but without any hoar frost being deposited on its exterior.
FROST

FROST, William Edward, an English painter, born at Wandsworth in 1810, died Aug. 5, 1877. He commenced his career as a portrait painter, and executed in the course of 14 years upward of 800 pictures of this class. In 1839 he attempted historical composition, and his "Prometheus Bound," exhibited in that year, gained the gold medal at the academy. In 1843 he won a prize of $100 in the Westminster hall competition by his cartoon of "Una alarmed by Fauns." He afterward confined himself chiefly to classical subjects. Among his principal pictures are the "Disarming of Cupid" and the "Bacchanalian Reuel." He was elected a royal academian Dec. 30, 1870.

FROTHINGHAM, I. Nathaniel Langdon, an American clergyman, born in Boston, July 23, 1793, died there, April 4, 1870. He graduated in 1811 at Harvard college, where in the following year he became instructor in rhetoric and oratory. In the mean time he studied theology, and in 1815 was ordained pastor of the first Congregational church in Boston. This charge he retained till ill health compelled his resignation of it in 1850. He was the author of more than 50 sermons published occasionally, and of a volume of "Sermons in the Order of a Twelvemonth" (Boston, 1859). He also contributed in prose and verse to periodicals, and a collection of his poems has been published under the title of "Metrical Pieces, Translated and Original" (Boston, 1855). They are distinguished, like his prose writings, by singular refinement of sentiment and grace of expression.

II. Octavius Brooks, an American clergyman, son of the preceding, born in Boston, Nov. 26, 1829. He graduated at Harvard college in 1848, spent three years in the Cambridge divinity school, and was settled as pastor of the North church (Unitarian), Salem, Mass., March 10, 1847. He removed to Jersey City, N. J., in May, 1858, where he preached till May, 1859, when he accepted a call to New York, and became pastor of a congregation which in 1860 was organized under the name of the "Third Unitarian Congregational Church." He is distinguished for the intellectual character of his preaching, his wide scholarship in various branches of learning, and his impressive eloquence. He is one of the principal leaders of the so-called free religious movement, which has for its object the promotion of rationalist ideas in theology, in place of the received dogtrine of the Christian church. He has written extensively for various journals, contributed numerous papers to prominent reviews, and, besides publishing more than 150 sermons, is the author of the following works: "The Parables" (Boston, 1864); "Stories from the Old Testament" (Boston, 1864); "Renan's Critical Essays," translated (New York, 1864); "The Child's Book of Religion" (New York, 1871); "The Nature of Humanity" (New York, 1872); and "The Life of Theodore Parker" (Boston, 1874).
isters. His delineation of the character of Mary queen of Scots is very severe, and has given rise to much controversy. H. Richard Hurrell, brother of the preceding, an ardent supporter of the "Oxford movement" in the church of England in its earlier stages, born March 22, 1808, died Feb. 28, 1883. He was educated at Eton and Oxford, in 1826 was elected fellow of Oriel college, and three years after was ordained by the bishop of Oxford. Four volumes of "Remains," made up of extracts from his journals, correspondence, and writings, in which may be seen the Roman tendencies of the Oxford movement even at that period, were published in London in 1886.

FRY, Elizabeth, an English philanthropist, born at Brampton, near Norwich, May 21, 1780, died in Ramsgate, Oct. 12, 1845. She was the daughter of John Gurney of Norwich. The family belonged to the society of Friends, but did not adhere strictly to its usages either in dress, language, or social habits. But in 1798 William Savery, an American Quaker, visited England, and by his means Elizabeth was converted to the strict piety and customs of a "plain Friend." In 1800 she was married to Joseph Fry, and in 1810 she became a minister. In 1818 she made her first visit to Newgate prison, and in 1817 succeeded in establishing a school and manufactory within the prison, organized a ladies' association for the reformation of the prisoners, and thenceforward devoted all her energies to the promotion of prison reform. Within a few years her influence was apparent in most of the jails, houses of correction, lunatic asylums, and infirmaries of the United Kingdom. From 1837 to 1842 she made several journeys in France and in northern and central Europe, visiting prisons, and expounding her plans of improvement to the public authorities.—See "Memoirs of Elizabeth Fry, with Extracts from her Journals and Letters, edited by Two of her Daughters" (2 vols., 1840 and 1841).

FRY, William Henry, an American composer and journalist, born in Philadelphia in August, 1815, died in the island of Santa Cruz, Dec. 21, 1864. His father, William Fry, was proprietor of the "National Gazette" of Philadelphia. His aptitude for music was very early manifested. His first orchestral productions were four overtures performed by the Philharmonic society of Philadelphia in 1835, for which he received an honorary medal from the society. In 1839 he became regularly connected with the "National Gazette," and in 1844 he was engaged as editor of the Philadelphia "Ledger." In 1845 his opera of "Leonora" was performed in Philadelphia, and in 1855 an Italian version of it was produced. In 1846 he visited Europe, and remained there six years, residing chiefly in Paris, and corresponding with various newspapers. His lectures on music delivered in New York, a series of ten lectures on the history of music, as illustrations to which he composed two symphonies, "The Breaking Heart" and "A Day in the Country," these, with the symphonies "Santa Claus" and "Child Harold," were performed by Jullien's band. He published a "Statut Moter," with full orchestral and vocal score. After his return from Europe he was attached for the rest of his life to the staff of the "New York Tribune." He was also a political orator, and a popular lecturer on miscellaneous subjects.

FRYKEN, a series of small lakes of Sweden, about 12 m. N. W. of Lake Wener. They consist of three distinct parts connected by narrow channels, extend about 40 m. from S. to N., and present the appearance of a large river. They are situated in the Frykedal, renowned for its beautiful scenery. At the N. end of the lakes is the village of Frykenodee, and at the S. extremity is the small town of Frykstenen.

Fryxell, Anders, a Swedish historian, born at Hesselby, in Dalcarlia, Feb. 7, 1795. He studied in the university of Upsal, became a professor, a clergyman, and provost of North Wermland, which post he resigned in 1847 to devote himself exclusively to his historical labors, in the course of which he had visited many countries. His fame rests upon his "Berättelser ur Svenska Historien" ("Narratives of Swedish History," 34 vols., 1823-64), part of which, relating to Gustavus Adolphus, has been translated into several languages.

FUAD PASHA, a Turkish statesman, born in Constantinople about 1814, died in Nice, Feb. 11, 1869. He received an excellent education, and his father's fortune having been confiscated by Sultan Mahmoud, he studied medicine. In 1834 he was appointed physician to the admiralty and accompanied the naval expedition to Tripoli. Returning to Constantinople, he entered the diplomatic service, and in 1849 became an attaché of the Turkish embassy in London, and in 1848 second dragoman of the Porte and director of the bureau of translation. After having fulfilled special missions in Spain and Portugal, he was made first dragoman in 1845, grand referendary of the divan and commission general in the Dambian principalities in 1845, minister of the interior in December, 1849, and minister of foreign affairs in 1852. He strenuously opposed the Russian pretensions which led to the Crimea war, and resigned his office in March, 1853, in consequence of a dispute with Prince Menshikoff, the Russian ambassador. In 1854 he quelled insurrectionary movements in Epirus, afterward became a member and president of the newly established council (taneimat), and acted again for several years as minister of foreign affairs. In 1860-61 he distinguished himself as a commissioner in Damascus and the Lebanon, and in November, 1861, became grand vizier. He resigned in 1868, and was minister of war from that period till 1869. His previous position and influence of financial affairs had somewhat impaired his popularity, but his prestige in Europe as a brilliant diplomat led to his return.
to the foreign office in 1807, Aali Pasha being
grand vizier. He urged the sultan to visit the
principal European sovereigns, accompanied
him on the journey, and died while residing
at Nice for the benefit of his health. He was
European in his manners and in many of his
views, spoke French fluently, and was regarded
as the ablest Turkish statesman of his day.
He was fond of poetry, and was one of the
earliest members of the Turkish academy of
science and literature. He published a Turkish
grammar (1889), and La vérité sur la question
des saïnta lieux (1869).

FUCA, or Juan de Fuca, Strait of, a body of
water lying between the N. W. portion of
Washington territory and the S. E. extremity
of Vancouver island. It enters the Pacific at
Cape Flattery, and communicates with the gulf
of Georgia through Rosario and Haro straits.
It is about 80 m. long, 11 m. wide at its W. and
25 m. at its E. end, and free from shoals.

FUCHE, Johann Nepomuk von, a German chem-
ist, born at Mattenzell, May 18, 1774, died in
Munich, March 6, 1856. He was professor of
mineralogy and chemistry at Landshut and
subsequently in Munich, where he was also
appointed keeper of the mineralogical collec-
tions, and held other important functions in con-
nection with scientific departments. He made
various chemical discoveries and researches,
and was especially distinguished for his inven-
tion of soluble glass and its application to
stereochromy, as explained in his Bereitung,
Eigenschaften und Nutzamwendung des Was-
sersalzes (1857). Among his most valuable con-
tributions to mineralogy is his Naturgeschichte
des Mineralreichs, included in his Gesammelte
Schriften (1866). His life has been written by
Kobell (1866).

FUCHES, Konrad Heunrich, a German physician,
born in Bamberg, Dec. 7, 1803, died in Göttingen,
Dec. 2, 1855. He studied at Würzburg,
where he became an assistant of Schönlein,
and was subsequently professor there, and from
1888 in Göttingen. He was a high authority
on nosology, diagnostics, and therapeutics.
His principal works are: Die krankhaften
Veränderungen der Haut und ihrer Anhänge
(3 vols., Göttingen, 1840–41); Die ältesten
Schriftsteller über die Lustseuche in Deutsch-
land (1845); and Lehrbuch der spezellen Nosolo-

FUCHS, or Fuchs, Leonhard von, a German
botanist, born at Wendingen, Swabia, Jan. 17,
1601, died May 10, 1666. He studied at Erfurt
and Ingolstadt, adopted the doctrines of Luther,
became in 1526 professor of medicine at Ingol-
stadt, and in 1538 first physician to the mar-
grave of Anspach, and held the chair of med-
icine at Tübingen from 1536 till his death. He
was knighted by Charles V. He contributed
much toward overthrowing the authority of the
Arab physicians and restoring the Greeks to
honor. As a botanist he corrected many
current errors in the nomenclature of plants.
An American plant, the fuchsia, bears his
name. He wrote a number of medical and
botanical works, of which the most important
is De Historia Stirpium (fol., Basel, 1542).

FUCHSIA, popularly called Ladies' Eardrop,
a genus of ornamental and mostly very showy
plants, belonging to the natural order onag-
raeae. The flowers of the fuchsia have the
tube of the calyx adherent to the ovary, with
the limb four-lobed, spreading or recurved;
four petals, attached to the calyx tube, and
usually shorter than the calyx lobes and of a
different color; eight stamens, and a threadlike
style. The fruit is a four-celled, many-seeded
berry, which is ovate-globose or oblong in
shape. The species are shrubs or small trees,
having usually opposite leaves, the flowers
borne upon single axillary pedicels, or some-
times they are disposed in racemes at the ends
of the branches. Perhaps the history of no
other greenhouse plant presents so many inter-
esting items as do the changes produced by
the hybridizing and rearing of new varieties of this
elegant flower. London, in his “Encyclopaedia
of Plants” (1829), gives only four species and a
single variety; in his “Arboretum et Frutice-
tum Britannicum” (1844) he gives 21 species.
At present there are about 60 admitted species,
while the varieties produced by cultivators are
almost innumerable, each year bringing a long
list of "novelties" in fuchsias. With the ex-
ception of two found in New Zealand, the gen-
us is an American one, most of the species
being natives of the Mexican and Brazilian
mountains. The fuchsias in cultivation may be
divided into three sections: the long-flowered,
the short-flowered, and those with the flowers
in panicles. Among the short-flowered fuch-
sias is F. coccinea (also called F. globosa by
some florists) from Chili, which for many
years was the only kind known in the United
States, and considered not more than 40 years
ago one of the most elegant of plants, con-
spicious for its axillary and drooping flowers,
with scarlet calyx and violet-colored petals. In the long-flowered section the calyx tube is elongated to the length of two or three inches. F. fulgens, a brilliant Mexican species, belongs here, as does the corymbose fuchsia (F. corymbiflora, Ruiz and Pavon), the flowers of which are 2 in. long, scarlet, and hang down in beautiful corymba; an elegant shrub about 6 ft. high, native of Peru about Chinca and Muna. As an example of those with pannicled or clustered flowers, we may cite the tree-like fuchsia (F. arborescens), which not unfrequently attains a height of 15 ft.; its branches are smooth, the leaves disposed in whorls of threes, oval-oblong, acuminate at both ends, petiolate, quite entire; the panicle terminal, trichotomous, nearly naked; the calyx funnel-shaped, with the lobes ovate-acute, spreadingly reflexed, as are also the petals; a native of Mexico. It would be difficult, if not impossible, to determine at this time from what species the present highly reputed varieties have been obtained, as they have been hybridized and crossed to such an extent that the typical forms are obliterated. We have now both double and single varieties; indeed, in some the petals are multiplied to an extent that renders the flowers monstrous, and there is one variety in which not only is the number of petals increased, but the long stamens have become petaloid and give the flower a singular two-storied appearance. In a florist's classification we have: calyx red and corolla white, both single and double; calyx red and corolla purple or bluish, single and double; and calyx white and corolla red or other color, single and double. Besides these sections, under each of which there are many varieties, there are a few kinds with variegated foliage. The taller growing kinds are frequently trained to single stems, and form superb-looking objects for the conservatory. Mr. Downing thought the F. corallina, among many kinds, was the finest sort for this treatment. The flowers are seen at their best when viewed from below, and these "pillar" fuchsias, as they are called, lift their flowers well above the observer's head; we have seen the same effect produced by training the plants to the rafters of a greenhouse. Fuchsias are admirable plants for summer decoration; the winter-blooming kinds are few, and disappointment often results from a want of knowledge of this fact. They are used in England to some extent as bedding-out plants, but the heat of our summers is too severe for these natives of the Brazilian mountain forests. Their proper use is in the summer decoration of rooms, conservatories, and verandas, though in a well shaded place they may be turned into the open border. When they have finished flowering the plants should be allowed to rest and be kept in the cellar until February or March, when they may be brought into growth. Fuchsias are propagated with the greatest ease from cuttings of the new shoots; a cutting an inch or two long, if properly treated, may be grown to a plant several feet high in a single season. Owing to the readiness with which shoots start from the stem, the plants are readily trained to a pyramidal, bush, or globular form. The wood of F. coecina is used in Chili to make a black coloring matter, and the leaves and branches are used for some kinds of medicine. The berries of F. microphylla are very sweet. Those of F. excorticata, a native of New Zealand, are greedily eaten by swine; and so sweet are they when ripe, that attempts have been made to use the species as a sugar plant.

FUCUS (Gr. φοος, a seaweed), a genus of marine melanospermous algae. Of this genus, which is readily recognized by the inflated air vessels in the substance of the stem or branches, there are but two species upon the Atlantic coast of the United States, two on the Pacific coast, and two upon the coasts of Greenland.
and Newfoundland. They are found upon rocky shores growing between high and low water marks. Our Atlantic species, _fucus_ tenuis or _f. tenuis_ of the ocean, presently the common, are popularly called rock-weed and bladder-weed, and form a large share of the vegetation of the tidal rocks from New Jersey northward, where they are conspicuous at low tide and give the rocks a very sombre appearance. Upon the shores of northern Europe the species of _fucus_ are valued as furnishing an important part of the winter fodder of cattle, the animals being regularly driven to the pasturage at the recess of the tide; in some localities these seaweeds are collected and boiled with coarse meal as a food for animals. The chief value of these plants upon our coasts is as a fertilizer, and in some localities large quantities are collected to apply to the land, where they rapidly decompose.

Before the discovery of the process of preparing soda from common salt, the species of _fucus_ were of considerable economical importance, as their ashes, called kelp, were the chief source of soda, and afforded a large income to the owners of estates upon the coasts of Great Britain and Ireland, as well as to the inhabitants of the Orkney, Shetland, and other islands. But little kelp is now produced, as other sources furnish soda more cheaply; but some is still burned for the purpose of procuring iodine, of which the fuel and the related seaweeds are the only available source.—Besides living species of _fucis_ there are others of particular interest from the occurrence of their fossil remains in the most ancient stratified rocks, associated with those of the oldest forms of animal life, also marine, to which they no doubt served as nutriment. They are abundantly met with in the sandstones of the Appalachians, covering the surface of the slabs with irregularly shaped ridges. The flagstones obtained from the Portage group of the New York system so abound with them, that the fossils are seen in every village where these stones are used for the sidewalks. They are particularly noted in the streets of Geneva, N. Y. (See Hall’s “Geology of New York,” p. 242.) The fossil fuel of the most ancient formations, according to A. Brongniart, are nearly related to existing species, which belong to tropical climates; but the forms of marine vegetation found fossil in the rocks of the secondary and tertiary formation resemble those now living in temperate climates.—Some species of algae formerly placed in the genus _fucus_ and others related to it, found about the islands on the southern extremity of South America, are so remarkable as to deserve particular notice. They grow up from deeply sunken rocks, and spread over the surface of the mud in the summer season, forming extensive mud meadows. Ships penetrate with difficulty through the obstructions they present. The stems grow very rapidly, and have been known to attain the length of 700 ft.; Lamouroux describes them as even exceeding 800 ft.; the Agassiz expedition, in the United States coast survey steamer Hassler (1872), found specimens 1,000 ft. long. Dr. J. D. Hooker, in the “Botany of the Antarctic Voyage of H. M. Discovery Ships Erebus and Terror, in the Years 1839–43,” gives an interesting account, among others, of the gigantic _Lessonia fuscescens_ and _macrocytis_. Seen from the surface in sailing over them, they appear like groves of trees, their stems from 8 to 10 in. in diameter, and the branches of the former species spreading out and dividing into sprays, from which the leaves are suspended. Covered with parasitic algae, and with numerous species of adhering shell fish, as the chitons and patelles, and many crustaceans and radiata swarming among their tangled roots, while fish of different species are seen darting through their foliage, they remind one of the coral reefs of tropical seas. Their stems strewed upon the beaches appear like driftwood, and, as they decay, exude an almost insufferable odor like that of putrid cabbage. The _macrocytis pyriformis_ is a conspicuous species of the N. W. coast, and is also found in the south Atlantic. It forms stems from 5 ft. to several hundred feet long, which bear pear-shaped air vessels. It is seen upon the beaches rolled up by the waves in great strands larger than a man’s body, entangled one with another. The harbors about the Falkland islands, Cape Horn, and Kerguelen Land are so filled with it that boats can hardly be forced through.—The charcoal of _fucus vesiculosus_ or bladder-weed, has been used in goitre and scrofulous affections. Its efficacy depends upon the iodine which it contains, although in much less quantity than _F. digitatus_ (or _laminaria digitata_) and other deep-sea plants. The whole plant has been employed in substance, decoction, and extract, for the purpose of diminishing obesity, and with alleged success. _F. (or _papuana_)._ _helminthocorron_ has some reputation in Europe as an anthelmintic, and is said also to be a febrifuge.

**FUEL,** the material used for producing heat by combustion. Wood, the most universally known variety of fuel, presents itself in forms and qualities varying with the tree, and to some extent with the part from which it is obtained. It is made up of several compounds—the woody tissue or lignine, the sap, and the alkaline and earthy matters which remain after combustion as its ash. It also contains a variable proportion of water. The first two named are its combustible ingredients, upon which its value as fuel depends; and of these the lignine is of chief importance, often constituting in thoroughly dried wood 95 per cent. or more of its weight. Yet it is not the ingredient which gives to the wood its distinctive character, except so far as this depends upon its density, for pure lignine, freed from the matters soluble in water, alcohol, or alkalies, is of uniform composition in all woods and leaves. The sap and the matters it brings with it differ in the differ-
ent woods; on those of the pine family the sap betows their resinous properties, on the oak its tannin, and on all the peculiar extractive matters which distinguish them. Its proportion is small in the mass of the wood, and varies at different seasons. Schäffer found that the ash tree fell in January contained of water 23-8 parts, while that cut in April contained 38-6 parts; the sycamore, 23-6 in January, and 40-6 in April; the white fir, 52-7 and 61-0. As the expulsion of the water present involves the consumption of a portion of the carbon of the wood, the more thoroughly this is air-dried or seasoned, the greater is its heat-producing power. As it dries it loses sometimes one fifth of its weight, yet from 20 to 25 per cent. of that which remains is moisture. If this be all expelled, the wood will absorb from the air 10 per cent. or more of moisture. The mean quantity of hygrometric water in 100 parts of various specimens of wood is thus given in the treatise of Richardson and Ronalds; in cord wood the seasoning would not have been so effectual as in the specimens employed:

The gravity of wood varies greatly with the different species, and also with its condition as to dryness. Though the solid fibre is heavier than water, the air contained in the cells causes it commonly to float. As the fibre is the heaviest ingredient, a greater weight in dry wood indicates a greater proportion of woody or combustible matter. The experiments of Marcus Bull upon American woods were conducted with great nicety, the specific gravity of each being taken by coating the dry sample with a varnish of the same weight as water, thus retaining the air in the cells. The table on p. 517 is contained (except changes in some of the names) in his original memoir, read April 7, 1826, and published in the "Transactions of the American Philosophical Society" (vol. iii., new series, pp. 1–60). This gives the weight of a cord of wood as it should be put up, the interstitial matter even then amounting to 44 parts in 100 of the whole bulk; as it often much exceeds this, the measure affords an estimate of the quantity of woody matter even more uncertain than would be the estimate by weight, variable as this has been shown to be. The arrangement of the columns is as follows: A, specific gravity; B, lbs. avoirdupois in one cord; C, charcoal in 100 parts of dry wood by weight; D, specific gravity of dry coal; E, lbs. of dry coal in one bushel; F, lbs. of dry coal from one cord of dry wood; G, bushels of coal from one cord of dry wood; H, time in hours and minutes during which 10° of heat were maintained in the room by the combustion of 1 lb. of each wood; I, value of specified quantities of each wood compared with shell-bark hickory as the standard.—When wood is exposed to the action of heat, its more volatile ingredients, as the hygro- metric moisture, first escape; its gaseous elements are next disturbed from their state of equilibrium, and the hydrogen and oxygen when set free from one combination enter into new ones; portions of these gases combine to produce water; other portions seize upon the carbon and form with this a multitude of unstable compounds, varying with the degree of temperature and the proportions of the elements present. If the process be conducted in close vessels away from the action of air or oxygen, the volatile ingredients may be driven off in the form of inflammable gases and of vapors of water holding in solution numerous combustible principles, and last of all the vapors of the resins and ethereal oils constituting tar. When wood is consumed in the air, heat is first applied to drive out the volatile elements. The hydrogen eliminated in the pores of the fuel at a heat below that of redness takes hold of a portion of the solid carbon, and meeting the air they rapidly enter into combination with oxygen. New supplies of the volatile ingredients are disturbed further within the mass of the burning body, and there by their ignition serve to keep up the process. If the supply of oxygen is sufficient, the combustion is complete, and the volatile products of the distillation process, if generated at all, pass immediately into the stable compounds of carbonic acid and water. The carbon attacked at its surface by the oxygen of the air yields more slowly, and a portion of it is left behind after the flame and rapid chemical action caused by the combustion of its volatile associates have disappeared. When concentration of heat is required, as in the smelting of ores, a condensed form of fuel like charcoal is more effective than one containing gaseous elements, which in their combustion dispense a very uncertain amount of heat, as they flit, perhaps but partially consumed, past the points where the effect is wanted, carrying with them a portion of the carbon of the fuel, and also more caloric rendered latent than the product of combustion of an equal weight of carbon is capable of absorbing. The difference in the pyrometrical effect of wood and charcoal would be still greater than it is, were it not for the property of charcoal of rapidly absorbing moisture from the air. When it is desirable to apply the heat generated by combustion at a distance from the fire, as in reverberatory furnaces, fuel is preferred that burns with a flame.—As charcoal is obtained from wood by charring, so from peat this fuel is obtained in a condensed form called peat charcoal, and from the bituminous coals the mine-

</table>

The percentage of the mineral ingredients varies in good peat from 1 to 5; some qualities contain much more, even 38 per cent., but such are worthless for fuel.

---

The Chinese have for ages been in the habit of mixing the dust from their coal mines with clay and bitumen, and also with refuse matter, and such artificial fuel is in China an article of considerable trade. The methods introduced in western Europe of utilizing the dust of mineral coals and of charcoal are nearly all based upon the principle of making these substances cohesive by thoroughly incorporating them with tar or pitch, and then exposing the compound, when moulded into blocks, in some cases to a current of air to dry them, and in others to a high temperature in vessels serving the pur-
pose of retorts. The former mode of drying is employed for mixtures of charcoal dust, tan, and similar substances, with tar or pitch, and the latter when refuse bituminous coal is used with about a quarter of its weight of pitch. Unless this distillation is conducted at a heat of from 400° to 600° F., so as to dispel the volatile ingredients, there is danger of subsequent spontaneous combustion. At Blanzy in France the coal is separated from the slaty and pyritous particles, and is then crushed and introduced into a circular metallic basin, which revolves horizontally in a reverberatory furnace, the flame of which passes under it. Hot tar or pitch is gradually let in upon the coal from a reservoir over the fire to the amount of 7 or 8 per cent., and the mixture is stirred by stationary rakes attached to rods let down through the arched cover. When sufficiently mixed, the materials are made to drop through the bottom into a receptacle, whence they are removed while plastic to the moulds and there pressed by the hydraulic machine. The process of Mr. Bessemer appears to be most highly approved. It is applied only to fine bituminous coal without mixture, the object being to render this plastic by heat and mould it by heavy pressure into convenient shapes. In the softening process the coal may be exposed to the heat long enough for a portion of its volatile elements to be expelled, by which the product is rendered more dense and of the nature of coke; or it may be softened so quickly as to be but slightly altered in its chemical composition. It is then formed into blocks by machinery working under great pressure. There are vast quantities of coal dust lying as waste material at the various extensive coal mines in this country, which might be utilized by mixing with proper proportions of the coal tar of gas works and compressed into bricks by machinery similar to that employed by Bessemer. There can be no doubt that fuel could be furnished in this way at an economical price.—The composition of fuels is commonly expressed by stating the proportions of coke or charcoal, volatile matter, moisture, and ash. The ultimate analysis reduces the whole to its elements, and expresses the proportions of carbon, hydrogen, oxygen, nitrogen, and the ingredients of the ash. In order to ascertain the fitness of fuel for making gas and producing the fatty products, the proportion of volatile ingredients must first be ascertained, and then the nature of these, as the proportion of the inflammable gases to the liquid products. For other purposes the simple form of analysis is commonly sufficient. The ash is obtained by thorough combustion in an open platinum crucible, continued till nothing is left but the gray or brown ash. The difference of weight of the crucible and its contents before and after the ash is obtained, gives that of the ash. Another weighed sample subjected in a similar way to a heat of about 800° will give by loss of weight the amount of moist-

ure; the crucible containing it is then closely covered to exclude the air, and is set in a Hessian crucible also closed with a cover, and containing calcined magnesia. This supports the platinum crucible, and keeps it from contact with the outer one. The whole is now exposed to a red heat for an hour. The volatile matters are thus driven off, and the difference of weight of crucible and contents before and after the operation gives their proportions. The charcoal or coke is the difference between the crucible with the residuum it contains and that of the crucible alone less the weight of the ash. This may be again obtained by consuming the carbonaceous residue exposed to a current of air. The intense degree of heat evolved in the use of the condensed fuels adds largely to the capacity of heat of the aqueous vapor, and hence further lessens the value of hydrogen in fuels intended for the uses to which they are applied. But for other objects, requiring a quick heat and at the same time diffused over considerable space, the more inflammable fuels are found more efficient; and according to the mode in which their heating power is estimated they may even be classed as producing a greater amount of heat than the more carbonaceous varieties. Whenever the heat from the combustion of hydrogen can be concentrated, as in the oxyhydrogen blowpipe, a more intense degree is obtained than by the use of any other fuel. Other considerations, therefore, besides the chemical composition of fuels, affect their value. For practical purposes a mere change in the mechanical structure may give an entirely different character to them, while their real calorific power is not altered. This is apparent in the coals, which are rendered almost worthless when reduced to dust, until in the patent fuels they are reconverted into solid form. Wood possesses very different values in solid sticks, in shavings, and in sawdust. In ordinary use fuel consumption rates are to be taken into account, as the arrangements for utilizing the heat produced, so that there shall be the least amount lost; also the provisions for insuring perfect combustion of the fuel. The loss of heat resulting from imperfect arrangements in these respects alone has been estimated at full one half of all that generated. The chimney necessarily carries off a considerable portion, as there will be no draught, and consequently no continued supply of air to support the combustion, unless the column floating upward by its rarity produces a partial vacuum to be filled with fresh air passing through the fire. The quantity of this admitted should be limited to a proper excess only of that absolutely required for the thorough combustion of the fuel, and this can be determined for each variety of fuel only by the experience and good judgment of the person, devoted to the view of a uniform rate of combustion, more or less rapidly conducted, according to the fuel employed and the special purpose to which it is applied. The quantities necessary for complete combus-
tion of one pound of the different fuels are given in the following table, the temperature of the air being 66°-2 F. and its weight 0.075 lb.:

The qualities of the American coals have been investigated by Prof. W. R. Johnson, who was commissioned by the United States government for this purpose, and whose report was addressed to the navy department in 1844 (Senate Document No. 886). The results are presented in a condensed form by Prof. Johnson in the American edition of Knapp's "Chemical Technology," the table below being arranged from the more detailed tables contained in his report. It contains 25 varieties of coals, five from each one of five different classes, succeeded by a summary of the results, presenting a general scale of relative values made up from the averages of the classes. From this it appears that in evaporative power under equal weights the Cumberland class surpasses the anthracite by about 2-3 per cent, and under equal bulk by 1-4 per cent. From single experiments, however, the most water evaporated was with anthracite. The anthracites also surpass the foreign bituminous coals 20 per cent. when we compare equal weights, and 26 per cent. by equal bulk. In freedom from clinker the anthracites stand preeminent; in rapid production of steam when once in action, the Pennsylvania bituminous coals are somewhat superior to all others; and for rapidly getting up steam the foreign bituminous coals are most effective. Column A gives the relative evaporative power of equal weights of coal; B, comparative power of equal bulk of coals; C, relative freedom from tendency to clinker; D, rapidity of action in evaporating water; E, facility of ignition, or readiness with which steam is got up; F, sum of the relative values in the preceding columns.

His operations were conducted upon a large scale, four trials being usually made in ascertaining the evaporative power of each coal, and each trial consuming from 800 to 1,200 lbs. The total number of trials was 144, in which 62½ tons were consumed. The object
was particularly to determine what coals were best adapted for steam navigation; and the points of special attention were essentially the same as those to which the attention of the commission afterward appointed by the British government was directed, viz.: 1, the capacity of the coals for raising steam quickly; 2, for raising it abundantly for the quantity consumed; 3, freedom from dense smoke in its combustion; 4, freedom from tendency to crumble in handling; 5, capacity, by reason of its density, of close stowage; and 6, freedom from sulphur. The names and the exact localities of the particular kinds of coal which were employed in these experiments are now in most instances lost; but their composition being preserved in the records of their analyses, the principles established are readily applied to other coals of similar composition.—For further information relating to this subject of fuel, see Anthracite, Charcoal, Coal, Coke, Gas, Peat, and Wood.

FUENTERRABIA, or Fontarabia, a city and port of Spain, in the Basque province of Guipúzcoa, at the mouth of the Bidassoa, on the French frontier; pop. about 3,000. It was formerly well fortified, but the French dismantled it in 1794. It has some manufactures of henequen shoes, linen, clotl, marine stores, and earthenware. It has sustained several sieges, and was the scene of a victory over the Carlists by the auxiliary British legion under Gen. Evans in 1887. During the Peninsula war, the Fuenterabians were reproached with singularly inhospitable treatment of disabled British troops. Milton celebrated it in connection with the rout of Roncesvalles.

FUEROS (from Lat. forum, a law court), a term applied in Spanish law to customs, codes, charters, and grants, and to courts and their jurisdiction. The Fuero Juzgo, or Forum Judicium, is a collection of Visigoth laws, which St. Ferdinand sent to Cordova in 1241, to be observed there as the law of the territory which he had rescued from the Moors. The first printed edition of it is of 1600; the best is that of the academy, in Latin and Spanish (1 vol., Madrid, 1815). The fueros or constitutional privileges of the Basque provinces, Guipúzcoa, Álava, Biscay, and Upper Navarre, place them outside of the ordinary administration of the kingdom. Their government is essentially republican, the executive having only the power of nominating the corregidor or chief magistrate, whose nomination has to be confirmed by the junta of the province, a legislative body elected by almost universal suffrage. The inhabitants of these provinces are exempt from all taxes and imposts, except such as they vote themselves, and claim by virtue of their birth the privileges of Spanish nobility. From the remotest antiquity they have maintained their rights against all the dynasties of Spain. In the 13th century the fueros were embodied in a written code, which was enlarged and reconfirmed in the reign of the emperor Charles V. The fueros, suppressed in 1812, were recovered after two insurrections, in the last of which, from 1821 to 1823, the Basques maintained their cause till the French intervention took place. Deprived of them again by Isabella in 1838, they fought for their recovery under Don Carlos till 1889, when the queen, and in 1844 the cortes, guaranteed their enjoyment. (See Basques.)

FUERTÉ, or Villa del Fuerte, a town of Mexico, in the state of Sinaloa, on the Fuerta river, about 60 m. from the gulf of California, and 150 m. S. E. of Guaymas; pop. about 5,000. It is situated in a delightful plain, and possesses many handsome houses. It is chiefly important as a depot of the transit trade between Guaymas and the interior.—The Rio del Fuerte rises in the Sierra Madre toward the W. confines of Chihuahua, and after flowing about 200 m. in a general E. S. W. direction, empties into the gulf of California.

FUGGER, the name of a German princely family, whose founder was JOHANNES, a weaver in Graben, near Augsburg, in the first half of the 14th century, who acquired a large property in lands by commerce in cloths. His son, of the same name, continued the occupation of weaver and cloth merchant, and obtained by marriage the right of citizenship in Augsburg. ANDREAS, eldest son of the latter, was known as "Fugger the Rich." The nephews of the last, ULRICH, GEORG, and JAKOB, born about the middle of the 15th century, covered the Baltic with their commerce, which extended also to Hungary, Italy, and even to India, influenced the affairs of the empire by lending money to the princes, married into the most illustrious families, and were ennobled by the emperor Maximilian I. They built in Tyrol the splendid castle of Fuggeran, embellished the city of Augsburg, and found a new source of wealth by working the mines of the Inn valley. The only heirs of these three brothers were the two sons of Georg, RAIMUND (1489-1553) and ANTON (1498-1560). The emperor Charles V. resorted to them both when pressed for money, yielded to them the privilege of coinage, made them counts and princes of the empire, and was lodged in the splendid mansion of Anton when he attended the diet of Augsburg. They established at Augsburg a cabinet of antiquities, a gallery of paintings, and a botanical garden, built the church of Saint Maurice, paid 8,000 crowns to Titian for a few paintings, and collected the two largest libraries that had yet been seen in Germany. Their name was given to a street in Madrid, and "as rich as a Fugger" became a proverb. Upon the death of these two brothers the family divided into numerous lines, and its most important branches at present are the princely houses of Fugger-Kirchberg and Fugger-Babenhausen.

FUGITIVE (Lat. fugire, to flee), literally, one who flees away. Under this head might be considered two classes of cases: 1, that of
fugitives from justice, by which is meant those who flee from one jurisdiction to another to escape prosecution or punishment for crime (see Extradition); 2, that of persons fleeing to avoid compulsory labor for others. It was one of the compromises of the constitution of the United States that "no person held to service or labor in one state, under the laws thereof, escaping into another, shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due." (Art. iv., § 2.) Although the word slave was not here employed, the purpose was to provide for the reclamation of slaves fleeing from their masters; and in 1793 an act was passed by congress to give effect to the provision by means of the arrest of any person claimed as a fugitive from slavery, and his return to the state from which he was found to have fled, after a summary judicial hearing. The repugnance to the institution of slavery on the part of large numbers of people in the northern states rendered this act of little practical value, and another was passed in 1850 with more stringent provisions. Some of these were exceedingly obnoxious, especially that which gave a larger fee to the judicial officer when the person arrested was adjudged to be a slave than when decided to be free, and that which required all persons to assist when called upon in the arrest and return of the person claimed. Although many persons were remanded under this act, the hostility to slavery which was created, or at least intensified by it, probably led to the giving of assistance in a larger number of escapes than had ever been made before, and the act became of little service. A widespread organization to assist fugitives to their liberty became known popularly as the "underground railroad," and a great many persons were aided by it. The act was repealed after the civil war broke out, and the constitutional provision became unimportant after slavery was abolished.

Fugue (Lat. fugā, flight), a species of musical composition in which one voice or part seems to be perpetually flying away from another, whence the name. The principal musical thought of the piece, or the subject, having been performed by one voice or part, is taken up by another, and so on with all the voices or parts, each commencing after the others, and all performing together. The result is an endless pursuit and flight of the same theme by the different parts. Fugues are simple, double, or counter, the last being much the most complicated.

FUGG, Joseph von, a German painter, born at Kratsau, Bohemia, Feb. 9, 1800, died March 13, 1876. He studied in Prague and Rome, and was early associated with Overbeck and other artists in decorating the villa Massimi. In 1834 he settled in Vienna, where he became professor of historical painting. He stood at the head of his profession in his specialty of Scriptural painting, and executed admirable works for the church of the Viennese suburb Lerenfeld and for other churches. Among his later productions are the celebrated missal completed in 1868 for the emperor Francis Joseph as a present for the pope; two allegorical cartoons representing spring and autumn (1869); and a series of illustrations of the parable of the prodigal son (1870).

FULDA, a town of Prussia, in the province of Hesse-Nassau, on a river of the same name, here crossed by three bridges, 56 m. N. E. of Frankfort; pop. in 1871, 2,490. It contains a palace and gardens, formerly the residence of the prince-bishops, a number of churches, two convents, an ecclesiastical seminary, and a number of schools. The cathedral is a fine modern building, the fourth which has stood on this site. Of the ancient church it retains only a crypt, in which is the sarcophagus of St. Boniface. There is a library of 60,000 volumes, manufactories of cotton, linen, and woolen, and trade in corn and cattle. The abbey of Fulda was founded about 750 under the auspices of St. Boniface, became flourishing in the following century through the learning of Rabanus Maurus, who taught at the school connected with the abbey, and obtained from Otto I. in 968 the primacy of all abbies in Germany. It was raised to the dignity of a bishopric in 1733. This was secularized in 1802, and given to the prince of Orange-Nassau, was annexed to the grand duchy of Berg in 1806, and in 1809 to the principality of Frankfort. After the peace most of the territory was given to the electorate of Hesse, and in 1866 was with the latter annexed to Prussia.

FULHAM, a suburb of London, on the left bank of the Thames, about 6 m. S. W. of St. Paul's cathedral; pop. of the parish in 1871, 23,878. The village of Fulham is connected with Putney by a wooden bridge. Though irregularly built, it contains many fine houses and villas. The most celebrated public building is the palace, which has been the summer residence of the bishop of London since the days of Henry VII. The grounds, nearly 40 acres in extent, are surrounded by a moat over which there are two bridges. The palace is remarkable for its size and historical associations rather than for architectural merit. The ancient parish church of All Saints has a fine Gothic tower and monuments of the bishops of London and other notabilities. There are many nurseries and market gardens, noted especially for the cultivation of asparagus, for the London markets. The population of the parish is rapidly increasing.

FULHAM, Andrew, an English Baptist theologian, born at Wicken, Cambridgeshire, Feb. 6, 1754, died at Kettering, Northamptonshire, May 7, 1815. He was settled first at Soham in 1775, and afterward at Kettering in 1782. In 1784 he published a treatise entitled "The Gospel Worthy of All Acceptation," which excited much controversy. In 1799 he composed
his "Dialogues and Letters" (published collectively in 1606). In 1792 he took an active part with Carey and others in establishing the Baptist missionary society, and was appointed its first secretary; and till the close of his life he was constantly engaged in promoting its missions. In 1794 he published "The Calvinistic and Socinian Systems, examined and compared as to their Moral Tendency"; in reply to which Dr. Joshua Toulmin wrote "The Practical Efficacy of the Unitarian Doctrine considered," and Fuller rejoined in "Socinianism Indefensible, or the grounds of its Moral Tendency" (1797). He was the author of a great number of other treatises, sermons, &c. His "Complete Works" have been published in 8 vols. 8vo (London, 1824), in 1 vol. imperial 8vo, with a memoir by his son (1852), and in many other editions. The degree of D. D. was conferred on Mr. Fuller by Yale college, and also by the college of New Jersey, but he declined receiving it as unscriptural and inconsistent with Christian simplicity.

FULLER, Margaret. See OSBOLI, MARGARET FULLER.

FULLER, Richard, an American clergyman, born in Beaufort, S. C., April 22, 1804, died in Baltimore, Oct. 20, 1876. He graduated at Harvard college in 1824, studied law, and before his 21st year was admitted to the bar of South Carolina. He almost immediately entered upon a large and lucrative practice, and was on the road to professional eminence when he was prostrated by sickness. On his recovery he became a member of the Episcopal church, afterward joined the Baptist denomination, and studied for the ministry. He was ordained in 1833, and took charge of the Beaufort Baptist church. In 1847 he assumed the charge of the seventh Baptist church in Baltimore. He published "Letters concerning the Roman Church," being a public correspondence between him and the Roman Catholic Bishop England (Baltimore, 1840); "Correspondence with Dr. Wayland on Domestic Slavery" (1846); "An Argument on Baptism and Close Communion" (1849); volumes of "Sermons" and "Letters;" and, in connection with J. B. Jeter, "The Psalmist," a hymn book in general use in the Baptist denomination.

FULLER, Thomas, an English author, born at Aldwinckle, Northamptonshire, in June, 1608, died Aug. 15, 1661. He was educated at Queen's college, Cambridge, won the highest university honors, received the living of St. Benet's, Cambridge, where he exhibited great eloquence as a preacher, and was also made a prebendary of Salisbury. His first publication was a poem entitled "David's Hainous Sinte, Heart's Dependance, heave Punishment" (London, 1681). He was soon after presented to the rectory of Broad Windsor, Dorsetshire, where he prosecuted several works that he had planned at Cambridge. After seven years he removed to London, where his fame for pulpit eloquence secured for him the lectureship of the Savoy, and he published his "Historie of the Holy Warre" (Cambridge, 1639). In 1640 he was a member of the convocation assembled in Henry VII.'s chapel, Westminster, to make canons for the better government of the church, of whose proceedings he gives an interesting account in his "Church History." After the outbreak of the civil war he identified himself with the royal cause, and obtained a chaplaincy in the army under Sir Ralph Hopton. He improved the leisure which this position gave him, and the facilities presented by the marches and counter-marches through the country, in collecting an extensive correspondence and personal inquiries the materials for his "Worthies of England." He was besieged at Basing House in 1644 with a small party of royalists, but animated the garrison to so vigorous a defense that the parliamentary commander was obliged to retire with considerable loss. Taking refuge in Exeter on the defeat of Hopton in 1645, he preached constantly to the citizens till its surrender in April, 1646, and published there his "Good Thoughts in Bad Times" (1645). His "Good Thoughts in Worse Times" appeared in 1646, after his return to London, and he published a new edition with the "Second Century of Good Thoughts in Bad Times" (1647); in 1660 he completed the series with "Mixt Contemplations in Better Times." He continued to preach and to publish tracts and sermons, notwithstanding "it had been the pleasure of the present authority to make him mute," and notwithstanding Cromwell's prohibition of all persons from preaching or teaching schools who had been adherents of the late king. In 1648 he became rector of Waltham abbey in Essex, and in 1658 chaplain to Lord Berkeley and rector of Cranford. Shortly before the restoration he was reinstated in his lectureship at the Savoy, and after that event was chosen chaplain extraordinary to the king, and regained the prebend of Salisbury. A bishopric was expected for him when he died. He was buried in his church at Cranford, in the chancel of which his monument still remains. His "Holy and Profane State, a collection of Characters, Moral Essays, and Lives, Ancient, Foreign, and Domestic" (Cambridge, 1649), proposing examples for our imitation and abhorrence, is one of his best productions, and fully exhibits his sagacity of thought and pithiness of style. His "Church History of Britain, from the Birth of Jesus Christ until the year MDCCCLVIII." (London, 1655), though abounding in jokes, quibbles, deductions, anecdotes, and curious and irrelevant learning, is one of the most remarkable works in the language for wit, piety, pathos, and imagination. The "Historie of the Worthies of England," a collection of eccentric biographies, published posthumously (London, 1662), has been more generally read than any other of his works, and abounds in gossip, admirably told stories, curious details, and witty and excellent re-
flections. The style of all his writings is extremely quaint and idiomatic, in short and simple sentences, and singularly free from the pedantry of the time.

FULLERS' EARTH, an unctuous sort of clay, much of it kaolinite, useful in fulling cloth, from its property, common to aluminous earths, of absorbing oil and grease. That variety of clay is preferred which falls to pieces when put in water, making a slight crackling sound. Its colors are various shades of yellowish, greenish, bluish, brown, and gray; lustre dull, but appears greasy when rubbed. Its composition is given by Dr. Ure as follows: silica 53, alumina 10, peroxide of iron 9 75, magnesia 1 25, lime 6 5, water 24, potash a trace. Dr. Thomson found silica 44, alumina 23 06, protoxide of iron 2, magnesia 2, lime 4 08, water 24 95. It is not now esteemed of so much value as formerly, soap having taken its place. In England it used to be so highly valued that its exportation was prohibited. When used, it was first dried by the sun or by fire, and then thrown into cold water. The powder thus formed was sorted by washing into coarse and fine qualities, the former of which were applied to inferior, the latter to finer cloths.

FULLERTON, Lady Georgiana Charlotte, an English authoress, born Sept. 28, 1813. She is the daughter of the first earl of Granville, and was married in 1833 to Capt. Alexander George Fullerton. Her first publication, a novel entitled “Ellen Middleton,” appeared in 1844, and was succeeded within a few years by “Grantley Manor.” Both works exhibit constructive skill and an analysis of character of no mean order. “Lady-Bird,” published in 1853, after her conversion to the Roman Catholic church, is a narrative of her religious struggles. From this time she devoted her pen to the glorification of her church, and published a number of romances on saints, missions, and conversions; among them, “Constance Sherwood” (1865), depicting the sufferings of the Catholics under Elizabeth; “A Stormy Life” (1867), representing Henry VI. as a martyr-saint; “Hesperos of the Holy Souls” (1869); and “Mrs. Gerald’s Niece” (1889). She has also published works in French, as La contessa de Bonnaeul, Histoire du temps de Louis X1V. (1857), and Rose Léblanc (1860).

FULLING, also called Milling, the operation of removing greasy matters from woollen goods, and of giving to them a more compact texture by causing the fibres to entangle themselves more closely together, as in the process of felting. Fulling mills are ancient inventions, the process probably having been applied to the first woven fabrics, as felting must already have been then known. Cloths brought to the fulling mills contain the oil which was applied to the fibre in weaving. The first process to which they are subjected is called scouring or braying. This is effected by placing the rolls in troughs so arranged that they can retain the detergent liquid, as, first, stale urine and hogs' dung, subsequently urine alone, and again fullers' earth and water, while heavy oaken mallets or pounders slide down with force into one end of the troughs and mash and roll over the folds of cloth. The pounders are lifted by revolving cams, and kept in action for hours together, one to each trough. The oil is absorbed by the clay, and both are washed off by the water. The fulling is properly a second process performed in the same machines with the use of soap applied liberally in solution. The stampers are better made of polished iron, and the operation is facilitated, with economy of soap, by keeping the trough filled with hot steam. Cloth is also full in what is called the fulling machine without stamping, the cloth being pushed in a succession of folds through a low trough, the top of which is made by weights to press upon these folds and resist their progress through. The soap is washed out after the fulling, and the nap is raised by teasling. To full a piece of ordinary broadcloth it has been customary to allow from 60 to 65 hours, and 11 lbs. of soap; the shrinkage in width is from 12 quarters to 7, and in length from 64 yards to 40.

FULMAR, a species of large petrel of the genus Procellaria (Linn.) or fulmarus (L. s.). This bird (P. glacialis, Linn.) is about 20 in. long, with an alar extent of 3 ft. and a weight of 1½ lb.; the bill, iris, and feet are yellow, the latter with a greenish tinge; the head, neck, and lower parts pure white; back and wings light greyish blue, palest on rump, and the tail bluish white; quills and their coverts blackish brown; a black spot before and partly over the eyes. It is abundant in the arctic seas, where it attends the whale ships, seizing the pieces of blubber which fall into the water,

and often boldly helping itself from the carcass while the men are at work. It breeds in the northern regions, coming down on the American coast as far as Long Island in the autumn, winter, and early spring, and is pretty common on the banks of Newfoundland, where
it feeds on the garbage rejected by the cod fishers. It also breeds in the island of St. Kilda, on the W. coast of Scotland, where the inhabitants eat the flesh and eggs, preserve the down and feathers, and collect oil by boiling down the young, which is used for burning and for medicinal purposes. The eggs are pure white, with very brittle shells, regularly oval, 2½ by 2 in., and are obtained with great difficulty and danger, as the nests are in the crevices of nearly perpendicular rocks. It is a bold and powerful bird, a rapid and graceful flyer, an excellent swimmer, but awkward on land; it rarely dives; it is hardy, difficult to kill from the thickness of its plumage, and can inflict severe wounds with the bill. Several other large species of petrels are also called fulmar. (See Petrel.)

FULMINATES. See Explosives.

FULMINIC ACID (Lat. fulmen, lightning), one of the isomeric modifications of cyanic acid, represented by the formula CyH_2O. Its compounds are distinguished for their explosive character, in which they differ from those of cyanic acid. All attempts to obtain it isolated have failed, from its tendency to instantaneous decomposition with explosion.

FULTON, the name of eight counties in the United States. I. An E. county of New York, drained by Sacandaga river and East Canada creek; area about 530 sq. m.; pop. in 1870, 27,064. The soil is fertile and the surface uneven, with several mountainous elevations. The New York Central railroad passes near its S. boundary. The chief productions in 1870 were 4,530 bushels of wheat, 12,988 of rye, 107,428 of Indian corn, 803,914 of oats, 62,178 of buckwheat, 500,949 of potatoes, 54,852 tons of hay, 255,478 lbs. of cheese, 667,182 of butter, 56,761 of wool, and 72,503 of hops. There were 4,001 horses, 11,197 milk cows, 7,327 other cattle, 16,099 sheep, and 6,210 swine; 116 manufactories of goods and molasses, 14 of dressed skins, 9 of paper and wood boxes, 8 of cheese, 1 of hardware, 10 of paper, 2 of woolen goods, 7 flour mills, 23 saw mills, 1 planing mill, 15 tanneries, and 2 currying establishments. Capital, Johnstown. II. A S. county of Pennsylvania, bordering on Maryland, and drained by Conolway and Licking creeks, tributaries of the Potomac; area, 860 sq. m.; pop. in 1870, 8,860. Its E. boundary is formed by the W. frontier, and between the two are fertile valleys. The uplands produce timber, which is one of the principal staples. The chief productions in 1870 were 102,144 bushels of wheat, 43,202 of rye, 142,176 of Indian corn, 108,705 of oats, 40,081 of potatoes, 9,184 tons of hay, and 171,741 lbs. of butter. There were 2,945 horses, 8,500 milk cows, 4,500 other cattle, 8,579 sheep, and 6,900 goats; 8 flour mills, and 7 tanneries. Capital, McConnellburg. III. A N. W. county of Georgia, bounded by Chattahoochee river; area, 300 sq. m.; pop. in 1870, 83,446, of whom 15,282 were colored.

The surface is diversified and the soil fertile. Numerous railroads centre at Atlanta. The chief productions in 1870 were 24,604 bushels of wheat, 134,996 of Indian corn, 10,207 of oats, 10,062 of Irish and 81,596 of sweet potatoes, and 866 bales of cotton. There were 414 horses, 716 mules and asses, 1,204 milch cows, 2,711 other cattle, 727 sheep, 6,177 swine, and many manufacturing establishments, chiefly at Atlanta, the capital, which is also the capital of the state. IV. A N. county of Arkansas, bordering on Missouri, and drained by the N. fork of White river; area, 860 sq. m.; pop. in 1870, 4,948, of whom 86 were colored. It has a hilly surface and a good soil, suitable for grain and pasture. The chief productions in 1870 were 18,498 bushels of wheat, 141,925 of Indian corn, 10,598 of oats, 276 bales of cotton, and 22,750 lbs. of tobacco. There were 1,818 horses, 1,882 milk cows, 3,520 other cattle, 7,871 sheep, and 7,859 swine. Capital, Pilot Hill. V. A S. W. county of Kentucky, bounded S. by Tennessee, and separated from Missouri on the W. and N. W. by the Mississippi river; area about 200 sq. m.; pop. in 1870, 6,161, of whom 987 were colored. The surface is somewhat diversified, and the soil generally fertile. It is traversed by the Mobile and Ohio and the Nashville and Northwestern railroads. The chief productions in 1870 were 40,844 bushels of wheat, 438,014 of Indian corn, and 888,686 lbs. of tobacco. There were 1,299 horses, 1,210 milk cows, 1,828 other cattle, 3,790 sheep, and 12,428 swine. Capital, Hickman. VI. A N. W. county of Ohio, bordering on Michigan, drained by Tippecanoe river, a branch of the Maumee; area about 887 sq. m.; pop. in 1870, 17,789. It has an undulating surface and a fertile soil, suitable for grain and pasture. It is intersected by the Lake Shore and Michigan Southern railroad. The chief productions in 1870 were 288,208 bushels of wheat, 199,725 of Indian corn, 176,928 of oats, 106,686 of potatoes, 23,877 tons of hay, 119,559 lbs. of cheese, 512,290 of butter, and 150,424 of wool. There were 4,924 horses, 6,048 milk cows, 6,805 other cattle, 88,883 sheep, and 10,182 swine; 9 manufactories of carriages and wagons, 2 of cheese, 4 of barrels, &c., 5 of saddlery and harness, 21 saw mills, 4 tanneries, and 7 flour mills. Capital, Ottokiee. VII. A N. county of Indiana, drained by Tippecanoe river; area, 866 sq. m.; pop. in 1870, 13,728. It has a level surface, occupied partly by prairies, partly by oak openings, and partly by forests. Iron is found in some localities, and the streams furnish abundant water power. The soil is mostly of good quality. The Chicago, Cincinnati, and Louisville railroad passes through it. The chief productions in 1870 were 278,146 bushels of wheat, 142,984 of Indian corn, 138,399 of oats, 30,399 of potatoes, 13,246 tons of hay, 329,108 lbs. of butter, and 45,754 of wool. There were 4,700 horses, 8,817 milk cows, 4,924 other cattle, 14,940 sheep, and 10,588 swine; 2 manufactories of
carriages and wagons, 2 of woollen goods, 1 of boots and shoes, 6 flour mills, and 14 saw mills. Capital, Rochester. VIII. A W. county of Illinois, bounded S. E. by the Illinois river, and drained by Spoon river: area, 870 sq. m.; pop. in 1870, 88,391. The Illinois river, which is here navigable, is the channel of a large export trade. Spoon river is valuable for water power, and nearly all the streams are bordered by a good growth of timber. The soil of the county is rich, and the surface undulating, occupied partly by prairies and partly by woodlands. Coal is found in abundance. The Toledo, Peoria, and Warsaw railroad, and a branch of the Chicago, Burlington, and Quinncy railroad pass through it. The chief productions in 1870 were 417,599 bushels of wheat, 181,711 of rye, 1,508,763 of Indian corn, 261,390 of oats, 98,307 of potatoes, 27,545 tons of hay, 488,878 lbs. of butter, and 105,289 of wool. There were 12,825 horses, 8,510 milch cows, 15,949 other cattle, 2,078 sheep, and 87,905 swine; 3 manufactories of agricultural implements, 18 of carriages and wagons, 3 of boots and shoes, 6 of furniture, 2 of hubs and wagon material, 11 of saddlery and harness, 3 of woollen goods, 10 saw mills, and 12 flour mills. Capital, Lewiston.

**FULTON.** I. A village of Oswego co., New York, on the E. bank of the Oswego river, about 10 m. S. E. of Oswego, and on the Oswego canal, and the Oswego and Syrausque and New York and Oswego Midland railroads; pop. in 1870, 8,507. It is chiefly noted for its manufactures. The principal establishments are machine shops, iron founders, a planing mill, flour mills, woollen mills, and manufactories of sails, tubs, paper, boat, sashes, doors, and blinds, bedsteads, lime, potash, edge tools, &c. There are marble yards, many fine stores, two national banks, and two weekly newspapers. The Failey academy (Presbyterian) in 1872 had 5 instructors and 85 pupils. II. A town and the capital of Oallaway co., Missouri, on a branch of the Chicago and Alton railroad, 13 m. from the Missouri river, and 20 m. N. E. of Jefferson City; pop. in 1870, 1,555, of whom 480 were colored. It is the seat of the state asylum for the deaf and dumb, and of the state lunatic asylum, which occupies a beautiful edifice, five stories high and 310 ft. long, on a plot of 460 acres. Westminster college (Presbyterian) in 1872 had 13 professors and instructors, 101 students, and a library of 2,500 volumes. The town contains a national bank, three weekly newspapers, and manufactories of earthenware.

**FULTON, Robert,** an American inventor, born at Little Britain, Lancaster co., Pa., in 1765, died in New York, Feb. 24, 1815. When about three years old he lost his father. He received a common school education. He went to Philadelphia at the age of 17, and became a miniature painter. Mechanical pursuits, however, mingled with those of the artist. Before attaining his majority he had laid by a sum sufficient to buy a small farm, upon which he placed his mother, and soon afterward went to London to study under West, with whom he remained several years. Afterward he became acquainted with the duke of Bridgwater, at whose instance he adopted the profession of civil engineer. He had in the mean time become acquainted with Earl Stanhope, who was engaged on a scheme of steam navigation. In 1798 Fulton wrote to him, suggesting some of the views which he afterward reduced to practice on the Hudson. At Birmingham he was brought into communication with Watt, who had just succeeded in his great improvement of the steam engine, with the structure of which Fulton made himself familiar. During his residence here he devised an improved mill for sawing marble, for which he received a vote of thanks and an honorary medal from the British society for the promotion of arts and commerce. To this period also are referred his patented machines for spinning flax and for making ropes, and the invention of an excavator for scooping out the channels of canals and aqueducts. In 1796 he published in London his treatise on the improvement of canal navigation. Having obtained a patent in England for canal improvements, Fulton went to France with the view of introducing them there, but his attention was soon diverted to other objects. In 1797 he took up his residence at Paris, where he resided for seven years with Joel Barlow, and superintended the illustration of his "Columbiad." At this time he devised the submarine boat, afterward styled a nautilus, connected with which were submarine bombs, afterward known as torpedoes. This invention he offered several times to the French government, and once to the Dutch ambassador at Paris, without exciting their favorable attention. Negotiations were subsequently opened with him by the British government, which induced him to visit London in May, 1804. A commission, at the head of which was Sir Joseph Banks, reported that the submarine boat was impracticable. In October, 1805, he was permitted to experiment on a brig of 200 tons burden with a carcass of 170 lbs. of powder. In 15 minutes from the application of the carcass the explosion took place; the brig, according to Fulton's account, made no more resistance than a bag of feathers, and went to pieces like a shattered egg shell. Notwithstanding this success Fulton was disappointed in his hopes of government patronage, and at length embarked for his native country. He reached New York in December, 1806, and in the following month went to Washington, where his models and drawings made a favorable impression, and a sum was appropriated to defray the cost of experiments with the torpedo. He went to London in connection with England, consequent on the affair of the Leopard and Chesapeake, made the summer of 1807 propitious to his project, and on July 20 he decomposed a large hulk brig in the
habor of New York with a torpedo containing 70 lbs. of powder. In 1810 he again visited Washington, and explained some improvements in his plans to Jefferson, Madison, and a num-
ber of members of congress. So successful was he in his explanations that congress appropri-
ated $5,000 for further experiments, to be prose-
cuted under the direction of the navy depart-
ment. The sloop of war Argus had been pre-
pared, under the orders of Commodore Rodg-
ers, to defend herself against Fulton's attack, which proved unsuccessful. Various reports
were made by the commissioners, but Rodgers
pronounced Fulton's system to be impractic-
cable. Fulton still believed in it, but he had
engaged in other schemes which left him no
time to continue his experiments. While resi-
ding in Paris he had become acquainted with
Robert R. Livingston, then United States min-
ister to France, who had previously been con-
nected with Nicholas Roosevelt and John Ste-
vens in steamboat experiments at home. He
now entered into the views of Fulton, and of-
fered to provide funds for an experiment, and
to contract for the introduction of the new
method, if successful, into the United States.
In 1798 an act was passed by the legislature of
New York, repealing the act of 1787 in fa-
vor of John Fitch, and transferring to Living-
ston the exclusive privilege of navigating the
waters of the state by steam, on condition that
he should within a twelvemonth give proof of
his having built a boat of 20 tons capable of a
mean progress in the Hudson river of four
miles an hour, and at no time omit for one
year to have a boat of this construction plying
between Albany and New York. This act was
from time to time continued, and Fulton was
finally included within its provisions. Late in
1803 Fulton constructed a working model of
his intended boat, and at the same time com-
cenced building a vessel 66 ft. in length and 8
ft. in width. When finished, it did not move
with the speed that was expected. In the
same year, however, he sent an order to Watt
and Boulton for a steam engine to propel a
boat of large size, which was completed and
reached New York in 1806. Fulton had mean-
while informed himself of everything that had
been attempted in steam navigation in Europe
and the United States. He planned for the
new machinery a boat that was completed
and fitted in 1807 and named the Clermont. Its
progress through the waters of the Hudson is
stated at five miles an hour. In the course of
the ensuing winter it was enlarged to a boat of
140 ft. keel and 16½ ft. beam. So com-
pletely was the utility of the invention estab-
lished that the legislature extended the ex-
clusive privilege of Livingston and Fulton five
years for every additional boat, provided the
whole term should not exceed 30 years; and
in 1808 passed another act subjecting to for-
feiture any vessel propelled by steam which
should enter the waters of the state without
their license. His second large boat on the

Hudson was the Car of Neptune, built in 1807.
In 1809 Fulton obtained his first patent from
the United States; and in 1811 he took out a
second patent for some improvement in his
boat and machinery. Meanwhile the power of
the legislature to grant the steamboat mono-
poly was denied, and a company was formed
at Albany to establish another line of steam
passage boats on the Hudson, between that
city and New York. The state grantees filed
a bill in equity, and prayed for an injunction,
which was refused on the ground that the act
of the state legislature was repugnant to the con-
stitution of the United States and against com-
mon right. This decree was reversed by the
court of errors, and a compromise was effected
with the Albany company by an assignment to
them of a right to employ steam on the waters
of Lake Champlain. Other litigation followed,
the result of which was that the waters of the
state remained in the exclusive possession of
Fulton and his partner during the lifetime of
the former. A similar controversy arose in
New Jersey, which was also compromised.
Pending these controversies, Fulton constructed
ferry boats to run between New York and New
Jersey, one for a Brooklyn company, a boat
for Long Island sound, five for the Hudson
river, and several boats for steamboat compa-
nies in different parts of the United States, some
of them for the Ohio and Mississippi rivers.
In 1811 he was made one of the commissioners
appointed by the legislature to explore the
route of an inland navigation from the Hudson
river to the lakes. In 1814 congress authorized
the president to build and employ one or more
floating batteries for coast defence, and Fulton
was appointed the engineer. He commenced
immediately the construction of a war steamer,
which was launched within four months, and
was styled by the constructor the Demologos,
though it was afterward named Fulton the
First. This first war steamer was a heavy and
unwieldy mass, which obtained a speed against
the current of some 2½ miles an hour; but as
the pioneer of the steam navies of the world it
was regarded as a marvel, and as a most for-
midable engine of defence. The war having
terminated before her completion, she was
taken to the navy yard at Brooklyn, where she
was used as a receiving ship till June 4, 1829,
when she was accidentally blown up. While
engaged in the construction of this war
steamer, Fulton was employed by the president
upon an improved modification of his submarine
boat, which was arrested by his death. The
“Life of Robert Fulton,” by C. D. Colden,
was published in 1817. His life has also
been written by James Renwick, in Sparks’s
“American Biography.”

FULVIA, a Roman lady, born about 80, died
about 40 B. C. She was married successively
to Clodius, Curio, and Mark Antony, and had
part in arranging the fearful proscription of the
second triumvirate. When the head of Cicero
was brought to her, she pierced the tongue
with her needle. To withdraw Antony from Egypt, where the charms of Cleopatra detained him, and to take revenge upon Octavius, who had affronted her by repudiating his wife, her daughter Clodia, she excited her brother-in-law Lucius Antonius to make war upon Octavius. The war was unsuccessful, and Fulvia escaped to Greece, was reproached by Antony, who met her at Athens, and died of shame and regret at Sicyon.

FUMBINA. See Adamawa.

FUNCHAL, a seaport town and the capital of the island of Madeira, on the S. E. coast, in lat. 32° 37' N., lon. 16° 54' 30" W.; pop. about 25,000. It stands on a wide shallow bay, embraced by the steep promontories of Punta da Cruz on the west and Cape Garajão on the east, and enclosed in the rear by broken volcanic ridges. The town is defended by four forts. It presents a picturesque appearance, the white walls of the houses, which are mostly of stone, contrasting with the never failing foliage of the gardens. The streets are narrow, with steep ascents, and paved with small stones. Travelling and the transfer of merchandise are done on sleds, drawn by oxen. There are no public buildings of much elegance, and the numerous churches and convents have no architectural beauty. The cathedral, however, deserves mention. The harbor, which is covered by the forts, is indiffer. Fresh meat and poultry are sold at high prices, but the richest fruits, excellent fish, and vegetables may be had cheaply in abundance. The town is resorted to by invalids from all countries on account of its delightful climate. The mean temperature

is about 63° F., and the difference between the hottest and coldest months (August and February) averages only 10°. The imports for 1871 amounted to $1,006,373; the exports to $796,800, of which wine constituted $833,000, nearly the whole of which was sent to Great Britain and the British colonies. The entrances to the port were 266 steamers and 205 sailing vessels. The trade is chiefly in the hands of the English residents.

FUNDY, Bay of, a deep inlet of the Atlantic, separating the Canadian provinces of Nova Scotia and New Brunswick. It is about 170 m. long, and from 30 to 50 m. wide. From its mouth, between the S. W. extremity of Nova Scotia and the easternmost point of Maine, its coasts trend N. E. until near its upper extremity it branches into two inlets; the northern, called Chignecto bay, is about 30 m. long and 8 m. broad; the southern bears the name of Minas channel, and opens into Minas basin in Nova Scotia. At St. John, N. B., situated at the mouth of the river St. John, on the N. coast, the bay is 36 m. wide, and it continues of nearly uniform width from that point to its branching. It is deep, but difficult of navigation. It is remarkable for its extraordinary tides, which rush up from the sea with such rapidity as sometimes to overtake swine feeding on shellfish on the shores, and rise in Minas basin 40 ft., and in Chignecto channel 60 ft. Grand Manan, Campo Bello, and Long islands lie at the mouth of the bay, which receives the rivers St. John and St. Croix.

FÜNEN (Dan. Fyen), an island of Denmark, having on the N. the S. W. prolongation of the Cattegat, E. the Great Belt, W. the Little Belt, and S. the archipelago connecting the two Belts; area about 1,100 sq. m.; pop. in 1870, 217,244, including the inhabitants of a
number of small islands which come under its administration. It is the largest of the Danish isles after Seeland, and forms with the islands W. of the Great Belt, including Langeland and Arró, a circle of the kingdom. The coast is not very elevated, but is in general rugged and steep, and much indented by bays and arms of the sea. The interior toward the west is somewhat hilly; in every other direction it is composed of large and fruitful plains, which produce abundant crops of corn. The largest stream in the island is the Odense Aa, which has a northerly course of 36 m., and discharges into the Odense fiord, about 9 m. long, and from 1½ to nearly 5 m. wide. A canal, navigable by vessels drawing 8 ft., connects the town of Odense with the Odense fiord. The largest lake is the Arreakov, which is about 7 m. in circuit, and abounds in fish. Funen is divided into the bailiwicks of Odense, which contains the capital, of the same name, and Svendborg.

FUNERAL RITES. See Burial.

FUNES, Gregorio, an Argentine historian, born in Cordova, died there in 1820. He was educated at Cordova, entered holy orders, became dean in the cathedral church, and attempted to introduce into the university the study of the higher mathematics, the law of nations, the modern languages, music, and drawing. During the revolutionary tumults the possessions of his father were confiscated by the royalist party. He wrote Ensayo de la historia civil del Paraguay, Buenos Ayres y Tucuman (3 vols. small 4to, Buenos Ayres, 1816 et seq.), which contains an excellent epitome of the annals of a vast territory, of which but little was yet known in Europe.

FUNSKIRCHEN (five churches; in Hungarian Pécs, which in the language of the surrounding Slavic tribes means five), a town of Hungary, capital of the county of Baranya, 105 m. S. W. of Buda; pop. in 1870, 17,447. It is surrounded by rich vineyards, in the vicinity of mineral springs, and is one of the pleasantest towns of Hungary. It is the seat of a Roman Catholic bishop, and has an old Gothic cathedral, built on the site of a Roman castle, two monasteries, a public library, several schools and hospitals, and a theatre. The population consists chiefly of Magyars, but the Slav and German inhabitants are also numerous. The town has a large trade in coal, alum, vitriol, wine, grain, tobacco, rape seed, wool, and other products of the neighboring country.—Funfskirchen is supposed to be the Colonia Serbinum of the Romans. In the time of Hungarian independence it was larger and much more important than now. History mentions that 2,000 of its students marched out to the battle field of Mohács, where the Hungarians were defeated by the Turks under Solymán, Aug. 29, 1526. This sultan passed some time at Funfskirchen, during the siege of the fortress of Szigeth, and was so delighted with the place that he called it a paradise on earth. It re-

mailed in the hands of the Musumians from 1648 till 1886.

FUNGI (Gr. σπόρος, a sponge), an extensive family of cryptogamic plants, generally known under the names of mushrooms, toadstools, rusts, smuts, bunt, and mildews. With rare exceptions, they are parasitic plants, growing upon and drawing their nourishment (or at least a part of it) from the substance of the object they infest. Fungi occur in all parts of the globe, finding their maximum in the moist temperate zones; abounding in a climate like that of Sweden, which has produced more species upon a given area than any other known locality, except perhaps the southern United States. They are found wherever there is decaying vegetation, upon which they feed; they often prey upon living tissues, which they destroy by their attacks; their vegetating fibres are of such extreme minuteness that they penetrate the hardest woods, and powerfully hasten their decay. Nothing of vegetable origin is free from their ravages when exposed to influences favorable to their growth. They are found also on animal dejections, on insects, whose death they cause, on the human skin, and even on bare stones, on iron which was in a forge a few hours before, on lead, and on chemical solutions. The disease in silkworms is caused by a mould (botrytis bassiana). The flies found adhering to windows in autumn, fixed by the proboscis, are destroyed by a mould (sporendosoma muscæ), which produces the little white rings between the abdominal segments and discharges its seed upon the glass around like a little cloud. The celebrated caterpillar fungus of New Zealand (cordyceps Eberthii), which infects the caterpillar of hepialus eirenes, is a remarkable instance. American caterpillars are destroyed by other species. The larvae of the common May beetle (lachnosterna quercina), which passes three years of its destructive life under ground, is sometimes attacked by a fungus which soon causes its death. Onygena equina grows on the hoofs and horns of animals. Some of the microscopic species cause cutaneous disorders in the human system, and others have been found in the brains of birds. (See EPHYTIS.)—Notwithstanding the long time which has been given to the study of fungi, there is no class of organized structures so little known. Their microscopic character, their abnormal growths, their polymorphic forms, have baffled the researches of the closest observers. It is only within a comparatively short time that an approach has been made to a clear insight into their laws of growth and reproduction. Some even now deem them to be of spontaneous or chemical origin, an opinion which their sudden appearance in vast numbers after a long rest, and their occurrence in closed cavities, have tended to establish. But this idea has been clearly disproved. That they are perfect plants, growing from and reproducing bodies analogous to seeds, is too firmly established to be questioned. When
we learn that a single plant produces millions of these reproductive bodies, so small that they float on the air scarcely influenced by the force of gravity, that they may remain an indefinite period inert, and be called into sudden vitality by atmospheric changes favorable to their germination, their sudden appearance can be readily understood. They have been traced through their metamorphoses. The infinitesimally small spore has been watched in its growth into a perfect plant; and one such observation, unquestionably made, is positive proof of their being perfect plants, having a development following certain laws.—Fungi are of purely cellular growth. They form no woody fibre like flowering plants, though many become corky, woody, and horny in the course of their growth, nor do they form chlorophy! in their tissues. They consist of mere aggregations of homogeneous cells, but exhibit a wonderful variety of external forms. Their earliest vegetation is a prolongation of the membrane of their spores, a name given to their reproductive seminal duct, which, though performing the office of seeds, differs from true seeds in being mere individual cells. From these arises a delicate, minute, webby growth, called the mycelium, which is the true vegetation of the plant, and which gives rise to the reproductive bodies at once, or builds up a receptacle which contains them. It is this mycelium which penetrates and destroys the object on which it is parasitic. It is made up of radiating and intertwining fibres formed of rows of cells placed end to end. These are in many instances so minute that they easily traverse the tissues of living plants and the pores of solid wood. From this mycelium grow the spores, which in their simplest form consist of the terminal cell or cells, which drop off to form new plants. They are of the extreme minuteness, appearing to the eye like a mere cloud of impalpable powder. As we rise in the scale, special branches and processes are formed to bear the spores, either singly or in groups. Still more complex forms build up a special organ called the peridium, within which the spores arise contained in little sacs termed sporangia. The large fleshy growths met with in the woods or on trees are processes belonging properly to the reproduction and not the vegetation of the plant. They are very disproportionately large compared with the mycelium, and consist of a main stem called the stipe and an expanded top called the pileus, on which these spores are borne in various ways, on gills, ribs, prickle, &c. The mycelium is sometimes reduced to a mere trace of evanescent, floccose growth; while the reproductive body becomes a fleshy mass, several pounds in weight. But the spores are always minute, being sometimes only 1/1000 of an inch in diameter.—Fungi occupy an intermediate position between algae and lichens, into which orders they gradually merge at different points. Indeed, so nice is the distinction at times, that some systematists have reduced lichens to a suborder of fungi. They differ from lichens mainly in deriving their sustenance from the object on which they grow (though this has exceptions), in not producing a foliose or thalli- lus, and in not forming green chlorophyll; from algae, in being aerial, not aquatic, and in deriving their nourishment from their matrix and not from the surrounding medium. Those species of fungi which are found in fluids, such as the yeast and vinegar plants, are now proved to be merely submerged mycelia of certain moulds (penicillium), which do not attain their perfect stage until they reach the air. Their propagation in fluids is due to a power the mycelium possesses of retaining its vitality under a variety of circumstances, of suffering division and enduring extremes of temperature. Besides this, it has a propagating power analogous to that of budding. In some aerial forms it goes on reproducing itself in peculiar ways, and rarely reaching the normal or perfect asexual fructification. For this reason many species have been thought to be distinct plants when they are merely arrested stages of growth of one single species. Some aerial forms never reach a further growth than a compact, dense mass of mycelium. Oak trees sometimes contain a solid mass of a leathery texture (cystostroma giganteum), which never advances beyond that stage. The genera solerotium and viseaeopha, with their so-called species, are mere compact bodies of mycelium, which have in some instances been artificially forced to develop themselves, and have produced plants of widely different structure. The ergots of grain are the ovary arrested in its proper development and transformed into a peculiar growth by the presence in its tissue of a minute fungus. Tulmse and others have watched their development into species of corycepes. These forms remain constantly arrested; yet very many of those which under favorable circumstances reach perfection remain similarly checked, and confuse the student with their multiple forms. This has caused the naming of hosts of species which are merely forms of others. There is no branch of science whose synonymy is more burdensome. It is almost a hopeless task to attempt to identify the species of authors by description alone, the plant itself being necessary for comparison. Long and continued observations are required to determine and connect the many forms which a single fungus may assume in the course of its existence.—Few objects in nature exhibit more gorgeous colors. The larger fleshy forms present an endless variety of graduated tints. Some of the boletis exhibit on being broken a remarkable change of color, the white or yellowish hue of the interior changing instantly to a vivid blue. This is supposed by Prof. Robinson to be due to a molecular and not to a chemical change. Their texture is as variable as their color. Some are almost fluid, others fleshy, papery, leathery, corky, or hard and horny. Their size is equally various, from
mure specks to masses of some feet in girth. Their rapid growth is astonishing. Puff-balls sometimes grow 6 in. in diameter in a night. Masses of paper, full grown out hot from a vat have been found within 24 hours filled and swollen with a species of agaricus. Schweinitz records the growth of a species of athalium found on a piece of iron which was heated the night before in a forge. Some of the ephemeral copris grow up in a night and melt away in the morning sun. Other species, like the polyphori, grow very slowly and add a new layer every year, covering that of the previous season. Their expansive force in growing is very great. Notwithstanding their soft, yielding texture, agarics are able to raise heavy stones under which they spring up; Bulliard tells of a phallus which burst a glass vessel in which it had been confined; and a case came under the writer's observation in which a puff-ball broke up through an asphalt walk that had been long established and well hardened. Their sudden occurrence over wide districts depends upon peculiar states of the atmosphere favorable to the development of the spores. They generally appear in the greatest abundance in moist autumn weather, though some are found wherever there is moisture. Some depend so much on peculiar states of the atmosphere that they appear suddenly and then disappear for a while. The postural forms, however, which abound on the dead bark of trees, shrubs, old stumps, and fallen twigs, are more durable from their more solid structure. Some species of agaricus possess a remarkable luminosity, and certain rhizomorphs growing in mines shed a phosphorescent light of extreme brilliancy. Fungi differ from flowering plants in their chemical influence upon the air. They absorb oxygen and exhal carbonic acid, per- forming the same office in this respect as animals, which they most resemble in chemical composition, in being highly azotized. The odors they emit in decay are more like putrescent animal than vegetable matter. The flabby sorts generally possess a peculiar earthy odor, but some species of phallus and claethus emit a most intolerably offensive stench, which will render a close apartment untenable. Others, on the contrary, are very agreeable to the smell, and some in drying acquire a fine aroma. They are quite as variable to the taste. The prevailing flavor is rather negative and peculiar to the order; but they are also bitter, acid, biting, astringent, oily, and nauseous, as well as savory and agreeable. Most of them lose these qualities in drying.—Fungi have been used as an article of food from remote antiquity. The writings of the ancients make frequent mention of them as among their most esteemed viands. They are extensively eaten in Europe by all classes, and many works have been written laudatory of their virtues, with copious directions for dressing them in a great variety of ways. Notwithstanding the virulent poisonous qualities of some, others are eagerly sought for, and in some places it is said that the people have burned down woods to get certain species of fungi whose growth followed the combustion. While these few years much attention has been given in England to the edible fungi, and societies and clubs have been formed for the purpose of making the useful species better known by means of exhibitions, excursions, and dinners, at which the various edible fungi take the place of meats. So important is this subject regarded in England that in 1873 the royal horticultural society held an exhibition at which prizes were awarded for collections of both edible and poisonous fungi. The list of species which may be used as food is now large, but the great obstacle to the popularizing of them is the difficulty of distinguishing between the safe and dangerous ones. In America they have for the most part been regarded as noisome and disgusting by the great mass of the people; they have been usually despised as the unsightly evidences of decay, which, though palatable as delicious food, which many of them are. During the late civil war the Rev. M. A. Curtis of Society Hill, S. C., who had long been our best instructed mycologist, turned his attention to the fungi as a source of food supply, and found that a great number of our native species were not only edible but highly palatable. He embodied his observations in a work, but unhappily died without seeing its publication. The mushroom proper (agaricus campestris) grows wild in old fields and pastures, but is propagated by planting its spawn, which is the mycelium of the plant, in hotbeds. Although this is the most widely used, many other species are equally excellent. The truffle (tuber cibarium) grows beneath the ground, and is eaten with avidity by different animals. (See Mushrooms, and Tuber.) Their reputation as aphrodisia is thought to be unfounded, having its origin in the old doctrine of resemblances. Polyporus tuberarius grows from the celebrated fungus stone pieta funghi, which is a mass of earth traversed by the mycelium of the plant; the latter is watered from time to time, and produces successive erops. The heads of poplar trees are watered in autumn, and they then bear the agaricus caudicicus, greatly esteemed. Blocks of the hazel tree are singed over straw and watered, and they produce in abundance the polyporus corinicus. Among other species eaten, the principal are agaricus prynulus, orsella, procerus, and equisitica, lactarius deliciosus, cantharolus cibarius, boletus adulus, marasmius oreades, hydnum repandum, fuscina hepatica, morchella esculenta, and helvellia erica. These are all flabby fungi. Some of the most virulent poisons are found among fungi, and many fatal accidents have arisen from the eating of poisonous species, yet fungi which are known to be ordinarily injurious are eaten with impunity by some. Rye meal containing large quantities of ergot pro-
duces a terribly disgusting and fatal gangrenous disease. Pickling and salting renders many fungi innocuous. *Agaricus muscarius* is one of the most injurious; yet it is used as a means of intoxication by the Kamchatkan. One or two of them are sufficient to produce a slight intoxication, which is peculiar in its character. It stimulates the muscular powers, and greatly excites the nervous system, leading the partakers into the most ridiculous extravagances. The only fungus used at the present day in medicine is the ergot of rye, sometimes employed in cases of protracted labor. Several others have been used in times past, like the *Sordyceps Sinensis*, a sphaeroid species parasitic on a caterpillar; but these are now thought to be of no value. The lycoperdons or puff-balls have been used as styptics. Some *polypor* make admirable razor strops when sliced with a sharp knife. *Polyporus fomentarius* and *igniarius* have for many years furnished the punk which is used as tinder, the corky portion being pounded till its compact mass of soft, silky fibres becomes loosened and flexible, and is sometimes used to make caps and other articles of clothing. *Agaricus muscarius* is used as fly poison. Some fungi are among the greatest pests of the agriculturist. The rusts, smuts, and bunt of grain are all fungi of the genera *Uredo*, *Sclerotium*, and *Puccinia*. Their mycelium penetrates the tissues of the plants, destroys their vitality, and bursting through their cuticles covers them with myriads of their orange, brown, yellow, or black spores. They probably induce decay by a chemical influence which they exert on the juices of the infected plant, as well as by their mechanical interference with its organism. It has been a question how their spores are carried into the tissues, where their earliest growth is entirely separated from the outer atmosphere. But when we remember their extreme minuteness, we can understand that they may be drawn up with the fluids which enter their roots, or receive them directly into their tissues through the infinity of breathing pores with which the surfaces of the plants they infect are perforated. For many years agriculturists have had a prejudice against the common barberry as being injurious to wheat, and in some states it has been prohibited by law from growing near wheat fields. This has been looked upon by botanists as a whim which had no foundation in fact; but in this case, as in others, popular belief was right, although the reason it assigned for the effect, in this case, the pollen of the barberry, was wrong. It is now found that the fungus so common upon the leaves of the barberry is one of the several forms of the wheat smut. The mildews of the grape and other fruits are myceloid growths, which in certain stages have been thought to be perfect plants (*oidium*), from their possessing a power of reproduction. Certain cells take on a vesicular growth filled with a mass of minute bodies which were thought to be the true fruit. But the later observations of Léveillé, Tulasne, and others, have shown that these are arrested stages of growth of an entirely different ascigerous genus, *Arystipe*. These produce their fruit in minute black pustules, from the base of which peculiar radiating processes arise, sometimes of great beauty. The mildews grow on the surface of fruits, and injure them more by choking up their pores and mechanically confining them with their dense, felted growth, than by abstracting their juices. The potato rot is accompanied by a rapid growth of the mycelium of *Botrytis infestans*, which penetrates the leaves, stems, and tubers, inducing rapid decay. It appears on the surface of fruits, in the form of a minute white mould. Many other plants are similarly affected. *Boletus* are sometimes traversed by a minute mould, *Sordyceps* or *Claviceps*, which gives a golden-yellow hue to the flesh. Dry rot in timber is caused by the penetrating mycelium of *Merulius lacrymans* and *Polyporus destructor*. The black exudant growth on plum trees is occasioned by the *Sphaeria morbida*, which covers the warts its mycelium has made with its minute black, compacted *perithecia*. The fairy rings which in olden times were thought to be the scenes of midnight fairy revels, are produced by the growth of different species of *agaricus*. As they exhaust the soil by one year's growth, their mycelium pushes into the richer portions around; and thus they extend the circle of their growth, furnishing, by their decay a manure for the next year's grass, which is darker and denser in consequence.—Fungi have been classified in various ways by different mycologists. By the early writers they were arranged according to their external appearances; but as more exact means of observation multiplied, their microscopic structure became better known, and a nearer approach was made to a classification in consonance with their true affinities. From Celsalpinus in 1833 to Nees von Essenbeck in 1817, the pro
gress of knowledge was comparatively small for a period of nearly 250 years. But in 1821 appeared the Systema Mycologicum of Elias Fries, a work of the most learned and profound character, evincing a comprehensiveness and thoroughness far surpassing all that had preceded it. It is even now the great work to which all students refer, though since that time a host of observers have been exploring this obscure field, and collecting a vast array of facts concerning the laws which govern these minute organisms. Montagne, Léveillé, Tulasne, Berkeley, Desmazières, and many others have of late years been engaged in the elucidation of their structure. The latest system given to the world is that in Berkeley's "Introduction to Cryptogamic Botany," which is essentially similar to that of Fries. The two principal divisions are: sporidiferi, spores contained in special sacs called asci; and sporifera, spores naked, not enclosed. These are again subdivided into six principal orders, all formed on the mode in which the spores are borne, viz.: 1. Ascomycetes (Berk.), spores produced in little sacs (asci), and formed out of the protoplasms they contain. This order comprises a vast number of the black, postural growths, abundant on dead wood, bark, twigs, leaves, &c. They are generally formed of a mass of carbonized cells arranged in the form of hollow spheres or cups called perithecia. Within these grow the asci containing the spores, which escape either from a pore in the perithecia or by its breaking up irregularly. The basal cells bearing the asci are collectively termed the hymenium. Among these are the mildews (Erysiphe) and the black mildews (Cercospora), and the whole great tribe of Sphaeria. The truffles (Tuber) also belong here. They are subterraneous, fleshy forms, whose substance is intersected by veins which are inward folds of the hymenium, covered by the expanded growth of the fleshy receptacle. The morels (Morchella) and the helvella are carnose, bulky forms, which have their asci on the outer surface of a variously folded, wrinkled, and pitted hymenium. The cystaria is akin to these, of a sub-gelatinous consistence. These are all made up of compacted cells, forming horny, carbonized, or heavy, fleshy masses. 2. Phycomycetes (Berk.), spores growing in bladder-shaped cells on the end of delicate, individual, scattered fibres, composed of cells applied to each other in a linear series. A small group comprising the true moulds (Mucor). 3. Hyphomycetes (Fr.), spores naked, simple, or aggregated on the ends of fertile threads. These differ from the last in the naked growth of the spores. Here belongs the great host of minute moulds which cover almost every substance exposed to dampness with their floccose fibres. Nothing organic is free from their attacks. Their colors are sometimes extremely beautiful. To this order belong the mould of the potato rot (Fusarium infestans), and many which induce decay in fruit (Oidium), the bread and cheese moulds (Penicillium, Aspergillus), the rigid black moulds (Cladosporium, Helminthosporium), and the yeast and vinegar plants, which are submerged mycelia of Penicillium. (See Penicillium.) 4. Coniomycetes (Fr.), spores naked on the ends of filaments or vesicles; hymenium

1. Wheat straw attacked by mildew.  a, c, The stem, on which is the swelling b, from which has grown the sheet-like leaf a, c. 2. Cluster of spores of corn mildew magnified. 3. Single spore of corn mildew magnified 200 times. Sometimes obsolete, sometimes contained in a perithecium. This order differs from the last in having scarcely any filamentous growth, and in having the spores produced in the utmost profusion, greatly disproportionate to the rest of the plant. It comprises an infinity of minute Hustle forms, which infest the tissues of every variety of plant, many presenting to the eye but a mere speck on their surface. Here belong the whole family of rusts, smuts, and bunt

1. Cluster of cups from the barley magnified. 2. Same, from above. 3. Leaf of barley, with a similar cluster.

(Puccinia, Uredo, Ustilago, Tilletia, Oidium, &c.), which creep through the tissues of living plants, and finally burst forth on the exterior and fructify in dense, dusty masses, which cover their whole surfaces. Different species affect different organs, some being on stems and
leaves, others on flowers and fruit. They are the scourge of the farmer, whose fields they devastate. The savin trees (Juniperus) are attacked by a peculiar genus (Podocisma), which bursts from their bark and swells under the influence of moisture to a gelatinous mass. It also occasions the globular excrescent growth called cedar apples, from orifices in which it protrudes in long orange-colored spurs, formed by the spores, tipping the aggregated mass of filaments. The black, irregular scars on apples are caused by the Epiloea fructigena. An extensive group of this order comprises those minute pustular forms which, resembling the true asciigerous fungi in many respects, differ in producing their spores on the ends of the filaments instead of being contained in asci. There is great obscurity overhanging this whole group. They exhibit themselves in so many anomalous forms that it is almost impossible to establish limits to genera which may be clearly understood. Writers on the subject record great numbers of genera, but hardly any two agree upon their characters, and the whole subject is burdened with an inharmonious synonymy. New light has been shed upon the subject of later years by the observations of Berkeley, Léveillé, Tulasne, and others, who have pretty clearly established the fact that many so-called genera are merely stages of growth of true asciigerous fungi. Some genera, such as Urosepsis, are known to produce several different kinds of reproductive bodies; and Tulasne has carried his researches into this manifold fructification, showing that many ascigerous species are attended by processes (pyramidia) which produce minute bodies (epiamatia, stylospores) differing much from true spores, and growing beside them, sometimes within the same receptacle. He shows that certain growths recorded as distinct species of different genera and orders are, in fact, different forms of one single plant, whose perfect state is ascigerous. If such be the case, and the process of growth has been followed, we may safely conclude that the whole mass of conomiysotid species, or at least those of the suborder Speronemata, may be arrested or non-developed stages of growth of higher ascigerous forms. Such being the case, the classification of this whole orde of plants will one day need rearrangement.

5. Gyrophoromyces (Fr.), mycelium gelatinous, floccose, or cellular, giving rise to a stalked or sessile peridium, composed of one or more coats; the spores borne on the apices of filaments lining the interior. This includes the whole tribe of puff-balls, as well as the subterranean fungi which look like truffles, but are dusty and smutty within. The peridium is generally of a rounded form, cracking in various ways at maturity, and giving forth myriads of spores like a cloud of dust. In some cases the spores are covered with stellate structures, leaving the spores free (lycoperdon); in others it resolves itself into a fluid which drips from the elongated receptacle (pallium). In some it retains its form, after parting with its spores, in an intricate mass of anastomosing fibres (trichia, arcuria). The Athalium, which infests the hotbeds of greenhouses, belongs here. The earth star (Geaster) are peculiar in the dehiscence of the outer peridium, which splits into segments and unfolds in a starry manner; it is also very hygrometrical, unfolding or closing as it is moist or dry. The little bird's nest fungus (Cromatium) is peculiar in having its spores in distinct masses at the bottom of its nest-like peridium, looking like little eggs. Spharobolus stellatus has the remarkable power of projecting its sporangium to a great distance; the lower, internal part of the peridium is suddenly inverted at maturity, ejecting its soft sporangium, of the size of a mustard seed, several inches. The species of Phallus and Cephalus are notorious for the intolerable stench of their dissolving hymenium. 6. Hymenuomyces (Fr.), mycelium floccose, webby, giving rise to a distinct hymenium, borne either immediately on the mycelium or on special receptacles bearing the spores on gills, wrinkles, tubes, prickles, &c. Here occur the jelly-like acidia, so common on trees after rains; the branching coral-like Clavaria, abounding in our woods in autumn, all of which are edible; the corky Polyporus, bearing their spores in minute, compacted tubes beneath the receptacle termed a pyrus; the Boleti, which resemble the last except that they are fleshy, and of which many are eaten; the Hydnum, which bear their spores on the exterior of prickly-like processes; and, lastly, the Aparia, which include the edible mushrooms and kindred forms, whose spores are borne on radiating blades beneath a cap borne up by a stem like an umbrella.—Mycology, as the study of fungi is termed, is among the most recondite of sciences. Among the authors whose works are of principal value are Berkeley, Bulliard, Corda, Desmazières, Fries, Greville, Klotzsch, Kromholz, Léveillé, Link, Montagne, Nees von Esenbeck, Persoon, Schaeffer, Schweinitz (for American species), Sowerby, Tulasne, and Vittadini. The principal recent American authors are the Rev. M. A. Curtis and Mr. H. W. Ravenel. Of special value is Cooke's "Handbook of British Fungi" (2 vols., London, 1871). "Rust, Must, and Mildew," by the same au-
FUNGIBLE, a word supposed to be derived from the phrase \textit{functionem reciperis}, in the civil law. It is not much known in English law, but is often used in French and Scotch law, and has recently been introduced into American legal language. It is used to mean what we have no other word for, that is, \textit{re kursus pondere, numero, et mensura constant} (1 Bell's "Commentaries," p. 255), or things which may be returned or replaced by any others of the same kind, in contradistinction from those which must be returned or delivered specifically. Thus money is nearly always a fungible, because so much paid in any way that is a legal tender satisfies a claim for it. But it might happen that A lent B certain specific coins, for a specific purpose, which were to be specifically returned; and these would not be fungibles. If one lent to another corn, or meat, or manure, to be used, and return to be made in a like quantity of things of like quality, they would all be fungibles.

FUR, the covering of certain animals, especially such as inhabit the lands or waters of cold countries, distinguished from hair by its greater fineness and softness; also the skins of such animals dressed with the fur on. Before being dressed the skins are known in commerce as peltry. Fur is used especially for winter clothing, for which it is well adapted not merely by reason of its warmth and durability, but also on account of its great beauty. Skins of animals were among the first materials used for clothing. The ancient Assyrians used the soft skins of animals to cover the couches or the ground in their tents; and the Israelites employed skins which were dyed red as ornamental hangings for the tabernacle. The ancient heroes of the Greeks and Romans are represented as being clothed in skins; but the Romans of later periods regarded the clothing as that of barbarous times and people, associating it with the habits of the savage tribes on their eastern and northern frontiers. In the 2d or 3d century fur dresses appear to have been in use and in high estimation with the Romans. The fur of the beaver was in use, either in the skin or for manufacturing fabrics, in the 4th century; the animal was known as the Pontic dog. The sable of the far-off regions of Siberia was not known till many centuries later; but it was the production of that region in furs that chiefly prompted the Russians to its conquest. In the early periods furs appear to have constituted the whole riches of the northern countries; they were the principal if not the only exports; taxes were paid with them, and they were the medium of exchange. In the 11th century furs had become fashionable throughout Europe. The art of dyeing them was practised in the 12th century, chiefly red. Richard I. of England and Philip II. of France, in order to check the growing extravagance in their use, resolved, in the crusade about the end of the 12th century, that neither should wear ermine, sable, or other costly furs. Louis IX. followed their example in the next century, when the extravagance had grown to such a pitch that 746 ermines were required for the lining of one of his surcoats. In these times the use of the choicer furs was restricted to the royal families and the nobility, and the fashion extended to the princes of less civilized nations, if it was not indeed originally adopted from them. In 1272 Marco Polo observed that the tents of the khan of Tartary were lined with rich skins. In 1387 the use of furs, which had become common in England, was prohibited by Edward III. to all persons not able to expend £100 per annum. The early trade of western Europe in furs was through the Hanse merchants on the south coast of the Baltic, who received them from the ports of Livonia. In the 16th century a direct trade was opened between the English and Russians; and a company of the former, protected by the earl, established posts on the White sea with a warehouse at Moscow, whence they sent parties to Persia and the countries on the Caspian. Ivan the Terrible sent presents of beautiful furs to Queen Mary and to Queen Elizabeth; but the latter prohibited the wearing of any but native furs, and the trade was abandoned. Siberia was about this time conquered by the Russians, and its tribute was paid in furs. This country also furnished large quantities to China; but the choicest kinds were taken to Moscow and Nishni Novgorod for the use of the princes and nobles of Russia, Turkey, and Persia.—The settlers of North America early learned the value of the furs of the numerous animals which peopled the rivers, lakes, and forests. They collected the skins in abundance, and found an increasing demand for them with every new arrival from the mother country. The nations were stimulated by trifling compensation to pursue their only congenial peaceful occupation. The Frenchmen, readily assimilating to the Indian habits, became themselves hunters and explorers; and the classes of voyageurs and coureurs des bois, to which this trade gave rise, became the pioneers of all the new settlements. To protect and control the trade, forts were soon required in the Indian territory. That established at Mackinaw became an important central point. The value of this trade early engaged the attention of wealthy and influential persons connected with the government of Great Britain, as Prince Rupert, the duke of Albemarle, the earl of Craven, Lord Ashley, and others. After a successful enterprise in which they had embarked they obtained from the French an act for incorporation, giving to them full possession of the territory within the entrance of Hudson strait not already granted to other subjects, or possessed by those of any other Christian prince or state. In this was included the mo-
nopoly of all trade in these regions, and this was the origin of the Hudson bay company. The territory they claimed extended from Hudson bay west to the Pacific, and north to the Arctic ocean, excepting that occupied by the French and Russians. They soon formed settlements upon the rivers which empty into Hudson bay, and carried on their operations with great vigor and success. The company continued to prosper notwithstanding the persistent opposition of the French. Their forts or factories were extended further into the interior of British America; and their power was supreme throughout the country, and in great measure over the Indians whom they employed to collect the skins. Still their charter had never been ratified by act of parliament. In 1749 a question arose in parliament respecting their rights, which was decided in their favor. But the Canadians organized a company in the latter part of the last century, composed of some of the chief merchants of Canada, under the name of the northwest company. Their headquarters were in Montreal, and their operations were carried on with great energy in the interior, extending to the rivers that flow into the Pacific, where they established factories about the year 1805. The annual meetings of the active partners were held at Fort William at the mouth of Pigeon river, on the N. shore of Lake Superior. The company thus soon became a formidable competitor with the Hudson bay company for the furs of these regions. In 1818 they acquired possession of Astoria on the Columbia, the settlement having been sold to them by Mr. Astor's partners in consequence of the war between the United States and Great Britain. The two companies were afterward involved for two years in actual war. In 1821 they united in one company, called the Hudson bay company, with the privileges of the old company extended by act of parliament over all the territory occupied by both. The license granted on May 30, 1828, for 21 years, expired in 1859. Formerly the company possessed large establishments scattered from Labrador to the Pacific, and from the northern boundaries of Canada to the Arctic ocean, which are of no value for any other purpose. In 1868 the proprietors sold the controlling interest in the company to a new body of proprietors, who in reorganizing increased the capital stock from 2,000,000 to 2,000,000, and elected Sir Edmund Head, who had been governor general of Canada, governor, and Sir Curtis Lampson, an American long resident in England, as deputy governor. The new organization, after protracted negotiation with the governments of Great Britain and Canada, transferred to the latter in 1869 almost the whole charter of the territorial rights, embracing an area nearly equal to that of the original states of the American Union, for 380,000,000, reserving only a limited area in the vicinity of each fort or station. In 1870 a long pending dispute between the United States and the Hudson bay company, growing out of the claims of settlers in Oregon, Puget sound, &c., was settled by a commission sitting in Washington, awarding to the Hudson bay company $800,000. The charter of the company having expired with all its rights of jurisdiction and territorial powers, it is now simply a trading company. The furs collected are sold at the great semi-annual sales of the company in London. Until within a recent date the mode of conducting these sales was at auction "by the candle." A pin having been stuck into a lighted candle, the bidding was continued until the pin fell in consequence of the approach of the flame, and the highest bidder before the fall of the pin was declared the purchaser. The importance of the fur trade led to the early settlement of the western territories of the United States. The first organization for carrying it on was that commissioned in 1763 by M. d'Abadie, director general of Louisiana, made up by merchants of New Orleans, under the title of Pierre Ligne Laclède, Antoine Maran, and Co. Laclède, the principal projector, conducted the expedition to St. Genevieve, Mo., arriving there Nov. 8, 1763. The same year he selected for the site of his establishment the spot now occupied by the city of St. Louis, and then gave it that name. The place soon became of similar importance to Mackinaw and Montreal. The brothers Auguste and Pierre Chouteau were of his party; and they, with Pierre, son of the latter, became identified with the fur trade. (See CHOUTEAU.) In 1859 Martin Bates of New York and Francis Bates of St. Louis became the successors of Pierre Chouteau, jr., and still continue in the trade. The vast Indian territories bordering the great tributaries of the Missouri and the Mississippi opened a boundless and almost unexplored field for the operations of the fur traders. The Rocky mountains served only for a time as a barrier to their explorations, their trading posts before ten years of the present century had elapsed, being established on Lewis and Columbia rivers. The furs, collected by long and tedious navigation in canoes and Mackinaw boats from the most distant sources, were brought down the dangerous rapids of the streams, and packed upon the backs of men around falls, and past the shoals which the hardest voyageurs might not navigate. Their market was then reached by another voyage of several months to New Orleans, where they were exchanged for a return freight of groceries; or to the great trading post of Mackinaw, whence the voyageurs went back with English goods. For 40 years preceding 1847 the annual value of the trade to St. Louis is supposed to have been between $200,000 and $300,000, and the latter half of this term much more than the larger sum named. The trade was of great importance in developing the resources of the wild territories west of the Mississippi, and opening these to the settlement of civilized
The annual value of the fur trade of Alaska is estimated at upward of $1,500,000, while the sum received by the government as a tax imposed upon the taking of seals exceeds $300,000 yearly. The number of fur skins collected in Alaska in 1872 was as follows:

- Beaver: 17,541
- Ermine: 1,549
- Muskrat: 4,000
- Fox, blue: 8,661
- Otter, land: 1,476
- " cross: 1,394
- " sea: 8,190
- " red: 4,200
- " silver: 440
- Seal, fur: 100,000
- " white: 500
- " hair: 147
- Lynx: 200
- Squirrel: 68
- Marten: 10,000

The most fashionable and costly of all furs is the Russian sable, the skin of the mustela sibirica, which is about three or four times as large as the common weasel, to which family it belongs. A choice skin of the sea otter or the black fox may command a higher price than one of the Russian sable; but the cost of the latter will be relatively greater on account of its smaller size. The fur of the Russian sable is brown in summer, with some gray spots on the head, and may be distinguished from all other furs by the hairs turning and lying equally well in any direction. In winter, when the animal is usually taken, the color of the fur is a beautiful black. The darkest skins are the most valuable. In its natural condition the fur has a bloomy appearance; but dried sables generally lose their gloss and the hairs become twisted or crisped. Sometimes the skins are blackened by being smoked, but the deception is exposed by the smell and the crisped hairs. A dyed or smoked fur may be detected by rubbing it with a moist linen cloth, which will then become blackened. It is said, however, that the Chinese dye the sables and give them a permanent color without destroying the gloss; in this case the fraud may be detected by the crisped hairs. The best skins are obtained in Yakutsk, Kamchatka, and Russian Lapland. Only about 25,000 are annually taken, and these command extraordinary prices, the average price of a raw skin being about $25, while a choice "crown" Russian sable will sell for $200. But few of these furs reach the English or American market.

The chief demand is in Russia, where the use of the sable is monopolised by the imperial family and the nobility, by whom it is chiefly used for linings for civic robes, coats, &c., and for ladies' sets. In America Russian sable is used for ladies' muffs and boas. The price of the choicest sets, consisting of these two articles, is from $1,000 to $1,600, though sets of lighter shade and inferior quality may be bought for from $250 to $400. Beautiful sets are also made of the tail of the animal. Of the sables, the next to the Russian in value and beauty is the pine marten, obtained in British North America, and known as the Hudson bay sable. The fur is fine, long, and generally of a lustrous brown color, which is frequently tinted to resemble the Russian
sable. The average value of a dressed skin is about $8, and the choicest are worth about $25. The Hudson bay sable is the leading fur in England, France, and Germany, for muffs, capes, collars, boas, &c., and is much worn in the United States in muffes and boas, selling from $100 to $300. Much inferior to this is the fur of the European pine marten, which is usually grayish brown; the skins range in value from $3 to $4, and are chiefly sent to England and dyed to imitate the finer grades of Hudson bay sable. The fur of the beech or stone marten is yellowish brown, but is often dyed in imitation of more valuable sables. The French excel in dyeing this fur, which therefore is often known as French sable. The best specimens are obtained in Europe, where it is much used for trimmings and articles of ladies' wear; in America it has passed out of general use. The value of an average skin is about $3, and of the finest specimens about $5. The mink or minx (Putorius vision) is found in the northern parts of America, Europe, and Asia, the demand being chiefly supplied from America. The value of a dressed skin ranges from $3 to $8. The choicest furs have a chestnut-brown color glossed with black; those of a lighter color are less valuable, but are dyed in imitation of superior furs. The mink was formerly a favorite fur in America for muffs, collars, &c., and commanded a high price; but it is now rapidly passing out of fashion. One of the most noted furs of this class is that of the ermine (P. erminea), a small animal only 10 or 12 inches in length, much resembling the common weasel, and inhabiting the northern regions of Europe, Asia, and America. About 400,000 skins are obtained annually, the best from Russia, Sweden, and Norway. In summer the fur is yellowish brown, but in winter at the north it becomes a pure white and exceedingly beautiful. Further south the change from brown to white is less rapid and obvious. With advancing winter, the animal is generally caught in the winter, when its fur is most valuable. The end of the tail is shining jet black in all seasons, and is commonly inserted at intervals in the white fur, as an ornament. The paws of the black Astrakan lamb are often substituted for the tail of the ermine. This fur, called mincer in heraldry, has been the royal fur of several European nations, and has been much used in England to line official robes of judges and magistrates, its snowy white color being regarded as the emblem of purity. In the reign of Edward III. its use was restricted to the royal family. At present it may be worn by any one; the modes of ornamenting it, however, as it is worn on state occasions, serve still to distinguish the sovereign and the rank of the person possessed, judges, &c. Only the robes of the royal family are permitted to be trimmed with ermine thickly spotted with black paws of the Astrakan lamb. The use of the ermine fur is restricted in Austria to the imperial family; and it also distinguishes the sovereigns of Germany, Portugal, and Russia. The ermine is little used in the United States. The value of the skin is from $1 to $3.—The fur of the black fox is exceedingly rare; a single skin commands a higher price than that of any other animal, except perhaps the sea otter. The color is a glossy black with a silvery grizzle on the forehead and flanks. It is found in the N.W. part of the United States, in British North America, and in the arctic regions, the choicest specimens coming from Canada and Labrador. But few skins are obtained, and these command enormous prices; single specimens have been sold in London for $200, and there was exhibited at the world's fair in that city in 1851 a pelisse belonging to the emperor of Russia, lined and trimmed with this fur and valued at £2,000. The largest demand is in Russia, where it is worn by the nobility, and in China. The fur is fine and downy, and is used chiefly for ladies' sets and for trimmings; it being specially adapted as a trimming for velvet. A muffs and bos of black fox fur are valued at from $300 to $500. In natural history and in commerce the black fox is known also as the silver fox; but among furriers and purchasers a marked distinction is made between a skin having black and one having silver fur, the difference being chiefly one of color. While the former has the appearance above described, the latter presents a rich, glossy, silvery color. The price of an average black fox skin is about $50, and of the choicest about $200; when the fur has the silvery appearance, it is valued at only about half as much. While these two grades are recognized by the London dealers, the number of skins bought and sold is generally classed under the head of silver fox. Next in value is the fur of the cross fox, the choicest skins being valued at about $10; it is used for the same purposes as the preceding, and also for the finest kinds of carriage robes (shorter than those of the black fox). A white fox (V. vespertil), very abundant in the arctic regions. Its color is white in winter, and brown, gray, or bluish in summer. The fur is long, fine, and woolly; it is used for ladies' sets, dress trimmings, and sleigh robes. The price of an average skin is about $2 50, and of the choicest about $5. They are mostly exported to Europe. Other varieties of fox fur of less value are those of the blue, the red, the kilt, and the gray fox. The furs of the two last named are extensively used in Turkey and Greece for linings for robes, &c. The skins of the red fox go chiefly to Germany, Poland, and Greece. The fur of the fisher, a North American animal much resembling the fox, is rich and soft and of a dark brown or blackish color. It is not much used in the United States, but is generally sent to Germany, Poland, and Russia, where it is used for linings for dresses, trimmings, and ladies' apparel. The tail is also used for trimmings, and frequently as an ornament for the cape, especially at marriage fea-
tivities in Poland. The skins of the fisher are worth from $10 to $20 each.—The use of fur-seal skins has recently increased to such an extent that it is now one of the leading furs of Europe and America. In England it is a staple article for ladies' jackets. In Russia it is much used for linings, and in the United States it has become fashionable for both ladies' and gentlemen's wear. The total number of fur-seal skins annually obtained is about 160,000. They are found in small numbers on the E. coast of Asia, on the W. coast of South America, and in the South Atlantic and Indian oceans; but most of the vast reserves of former years in the Southern ocean have disappeared, and the race has been nearly exterminated by indiscriminate killing. The chief source of supply is now the islands of St. Paul and St. George, where seals resort in great numbers from May to November for the purposes of reproduction, rearing their young, and shedding their coats of hair. During this season the shores for miles are lined with millions of these animals, of which about 100,000 are annually taken. The seal skins, when taken from the animal, are simply salted, and in this condition sold to the manufacturers, who clean, dress, and dye them; the process taking about four months, and involving a vast amount of labor and skill to bring them into a proper condition to be made into garments. In the process of manufacture each skin is handled more than 200 times before it is turned out in a state suitable for the purveyor's use. The natural color of the fur, which underlies the coarse hair or outside covering, is a dirty cinnamon, and the skins are dyed 12 to 18 times to bring them to the dark bronze or jet-black usually worn. The great amount of skilled labor required to perfect them adds materially to the cost. Thus the average price of raw skins is about $18 each, and of dressed about $31. The choicest specimens of the latter are valued at about $65. Sacques made of seal skin for ladies command prices varying from $100 to $400. This is the only standard fur which is improved by being dyed; in all other cases this process is used to palm off an inferior fur for one of superior grade. But the fur of the seal is not only made more beautiful in color by being dyed, but it is changed from a curly to a straight condition, and acquires a rich velvety quality. The chief establishments for the preparation of seal skins are in London, and employ a large capital and numerous workmen. The knowledge of the dye used is kept a strict secret. There is but one establishment of this kind in the United States (in Albany, N. Y.), and this is of limited capacity. The skin of the hair seal, found on the E. coast of North America, is used for trunks, military purposes, &c.; that of the wool seal is used largely in the French army for knapsacks.—The skins of the otter (lutra vulgaris, L. canadensis) make a beautiful and warm fur, which is much valued, especially by the Russians, Greeks, and Chinese. It is for the most part an American product; but it is also procured to some extent in the British Isles from a smaller variety of the species. Another small variety with short fur is also found in the East Indies. The American otter is most abundant in the British possessions. It has a dark glossy brown fur, which is of two kinds, one being short, soft, and thick, the other longer and coarser, and intermixed with the former. It is worn chiefly by gentlemen, and is also used for ladies' trimmings. The price of an average dressed skin is about $13, and of the finest specimens about $18. Among valuable furs that of the sea otter holds a high rank. Its production is limited, and it commands a very high price, $400 being sometimes paid for a choice skin, while the average price is about $50. These furs are extensively worn by the nobles of Russia, and are highly esteemed by the Chinese. The supply is obtained chiefly along the coasts and islands of the North Pacific and about Kamchatka and Alaska. About 4,000 are annually taken off the coast of Alaska. The thick glossy fur, which is exceedingly fine and long, has a prevailing rich black color, tinged with brown above, and presenting lighter colors below. The finest kinds are sometimes tipped with silver-gray hairs. It is a curious fact that the skins of this animal are sometimes taken almost around the world before reaching the place where used. Thus many of them, caught N. W. of Alaska, are sent successively to San Francisco, London, Leipsic, Moscow, Nizhni Novgorod, and finally to their destination in China.—The chinchilla (chinchilla lanigera) is an animal intermediate between the squirrel and the rabbit, and inhabits South American countries. Individuals producing the darkest and best colored skins are found in the cold mountain regions of Chili and Peru. The fur, which is silvery gray, is remarkable for its fineness and softness. It is used for ladies' and children's sets, but more especially for lining and trimming cloaks and other articles of clothing. About 100,000 skins are taken annually, which are chiefly consumed in France, Germany, and Russia. The best skins of the Ario (chinchilla, from Buenos Ayres, are worth about $6, though the average price is only about half that sum.—The lynx includes the Canada lynx and the lynx cat (Felis canadensis, F. rufa). The fur is soft, warm, and light, naturally grayish, with dark spots, but commonly dyed a beautiful shining black. It is used for fencings and linings of cloaks, for the most part in America, brought back from England. It is also largely used for ladies' mourning attire. The skins of the lynx are valued at from $8 to $5. The fitch is the European polecat (putorius communis). Its fur is of about the same value as that of the lynx, and is used chiefly for coat linings and ladies' wearing apparel. The demand for it
in the United States has greatly diminished. Long, costly furs used for general purposes are those of the brown mink, muskrat, skunk, raccoon, weasel, wild cat, and muskrat. The skins of the raccoon (Procyon lotor) are obtained from North America, and sent chiefly to Russia and Germany, where they are the great popular fur for lining coats, &c. The average price of raw skins is about 50 cts., though the choicest black specimens sell for $8. This fur has also been used in the manufacture of hats. Rabbit skins are used in the natural condition and dyed for articles where cheapness is essential. They are extensively used by hatters. The Siberian squirrel has a short silky fur of a beautiful gray color, which is used chiefly in Europe for linings and small articles worn by ladies and children. The skins are worth from $6 to 75 cts. each. Of about the same value is the skin of the wild cat, used chiefly in Europe for coat linings and cheap sleigh robes. The muskrat (Ondatra Zibethica). The aspens of North America, found generally along the banks of streams and in meadows. The skins are worth about 80 cts. each. They are generally dried, and furnish a popular fur in Germany and Italy for linings and ladies' apparel. The skin of the skunk is an American production, valued at from 50 cts. to $1. It has been used in this country for linings and small articles of apparel, often under the name of Alaska sable. The demand for it is rapidly decreasing, and it is now chiefly used in France and Germany. The fur of the beaver (Castor Americanus) is fine, thick, and of a uniform reddish brown. The skins are obtained chiefly in British America and exported to England. The price of an average dressed skin is about $50, and of the best about $8. Formerly this fur was much used in the manufacture of hats, and was the leading article in the fur trade; but its use for this purpose greatly diminished in consequence of the employment of silk and other less expensive materials. It has, however, again been brought into extensive use by the introduction of a process of preparing the skins by which a handsome fur for trimmings and for gentlemen's collars and gloves is obtained. The fine silky wool of the beaver has also been successfully woven. The white wool from the belly of the animal is still used in France for bonnets. Sleigh robes are often made of beaver skins. Much resembling the fur of the beaver is the nutria fur of the coypu, obtained from South America. The skins are worth from 32 to 25 cents each, and are chiefly used in America in the manufacture of hats. The above constitute the leading furs used as articles of apparel for comfort or ornament. There are valuable skins of other animals which are extensively used for special purposes. Among these are the bear, buffalo, wolf, and wolverene. In northern regions bear skins afford the most useful and comfortable material for beds, caps, gloves, and other articles of clothing. Further south, in Europe and America, they are used for sleigh robes and masts. The most valuable of the bear skins is that of the white or polar bear, which has a fine, long, soft fur, silver white tinged with yellow. The average value of a dressed skin is about $60, while a skin of the best quality is worth about $150. The skins of the black bear (Ursus americanus) and grizzly bear (U. horribilis) are used for military purposes, while articles of ladies' apparel are sometimes made of the fur of the brown bear. The skins of the black and the brown bear sell for from $20 to $40 each, while that of the grizzly bear commands a somewhat lower price. The skins of the wolf and the wolverene are generally used for sleigh robes and masts, though cloak linings are sometimes made of the latter in Germany. The average value of wolf skins is about $3; the finest specimens from the Hudson bay region are worth about $8. The skins of the wolverene are valued at from $6 to $7. Valuable furs are still obtained from many other animals besides those enumerated, as the mink, whose long wiry hairs are also used for shaving brushes. The domestic cat is bred in Holland for its fur, and the skins are merchantable in the United States, being worth from 10 to 50 cts. each. Mention has been made of the paws of the black Astrakhan lamb. This animal is covered with the most rich and glossy silk-like fur, all the more delicate, it is said, when obtained, as is not unusual, by slaughering the mother before the birth of the lamb. The fur of the Persian gray and black lambs is made the better to retain its curliness by the practice of sewing the animal tightly in leather immediately after its birth. The furs of the leopard, tiger, lion, &c., find uses as sleigh robes, masts, &c. The most valuable furs are generally obtained from small animals inhabiting cold countries. Land fur-bearing animals are taken by means of the dead-fall, poisoning, shooting, and steel traps. The last named method is the best and the one most generally practised, as the fur of the animal if captured in any of the other ways is likely to be injured. All furs, at least of the land animals, are in the best condition in the winter; the trapping, therefore, is generally carried on between the first of October and the middle of April. During the summer the fur-bearing animals generally shed their coats, or at least lose the finest and thickest part of their fur. At the approach of winter the fur becomes glossy, thick, and of the richest color, and the inside part of the skin, or pelt, when taken from the animal and dried, has a clean, white appearance. The fur seal, however, is taken between May and November. As a rule, furs, except those of the highest class, are not regarded with the most favor in the country where they are obtained. The price of the fur is regulated more by fashion than by its intrinsic value, and is therefore subject to marked fluctuations. The handsome fur of the black skunk was fashionable for many years before it was worn in the United
States; while the fur of the fitch, which was at one time generally worn by men, was not esteemed in Germany; and so the silver-gray rabbit, despised in England, was long highly prized by the mandarins of China. Several kinds of furs which commanded high prices a few years ago are now in little demand in consequence of having become unfashionable. The values heretofore mentioned are given by C. G. Gunther’s sons of New York, the leading dealers of the United States in manufactory furs, as the average wholesale prices for 1874, according to the London market. The greater portion of the furs of commerce are collected from the North American continent.—The chief fur market of the world is London. Two great semi-annual sales, attended by dealers from all parts of the world, are held in March and September, besides a sale of less importance in January of each year. Two great annual fairs for the sale of furs and other articles are also held in Leipzig, the supply of furs being largely obtained from the London sales. The larger portion of the furs sold in London are offered by the Hudson bay company and C. M. Lampson and co., the former importers and the latter commission merchants. It is estimated that the value of the furs sold annually by them and some smaller dealers is about £1,500,000, including seal skins valued at £400,000, all of which are the production of the United States and British America. In addition to the above, American furs to the value of about £100,000 are annually sent direct to Germany and Russia. The variety of furs in use, their relative value, and the extent of the fur trade, are indicated in the following table of sales in London in 1879 of the two leading fur-dealing companies of the world:

</table>

In addition to the above, about 160,000 fur seal skins were sold at from 5s. to £4 4s. each, the average price being about £2. There are also sold annually in London a considerable number of chinchilla, nutria, and ermine skins. Besides the furs sold in London, a moderate portion of those annually collected in the United States are retained there for use, amounting to about 150,000 mink and 750,000 musquash skins; and a small number of the other furs are manufactured and worn. The number of the chief fur skins annually collected in Russia, Sweden and Norway, Iceland, and Greenland has been estimated as follows: badger, 33,000; bear, 2,800; cat, 205,000; ermine, 50,000; fitch, 220,000; fox—silver and cross 100, blue 6,600, white 23,000, red 85,000; hare, 1,200,000; lynx, 9,000; marmot, 6,000; marten, 60,000; mink, 55,000; otter, 9,000; sable, 6,000; seal (hair), 330,000; squirrel, 1,000,000; stone marten, 150,000; wolf, 6,000; wolverene, 700.—F. C. Dusen. As skins are sent to markets, they have been commonly merely dried in the sun or by a fire; but small skins are sometimes first steeped in a solution of alum. The object is to render the pelt perfectly dry, so that when packed it shall not be liable to putrefy. When stored in large quantities the skins are carefully protected from dampness. As the fur dresser re-
ceives the skins he causes them to be subjected to different processes according to the kind of fur and the object for which it is intended. The fine qualities for ornamental dresses are usually placed in tubs together with a quantity of rancid butter or lard, and are then tramped upon by the feet of men. The pelt thus becomes softened, as if partially tanned. They are next cleaned of the loose bits of integument by rubbing them with a strip of iron. The grease is then removed by trampling them again with a mixture of sawdust (that of mahogany is preferred) and occasionally beating them, and combing the fur. Another process is to steep the skins in a liquid containing bran, alum, and salt, in order to cleanse them from greasiness, and then to apply a preparation of soap and soda, which removes a kind of oil formed in the fur itself. Finally the skin is washed in clear water and dried, when it is found to resemble mink, or to be very close to it. The skin is now left to dry, and is then ready for each use. It is all that is necessary to prepare them for the cutter, whose office it is to cut out the variously shaped pieces, and sew them together to make the different articles. The cutting requires much skill to avoid waste. From a great number of similar skins parts of the same shades of color are selected, and thus each muff, mantle, or other article is made to present a uniform color. The seams are concealed by the lining with which the furs are finished. For the treatment of fur skins used for felting, see Hat. - Furs are subject to injury by moths, which deposit their eggs at the roots of the fine hairs, and as soon as the worm is hatched it begins its work of destruction. They will also decay if exposed to moisture. To preserve furs, therefore, it is necessary to keep them dry and well aired, and to protect them from moths. The latter object is often accomplished by frequently beating the furs and keeping them in a camphor-wood or cedar-wood trunk or apartment, or by sprinkling them with camphor, tobacco, or powdered cedar or sandal wood. Some of the largest dealers find that the most effective method for preserving furs from moths is simply to beat them about once a month with a rataan.

FURUEDPOOR, or Dacca Jelnapoor, a district of the commissionership of Dacca, Bengal, British India, bounded N. by Mymunsing, E. by Dacca, S. by Backergunge, and W. by Jessore and Pubna; area, 2,065 sq. m.; pop. about 860,000. It is wholly alluvial, and, being intersected frequently by the Ganges and its branches, is periodically inundated, particularly in the S. and N. E. parts, which are low and marshy; but in the N. and N. W. the land is more elevated. The soil is of extraordinary fertility, producing large crops of rice, sugar cane, cotton, hemp, indigo, pulse, and oil seeds. Sugar, indigo, and rum are manufactured, and much coarse cotton cloth is made for home use. The population is composed of Mohammedans and Brahmins, about equally divided, the latter being the more numerous in the N. part. There are also several thousand native Christians, descendants of the offspring of Portuguese men and native women. The district was granted to the East India company in 1765 by Shah Alum. - FURUEDPOOR, the capital of the district, is a straggling town on the right bank of the Ganges, 115 m. N. E. of Calcutta. The principal buildings are those of the civil departments of the government. It was once a noted resort of river pirates.

FURESTIERE, Antoine, a French author, born in Paris about 1630, died May 14, 1688. He was successively an advocate, a fiscal agent, an abbé, and a prior, and was admitted into the French academy in 1663. While the academy was preparing its dictionary, Furetière, regarding the work as defective, determined to edit and publish a lexicon on his own account. Hence the academy excluded him, and a war of epigrams, satire, and libel, unsurpassed for violence, began between him and the leading academicians. Furetière was protected by the most important personages, by Racine, Boileau, Mollière, Bossuet, and even Louis XIV., and his wit and vivacity distinguished him in society; but his death occurred before the suits which he prosecuted against the academy was decided. His dictionary, enlarged by Beaumarchais, passed through several editions.

FURIES. See Eumenides.

FURLONG (Sax. for or fur and long), an old English measure of 40 rods or poles, equivalent to of a mile. In Ireland it is 0:15 of a mile, and in Scotland 0:1409. In the United States the measure is not in use. As a superficial measure, a furlong in Great Britain is generally 10 acres, according to the acre of different counties; but it was formerly used for a piece of land in no particular dimensions.

FURNACE (Lat. fornas), a structure containing a fireplace, intended for maintaining intense heat. In all the useful arts the first requisite is the means of obtaining a very high temperature. In all metallurgical operations, the object of which is the reduction of the ores and treatment of the metals, and in almost every art involving the use of fire, a furnace of some kind for producing this heat is in demand. The ancient Greeks employed furnaces for casting statues of bronze; Homer makes mention of a blast furnace with 20 crucibles (II. xviii. 470). The Egyptians are known to have made use of melting pots, but we have no knowledge of their furnaces. An ancient smelting furnace was discovered near Arles, in southern France, which was shaped like an inverted bell, having under the surface of the ground a channel for the discharge of the melted metal. Strabo speaks of furnaces built in Spain, which were raised to a great height for conveying off the noxious fumes; they were also furnished with long flues and chambers for collecting the oxides and other sublimed matters. The forms and dimensions of modern furnaces vary greatly according to the different
purposes they are designed to serve. The iron manufacturer, smelting the ores upon a vast scale, builds an immense structure with a capacity of hundreds of tons, and furnishes it with heavy machinery for supplying the great volume of air blown in almost without ceasing, as the operation is continued during a single blast of two years or more.—All furnaces employed in melting refractory materials—those for assaying, as well as those operating upon a large scale—require a free supply of air, proportional in quantity to the amount of fuel they consume. The generation of heat depends upon the rapid chemical combination of carbon with oxygen, and a sufficient supply of the latter element is as essential as is that of the former. Every pound of good bituminous coal, according to Dr. Thomson, requires 180 cubic feet of air, or allowing one third more for waste, there should be supplied at least 200 cubic feet. So immense is the quantity of this invisible element consumed and wasted in the large furnaces for smelting iron ores, that its weight even is greater than that of all the other materials, ores, coal, and flux, introduced; and the power required to force this volume of air through the dense column of heated matters far exceeds that expended in charging the furnace with its solid contents, even adding to this the power involved in the removal of the products of the operation. To provide for this large supply is then a matter of the first consequence to furnaces; and according to the mode in which this is effected they are separated into two classes. The kind called air or wind or reverberatory furnaces receive their supply by means of the current produced by a tall chimney, the heated column rushing upward through the flue. To fill the space in the lower part of the flue, air presses in from without through every aperture; and none being allowed except those leading through the receptacle for the fuel, the supply of air is thus secured, heat is generated for the purposes required, and a portion is expended in furnishing the mechanical power involved in the movement of the current of air. Fireplaces, stoves, and grates are examples of air furnaces; and by means of the blower, which causes the air admitted into the chimney to pass first through the fire, the flue is prevented from becoming chilled by the entrance of cold air, the column ascends more rapidly, an increased supply of air is furnished to every portion of the body of fuel, and the chemical process goes on with augmented intensity and generation of heat. The other classes of furnaces are supplied with air through bellows or other blowing apparatus. (See Blowing Machines.) They are called for this reason blast furnaces, and are used when the resistance opposed to the passage of the current of air by the density of the contents of the furnace is so great, that sufficient quantity of it may not penetrate to keep up thorough combustion throughout the mass; or when the operations do not admit of the large openings beneath the fire, which the free admission of such bodies of air would require; or again, when the nature of the operation demands an intensity of heat concentrated in one spot. The blast in this case acts like the jet of the blow-pipe, and its effect is in many cases greatly increased by its being conveyed through iron pipes which are highly heated by exposure in suitable ovens to the waste heat of the smoke and gases which escape from the chimney. It thus restores to the interior of the furnace, in the form of highly heated air, a portion of the caloric that would otherwise be lost. Furnaces of both classes are often used in the chemical laboratory; but the blast furnace is rather preferable because it can always be more perfectly controlled. The one commonly employed for general purposes is a wind furnace, built of fire brick, and strongly secured with iron rods and straps. It has a flat top, with two or more openings, and on these are placed pans of cast iron for holding sand in which vessels are placed for exposure to moderate heat. The furnace has under the flue that leads into the chimney an oven for drying. With a good draught this furnace produces sufficient heat for many crucible operations. These are, however, better conducted in smaller furnaces, either wind or blast, constructed specially for this use.—The construction and manner of using the various kinds of reverberatory, blast, and assaying furnaces will be found described under the heads Assaying, Bloomery, Casting, Copper Smelting, Iron Manufacture, and others which treat of processes involving the use of these furnaces. Gas furnaces employ gas instead of solid fuel, and are constructed in a variety of forms, but always upon the principle of the Bunsen's burner. (See Flame.) Griffin's blast gas furnace, for metallurgical operations requiring high heat, is shown in section in fig. 1. Two fire-clay cylinders, a, a, form the body of the furnace. They rest upon a perforated fire-clay plate, b, into which the gas burner, c, is introduced. A plumbago crucible, d, sets upon a perforated plumbago cylinder, e, and is covered to a considerable depth with quartz pebbles from half an inch to an inch in diameter; f are plugs which may be removed to admit of inspection. The burner is represented in fig. 2, and consists of two chambers of cylindrical cast iron, one for the reception of air and the other for gas. By increasing in number from 6 to 20 or more, pass from the air chamber through the gas chamber, and

![Fig. 1. Griffin's Gas Furnace.](image-url)
FURNACE

through the axes of tubes passing from the latter, thus securing admixture of the combustible gases. A stand, \( p \), fig. 1, supplied with a thumb screw, holds the burner at any desired distance below the crucible. The gas is supplied at the usual pressure, but the air is urged with a bellows or other blowing machine at about 10 times that pressure. In the experiments made by the inventor, the gas and air pipes were of \( \frac{1}{4} \) in. calibre and 10 in. long, the gas having a half-inch and the air a five-inch water pressure. The quantity of gas used per hour was about 100 cubic feet.

Fig. 1 represents the furnace with the gas burner in an erect position, but it is perhaps more frequently used at the top, inverted, as shown in fig. 3, in which an additional perforated clay plate, \( a \), is laid on the top of the upper clay cylinder. Into the perforation the burner is introduced, and when in action throws its flame down upon the top of the crucible, \( d \), which is now placed upon a foundation of clay plates, \( k, k, k \), raised to the proper height, and of such a size as to leave a vacant space between them and the clay cylinders, which is filled with quartz pebbles, and through which the burned gases pass on their exit, which is now through perforations in the two lower clay plates. The hot gases give up nearly all their heat to the pebbles, and escape at a much lower temperature than would be supposed. The following experiment shows the power of this furnace: A clay crucible, 8 in. in both diameters, was filled with 24 oz. of cast iron, and not covered. The flame being thrown directly upon the iron, it was soon covered with a crust of magnetic oxide. In 20 minutes the crucible was removed, and a hole being broken through the crust, 20 oz. of melted iron was poured out. In the same furnace 16 oz. of copper can be fused in 10 minutes, commencing with the furnace cold, or in 7 minutes after it is hot. Gore's gas furnace is heated by a burner in which the air and gas are more thoroughly mixed previous to ignition than in Griffin's, but it is generally used in smaller operations.—One of the most important improvements which have been made in the arts is Siemens's regenerating gas furnace, which received the grand prize at the Paris exposition of 1887. The invention is not only important as affording an easily managed furnace of great power, but in possessing great economy in regard to fuel. It consists of three essential parts: 1, a gas producer; 2, a regenerator; and 3, a furnace chamber. The gas producer is shown in fig. 4, and is constructed somewhat like a base-burner warming stove, although the action and gaseous products are different because of the different direction of the draught. Bituminous coal is introduced at \( A \), and falls down over an inclined plane, \( B C \), the lower part, \( C \), being a grate for the admission of air. At \( D \) there is a stoppered opening, through which an iron bar may be passed to clear the walls of clinkers. At \( E \) there is an opening controlled by a valve, and which leads into a flue, \( F \), passing to the regenerator. The action is as follows:

![Fig. 4.—Gas Producer, Siemens's Furnace.](image)

The coal, being ignited at the grate, is heated to different degrees, a portion being converted into hydrocarbon gases and vapors, in the same manner as in a gas retort. Another portion, answering to the coke, principally combines with the oxygen of the air coming through the grate and forms carbonic acid, which is therefore a waste product; but a portion of it decomposes steam and furnishes combustible gases, as will presently be explained. But this carbonic acid, having to rise along with the other gases through the incandescent coal above, combines with another equivalent of carbon, forming carbonic oxide, which passes on into the flue with the other combustible gases. But for every cubic foot of carbonic oxide thus produced (the air consisting of about four parts in five of nitrogen by volume), two cubic feet of incombustible nitrogen are also taken up, tending to diminish the heating power. A small stream of water is delivered by the pipe \( G \) at the foot of the grate, and there being converted into steam ascends with the draught into the incandescent coal, where it is decomposed, with the generation of hydrogen and carbonic acid gases.
The generation of these gases is at the expense of heat, and therefore the amount of heat which they add in burning is inconsiderable, but the use of the steam serves to regulate the heat in the gas producer. When the heat rises more steam is decomposed, which action diminishes the heat in the gas producer, but increases it in the furnace chamber, where the mixed gases and air are burned. Fig. 5 gives a representation of the regenerators and the furnace chamber. There are two pairs of regenerators to each furnace chamber; one in each pair being for the transmission of air and the other for that of the gases furnished by the gas producer. The regenerators are chambers containing fire bricks, L, built up with open spaces between them to allow of the passage of the gases and air. These fire bricks are for the purpose of absorbing the heat which issues from the furnace chamber, and again yielding it to the gases which pass to the furnace chamber; and this is effected by having two pairs, which are alternately made to deliver currents to and receive them from the furnace chamber, by turning the valve S, in the centre of the figure, one way or the other. K K is the heating chamber, into the right-hand end of which, as the valve S is now turned, the gases and air are received from the regenerators on the right-hand also. The air enters through the openings O O, and the gases from the gas producer through R R. The air, having traversed the openings between the hot fire bricks, passes through N into the entrance of the furnace chamber, where it meets with the gases, heated in the same manner, coming through M. The two unite and produce an intense and uniform flame. The heated gases which are the products of the combustion in the furnace chamber pass out at the other end, down the flues M' N' and through the regenerators, yielding their heat to the fire brick in them, and passing into the flue of the tall chimney T. When these regenerators have become sufficiently heated, the valve S is reversed, and the air and gases are received through O' O and R' R, passing up through M' N' into the left-hand end of the furnace chamber, and out at the other end, through M and N, where before they were received. The flues which pass from the gas producer to the regenerators are not shown in the figures. The gas producers are at a higher level than the regenerators, and therefore a current of gas can be made to flow from the former to the latter by allowing it to cool in the descending portion. The mixture of gases on leaving the producer has a temperature between 300° and 400° F., but on arriving at the descending portion of the flue has lost from 100° to 150°, which increases its density 15 or 20 per cent., so that a current is urged toward the regenerators, which is increased by the expansion produced by the heated fire bricks. These furnaces are used with great advantage when high and regular heats are required for long periods, and are peculiarly applicable for metallurgic operations, on account of the facility with which, by increasing the amount either of air or of gas in the combustible mixture, an oxidizing or a carbonizing flame may be produced. They are also admirably adapted to glass manufacture, and were at first chiefly employed for that purpose.
FURNESSE, William Henry, D.D., an American clergyman and author, born in Boston, Mass., April 20, 1802. He studied at the Boston Latin school, graduated at Harvard college in 1820, completed his theological course at Cambridge in 1823, and was ordained pastor of the first Congregational Unitarian church in Philadelphia in January, 1825. One of his constant labors as a preacher and author has been to ascertain the historical truth and develop the spiritual ideas of the records of the life of Christ. To this end he has published "Remarks on the Four Gospels" (Philadelphia, 1836; London, 1836 and 1851); "Jesus and His Biographers" (Philadelphia, 1838); a "History of Jesus" (1850; new ed., Boston, 1853); "Thoughts on the Life and Character of Jesus of Nazareth" (Boston, 1859); "The Veil partly lifted and Jesus becoming visible" (Boston, 1864); and lastly, "Jesus" (Philadelphia, 1870). These works reveal a highly cultivated intellect, impelled by enthusiastic ardor and enriched by a glowing fancy, and present a peculiar humanitarian view of the character of Christ. "Aesthetic considerations," says a writer of his own denomination, "weigh more with him than historical proofs, and vividness of conception than demonstration." Dr. Furness has published a volume of prayers, entitled "Domestic Worship" (2d ed., Boston, 1850), and a volume of discourses (Philadelphia, 1835). He has also written hymns and other devotional pieces in verse, and has made exquisite translations from the German, among which are the "Mirror of Nature" from Schubert, the "Song of the Bell" from Schiller, a volume of "Gems of German Verse" (enlarged ed., 1859), and a volume entitled "Julius, and other Tales, from the German" (Philadelphia, 1856). He edited for three years the "Diadem," a Philadelphia annual, has contributed a few articles to the "Christian Examiner" of Boston, and is the author of a large number of pamphlets. His more popular works are those on the "Right of Property in Man," appeared in 1859. During the anti-slavery conflict Dr. Furness was a prominent abolitionist.

FURNIVAL, Frederick J. See supplement.

FURRUKKABAD, a city of British India, capital of a district of the same name, in the division of Agra, Northwest Provinces, 95 m. N.W. of Lucknow; pop. about 65,000. It is a walled town, and has clean wide streets, a number of which are shaded by trees. It has some good buildings, but most of the houses are mere mud hovels. The trade is considerable, the surrounding country being fertile and well cultivated. On the banks of the Ganges, 3 m. W., is Futtahgur, formerly a British military station. The district has an area of 3,123 sq. m. and a population of over 1,000,000. It is an alluvial flat, except the centre of the country, near F., where it is hilly, and is very fruitful. The principal productions are cotton, wheat, barley, maize, indigo, tobacco, sugar cane, and timber. It was annexed by the East India company in 1802.

FÜRST, Julius, a German orientalist of Jewish descent, born at Zerkowo, in the grand duchy of Posen, May 12, 1805, died in Leipzig, Feb. 9, 1873. He studied at Posen and Breslau, and in 1839 became lector at the university of Leipzig, and in 1844 professor. His historical, critical, and lexicographical works are numerous and widely used: the principal of them are: Lehrgebäude der aramäischen Idiome (1885); Concordantia Librorum Sacrorum Veteris Testamenti Hebraica et Chaldaica (1887-1904); Hebräisches und chaldisches Schulwörterbuch (1842), expanded as Hebräisches und chaldisches Handwörterbuch (1857-61), and translated into English by Davidson (London, 1865-76); Geschichte der biblischen Literatur und des jüdisch-hellenischen Schriftstüms (3 vols., 1867-70); and Der Kanon des alten Testaments nach den Überlieferungen in Talmud und Midrasch (1868). He also published Cultur- und Literaturgeschichte der Juden in Asien (1849); Bibliotheca Judaica (3 vols., 1849-58); Geschichte des Kardertums (2 vols., 1863-5); and Das persische Rechtsherrenverband im jüdischen Alterthum (1870). From 1840 to 1851 he edited Der Orient.—His son Levin (born in Leipzig, May 27, 1840) is a physician, and author of Das Märchen von den sieben Raben (1864) and Dormörschen (1865).

FÜHR, a town of Bavaria, in the province of Middle Franconia, at the confluence of the Rednitz and Pegnitz rivers, 44 m. by rail N. W. of Nuremberg; pop. in 1871, 24,569. This railway opened in 1855, was the first in Germany on which locomotive engines were used, and now extends from Frankfort to Munich. About 3,000 of the population are Jews, chiefly descendants of exiles from Nuremberg, who have a Talmud school, several minor schools and synagogues, two Hebrew printing establishments, and various benevolent institutions. One of the synagogues and the city hall are among the most noteworthy buildings. It is the most flourishing weaving town of Bavaria, with a large industry in looking-glasses, gold leaf, and articles known as Nuremberg wares. Gustavus Adolphus occupied Führ in the summer of 1632, and in 1634 it was burned by the Croats.

FUSE, SAFETY, a tubular cord of cotton, rendered slowly combustible for communicating fire to the explosive used in blasting. The cavity in the centre of the cord is filled with some slow-burning compound, and the cord is then wound with tarred twine, and covered outside with a coating of tar. It is thus protected from moisture, and is made sufficiently firm and hard not to be cut by the fragments used in tamping. It burns about three feet in a minute. A method has been patented of introducing a combustible thread through the centre of the cord, with the idea of providing another means of communicating the fire in case the powder is interrupted or the cotton of the tube does not continue to burn. For its use, see BLasting.
FUSEL OIL, or Amyl Alcohol, a liquid colorless when pure, of offensive smell and burning taste, obtained by continuing the distillation of the fermented infusions used for the preparation of ardent spirits after the alcoholic portion has been drawn off. In this condition, however, it is mixed with water, from which it should be separated by a second distillation, the water coming over first. As this brings with it a portion of oil, it is to be set aside for the latter to separate, and form a layer on the surface. Ardent spirits contain fusel oil, particularly if the distillation has been pushed far. It is detected by redistilling whiskey, especially that obtained from potatoes, a milky fluid coming over at the last, from which the oil separates by standing; or by redistillation, water first coming over, and then the oil at its boiling point of 269°. Thus obtained, it is usually of a pale yellow, of specific gravity 0.918; at 4° below zero it congeals in crystalline leaves. It inflammes only when heated to 180°. It unites with alcohol in all proportions, but has little affinity for water. The resins, fats, camphor, sulphur, phosphen, &c., are dissolved by it. Upon the animal system it acts as an irritant poison; its vapor produces nausea, headache, and giddiness. Its composition is represented by the formula C₉H₆O; or, on the supposition of its being a hydrated oxide of amyl, its formula is C₉H₁₂O₅. Fusel oil is used to some extent for burning in lamps, and for dissolving copal and other resins for varnishes, &c. Its presence is highly injurious to liquors, and when in sufficient quantity to be perceptible to the smell and taste indicates bad rectification or the use of damaged grain. It may be detected by agitating the liquor with water, and leaving it to stand for the oil to rise and appear at the surface. It is separated in rectifying by the introduction of some soft wood charcoal. Olive oil may also be added, and the mixture being well shaken, the oils will after a while collect together at the surface, when they may be decanted and the spirits be again distilled.

FUSELI, John Henry, a painter and writer on art, born in Zürich, Switzerland, Feb. 7, 1741, died near London, April 16, 1825. His father was John Casper Fuseli, also a painter. He received a good classical education in his native town, and in 1761 took orders. A pamphlet written by himself and Lavater, who was his schoolfellow, in which a public functionary was severely handled, was the cause of his leaving Zürich, and after spending some time in Vienna and Berlin he went to England, where for a time he supported himself by literary labors. Sir Joshua Reynolds, to whom he showed some of his drawings, advised him to devote himself to art, and he accordingly spent eight years in Italy and the schools of the great masters. Here he changed his name to its Italian form, Fuseli, which he ever after retained. Returning to England in 1778, he executed a number of pictures for Boydell's "Shakespeare Gallery." In 1790 he was elected an academician, and in 1799 he exhibited a series of 47 designs on a large scale from Milton's works. In the same year he became professor of painting in the academy. Among his literary labors was a translation of Lavater's "Aphorisms on Man." His "Lectures on Painting" was published in 1881, and translated into German by Eschenburg (1883). As a painter he possessed high imaginative powers, but his drawing was imperfect and unnatural. See his "Life and Writings," edited by John Knowles (3 vols., London, 1831).

FUSIBILITY, that property by which solid bodies are rendered liquid by the application of heat. It is probably possessed by all bodies, but some are so altered by chemical changes among their own elements or by the action of external bodies in contact, that they cease to retain their individual characteristics before their melting point is reached. Although it seems that in some crystalline organic compounds, and also in some of the fats, the fusing point varies after the body has been once melted, it is generally the case that the fusion takes place at a constant temperature for the same body, that this point is ascertained for many, and is given with each as one of the distinctive qualities. Carbon, however, resists this determination, and the assertions of its fusibility made by some experimenters are not generally admitted as establishing the fact. The range of the fusing point of bodies is very great, some existing in the solid state only far below the ordinary temperatures, while others require the most intense artificial heat to cause them to assume the liquid form. This is exhibited in the following table, which comprises many of the bodies thus arranged by Pouillet:

The fusing point of oils, &c., is ascertained by introducing them together with a fine thermometer into small glass tubes, and placing these in water, which is gradually heated till the substances melt. The thermometer indicates the temperature. The method of determining the high melting points of the metals, &c., will be described in the article Pyrometer.
FUSIBLE METALS

FUSIBLE METALS. See Alloy, and Bismuth.

FUSION DISK. See supplement.

FUSYAMA, a volcano of Japan, in the chain which traverses Nippon, the loftiest peak in the empire, its height being 14,177 ft. It is covered with perpetual snow. It was formerly the most active volcano in Japan, but no eruption has taken place since 1707. Native historians assert that in the year 283 B.C. an extraordinary natural revolution produced in a single night both this mountain and the basin of the great lake Oitz Mitoo; the elevation of surface caused by the former, as it rose from the bosom of the earth, being exactly counter-balanced by the depression which constitutes the latter. The Japanese hold this mountain in religious veneration. Some of its ravines are consecrated to the worship of Buddha, and every August crowds of devotees make pilgrimages to the idols in these spots.

FUSTIC, the dyewood of the morus tinctoria, a tree which grows to a great height in Brazil and the West India islands. A yellow dye is obtained by boiling the wood, and this is principally used for converting silks and woollens, cotton yarn, and light fabrics, already dyed blue, to a green. Its use is almost wholly for compound colors, bichromate of potassa and lead giving a better yellow. The yellow crystalline substance morine separates from a concentrated decoction of fustic by cooling. The wood is known as old fustic to distinguish it from the wood of the rhus cotinus, or Venice sumach, which is sometimes called young fustic, but more properly fustet, the name used by the French. The latter is a shrub cultivated in Italy and the south of France for purposes of dyeing and tanning. Its wood gives a yellowish decoction, which is used as an assistant to procure some particular tint. The color is too fugitive for use alone. The principal fustine is extracted from this wood.

FUTTEGHUR, Futtuughur, or Fatagar, a town of British India, division of Agra, North-west Provinces, situated on the right bank of the Ganges, in the district and 3 m. E. of the city of Furruckabad. It was once a considerable military establishment, but on the extension of the British frontier to the north-west the troops were withdrawn and many of the buildings have fallen into decay. The arsenal is protected by a fort built of mud, and most of the houses are of the same material. A few European merchants reside there. The chief native industry is the manufacture of tents.

FUTTEPOOR, a city of British India, capital of a district of the same name, in the division of Allahabad, North-west Provinces, on the line of the great trunk railway, 70 m. N.W. of Allahabad; pop. about 20,000. It is a large and thriving town, with some good houses, a well supplied bazaar, and an elegant mosque, and is the chief seat of the civil establishment of the district. The place existed before the 12th century. In the sepoy revolt it was captured by the rebels, but was retaken by Gen. Havelock on July 12, 1857.—The district has an area of 1,658 sq. m. and a population of about 700,000. The climate is remarkable for dryness and wide range of temperature. The principal productions are wheat, barley, cotton, opium, indigo, and sugar cane.

FUTTEPOOR SIKKI, a town of British India, North-west Provinces, in the district and 28 m. W. of the city of Agra; pop. about 6,000. It was enclosed by a high stone wall, 5 m. in circuit, with towers and battlements, by the emperor Akbar, whose favorite residence it was; but it contains now little more than heaps of massive ruins, a grand mosque, and a good bazaar. The mosque is built on a commanding hill, and is still in tolerable repair. Near the remains of a vast palace is a column 40 or 50 ft. high, built of composition moulded to imitate elephants' tusks; and outside the walls is a ruined embankment, 20 m. in circuit, which pent up the waters of a torrent till they formed a broad lake, on the margin of which was an amphitheatre for public games. These great works were constructed by Akbar about 1571.

FYZABAD, or Baag, a town of British India, in the province of Oude, on the right bank of the Gogra, which in the rainy season is here sometimes 1½ m. wide, 73 m. E. of Lucknow; pop. estimated at 100,000. It was founded by Saadat Ali Khan, first vizier of Oude, and was beautified by his successors, particularly by Surajah Dowlah, under whom it became the capital instead of the ancient city of Oude or Ayodha, adjoining it on the southeast. In 1775 the seat of government was removed to Lucknow. Since that time the deserted city has been falling to decay, and its population is rapidly decreasing. The only manufactures of consequence are cloth, hardware, and arms.
GABOON

G is the seventh letter in the Latin alphabet, and in others derived directly from it, as the English, French, German, and Italian. In Hebrew, Greek, and some other alphabets of Phoenician origin, it is the third letter. In English it has two entirely distinct normal sounds: the hard, as in get, and the soft (also represented by j), as in gem. In pronouncing hard G, the root of the tongue is raised so as to close the openings from the pharynx into the nostrils, and then by expelling the breath, vocalized by the vibrations of the membranes of the larynx, the sound is formed. The chief difference between hard G and K is that in the latter the breath issues without vocalization. (For the mode of pronouncing the soft G, see J.) In English, G at the beginning of a word has the hard sound when immediately followed by a, e, or u. The words goal and mortgager, when thus spelled, form exceptions to this rule; but they are now commonly written jail and mortgagor. In gu, followed by another vowel, the u is generally silent, as in guard and guide; in a few words, mainly of Spanish origin, as guano and guanaco, it is pronounced as u (in Spanish as tu, or simply u). In gy, except in a few terms of natural history, the g is pronounced soft, as in gymnastics. When followed by e or i, G may have either the hard sound, as in get, give, or the soft, as in gem, gin; the general rule, to which there are many exceptions, being that it is hard in words derived from the Saxon, and soft in those from Greek, Latin, and French. At the end of a syllable G is hard unless softened by a final e, as in rag, range; before an affix commencing with i, the softening e is usually omitted in writing, as in refrangible; if the affix begins with a, the silent e is retained, as in changeable. G enters into combination with several other consonants. In gh, at the beginning of a syllable, the h is silent, the g having its hard sound, as in ghost; at the end of a syllable gh is sometimes silent, as in though, and sometimes it has the sound of f, as in trough; in hough (now usually written, as pronounced, hock) it has the sound of k; in ght, the t only is sounded, as in night. In gl and gr both letters have their full sound, the g being hard, by whatever vowel followed. In gn, whether at the beginning or end of a syllable, the g is silent, as in gnaw, design. Ny in English occurs only at the end of a syllable; it has but one sound, by whatever vowel preceded, as in song, sing, song, and swing. In the Greek, Hebrew, and Germanic languages, and some others, G is hard in all positions. In the Romanic languages the rules for its hard sound are generally the same as in English, but its soft sound differs in character in French and Spanish. (See J.) It is never absolutely mute in any language but English, but is nearly so in Spanish before u, and as a terminal in Danish. — In the calendar G is the last dominical letter. In music, it is the name of the 5th diatonic interval, and the 8th string of the diatono-chromatic scale. It is the clef altered into the adjoining form of the violin or the treble. Capital G marks the deepest tone of the human voice, its octave being the small g. It is named sol in solmization.

GABELENZ, Hans Conrad von der, a German philologist, born at Altenburg, Oct. 18, 1807. He completed his studies at the universities of Leipsic and Göttingen, entered the service of Saxo-Altenburg, and was a member of the Frankfort preliminary parliament, and subsequently of the Erfurt parliament. He has published Éléments de la grammaire mandchou (Altenburg, 1858); a translation into Manchurian of the Chinese works Se-shu, Shu-king, and Shi-king, with a Manchurian-German glossary (Leipsic, 1864); and a large number of minor writings on the Mordvin, Sirian, and numerous other idioms. He has also published a new edition of Ufiilas's Gothic Bible version (4 vols., 1848).

GABRIEL. See Solomon ben (GABRIEL).

GABOON (called also the Mpong or Mpongwe in the language of the people at its mouth), a bay on the coast of west Africa, about lat. 0° 30' N., lon. 9° 20' E. It receives the united stream of the Oloombo and the Rhamboe, and was formerly believed to be a large and powerful river; but it is simply an inlet of the Atlantic ocean, about 40 m. long, 9 m. wide, and from 10 to 40 ft. deep. In 1843 the French established a fortified factory on the coast of the Gaboon bay, and obtained gradually from the native chiefs the whole coast land from Cape Lopez, in lat. 0° 86' S., to the Laucie promontory, in lat. 0° 40' N. In 1867 the area of this colony was reported to be 8,000 sq. m. It had about 5,000 inhabitants and 1,000 troops. The latter were withdrawn during the Franco-German war of 1870-71; and the protectorate of Grand Bassam and Assinie was abandoned by the French in 1872, because they could not control the native chiefs. At the beginning of 1874 there were no French authorities at Gaboon except the naval officers at the station, whose commander acts as governor. The settlement has substantial public buildings, stores, hospitals, a small dockyard, and a large depot of coals. French, English, American, German, and Portuguese missionaries reside here, as well as a French bishop. The Mpongwe language, which is spoken by the natives, has been reduced to writing, and is taught grammatically in the American missionary schools, and the French have translated part of the New Testament into it. The use of a corrupt English jargon is spreading. A number of slaves continue to be kept all along the
coast for domestic purposes. With a view of making the colony self-sustaining, an export duty has been recently imposed by the home government, which hampers trade.

Gaboriau, Émile, a French novelist, born about 1834, died in Paris, Sept. 29, 1878. His literary career began with sketches of theatrical, military, and fashionable life, published in the lesser Parisian journals. Collections of these sketches were published under the titles *Ruses d'amour, Les comédiances adorées, Mariages d'avenir,* etc. In 1866 appeared his novel *Dossier N° 118,* which was followed in rapid succession by *Le crime d'Orcival, L'Affaire Lerouge, Les escroqueries de Paris, La vie infâme, Le coeur au cou,* and other stories. *Ninette Susor* and *L'Argent des autres* were published posthumously. Most of Gaborian’s works are elaborate detective stories, the gloomy romance of crime. The plots, which have been compared to that of Edgar A. Poe and Wilkie Collins, are wrought out with great skill and dramatic effect. *Dossier N° 118* and *Le crime d'Orcival* are considered the best. Two have been translated and published in the United States, under the titles “The Mystery of Orcival” and “The Widow Lerouge” (1878).

Gabriel (Heb., the mighty one of God), the angel sent to Daniel to interpret the vision of the ram and the he goat (Dan. viii.), and to communicate the prophecy of the 70 weeks (Iz. 21–27); employed also to announce to Zacharias the birth of John the Baptist (Luke i. 11), and that of the Messiah to the Virgin Mary (i. 26). Though there is nothing in the Scriptures concerning his rank, he is accounted both by Jewish and Christian writers one of the archangels. According to rabbinical legends, he is the prince of fire, and presides over the ripening of fruit; he alone of the angels understood Chaldee and Syriac, and taught Joseph the 70 languages spoken at Babel; and he with Michael set fire to the temple at Jerusalem and destroyed the host of Sennacherib. Mohammedan writers esteem him one of the four most highly favored angels; he is styled the spirit of truth, and to him a copy of the Koran was committed, which he dictated in successive portions to Mohammed.

Gabriel, Channel, a remarkable channel in Patagonia, between Dawson island and Tierra del Fuego, about lat. 54° 20' S., lon. 70° 40' W. It is 25 m. long and from 4 to 14 m. wide, with shores nearly parallel. The N. shore is a ridge of slate rising to a sharp edge and descending abruptly on the other side into a valley. The S. shore is a mass of mountains, two of which, Mt. Buckland and Sarmiento, are remarkable. The former, estimated to be 4,000 ft. high, is a pyramidal peak of slate; the latter, 8,800 ft. high, terminates in two peaks. The summit of the range between these mountains is an immense glacier, which forms as it melts many cascades that find their way into the channel. From the humidity of the climate these peaks are usually enveloped in fogs. Whirlwinds sometimes descend the S. ridge and burst with violence on the opposite shore.

Gabriel, Caterina, an Italian vocalist, born in Rome in 1780, died in 1796. She was the daughter of a cook employed by Count Gabrielli, who, being struck with the girl’s remarkable voice, had her educated by Garcia and Forpora; and about 1747 she gave her first performance at Lucera, assuming the name of her protector. In 1750 she excelled to such an extent as Dido in Jomelli’s opera of that name, that Metastasio engaged her as first prima donna for the Vienna opera. She was as celebrated for her amours, prodigality, and eccentricities as for her vocal and histrionic talent. In Parma she was the mistress of the infante Don Ferdinand, whose excessive jealousy impelled her to escape to St. Petersburg, where Catharine II. received her with open arms. She asked 5,000 rubles a month, and the empress remarking that this salary exceeded that of field marshals, Gabrielli proposed to her to make those warriors sing. After her return to Italy, the tenor Pacchiarotti was so overcome by her wonderful singing that he fled from the stage while performing with her in Venice in 1777. She had tempting offers from London managers, but would not go to England, where she feared that her whims would not be tolerated. Her last performances were at Milan, where she sang together with her rival Marchesi, and the opera-goers of that city formed two parties which led to disturbances. She ended her life in retirement in Rome.—Francisca Gabrielli (1755–96) was another renowned vocalist, who became known as Gabriellina, to distinguish her from the proceeding.

Gabriel, Nicolas, count, an Italian composer, born in Naples in 1815. He was for 14 years director of the music of ballets in the San Carlo theatre at Naples, and subsequently removed to Paris. He has produced ballets for the Grand Opéra, including *Gemma* (1854), *Les elfes* (1856), and *L’Étoile de Massine* (1861); and a comic opera of his was performed at the Opéra Comique in 1859.

Gachard, Louis Prosper, a Belgian archivist, born in Paris, Oct. 12, 1800. He was a journeyman printer, joined the Belgian revolution of 1830, and was naturalized in Belgium in 1831. He was appointed archivist general, and commissioned to seek in the national and in foreign libraries for documents relating to
Belgian history, and in 1834 became secretary of the historical commission. He has most diligently explored the archives of Simancas in Spain, and others at home and abroad, and has published a great number of works and documents relating to the history of Belgium. Among the works edited by him are many volumes of correspondence of William the Silent, Charles V., Philip II., the duke of Alva, Margaret of Parma, &c., on the affairs of the Low Countries; official letters to the states general, and the acts of that body from 1576 to 1585; and Relazioni des troubles de Gand sous Charles V., par un anonyme, with 830 documents. In his work Jeannine la Folle (1809), he sets forth opinions opposed to those of Gustav Bergenroth concerning the mother of Charles V.

GAD (Heb., fortune), the seventh son of Jacob, elder son of Zilpah, Leah's maid, and whole brother of Asher. Where his youth there is no record. At the descent into Egypt he had seven sons.—The tribe of this name marched in the wilderness on the S. side of the tabernacle, and numbered 46,550. At the entrance into Canaan Gad and Reuben had many flocks, and obtained permission to settle E. of the Jordan, where the territory of Gad was central between Reuben on the south and Manasseh on the north, including the mountain district of southern Gilead and the lowland of the Jordan valley. The Gadites were restless half-nomads, and early extended over all Gilead; and later the names Gilead and Gad were used interchangeably. They were fierce and warlike, and some of them joined David during his outlawry. Among the famous members of the tribe were Jepthah and Buzzial, and probably the prophet Elijah. The isolation of the tribe, and perhaps the impulsive character of its people, weakened its influence in national affairs. Its territory was the battle field of Israel and Syria, and its population was carried away captive by Tiglath-pileser about 740 B. C.

GADARA, an ancient city of Palestine, the capital of Perea (the country beyond or E. of the Jordan), and one of the ten cities called the Decapolis. It was about 8 m. S. E. of Lake Tiberias, and gave its name to the canton or district known as Gadaritis or the country of the Gadarenes. In Matthew it is called the country of the Gergesenes, but this term, as well as the existence of the city of Gergesa, is supposed to have been invented by Origen in the endeavor to reconcile various readings, as no such city can be traced. Though now wholly in ruins, in the time of Josephus Gadara was an important city, strongly fortified, having a court of justice, and in its vicinity several famous hot baths and medicinal springs, reckoned by the Romans inferior only to those of Baiae. Among the remains of Gadara are tombs excavated in limestone rock, consisting of chambers about 20 ft. square, with recesses in the sides. The ruins of Um Keis reveal the splendor of ancient Gadara. It was captured by Vespasian, who reduced it to ashes. It became later the seat of a bishop, but was abandoned after the Mohammedan conquest.

GADDI. I. Gaddi, a Florentine artist, born in 1249, died in 1312. He was an excellent worker in mosaic, and is considered the founder of the modern mosaic art. He also painted altar-pieces. II. Taddeo, a painter, son of the preceding, born about 1300, died about 1360. His decorations of the Spanish church in the church of Santa Maria Novella at Florence, in competition with Memmi, are among the finest specimens of art produced in the 14th century. On one of the walls of this church are the reputed portraits of Petrarch and Laura. Taddeo was also distinguished as an architect. III. Angelo, son of the preceding, born about 1324, died about 1390. He was an imitator of his father and of Giotto, but did not improve in proportion to his abilities. He lived for many years in Venice, where he engaged in commerce, and has been considered the founder of the Venetian school.

GADEN, Niels Wilhelm, a Danish composer, born in Copenhagen, Feb. 22, 1817. He commenced the study of music at a comparatively advanced age, and in a few years became an accomplished performer on the violin and pianoforte, after which he devoted himself to composition. In 1841 his overture entitled "Echoes of Ossian" received the prize of the Copenhagen musical union, and secured to him a royal stipend to travel and study his art abroad. He passed several years in Germany and in Italy, and greatly increased his reputation by a symphony in G minor. In 1844 he was appointed to succeed Mendelssohn in the direction of the Gewandhaus concerts at Leipzig. In 1860, having received the appointment of royal chapel master to the king of Denmark, he returned to Copenhagen, where he now lives. Among his published works are seven symphonies, a number of overtures, sonatas, quintets, and romances, Comala, a lyrical drama, "The Crusaders," a religious cantata, and the Nibelungen, an opera.

GADES. See Cadiz.

GADFLY, a dipterous insect, belonging to the genus tabanus (Linn.), with three-jointed antennae and wide-spreading wings. The gadflies attack not only man, but cattle, horses, camels, and various ruminating animals. The most common species in the United States is the T. atratus (Fabr.), of a black color, with a whitish bloom on the back, like that of a plum; the eyes are very large, almost meeting at the top of the head, and of a shining purplish or bronze black color, with a jet-black band across the middle; it is about an inch long, with an expansion of wings of nearly two inches. The orange-belted gadfly (T. cinetus, Fabr.) is smaller and less common, black, with the first three abdominal rings orange-colored. A smaller and very common species is the T. lineola (Fabr.), which has a whitish line along the top of the hind body. There are many other American species, described and undescribed.
There are about 40 European species, for a knowledge of whose habits and metamorphoses we are principally indebted. The species which so torments cattle is the T. bovis (Linn.), about an inch long; the thorax and abdomen are dark brown, the former with yellowish hair, and the latter with a reddish yellow cross band on the hinder edge of the segments, and bright yellow triangular spots; abdomen yellowish gray, with black triangular spots; thighs dark brown, and tibias bright yellow. These insects appear about the end of June, and continue their attacks through summer; the proboscis, though not very long, is armed with six very sharp needles, by which they can pierce the thickest hide. In the allied genus chrysops (Meigen), or golden-eyed gadflies, may be mentioned the C. ocellata (Meig.), about one third of an inch long, common in Europe in meadows and pasture lands, stinging both men and horses very severely; the yellowish brown thorax is marked with three long black stripes; wings white with blackish brown spots; abdomen yellowish. American species are C. ferrugatus (Fabr.), black, and C. citternus (Wied.), striped black and yellow; they are found in woods and thickets in July and August. The genus hama-topota (Meig.) contains the troublesome gadfly called cleg in Scotland; this, the H. piuaria (Meig.), is about the size of the common house fly; the large eyes are greenish, with four undulating brown bands running through each of them; the body is gray, with brownish cross stripes; the wings gray, spotted with brown. It attacks man, cattle, and especially horses, in sultry weather just before rain; the wounds are painful at the time, but are not followed by any lasting burning or itching.—The name of gadfly is also given to several species of astrus, especially to that which deposits its eggs about the knees and sides of the horse, and which, conveyed into the stomach, constitute the disease known as bots. (See Borne.)

GADSDEN, a N. county of Florida, bordering on Georgia, bounded E. by the Ocklockonnee river and W. by the Appalachee; area, 700 sq. m.; pop. in 1870, 9,802, of whom 6,088 were colored. It is traversed by the Jacksonville, Pensacola, and Mobile railroad. It has an uneven surface and a fertile soil. The chief productions in 1870 were 145,165 bushels of Indian corn, 16,075 of oats, 40,930 of sweet potatoes, 3,258 bales of cotton, 118,799 lbs. of tobacco, 82,785 of rice, 42,384 gallons of molasses, and 60 hogheads of sugar. There were 691 horses, 803 mules and asses, 7,550 cattle, and 7,360 swine. Capital, Quincy.

GADSDEN, Christopher, an American statesman, born in Charleston, S. C., in 1724, died there, Aug. 28, 1805. His father having lost his large estate in play with Admiral Anson, the son engaged in mercantile business with such success as to recover it all by purchase. He was one of the boldest in denouncing British oppression from the time of the stamp act, and is said to have been the first to speak of American independence. He was a delegate to the stamp act congress, which assembled in New York in 1765, and to the first continental congress in 1774, in which he urged an immediate attack upon Gen. Gage at Boston; became senior colonel and afterward brigadier of three South Carolina regiments in 1776; was actively engaged at the siege of Charleston in 1776; was one of the framers of the constitution of South Carolina, adopted in 1778; resigned his military commission in 1779; and as lieutenant governor of the state signed the capitulation when Charleston was taken by Sir Henry Clinton in 1780. Shortly after, in violation of the terms of capitulation, he was arrested with 77 other influential public men, hurried on board a prison ship, and conveyed to St. Augustine. He alone of the prisoners refused to enter into any engagements to secure a degree of freedom on parole, and was therefore incarcerated for 42 weeks in the dungeon of the castle of St. Augustine. Being exchanged, he was sent to Philadelphia, and after his return to Charleston, as member of the state legislature, he opposed the confiscation of the property of loyalists. He was elected governor of the state in 1782, but declined the honor, preferring to retire to private life.

GADWALL, a fresh-water or river duck of the subfamily anatinae, and the genus chauleasamus (Gray). In this genus the bill is as long as the head, the lamellae distinctly visible below its lower edge, and its color black; the head and neck brownish white, each feather spotted with dusky, and the top of the head generally with a reddish tinge; lower neck, breast, back,
85, and the weight about 14 lb. The only species described is the *C. streperus* (Gray), which is generally considered the same in America and Europe. The gadwall is a good diver and swimmer, and walks uncommonly well; it is a rapid flier, with a whistling noise of the wings; in its excursions on land it nibbles the tender grass, and will eat acorns, seeds, and grain. Experiment has proved that this species is capable of domestication, the peculiarity of the plumage being retained.

**Gaêl** or **Gáel** (Gaelic, *Gaedhil, Gaidh, or Gaoidheal*), the plural of Gal or Cal (akin to Latin *celo*, to hide, as the people dwelt or were hidden in forests; or more probably signifying wanderer), the name of the northern and western branch of the great Celtic family of nations, whose other branch is formed by the Kymri or Cymri. The Gaël inhabit the Scotch highlands and Ireland, and distinguish themselves as Gaël Albinach, or Gaël of Al-
GAGARIN, the name of a princely Russian family, deriving its origin from the rulers of Starodub, having its seat in Moscow, and of which the most distinguished members are the following. I. Matyi Petrovitch, governor general of Siberia under Peter I., was executed in June, 1721, on the charge of having conspired to make himself sovereign of that province.

II. Alexander Ivanovitch, a general officer in the Russian army, distinguished himself in the Caucasus and the Crimea, and in 1857, while governor general of Kazan, was assassinated by the prince of Suanethi, which province he was endeavoring to annex to the empire.

III. Pavel Pavirovitch, an influential statesman under Alexander II., was prominent as a member of the council of emancipation; from 1864 to 1869 presided over the council of ministers and that of the empire; and subsequently he was associated in the latter office with the grand duke Constantine until his death in St. Petersburg, March 4, 1872.

IV. John (Ivan), a Jesuit writer and missionary, born in Moscow, Aug. 1, 1814. Like most of the younger members of his family, he embraced a diplomatic career, and was secretary of the Russian embassy in Paris, when he joined the Roman Catholic communion, and entered the society of Jesus Aug. 13, 1843. After receiving holy orders, he was appointed professor of theology in the Jesuit seminary at Laval, and in 1857 founded conjointly with Père Charles Daniel a serial entitled Études de théologie, de philosophie et d’histoire, at first published quarterly, then monthly, and finally fortnightly. Father Gagarin spent several years in Constantinople, where he founded the society of St. Dionysius the Areopagite, which aims at reuniting the Greek and Latin churches. He has published a large number of pamphlets, mainly relating to the history of the Greek-Russian church and to its reunion with that of Rome, the most recent of which are Constitution et situation présents de toutes les Églises de l’Orient (Paris, 1865), and Le clergé russe (Brussels, 1871; English translation, London, 1872).

GAGE, a S. E. county of Nebraska, bordering on Kansas, and intersected by Big Blue river; area, about 900 sq. m.; pop. in 1870, 2,359. The surface is diversified; the soil fertile. The chief productions in 1870 were 129,238 bushels of wheat, 146,180 of Indian corn, 42,586 of oats, 20,122 of potatoes, and 5,316 tons of hay. There were 1,088 horses, 832 milk cows, 1,527 other cattle, 1,979 sheep, and 2,020 swine. Capital, Beatrice.

GAGE, Thomas, the last royal governor of Massachusetts, born in England, died there in April, 1787. He was an active officer during the seven years’ war, was appointed governor of Montreal in 1760, and succeeded Gen. Amherst in 1768 in the chief command of the British forces in America. Being appointed to supersede Hutchinson as governor of Massachusetts, he arrived in Boston in May, 1774, while the people of that colony were preparing to resist the port act. Though personally esteemed, he inspired the public with neither confidence nor fear. He was instructed to seize and punish Samuel Adams, Hancock, and Warren, but durst not even attempt their arrest. As precautionary measures he seized the powder in the public magazine in Charlestown (Sept. 1), and began to fortify Boston. He planned the expedition to Concord which resulted in the battle of Lexington (April 19, 1775), and on June 12 established martial law throughout Massachusetts, and proscribed Samuel Adams and John Hancock by name, offering pardon to all other rebels who would return to their allegiance. After the battle of Bunker Hill (June 17, 1775) Gage was superseded by Gen. Howe, and sailed for England on the following Oct. 10.

GAIL, I. Jean Baptiste, a French author, born in Paris, July 4, 1756, died there, Feb. 5, 1829. He acquired eminence as a Hellenist, and became in 1791 adjunct and in 1802 titular professor of Greek literature in the Collège de France. He gave for many years gratuitous instruction to a number of poor students whom he boarded and lodged in his house. He translated and edited many Greek classics, and published Greek grammars. Among his numerous works are Le philologue (22 vols., 1814–26), and Géographie d’Hérédot (2 vols., 1829). I. Edme Sephele, a musical composer, wife of the preceding, born at Mélun in 1776, died in Paris, July 24, 1819. She was a daughter of the surgeon Garre, and married Gail in 1794, but soon separated from him and devoted herself altogether to music, studying under Mengozzi and giving concerts in southern France and in Spain. On returning to Paris, she be-
came famous by her ballads, while she studied under Félicia and other masters. Her comic opera La jealousy became exceedingly popular in 1818, but her subsequent operas were less successful, though Boieldien was her collaborator in Angéla. La stérénade, however, was much applauded at the Théâtre Feydeau in 1818.

GAILLAC, a town of France, in the department of Tarn, on the right bank of the river Tarn, an affluent of the Garonne, 12 m. W. by S. of Albi; pop. in 1866, 7,870. It is in a fertile region, abounding in vineyards, and surrounded by suburbs, one of which contains a large square, but the streets are exceedingly narrow. It contains two old churches, a communal college, a military prison, and an agricultural society, and various industrial establishments. Gaillac produces white and red wines of superior quality, the latter celebrated for enduring long sea journeys.

GAILLARD, Gabriel Harri, a French historian, born at Ostel, near Soissons, March 26, 1726, died at St. Firmin, near Chantilly, Feb. 18, 1806. He studied law, but devoted himself to literature, and was the lifelong intimate friend of Malesherbes. He spent the latter part of his life in the utmost seclusion, living in the most frugal manner. His principal works are histories of Francis I. (6 vols.), of Charlesmagne (4 vols.), of the rivalry between France and England (11 vols.), and between France and Spain (8 vols.); Dictionnaire historique (6 vols., 1791), in the Encyclopédie moderne; and Mélanges littéraires (4 vols., 1856-7). Several of his works passed through new editions. Though his arrangement of historical events is loose and his style rather stilted, he is regarded as a conscientious and painstaking historian.

GAINES. I. Edmund Pendleton, an American general, born in Culpeper co., Va., March 20, 1777, died in New Orleans, June 6, 1849. He entered the army as ensign in 1799, was for many years actively employed in frontier duty, and was instrumental in procuring the arrest of Aaron Burr. About 1811 he resigned his commission, but at the commencement of the war of 1812 returned to the army, with which he remained connected until his death. At the battle of Chrysler's field, Nov. 11, 1813, he rendered important services by covering the retreat of the American forces with his regiment, the 25th, and he subsequently commanded at Fort Erie when the night assault by the British troops under Gen. Drummond was repulsed. For his conduct during the siege of this place, where he was severely wounded, he was made brevet major general, and received the thanks of congress and a gold medal. He received similar testimonials from the states of Virginia, Tennessee, and New York. He was engaged in the Creek and Seminole wars, after which he had routine duty only.

II. Myra Clark, an American heiress, wife of the preceding, born in New Orleans about 1805. Her father, Daniel Clark, born in Sligo, Ireland, about 1756, emigrated to New Orleans, where he inherited his father's property in 1799. He was United States consul there before the acquisition of Louisiana, and represented the territory in congress in 1806-8. He died in New Orleans, Aug. 16, 1813, and his estate was disposed of under the provisions of a will dated May 20, 1811, which gave the property to his mother, Mary Clark, who had followed him to America and was living at Germantown, Pa. His business partners, Helf and Chew, were the executors. Clark was reputed a bachelor, but was known to have had a liaison with a young French woman of remarkable beauty, Zulimo des Granges, during the absence of her reputed husband in Europe. Two daughters were born of this connection, one at Philadelphia, in April, 1802, the other (Myra) in New Orleans, probably in 1808. The latter was taken to the house of Col. Davis, a friend of Clark's, nursed by a Mrs. Harper, and in 1812 went with Davis's family to reside in Philadelphia, where she passed by the name of Myra Davis. In 1880 Davis, being then in the legislature, sent home for certain papers; and Myra, in searching for them, discovered some letters which partially revealed the circumstances of her birth. In 1828 she married W. W. Whitney of New York, who in following up the discovery received from Davis an old letter which gave an account of a will made by Clark in 1813, just before his death, giving all his large estate to Myra and acknowledging her as his legitimate daughter. Whitney and his wife went to Matanzas, Cuba, saw the writer of the letter, and, after collecting other evidence, instituted suits to recover the estate, which included some of the most valuable property in New Orleans. On the trial of one of these causes, Mrs. Harper testified that four weeks before his death Clark showed her the will he had just made in favor of Myra, permitting her to read it from beginning to end, and acknowledged the child's legitimacy. Baron Boisfontaine testified that Clark told him the contents of the will and acknowledged the child. On this and other similar evidence the lost or destroyed will was received by the supreme court of Louisiana (Feb. 18, 1856) as the last will of Daniel Clark, though of the document itself no vestige had ever appeared. But by the law of Louisiana a testator cannot make devises to his adulterine bastard. It was proved by the testimony of two sisters of Myra's mother, one of whom swore she was present at the ceremony, that Clark privately married her in Philadelphia in 1808, a Catholic priest officiating; she having previously learned that des Granges, her supposed husband, had a prior wife living, and was therefore not legally his husband. Clark's contemplated acknowledgment of the marriage was said to have been frustrated by suspicions of her fidelity; and, deserted by him, she contracted a third marriage. In another suit the United States supreme
GAINSBROUGH, a town of Lincolnshire, England, on the right bank of the Trent, which is crossed here by an arched stone bridge, 16 m. N. W. of Lincoln; pop. in 1871, 7,564. It contains a fine parish and a new district church, a grammar school, and a literary institute. The quaint old Elizabethan hall or manor house, supposed to have been partly built by John of Gaunt, and recently restored, contains the mechanics’ institute and assembly rooms and the theatre. Gainsborough shares with Hull in the Baltic trade; the river Trent is navigable for ships of 200 tons, and various canals afford communication with almost all important commercial centres; the outward and inward vessels number annually about 500, with an aggregate tonnage of upward of 25,000. The principal manufacture is that of linseed oil, and ship building, matting, rope making, and other industries are actively carried on.

GARDNER, William, a British physician, born near Ayr, Scotland, Nov. 11, 1793, died in Avignon, France, in April, 1857. He graduated in medicine at Edinburgh in 1813, and until 1822 spent most of his time on the continent. He then settled in London and commenced practice. He was distinguished for his observations on the medical uses of iodine, and published a treatise on this subject. His “Gout, its History, Cause, and Cure” (London, 1849) has long been a standard work.

GAIUS, Gaius, or Gaïus, a Roman jurist, who flourished in the 2d century of our era, during the reigns of Hadrian, Antoninus Pius, and Marcus Aurelius. Of his personal history little or nothing is known, and even the spelling of his name has been the subject of controversy. From the references contained in the Digest it appears that he was the author of more than 15 works, of which the Institutes was by far the most important. This is supposed to have been the first work of the kind not compiled from previous sources, and to have afforded the first instance of a popular manual of Roman law in the sense of modern elementary text books. After a lapse of four centuries from its publication it was incorporated almost bodily into the celebrated Institutes prepared by the order of Justinian. In 1816 Niebuhr examined a palimpsest in the cathedral library at Verona, containing 251 pages, of which one detached and undated leaf of two pages had been described and partly published by Scipio Maffei 60 years before, with a conjecture that it was part of a compendium of Justinian’s Institutes. With this exception the whole original manuscript had been washed and sometimes scratched out and overlaid with the epistles of St. Jerome, and 83 pages had been written over a second time; yet Niebuhr succeeded in restoring and deciphering a portion of it. He communicated the results of his labors to Savigny, who published them, together with a learned note suggesting that the ancient text of the parchment was the lost Institutes of Gaius. The royal academy of Berlin in 1817 sent two accomplished civilians, Gœsch and Bethmann-Hollweg, to Verona, who, after incredible labor in deciphering the characters on the parchment, succeeded in making a transcript of the original writing, with the exception of three leaves and a few scattered passages which were illegible. A comparison of the work with the quotations in the Digest, and its agreement with the Institutes of Justinian, confirmed Savigny’s conjecture, and the discovery, by clearing up difficulties in the interpretation of ancient jurisprudence before regarded as hopeless, formed an era in the study of Roman law. Several editions of the text have been published, that of Gœsch (improved by Lachmann) of 1842 being considered the best; and commentaries on detached portions by Van Assen, Hoffler, Klenze, Böcking, and others, have appeared. The text, with an English translation and commentary
by Tomkins and Seniors, was published in London in 1869; a translation with notes, by Abdy and Walker, in 1870; and a translation and commentary, by Edward Foste, at Oxford in 1871.

**GALACTODENDRON.** See Cow Tazex.

**GALACTOMETER** (Gr. γάλα, gen. γάλακτος, milk, and μέτρον, measure), an instrument for determining the specific gravity of milk. The common hydrometer may be used for this purpose, but a better instrument is that called the centesimal galactometer, invented by M. Dino- court. This is a glass tube made to float upright in the liquid, and surmounted with a stem upon which are two scales, one intended to be used in skim milk, the other in milk from which the cream has not been removed. The normal range of each quality is designated upon one of the scales, and the divisions above are intended to mark hundreds of water that has been added. Though the specific gravity of genuine milk commonly is found between 1·026 and 1·031, the determination of this is a very uncertain test of its purity. Cream being specifically lighter than milk, its removal leaves the fluid comparatively heavier; water might be added to this, and the specific gravity be thus brought to that of genuine milk. The instrument therefore should be used only in connection with another called the lactometer, the object of which is to determine the proportion of cream present. This being known, and the specific gravity ascertained with the accuracy due to the graduation of the galactometer, the quality of the milk can be more correctly determined than by other instruments.

**GALAGO.** See Lemur.

**GALANGAL,** the root of an unknown Chinese plant, probably belonging to the ginger family. Two kinds, the larger (Alpinia galanga) and smaller, are described. It resembles ginger in many respects, and is but little employed in medicine, but occasionally forms an ingredient in some quack formula, or is peddled under some assumed name as a specific for diarrhoea, cholera, &c. It contains a volatile oil, a resin, and various extractive matters. The only active principles are the oil and resin. It was known to the Greeks and Africans, and its aromatic and stimulating properties led at one time to its extensive use. Recently discovered agents of similar action but more agreeable taste have superseded it. It may be given in substance or infusion. The dose of the former is about 20 grains; of the latter, two or three fluid ounces.

**GALÁPAGOS,** a group of islands lying in the Pacific ocean, under the equator, about 600 m. from the coast of Ecuador, to which politically they belong. They were discovered by the Spaniards, who named them from the numerous land tortoises, called galápagos in Spanish; but the single islands have received English names. In the latter part of the 17th century they became a great rendezvous of the buccaneers, who resorted to them for re-

freshments and to fit out expeditions against the Spaniards. The group consists of six principal islands, nine smaller ones, and many islets, some being mere rocks. Its northern and southern limits (including Galápagos and Isabella islands) are lat. 1° 40' N. and 1° 27' S., and it lies between lon. 89° 30' and 92° 5' W. The largest island, Albermarle, is about 60 m. long and about 15 broad; it is also the most elevated, reaching a height of 4,700 ft. The next in size is Indefatigable island, after which comes Narborough, James, Chatham, and Charles. All the islands are volcanic, and with the exception of a few ejected fragments of fused granite, found by Darwin, every part consists of lava, volcanic tuff, basalt, and other eruptive rocks. The general shape of the islands is that of the majority of oceanic volcanoes, a large dome, surmounted by a wide and shallow crater, and the sides furrowed by numerous lava streams. Small cones of eruption are occasionally seen on the flanks, but are particularly numerous near the foot. Darwin estimates that there are 9,000 of them in the group. The S. W. point of Albermarle island is studded with them. Volcanic activity seems to be nearly extinct at present. On Narborough island two craters were seen in action by H. M. S. Tagus in 1814, and a terrific eruption is described in Morrel's voyage in 1825. Darwin saw in 1835 a small jet of smoke issuing from one of the great craters of Albermarle island. It is certain that on these two islands the lava streams look much fresher than on the others, and the vegetation is much more scanty. As a rule, the volcanoes of the eastern islands appear to have been extinct for a much longer time than those of the western. The climate is remarkably temperate, considering the position directly under the equator. This is due to the low temperature of the Peruvian current, which coming from the Antarctic regions strikes here to the westward after having followed closely up the coast of South America. This current meets here a part of the equatorial current starting from the bay of Panama, so that the curious phenomenon was observed by H. M. S. Beagle of the water being 60° on the southern side of Albermarle island and 80° on the northern. The lower parts of the islands are remarkably arid and destitute of water; but the summits, which are generally covered by clouds, receive from them sufficient moisture to sustain an abundant vegetation and to be susceptible of cultivation. The rainy season is from November to March, but cannot be compared to the continental rainy season. Severe droughts occur occasionally; in 1872, previous to the visit of the United States steamer Hassler, more than 2,000 head of cattle had perished from drought, and only 200 were left. The Galápagos had no permanent inhabitants till 1882, when a party of exiles were brought over from Ecuador by Don José Vilamil. The largest settlement is on Charles island, and is called Floreana, at one time containing
from 200 to 300 inhabitants. At the time of the Hasler's visit the whole settlement had dwindled down to a so-called governor and about a dozen peons, who were very des- tinate, owing to the abandonment of the is-
lands as a place of call for whalers and other vessels, which can no longer procure the sup-
plies of turtles for which the islands were once famous. Besides Charles island, the only other inhabited island is Chatham. —The zoology and botany of these islands possess a peculiar interest, first revealed by the researches of Darwin. Not only is there a large number of animal and vegetable forms not found in any other part of the world, but some of them are confined to single islands of the group, and, what is still more extraordinary, strongly marked varieties, if not different species, of the same genus replace one another in islands not far apart. Considering the evidently re-
cent formation of the islands, the problem of the origin of organic life presents itself here in a most striking manner. Both the fauna and the flora have a most undoubted western American character. Of mammals there are no indige-
nous terrestrial representatives; a rat and a mouse found on some of the islands were prob-
able introduced. Seals, however, are very plentiful. Cattle, pigs, and goats have been intro-
duced on Charles and Chatham islands. About 36 species of birds are known to inhabit this group. Most of the water birds and a few of the land birds are American. The extreme tamelessness of these birds has always been a won-
der to visitors. The reptiles are of great inter-
est. It has been mentioned that the islands were named from the land tortoises, testudo ni-
gra, formerly so abundant that single ships are said to have taken away as many as 700. They were found weighing several hundred pounds, but at present they have greatly diminished in number, and large ones are seldom seen. Of lizards there are three or four species, one or two of which belong to the genus amphibius, and two large ones belonging to the genus rhynchus, confined altogether to these islands. Of these, one (A. cristatus) is the only marine saurian of our epoch. It in-
habits the shores of all the islands, swimming out to sea and feeding on seaweed. The other species (A. Demarili) is terrestrial and her-
vivorous, inhabiting burrows or crevices in the is-
lands; it is confined to the central islands of the group. Both attain a size of 3 or 4 ft., but the terrestrial is somewhat the smaller. A small snake of a South American species is abundant. Sea turtles are also very numerous. The fishes are mostly of South American types, but are not yet sufficiently known. Insects are scarce and small. One half of the shells, according to Mr. Cuming, are peculiar to the islands, the other half partly South American, partly common to the central parts of the Pa-
cific. Coral reefs do not exist here; but pieces of coral of two species, found also in Panama, were picked up on the beaches by the Hasler expedition. The scanty vegetation is so small-
leaved in general in the lower parts as to presen scarcely any appearance of verdure. Two large cactuses, cerasus and an opuntia, are arboreal and give a strange character to the landscape. Near the top of the mountains the vegetation is more luxuriant, and grasses and ferns abound, but there are none of the palms or tree ferns, so characteristic of the tropics.

GALÁPAOS, a burgh of Scotland, partly in Selkirkshire and partly in Roxburghshire, on both sides of the Gala, 27 m. S. E. of Edinburgh; pop. in 1871, 6,488 (in 1801, 1,314, and in 1881, 2,209). The place is of considerable antiquity, but the wool manufactures, to which it owes its recent progress, have only since the begin-
ing of the present century been carried on to any great extent. The town is well built, has six principal streets, and is lighted with gas.

GALATA. See CONSTANTINOPLE.

GALATIA. See Acts.

GALATIA, an ancient province of Asia Minor, bounded N. by Bithynia and Paphlagonia, E. by Pontus, S. by Cappadocia and Lyco-

nus, and W. by Phrygia, of which it was once a part. The Halyt traversed it from S. to N. It was called Gallo-Greece or Galatia from the Gauls, who conquered this region and settled in it in the latter part of the 5th century B. C. They were divided into three great tribes and twelve tetrarchies, each under a separate chief. They aided Antiochus the Great against the Romans, but the latter against Mithridates, for which one of their tetrarchs, Delotarus, was made king, receiving also Pontus and Armenia Minor. He fought with Pompey against Caesar at Par-

salus, was accused of an attempt on the life of Caesar and defended by Cicero, and at the close of his life sided with Brutus and Cassius. On the death of his successor, King Anyntas, the country was annexed to the Roman empire, 23 B. C. Its inhabitants, though intermixed with Greeks, retained their native Gaulish language until the time of St. Jerome, and, according to him, were in the 4th century the only people in Asia Minor who could not speak Greek. Roman writers call the inhabitants Galli. Theodosius I. divided the province into Galatia Prima and Galatia Secunda. Famous cities of Galatia were Ancyra, now Angora, Pessinus, and Gordi-

um, where Alexander the Great cut the knot. Galatia forms now part of the Turkish vilayet of Angora. —The Galatians were less effeminate and less debased by superstition than the natives of Phrygia, and therefore more ready to receive the gospel. Paul first re-

ached Christianity and organized churches in Galatia. He was there once with Silas and Timothy (Acts xvi. 6), about A. D. 53, and again several years later, on his return from Corinth (Acts xviii. 22).

GALATIANS, Epistles to the, a letter addressed by the apostle Paul to the churches of Galatia, and forming one of the canonical books of the New Testament. It is one of those Pauline
epistles whose authenticity has never been questioned by the critical theologians, and
which is therefore of prime importance for
establishing the theological views of the
apostle. It consists of two parts. The first (chap.
i. to v. 12), chiefly doctrinal, vindicates the
apostolic commission of Paul, urges the doc-
trine of salvation as the cardinal truth of
Christianity, and illustrates the relation of
the Christian to the Jewish church. The second
contains exhortations and benedictions. It
was called forth by some agents of the Jew-
ish Christian party who endeavored to over-
throw the belief in salvation by grace, and
to incorporate circumcision and other Jewish
rites with the ordinances of Christian worship.
There is much diversity of opinion as to when
and where the epistle was written; the major-
ity of exegetical writers at present appear to
assume that it was written from Ephesus, about
the year 56. Special commentaries on this
epistle have been written by Winer (4th ed.,
1859), Flatt (1828), Usteri (1833), Rückerl
(1833), Hilgenfeld (1852), and Wieseler (1859).
See also Holsten, Inhalt und Gedankengang
des Briefes an die Galater (1859).

GALATZ, or Galitz, a town of Roumania, in
Moldavia, on the left bank of the Danube, be-
tween the mouths of the Sereth and Pruth, 120
m. S. by E. of Iassy; pop. nearly 80,000, in-
cluding many Greeks and Jews, some Arme-
nians, and a vast multitude of foreign resi-
dents of almost all European nationalities.
The old part of the town consists of filthy
and narrow streets, but the new part contains
good stone houses, and has a more pleasant
appearance. The quay is used as the prin-
cipal street, and there are extensive warehouses,
granaries, and ship yards, and a large bazaar.
The new Roman Catholic and several of the
Greek churches are large edifices, and there
are several educational institutions, a hospital,
and an excellent quarantine building. Galatz
is a free port, and one of the most im-
portant emporiums of the Danube. The open-
ing of that river to all nations by the terms
of the treaty of Paris of 1856 produced a
great influx of merchants and traders, and
the population, which had increased from
8,000 in 1835 to 60,000, growing chiefly du-
during the Crimean war, rapidly rose to 70,000,
but has of late increased more slowly, ow-
ing to the partial diversion of the trade by
railways to other points. About half of the
trade by sailing vessels is carried on under
the Greek flag, though the English and Ital-
ian merchants have become great rivals of
the Greeks. The Sulina mouth of the Dan-
ube forms the outer harbor for the accommo-
dation of large ships, and the port of Galatz
proper is accessible to craft of 800 tons. The
exports of 1871 included nearly 400,000 quar-
ters of wheat and about 500,000 of maize, be-
sides flour and other cereals. Deal boards
and timber are exported in great quantities,
tallow, wool, and hides to some extent.
One third of the imports are from England,
and the total value of imports (including those
of Brailia), chiefly manufactured and colonial
goods and metals, is about 23,000,000. The
average annual number of ships clearing for
the Black sea is 1,150. Railways running re-
spectively through Brailia and Roman connect
Galats with Bucharest and Czernowitz. The
Russians took the town in May, 1789, and
the Turks gained a victory here in August
of the same year. Between 1848 and 1856
Galatz was on several occasions occupied by
Turkish, Russian, and
Austrian troops.

GALAXY (Gr. γαλαξία, milk; ἡ γαλαξίας τόκος,
the milky zone), the via lactea, or milky
way, an irregular band of light visible in the
heavens on a clear night. The following
is an abridgment of Sir John Herschel's ac-
count of this phenom-
enon. In the northern
heavens the milky way
is for the most part
faint. From Cepheus
over Cassiopeia, Per-
seus, Auriga, &c., to
Monoceros, it forms a
single stream, except
where in Perseus it
throws out a branch
which can be traced as
far as ζ Persei, and probably to the Pleiades
and Hyades. Beyond Monoceros, southward,
it becomes broader, brighter, and more com-
plicated, opening out in Argo into a fan-
lke expansion 20° wide. Here the continu-
ity of the stream is interrupted, a broad
black rift extending right across it in this part of its course. Beyond the rift is another fan-like expansion, whose widest part, like that of the other, abuts upon the rift. As the Milky Way narrows down toward the neck of this expansion, it becomes brighter, and its outline is in places singularly well marked. In Crux it expands again, but in the very heart of the expansion is a large black space perfectly clear of luminous stars and of Milky light. This is the Southern Coal-sack. Passing on toward Scorpio, we find the Milky Way dividing close by a Centauri into two branches, of which one only can be traced as a distinct branch for any distance. This stream passes northward over Sagittarius, where it exhibits a remarkably rich condensation, over Aquila, where are several such concentrations, and thence rapidly diminishing in brightness, to Cygnus. The other branch, as soon as it enters Scorpio, exhibits a multitude of complicated divisions, subdivisions, and detached portions. Near Antares it throws out a great projection toward Libra—that is, nearly at right angles to that of the main stream. Another subdivision, passing toward Serpens, seems to seek the main stream, but cannot be traced quite up to it, coming to an end a few degrees to the north of the star µ Sagittarii. Returning to the other stream near Cygnus, we find it proceeding to Cassiopeia, throwing out a projection from Cepheus toward the north pole, while from Cygnus a branch extends southward, very rich in Cygnus, but thence rapidly fading in brightness, until it comes to an end on the equator. In most maps this branch is carried southward beyond the equator to meet the branch which terminates near µ Sagittarii; but the two branches do not meet in reality.

The ancients held a variety of opinions concerning the Milky Way. Aristotle regarded it as constituted of the same substance as comets. Theophrastus looked upon it as the band along which the celestial hemispheres had been knit together, so carelessly that the fiery heavens beyond could be discerned. But Democritus formed the just opinion that the Milky Way consists of a multitude of stars. It was not until the invention of the telescope that its real nature could be demonstrated. Galileo, even with the small telescopic power at his disposal, was able to resolve the galaxy in many places into discrete stars. The labors of the Herschels, father and son, furnish the means of forming definite ideas respecting its constitution. In the first instance, Sir W. Herschel, regarding the Milky Way as of the same constitution as the star groups in our neighborhood, applied to it his famous method of star gauging. Where he counted most stars in the field of view of his telescope, he judged that the extension of the sidereal system was greatest, and thus he was led to the theory which has been called the "cloven grindstone" theory, according to which the sidereal system is greatly extended in the direction of the Milky Way, and so forms a flat stratum, divided into two laminas opposite the part of the Milky Way which appears double. Herschel advanced this view in 1786; but the progress of his labors compelled him to abandon the theory that the Milky Way is constituted like the star regions in our neighborhood. Thus in 1802 he writes: "The stars we consider as insulated are also surrounded by a magnificent collection of innumerable stars, called the Milky Way, which must occasion a very powerful balance of opposite attractions, to hold the intermediate stars in a state of rest. For though our sun, and all the stars we see, may truly be said to be in the plane of the Milky Way, yet I am now convinced, by a long inspection and continued examination of it, that the Milky Way itself consists of stars very differently scattered from those immediately around us. On a very slight examination it will appear that this immense starry aggregation is by no means uniform. The stars of which it is composed are very unevenly scattered, and show evident marks of clustering together into many separate allotments." In 1811 he abandoned even more definitively the principle on which his system of star gauging had been based. "By continuing my sweeps of the heavens," he says, "my opinion of the arrangement of the stars and their magnitudes, and of some other particulars, has undergone a gradual change. . . . An equal scattering of the stars may be admitted in certain calculations; but when we examine the Milky Way, or the closely compacted clusters of stars of which my catalogues have recorded so many instances, this supposed equality of scattering must be given up." In 1817 Herschel adopted a new method of estimating the profundity of certain of the richer parts of the Milky Way. He regarded the dimensions of the telescope necessary to effect the complete resolution of such regions as affording a measure of the distance to which the Milky Way extended outward into space. It is not too much to say, however, that this method was as imperfect as that of star gauging, since it involved an assumption equally opposed to existing analogies. In star gauging Herschel assumed that there was a general equality of scattering; he now assumed a general equality of stellar livest. If we consider his application of this principle to the great cluster in the sword hand of Perseus, we shall see that it was unsound. For from the gauging powers necessary to effect incipient resolution on the one hand and perfect resolution on the other (the latter not attained, but only a lower limit indicated), he inferred that the nearest part of this cluster is at about the 12th order of distance, the farthest certainly beyond the 34th order. But the cluster occupies but a minute space; it is indeed double, and the moon's disk would nearly hide both clusters at once. Is it credible, then, that we have here to deal with a long conical space having
a minute vertical angle, and the sun placed exactly at the vertex, while the remotest portion of the space thus occupied with stars is at least twenty-seven times further away than the nearest? Such a portion of space would have the shape of a long straight rod very delicate in its proportions. Apart from the antecedent improbability of such an arrangement, it is certain that a cluster of stars so shaped would have no dynamical stability. Moreover, the cluster in Perseus is not a solitary instance, since upward of thirty similar clusterings were counted by Herschel in the northern heavens alone, and Sir John Herschel observed many more in the southern portions of the milky way. These considerations seem to dispose of the principle on which Sir W. Herschel based his latest method of star gauging. It seems demonstrated by the evidence that the stars seen in the clustering aggregations of the milky way are of many orders of real magnitude, and arranged at distances among which there is not even an approach to general uniformity. Sir John Herschel's observations of the milky way in the southern heavens go far to confirm these conclusions, though he himself adopted a theory in some sense resembling that which his father advanced in 1785; only instead of regarding the galaxy as shaped like a cloven disk, he held that it resembles in figure a flat ring (cloven, necessarily, to explain the double portion of the milky way). The elder Struve was among the first to point out that the arrangement of the brighter stars over the heavens do not accord with either the cloven disk or the cloven ring theory of the galaxy. He found that the stars down to the eighth magnitude, which according to either theory should show no marked gathering toward the milky way zone, are nevertheless aggregated in the most striking manner upon that region. Hence Struve inferred that there is an aggregation of stars toward the medial plane of the milky way; and he adopted (quite unnecessarily, as it appears to the present writer) the theory that the range of stars constituting the milky way stratum is illimitable in all directions lying within that stratum. Struve's theory of an indefinite extension of the milky way in its own plane seems disposed of by the younger Herschel's observation that "throughout by far the largest portion of the extent of the milky way in both hemispheres, the general blackness of the ground of the heavens on which its stars are projected, and the absence of that innumerable multitude and excessive crowding of the smallest visible magnitudes, too small to affect the eye singly, which the contrary supposition would appear to necessitate, must, we think, be considered unequivocal indications that its dimensions, in directions where these conditions obtain, are not only not infinite, but that the space-penetrating power of our telescopes suffices fairly to pierce through and beyond it." Moreover, Sir John Herschel disposed very completely of the reasoning on which Struve based the theory that light is gradually extinguished in its passage through space. "We are not at liberty," he said, "to argue that at one part of the milky way's circumference our view is limited by this sort of cosmical veil which extinguishes the smaller magnitudes, cuts off the nebulous light of distant masses, and closes our view in impenetrable darkness, while at another we are compelled, by the clearest evidence our telescopes can afford, to believe that star-strewn vistas lie open, exhausting their powers and stretching beyond their utmost reach, as is proved by that very phenomenon which the existence of such a veil would render impossible, viz., infinite increase of number and diminution of magnitude, terminating in complete irresolvable nebulousness." Recent researches have led to the inference that the structure of the galaxy is not so simple as any of the theories advanced by the Herschels or Struve would imply. The stars, even in one and the same portion of the galaxy, seem to present all those varieties of size and aggregation which have hitherto been ascribed to the effects of distance. It appears that often where the Herschels supposed that they were passing further and further, by means of their powerful telescopes, into the depths of space, they were in reality merely searching more and more scrutinizingly a particular region of our star system. The galaxy, according to these more modern views, would come to be regarded as an infinitely complicated spiral, with outlying branches extending beyond the range of the most powerful telescopes yet made. Moreover, it seems as if those mysterious objects the nebula, instead of being distant galaxies as had been supposed (at least as respects the stellar nebulae), were in reality but portions of our own sidereal system. It is at least certain that the mysteries of the galaxy have not yet been fully solved, even if any noteworthy advance has been made toward their solution.

**GALBA, Servius Sulpicius**, a Roman emperor, born near Torrachna, Dec. 34, B.C., died Jan. 15, A.D. 69. As he inherited great wealth and possessed great talents, it was predicted both by Augustus and Tiberius that he would become the head of the Roman world. He attained the praetorship in A.D. 20, and the consulship in 38, carried on a war in Gaul in 39 against the Germans, was intrusted with the administration of Africa in 45, lived in retirement for several years under Nero, but in 61 was invested with the government of Hispania Tarraconensis. He was faithful to the emperor till in 68 Vindex rebelled in Gaul, and his own assassination was plotted by Nero. He then took the title of legate of the Roman senate and people, marched toward Rome, and on the death of Nero received the imperial dignity from the senate. He offended the praetorian guard by refusing the donation which had been promised in his name, and completed his ruin
by adopting Piso, a noble young Roman, for his successor. Otho, who had hoped for the adoption, formed a conspiracy among the soldiers, and Galba was murdered in the forum seven months after the beginning of his reign.

**GALBANUM**, a gum resin obtained from India and the Levant. The plant which produces it is not known with certainty, but it is probably a species of *Ferula*, a genus of the order *Umbeliferae*. The drug is imported in massive lumps of irregular shapes, apparently made up of agglutinated tears. They are brownish yellow, sometimes greenish, the tears sometimes translucent and bluish or pearl white. Its consistence in cold weather is that of wax; in warm weather it is soft and adhesive, and at 212° F. it can be strained, a process requisite to separate the stems and other impurities with which it is commonly mixed. When quite cold it is brittle and may be pulverized. The taste of galbanum is bitterish, hot, and acrid, and its odor balsamic, peculiar, and disagreeable. It is wholly soluble in dilute alcohol; less so in ether. Its specific gravity is 1.219; and its composition, by the analysis of Meissner, is as follows: resin, 65.8; gum, 22.6; bassorin, 1.8; volatile oil, 3.4; bitter matter with malic acid, 0.2; vegetable remains, 2.8; water, 2; loss, 1.4; total, 100. An essential oil is obtained by distillation, of a fine indigo blue, which it imparts to alcohol. Varieties of galbanum of somewhat different qualities are occasionally met with. Galbanum is rarely used medicinally as an internal remedy, though it possesses stimulant, expectorant, and antispasmodic properties, on account of which it is sometimes prescribed in catarrhs, chronic rheumatism, &c. Its most useful application is in the form of a plaster, alone or in combination with other substances, to produce a mild degree of counter-irritation. When given internally the dose is from 5 to 16 grs., which may be administered in the form of pills, or made into an emulsion with gum as in cases of the like nature.

**GALE, James**, an English inventor, born near Plymouth in July, 1888. Before reaching manhood he became totally blind. He was for a time a partner in a manufacturing house, and afterward practised as a medical electrician at Plymouth. In 1866 he announced that he had "discovered a means of rendering gunpowder non-explosive and explosive at will, the process for effecting the same being simple, effectual, and cheap, the quality and bulk of the gunpowder remaining uninjured." The invention consists in mixing powdered glass with the gunpowder, which renders it unexplosive, but which by a simple process can be separated from it again. Mr. Gale has also invented an ammunition slide gun, a fog shell, and a balloon shell. His biography, by John Plummer, was published in 1866, under the title, "The Story of a Blind Inventor." 

**GALE, Theophilus**, an English theologian, born at King's Teignstone, Devonshire, in 1628, died at Newington in March, 1878. He graduated at Magdalen college, Oxford, in 1649, became a fellow and an active tutor in 1650, and afterward a popular preacher in Winchester. At the restoration he was ejected from his fellowship for nonconformity. In 1677 he became pastor of a congregation at Holborn, and afterward taught private pupils at Newington. At his decease he left his property to trustees for the education of dissenting students, and bequeathed his library to Harvard college. Besides his great work, "The Court of the Gentiles, or a Discourse touching the Original of Human Literature, both Philologic and Philosophic, from the Scriptures and Jewish Church," &c. (5 vols. 4to, 1669-177), he published "The True Ideal of Janesinism" (1669), *Philosophia Generalis* (1676), sermons, &c.

**GALE, William.** See supplement.

**GALEAZZO.** See SPAZZA, and VISCONTI.

**GALEN, Christoph Bernhard von, a German soldier and prelate, born at Bisping, Westphalia, about 1600, died at Ahuna, Sept. 19, 1678.** Early connected with the church, and having studied at the Jesuits’ college and in various universities, he became prominent in the civil as well as in the ecclesiastical administration of Münster, and was promoted to be bishop of that see in 1650, after the death of the elector Ferdinand of Cologne. But he had no sooner restored the discipline and prosperity of his diocese, and caused the last remnants of the foreign invaders to leave, than he had to contend with the jealousy of the deacon Mallingkrotz, and with the refractory citizens of Münster. On his threatening to put the place in a state of siege, they sent emissaries with whom he concluded an arrangement. But the feeling against him continued, and the representative of the city at the Hague declared that it would rather be ruled by the Turks, or even by the devil, than by the bishop. While the Netherlands loaned 25,000 florins to the insurgent city, the emperor Leopold I. threatened (1660) to put it under the ban of the empire, and sent troops for the restoration of obedience. Münster was obliged to surrender (March, 1661) to the bishop, who ruled thenceforward with an iron hand and remained undisturbed in his authority. In 1664 he was appointed by the diet of Ratisbon as inspector, together with the margrave Frederick of Baden, of the military organization of the Rhenish alliance, joined with the bulk of his army the war against the Turks, and gained a renown which encouraged him to retaliate upon the Dutch republic, by attacking it on land, while England was to engage in hostile naval operations. Through the mediation of Louis XIV. peace was made in April, 1666, and the bishop was restored to the possession of his whole diocese with the exception of the domain of Borkei. In 1672 hostilities were renewed by his joining France against the Netherlands, and in this year he in the preceding year settled his differences with the Brunswick dynasty in regard to the abbey of Korvei, of which he had been appointed ad-
Galen

ministrator in 1682. The operations against the Netherlands opened auspiciously, but he was overwhelmingly defeated at Coevorden at the close of 1672; and the Emperor of Germany having entered into a coalition with the elector of Brandenburg, the bishop hastened home to protect his own dominions. He succeeded, with Turenne, in occupying several Westphalian possessions of the elector, but, with an army considerably reduced in numbers by defeats, he was but too glad to accept terms of peace in 1674, pledging himself to restore to the Dutch all the places which he had taken from them. Ever ready to join a fray, the warrior-bishop sided in 1675 with the emperor against France, and in August of the same year he joined Denmark and Brandenburg in operations against Sweden. He personally conducted the operations against the duchies of Bremen and Verden, which then formed part of the latter kingdom, and in August, 1676, captured Stade, the capital of the duchy of Bremen; after which he divided the conquered territories with the dukes of Brunswick, receiving the whole of Bremen and other localities. He now increased his military forces in order to furnish to Spain, in 1677, a contingent of 9,000 men against France, and to Denmark one of 5,000 against Sweden, while part of his troops reinforced the imperialists on the Rhine and the Moselle. But a portion of his soldiers having taken up winter quarters in East Friesland, complications arose in that region, again involving him in war; and he would have insisted upon a permanent occupation if the East Frieslanders had not induced him by considerable bribes to evacuate their soil in 1678. He participated in the negotiation of peace at Nimwe..—Tacken has published Geschichten des Stifts Münster under Galen (Münster, 1865).

Galen (Galeanus), Claudius, an ancient physician, born in Pergamum in Mysia, A.D. 130, died, according to Suidas, in 200 or 201, but according to his Arabic and some other biographers, from 10 to 18 years later. Galen at 15 studied logic and philosophy; two years after he began the study of medicine; and at about the age of 20 he travelled into various countries to complete his education. He was absent from Pergamum nine years, and when he returned he was appointed city physician to the school of gladiators. Some popular communions having arisen a few years after his appointment, he went to Rome, where he spent about four years, and acquired great reputation for skill in anatomy and medicine. As soon as the troubles in Pergamum had passed away, Galen hastened back; but hardly had he reached his destination when he was summoned by the emperors Marcus Aurelius and Verus to attend them at Aquileia, where a pestilence raged in the camp. Verus died of apoplexy on the way to Rome, and Galen accompanied Marcus Aurelius thither. When returning to the camp after the apotheosis of his colleague, Marcus Aurelius urged Galen to accompany him, but he declined under pretence that Aesculapius had enjoined him to remain. How long he sojourned in Rome during his second visit is uncertain, but while there he continually added to his fame by his lectures, writings, and practice. He ultimately returned to his native city, and died there. Galen was not only the most eminent physician, but also one of the most learned and accomplished men of his age; and for more than 1,000 years after his death his authority in medical matters was regarded in Europe as almost supreme. He was a very voluminous writer on medical and philosophical subjects. There are even extant 88 treatises of his, and 15 of his commentaries on various works of Hippocrates, besides fragments of his lost works and writings falsely attributed to him. The best edition of his works is that by Köhlin (20 vols. 8vo, Leipzig, 1821–88). Writings attributed to him were discovered and published in Paris by Minas in 1844, and by Daremberg in 1846.

Galen, sulphur, lead, the ore which furnishes most of the lead of commerce. It occurs in highly crystalline masses, which separate into cubical fragments. Its structure is also granular, and sometimes fibrous. Freshly fractured, it presents a brilliant lustre like polished steel, which changes by exposure to a dull lead-gray color. Its hardness is from 2.5 to 2.76; specific gravity, 7.25 to 7.7. Its composition, represented by the symbol PbS, is lead 86%, sulphur 14%; but it often contains other metals, as antimony, silver, zinc, iron, and copper, as well as the substance selenium. It is also largely intermixed with the earthy gangues that form the principal portion of the veins in which it is found. From these, and from the sulphures of zinc and the pyritous copper and iron usually associated with the ore, it is separated as far as practicable before smelting by the processes of stamping or crushing, jiggling, &c. (See Lead, and Metallurgy.) In some veins and beds it is frequently found in large groups of cubical crystals, which are very free from foreign substances. In this form it is met with in the fissures in the limestone of the lead region of Wisconsin, Iowa, and Illinois, imbedded in the clay with which the fissures are filled. Galena is a valuable ore for the silver it often contains, as well as for the lead. In reducing the ore by smelting, the silver all goes with the lead, which is run out; and from this it is separated either by the process of cupellation, or by crystallization, or other method. The lead ores however do not all contain silver enough to render its extraction profitable, although the separation is so cheaply conducted that 1 oz. of silver to the ton of lead will pay for the operation. Galena rich in silver is a product of numerous veins in the granitic and metamorphic rocks of New England and the Pacific states; but the more argentiferous it is, the less certain is the yield of the veins in quantity, and few of this character have been found
profitable to work. In Cornwall and Devonshire, England, mines of argentiferous galena have been worked profitably for centuries, even when a product of 9 or 10 oz. of silver to the ton of silver-lead was required to pay the expense of separation. The richest metal was from the ores of mines near Beer Alston in Devonshire, which yielded from 80 to 120 oz. of silver to the ton of lead; one portion of the mines, known as the South Hoe, yielded lead containing 140 oz. of silver to the ton. These mines, though now of little importance, were famous for their production in the time of Edward I. and II. The most celebrated mines of argentiferous galena in the United States are those of the Washoe district, Nevada. Galena may be formed artificially by fusing lead with sulphur.

GALENA, a city, port of delivery, and the county seat of Jo Daviess co., Illinois, and the centre of the region known as the "Galena lead mines," situated on both sides of the Galena river, 6 m. from its mouth in the Mississippi, and on the N. division of the Illinois Central railroad, 14 m. S. E. of Dubuque, Iowa; pop. in 1850, 6,004; in 1860, 8,196; in 1870, 7,019, of whom 3,473 were foreigners. Galena river is generally navigable for any steamboats that can ascend the rapids of the Mississippi. The ground upon which the city is built rises abruptly at a short distance from the river on both sides, and some of the bluffs reach a height of upward of 200 ft. These bluffs, which encircle the whole city, are composed of mountain limestone, and give the place an extremely irregular and picturesque appearance. The streets rise one above another, and communicate with each other by steps. The public and private buildings are mostly of brick, and many of them in a good style of architecture. On the W. side of the river are a fine high school building, the United States marine hospital (now used by the normal school and public building), accommodating the custom house and post office. In the environs are many streams of water, which afford ample power for manufacturing purposes. The city contains an iron foundery, two manufactories of furniture, a woollen mill, two flour mills, a saw mill, two planing mills, and a sash and blind factory. There are two national banks, with a capital of $325,000. For the year ending June 30, 1872, the number of vessels belonging to the port was 60, with an aggregate tonnage of 7,782, of which 25 of 3,783 tons were steamers, and 35 of 4,019 tons barges. The shipments in 1872 were 800,000 bushels of oats, 75,000 pigs of lead, 4,000 tons of zine ore, 75,000 barrels of flour, 46,000 of pork and lard, 4,000 dressed hogs, and 260,000 lbs. of meat in bulk; receipts, 7,000,000 feet of lumber; 1,000,000 lbs. of coal; 1,000,000 lbs. of salt; 600,000 bushels of meal; 12,000,000 lbs. of pork; 6,000,000 lbs. of shoes; 10,000,000 lbs. of cotton; and 15,000,000 lbs. of wool. Galena was laid out in 1837, and incorporated as a city in 1839, deriving its name from the sulphur of lead so called, which abounds in the locality. (See Lead.)

GALESPRITHEUS. See FLYING LEMUR.

GALENUS, Gaius Valerius Maximus, a Roman emperor, reigning from A. D. 805 to 811. A native of Dacia and the son of a peasant, he distinguished himself in the armies by his courage, and was appointed Caesar in 292 by Diocletian, whose daughter he married. Receiving Thrace and Macedonia for his province, he was defeated by the Persian king Narses, but was so disdainfully received by the emperor at Antioch on his return that he again set out, crossed the Euphrates, and gained a decisive victory over the Persian king. He now extorted from Diocletian an edict of proscription against Christianity, which was bloodily executed. After the abdication of Diocletian in 805 he reigned over the East; but when Italy recognized the authority of the usurper Maxentius, he rebelled against him to besiege Rome, which he had never yet seen, but was defeated by Maxentius (307). The rest of his life was devoted to the draining of lakes and the clearing of forests.

GALES. I. Joseph, an American journalist, born in England about 1760, died in Raleigh, N. C., Aug. 24, 1841. He was originally a printer and bookseller at Sheffield, where he founded and published the "Sheffield Register." His republican principles involved him in difficulty with the government, and in 1798 he sold his journal to James Montgomery the poet, and emigrated to the United States. He settled in Philadelphia, where he conducted the "Independent Gazetteer" for two or three years, and introduced the practice of reporting by shorthand the debates in congress. In 1799 he sold the paper to Samuel Harrison Smith and removed to Raleigh, N. C., where he established the "Register," which he conducted for nearly 40 years. II. Joseph, son of the preceding, born at Eckington, near Sheffield, April 10, 1786, died in Washington, D. C., July 21, 1860. He was educated at the university of North Carolina, went to Philadelphia to learn the art of printing, and in 1807 settled at Washington as the assistant and afterward as the partner of Samuel Harrison Smith, who in 1800 had removed the "Independent Gazetteer" to Washington and changed its name to the "National Intelligencer." In 1810 Mr. Gales became sole proprietor of the journal, which was published tri-weekly. In 1813 he took into partnership his brother-in-law, Mr. William W. Seaton, and in January, 1818, began to issue the "National Intelligencer" daily. It was continued till 1866.

GALESBURG, a city, county seat of Knox co., Illinois, on the Chicago, Burlington, and Quincy railroad, at the junction of the Burlington and Peoria branches, 160 m. W. S. W. of Chicago and 40 m. E. by N. of Burlington,
GALESVILLE, a town and the capital of Trempealeau Co., Wisconsin, situated on Beaver creek, about 6 m. from the Mississippi, and 120 m. N. W. of Madison; pop. in 1870, 1,068. It is the seat of Galesville University (Methodist-Episcopal), organized in 1855, which in 1872–3 had 5 professors, 145 students (35 collegiate and 110 preparatory), and a library of 4,500 volumes. The town was laid out in 1854 by the Hon. George Gale, who gave a considerable sum for the endowment of the university.

GALICIA (Ger. Galizien, Pol. Galicja), a crownland or province of the Cisleithanian division of the Austro-Hungarian empire, now comprising the kingdom of Galicia and Lodomeria, the duchy of Auschwitz (Jew'sheim) and Zator, and the grand duchy of Cracow. It lies between lat. 47° 40' and 50° 50' N., and lon. 18° 54' and 26° 35' E., and is bounded N. by Russian Poland, from which it is in part separated by the Vistula, E. by Russia, S. by Bukowina and Hungary, being separated from the latter by the Carpathian ridge, and W. by Austrian and Prussian Silesia; area, 30,909 sq. m.; pop. in December, 1873 (estimated), 6,329,361. Its S. part is occupied by the N. branches of the Carpathians, which in some parts rise to a height of 6,000 ft., and in some peaks above 8,000. The central region is hilly; the northern belongs to the great Polish plain. From the Carpathians and their offshoots descend all the rivers which cross the country, flowing mostly in a N. and partly in a S. E. direction. Those flowing N., the Biala, Soila, Skawa, Raba, Dunajec, Wisloka, San (which divides the country into two unequal parts), and the Bug, are tributaries of the Vistula; the Pruth and the Dniestrow S. E., the former to the Danube, the latter, with its affluents the Stry, Sered, and Podhorze, to the Black sea. There are some marlites in the N. E. part of the plain, and numerous mountain lakes, called "eyes of the sea," in the Carpathians, some at heights of 3,000 to 4,000 ft. The climate is healthy but cold, the country being exposed to the winds from the east and north, and closed against those from the south; the winters are long. The soil is varied, only the lower region, where loam and sand prevail, being productive, and in some places fertile; the mountains are rocky and sterile, or wooded. Tobacco and all the common grains, fruits, and vegetables are raised. There are very few vineyards, and these yield no wine. The pine prevails in the forests, but the oak and beech also grow to an imposing size. Honey and wax, potash and tar, are made in large quantities. The rivers are rich in various kinds of fish. The chief mineral productions are iron, which is found along the whole line of the Carpathians; salt, mostly from the celebrated rock salt mines of Wieliczka and Bochnia in the vicinity of Cracow, and partly from saline springs in the eastern parts of the country; sulphur, produced chiefly at Swosowice; coal, in the territory of Cracow; and naphtha. Lead, copper, zinc, silver, and gold are also found. The inhabitants belong mostly to two Slavonic tribes, the Poles and the Ruthenians, the former predominate in western (88 to 4 per cent.), the latter in eastern Galicia (87 to 20 per cent.), the remainder being Germans and Jews. In the whole country the Poles are about 48 and the Ruthenians 45 per cent. The nobility are mostly of Polish descent, vivacious, warlike, and ardently attached to their nationality; the peasants are hardy, rude, sluggish, and slovenly; the Jews, who are very numerous in the cities, of which they often form half the population, are distinguished by a peculiar half oriental dress, and an unpleasant German jargon. Education, agriculture, and industry are backward; wealth is rare; excessive misery, especially among the Jews and mountaineers, is frequent. Distilleries abound in the villages, and stores and trading shops in the town quarters of the Jews, who before the revolution of 1848 were excluded by the government from both cities proper and villages. Manufactures are making considerable progress; the chief articles produced are linen, woollens, paper, wooden utensils, tobacco, leather, imitation jewelry, sugar, potters' ware, and glass. Commerce is limited and carried on mostly by Jews, the chief commercial cities being Cracow, Brody, and Lemberg, the capital. The chief exports are cattle and horses, grain, salt, timber, potash, skins and hides, and wool. Brody is an emporium for the transit trade with Russia. The Roman Catholics, about 2,500,000, have bishops at Przemysl, Tarnow, and Cracow, and an archbishop at Lemberg; the members of the Greek united church, about 2,850,000, mostly Ruthenians, have an archbishop at Lemberg and a bishop at Przemysl; the non-united Greeks, about 1,400, mostly Moldavians, belong to the bishopric of Czernowitz in Bukowina; the
united Armenians, 2,100, have an archbishop at Lemberg; the Protestants (34,000 Lutherans, 5,800 Reformed) have a superintendent in the same city; the Jews, about 380,000, have no hierarchical centralization. Only 80 per cent. of the children of school age attend any school. There are two universities, at Lemberg and Cracow. The Polish students (754 in Lemberg and 683 in Cracow) number nearly three times as many as the Ruthenian (480 in Lemberg and 14 in Cracow). The number of literary productions has of late largely increased, and the Ruthenians are making great efforts to dislodge the Polish as the literary language in their districts, but as yet with very little success. (See Poland, Language and Literature of, and Ruthenians.) At the head of the administration is a statholder or governor, to whom are subordinate the political magistracies of Lemberg and Cracow and 74 Bezirkskapitainschaften. There are supreme courts of justice at Lemberg and Cracow. The diet consists of the provincial marshal, the 8 archbishops and the 8 Catholic bishops (the see of Cracow has long been vacant), the rectors of the universities of Lemberg and Cracow, 44 deputies of large landed estates, 4 of the capital, 8 of the chambers of commerce and industry (Lemberg, Cracow, and Brody), 16 of the towns and industrial places, and 74 of the rural communities. Galicia is the only large division of the empire which has no regular fortress; transportation of troops, however, is facilitated by good roads, as well as by extensive railway lines, which connect Lemberg and Lemberg with each other and with all the principal cities of the empire.—The earliest regular settlement of Galicia was by the Ruthenians (Pol. Rusin), who now occupy the eastern division, also called Red Russia. This was occupied toward the end of the 9th century by the Magyars, then passing to Hungary. Lodomeria, E. of modern Galicia, and then called Codomeria, was by the Magyars at the beginning of the 11th century. Various principalities, the chief of which was Halicz (from which the present name of the country is derived), were subsequently formed under the protection of the kings of Hungary. About the middle of the 13th century Galicia was annexed to Lithuania, in the early part of the 14th to Moscow, and after the death of the last prince of Halicz (1440) to Poland under the reign of Casimir the Great. From that time it shared the destinies of the latter country, down to the time of the first partition of Poland in 1772, when it was taken by the empress Maria Theresa, on the ground of the old claims of the crown of Hungary. It received the title of kingdom of Galicia and Lodomeria, though Lodomeria was in the possession of Bukowina. Bukowina was in 1777 united with it, and remained so until made a separate crownland in 1849. The last division of Poland (1795) brought new fragments of that country into the possession of the Hapsburgs, and the province was divided into E. and W. Galicia. A part was ceded in 1809 to the duchy of Warsaw, and was afterward annexed to Russian Poland; another part was converted by the treaty of Vienna into the republic of Cracow (1815), and was annexed to Austria after the Polish rising of February, 1846, which was suppressed in Galicia through a frightful slaughter of the nobility by the peasantry. Insignificant attempts at insurrection were made in the spring of 1848 at Cracow and Lemberg. The constitutional régime which began in that year was short-lived; several conspiracies, aiming at the restoration of Polish independence, were detected and severely punished. A return to a liberal policy took place in 1860, and Galicia received its representation in the Vienna Reichsrath under the constitution of 1861, and again under that of 1867. In this body, however, the Polish representatives generally sided with the Ozechs and other federalists, in opposition to the German majority, which aimed at preserving the unity of Cisleithan Austria. Various attempts to conciliate them by special concessions proved futile, and the Reichsrath finally baffled this opposition by the electoral reform law of 1878, which substituted direct elections to the Vienna assembly by districts for elections by the provincial diets. This at once divided the Galician representation, as in the elections toward the close of that year the Ruthenians carried a number of districts in direct hostility to the Polish national interest. The policy of abstention, in which the Poles formerly followed the Ozechs, was abandoned. (For further historical details, see Austria, Cracow, and Poland.)

Galicia, an old province, now a captaincy general, of N. W. Spain, comprising the modern provinces of Corunna, Lugo, Orense, and Pontevedra, bounded N. and W. by the Atlantic, S. by Portugal, and E. by Asturias and Leon; area, 11,344 sq. m.; pop. about 2,000,000. It is intersected by numerous narrow valleys, and is mostly mountainous, as the western continuation of the Cantabrian range spreads over the greatest part of the province, and watered by numerous torrents, streams, and rivers. The most remarkable of the latter are the Miño or Minho, with its affluents the Sil and the Tea, the Ulla, and the Tambr, which all become navigable in their lower course and empty into the Atlantic, forming there wide estuaries, or rías, and safe harbors. The coast, being rugged and more broken than those of Asturias and Biscay, owing to the violent currents of the Atlantic in these latitudes, presents many deep inlets and lofty promontories. Among its excellent harbors are those of Ferrol, said to be the best in Europe, and Vigo, the principal port on the W. coast, which is connected by rail with Corunna. The climate is cold on the interior and the more elevated regions, temperate in the lower country and along the coast. The proportion of arable land is very limited. The soil produces flax, maize, barley, wheat,
GALILEE

and an abundance of fruits, which constitute the main food of the population; the best oranges and wine are found in the S. part. Fishing and navigation form a principal part of the industry of the people, who also manufacture linen for domestic use. The inhabitants, calledGallegos, are hardy and robust, and speak a dialect greatly differing from the common Spanish. About 100,000 of them yearly leave their country, supplying the larger cities of Spain and Portugal with porters and servants, and the neighboring provinces with hands for the harvest, their wives performing the work in the house and the labor in the field during their absence. The chief towns are Orense, the capital, Ferrol, Pontevreda, Vigo, Lugo, Santiago de Compostela (the ancient capital), and Orense. Galicia was in antiquity the country of the Artabri and a section of the Spaniards. After the invasion of Spain by the Romans, in the commencement of the 3rd century, it was successively conquered by the Suevi, Visigoths, and Saracens. Ferdinand I. of Castile, about the middle of the 11th century, erected it into a kingdom for one of his sons, who was soon deprived of his throne and estates by his brother Alfonso, king of Castile. Galicia was subsequently often held by the younger sons of the kings of Castile as an appanage, became independent in the course of time, and was finally annexed to his dominions by Ferdinand the Catholic.

GALILEE, the northernmost of the three western main divisions of Palestine in the time of the Romans, subdivided into Upper and Lower Galilee. Upper Galilee was bounded N. and W. by Mt. Lebanon, Coele-Syria, and Phoenicia; E. by the Jordan, and S. by Lower Galilee. This division was called Galileo of the nations, or of the gentiles, because of the mixed nature of its population. It embraced the ancient territory of Naphthali, and the northern part of Asher. Lower Galilee was bounded N. by Upper Galilee, W. by Phoenicia and the Mediterranean, E. by the lake of Tiberias or Gennesaret, and S. by Samaria. This division contained the ancient territory of Zebulon and parts of Issachar and Asher. The inhabitants of Galilee spoke a rude, corrupt dialect, different from that of the Jews in Samaria and Judea, and were noted for their turbulent and rebellious spirit. It contained most of the places noted in the history of Christ, such as Nazareth, Cana, and Capernaum. The apostles were all Galileans by birth or residence. The chief city of Upper Galilee was Cesarea Philippi; of Lower Galilee, Tiberias, which after the destruction of Jerusalem by the Romans became the principal religious centre of the Jews in northern Palestine.

GALILEE, Sea of. See GENNESARET.

GALILEO GALILEI (Galileo, by which he is commonly known, being his Christian name), an Italian philosopher and mathematician, born in Pisa, Feb. 15, 1564, died in Arcetri, Jan. 8, 1642. He came of a noble Florentine family, whose original name was Bonajuti, which they exchanged for that of Galilei about the middle of the 14th century. Vincenzo, the father of the philosopher, was a man of learning and the author of a number of treatises on music. He was unable to give his sons a thorough education, but Galileo acquired, amid various discouragements, a fair knowledge of the classics and the common branches of learning, and also of music, drawing, and painting. The last named art he seems to have resolved upon cultivating as a profession, but his father sent him to Pisa to study medicine, where he was matriculated at the university as a scholar in arts, Nov. 5, 1581, and became a pupil of the celebrated botanist Cassanpinus. He still employed his leisure in his favorite branches of the fine arts, and his love of drawing led him to study geometry. After many fruitless remonstrances his father left him to the natural bent of his genius. His first discovery was about 1583, when he was led to infer the isochronism of the vibration of the pendulum by noticing the regular swinging of a lamp in the cathedral of Pisa. Though it was 50 years before the philosopher applied his discovery to clockwork, he at once perceived its importance, and caused it to be employed by physicians in counting the pulses of their patients. Some time afterward, having read the treatise of Archimedes on floating bodies, he invented a hydrostatic balance, and wrote a description of it, which introduced him to the friendship of Guido Ubaldi, the mechanist and mathematician. A paper on the centre of gravity was indirectly the means of securing for him at the age of 26 a professorship of mathematics in the university of Pisa. The salary was but 60 crowns, and he had to look for his support partly to private pupils. His sarcastic attacks upon the notions of the Aristotelians, although his arguments were fortified with careful experiments, raised up a host of enemies, whose animosity pursued him for the rest of his life. He demonstrated the error of supposing that the velocity of falling bodies is proportional to their weight, by letting fall unequal weights at the same time from the top of the leaning tower of Pisa, explaining that the trifling difference of time noticed in their respective descents was owing solely to the resistance of the air. The death of his father in 1591 imposed upon him the duty of supporting the family. Soon after this the interest of Ubaldi procured him the appointment of professor of mathematics for six years in the university of Padua. This new position, upon which he entered in September, 1592, gave him a salary of 150 florins, and enabled him to remove from a city where the hostility of the Aristotelians embittered his existence. He constructed several useful machines for the state, and composed treatises on gnomonics, astronomy, mechanics, architecture, and even fortification, which he delivered in the form of lectures. In 1597 he made a kind of thermometer in which both air
and water were employed. During this period he began a friendly correspondence with Kepler, which continued until the death of the latter; and about the same time appeared a treatise on the sphere after the Ptolemaic system, which has been attributed to Galileo on rather insufficient grounds. It was published from a MS. in the library of Somaschi at Venice (Rome, 1656). Probably between the years 1593 and 1597 Galileo became a convert to the Copernican theory of the revolution of the earth about the sun; but it is impossible to fix the date of this important event in his life, for he says in a letter to Kepler (1597), that in deference to public opinion he did not declare his conviction of the truth of the new doctrines for some years after he had formed it. On the expiration of the term of his professorship the Venetian senate appointed him for six years more, and raised his salary to 830 florins. In 1604, a new star of remarkable brilliancy having appeared in the constellation Serpens, he attacked the popular notion that it was a meteor, and proved by the absence of parallax that it was far beyond the limits of our system. His appointment at the university was again renewed, with an addition of 200 florins to his salary. The crowds that came to hear him were now so great that he was sometimes obliged to lecture in the open air. In 1609 a report reached him at Venice that a Dutchman had constructed an instrument which had the property of making distant objects seem near. On his return to Padua the philosopher immediately applied himself to the solution of the mystery, and, after trying several combinations of lenses, succeeded in making an instrument which magnified three times. It consisted merely of a leaden organ pipe, with a plano-convex glass at one end and a plano-concave at the other. This he carried to Venice, where it at once became an object of intense public curiosity. He presented it to the senate, who thereupon confirmed him in his professorship for life, and raised his salary to 1,000 florins. Galileo soon constructed another telescope which magnified eight times, and at length a third which had a power of 30. The wonders of the heavens now unfolded to him, which no man had ever seen before, filled him with "incredible delight." His earliest observations were upon the moon, whose inequalities of surface he was the first to trace. He saw myriads of stars in the Milky way, counted 40 in the Pleiades, and at length, on Jan. 13, 1610, after six nights' observation, discovered the revolution of four satellites around the planet Jupiter. He did not publish this intelligence until by repeated examination, up to March 22, he had insured himself against the charge of illusion. The news of his discoveries, which he entitled Sidereus Nuncius, the "Sidereal Messenger," was received by the astronomers of the old school with insults and incredulity. Some exclaimed against the impiety of scooping out valleys from the fair face of the moon; some attempted to explain away the satellites of Jupiter as mere appearances caused by reflected light. A professor in the university of Padua argued that as there were only seven metals, seven days in the week, and seven apertures in a man's head, so there could be but seven planets; and when forced to admit the visibility of the satellites through the telescope, he reasoned that, being invisible to the naked eye, they were useless, and consequently did not exist. Several persons claimed a prior discovery of the "Jovian planets," and the astronomer Zach, as late as 1788, claimed for Thomas Harriot the credit of having observed them on Jan. 16, 1610, some time before Galileo's discovery was made known. According to Sir David Brewster, however, Harriot did not see them till Oct. 17. Viviani, in his life of Galileo, tells us that the telescope led him to the construction of the compound microscope, and that he presented one to the king of Poland. The grand duke of Tuscany gave Galileo 1,000 florins, and made him his philosopher and mathematician with a liberal salary and nominal duties. He now removed to Florence. To guard against future attempts to steal his laurels, he published his subsequent discoveries in enigmatical form, and thus in the course of the same year he announced that Saturn was "triple," an appearance which Huygens subsequently showed was caused by that planet's rings. Galileo was the first to notice that Venus exhibits phases like those of the moon; and if not the first to discover spots on the sun's disk, he was at least the first to note their peculiarities, and to infer from them the sun's rotation. Some of these observations were made in 1611 at Rome, which he then visited for the first time, where he erected his telescope in the Quirinal garden belonging to Cardinal Bandini. He was received with the highest honors, and became a member of the famous Lincean academy. In 1612 he contributed in his work on the laws of floating bodies the common opinion that the tendency of substances to sink or swim in water depends on their shape. With this period in his life the philosopher may be said to have reached the zenith of his prosperity, while at the same time the malice of his enemies began to acquire a dangerous intensity. The Copernican system, which he had long taught in public, afforded a good pretext for attacking him. The sun's revolution round the earth was thought to be a truth of Scripture. Certain Tuscan ecclesiastics began to preach against the wickedness of sending our world spinning through space, and a sarcastic Dominican hurled a sermon at Galileo from the text: *Firi Galilei, quid statis adserieitens in caelestium?* "Ye men of Galilee, why stand ye looking up into heaven, and ferret after your philosophy?" In 1613 Galileo addressed a letter to his pupil Castelli, showing that the language of the Bible should be interpreted according to popular ideas, and that the Ptolemaic system is really as much at variance with it as the Copernican.
This was followed by one to Christina, grand duchess dowager of Tuscany, reiterating his views, and supporting them by quotations from the writings of the fathers. A Dominican, Lorniz, laid a copy of the Castelli letter before the Roman inquisition in February, 1615, but the inquisitors refused to act in the matter, remarking that by confining himself to the system and its demonstration, and letting alone the Scriptures, Galileo would be secure from molestation. His enemies, however, continued their intrigues, and about the end of 1615 he went to Rome, either to obtain a formal sanction of his opinions, or in obedience to a summons. His case came again before the holy office in February, 1616. He was charged with teaching that the sun is the centre of the planetary system, and interpreting Scripture to suit his own theory. The qualifiers of the inquisition pronounced the obnoxious doctrines "formally heretical, because expressly contrary to Holy Scriptures." Galileo's letters to Castelli and the grand duchess Coperница's work on the revolution of the heavenly bodies, and Kepler's epitome of the Copernican theory, were placed on the Index Expurgatorii, whence they were not removed until the time of Benedict XIV.; and Galileo himself was forbidden ever again to teach the motion of the earth and the stability of the sun. Thenceforward he was not permitted to express himself as though Copernicanism were, in the words of the Roman curia, "an actually grounded hypothesis." But he was permitted and encouraged to use the hypothesis most actively as his clue to fresh scientific results, and to treat with the utmost justice the scientific arguments for and against. He was permitted to maintain that Copernicanism was scientifically likely in the highest possible degree; but as was not at liberty to teach expressly that it had received absolute and irrefragable proof. He had an audience of the pope, however, who assured him of his protection, and in 1617 he returned to Florence. Sickness prevented him from observing the three comets which appeared in 1618, but he entered warmly into discussions about them, and is supposed to have had the chief share in a lecture delivered by his friend Guicciardi and printed in 1619, in which they are held to be only meteors. This discourse was attacked by the Jesuit Grassi under the pseudonym of Lotario Sarri, and defended by Galileo in his Saggiatore ("As sayer"), one of the most beautifully written of his works. On the accession of his friend Cardinal Barberini to the pontificate under the title of Urban VIII., he went to Rome to offer his congratulations, arriving in the spring of 1624, and receiving during the two months that he remained every mark of esteem and liberality. The pope granted him a pension of 100 crowns, and one of 60 crowns to his son. He now set about composing a work in which he might sum up all the arguments for and against his favorite theory. It was written in the form of dialogues, and accompanied by a preface in which he protested ironically against the idea that the decision of the inquisition in 1616 was rendered through ignorance or passion. He says that, on the contrary, its officers listened with attention to his statement of the scientific arguments on which his theory was based, and maintains that the grounds upon which their decision was justified were entirely religious. The book was published at Florence in 1632 under the title of "Dialogue on the two Principal Systems of the World, the Ptolemaic and Copernican." This being regarded as a violation of the injunction, Galileo was ordered to appear in person at Rome, where he arrived in February, 1633, and took up his quarters with the Tuscan ambassador. His trial was short. The principal ground of complaint was the disobedience of the command of 1616, and the scientific reasons which Galileo again urged in support of his theory were not appreciated any better than before, but were met with religious arguments. The sentence was solemnly pronounced June 22. It set forth the offence of the accused in teaching a condemned proposition, violating his pledge, and obtaining a sanction for his book by improper means, declared him to be vehemently suspected of heresy, required him to abjure his errors and all other heresies against the Catholic church, prohibited his "Dialogues," and condemned him to be imprisoned at the inquisition during pleasure, and to recite once a week for three years the seven penitential psalms. Galileo made his abjuration with all the formality which commonly attended such proceedings. Clad in sackcloth and kneeling, he swore upon the Gospel never again to teach the earth's motion and the sun's stability; he declared his detestation of the proscribed opinions, and promised to perform the penance laid upon him. Then rising from the ground, he is said to have exclaimed in an under tone: E pur si muore—"It does move, for all that!" After four days' confinement under the eyes of the holy office, Galileo returned to the Tuscan ambassador's, but for the rest of his life he was kept under surveillance. He passed some time in Siena, in the archbishop's palace, and in December reentered his own house at Arecci, near Florence, where he remained until the close of his life. The death of his favorite daughter Maria so affected his already broken health that he begged permission to visit Florence for medical assistance. It was only after four years (1638) that he obtained it, and then under severe restrictions. He seems now to have paid little attention to astronomy, but employed himself in other branches of natural philosophy. In 1636 his book of "Dialogues on Local Motion," completed two years before, which he prized above all his other works, was printed at Amsterdam by Louis Elzevir. In 1636 also he discovered the moon's diurnal libration. In 1637 a disease which had impaired his right eye for some years attacked the left also, and in a few months.
he became totally blind. The severity of the inquisition was somewhat relaxed in his affliction; he was visited by eminent men of his own and foreign countries, among whom were Milton, Gassendi, and Diblasi, and in the last years of his life his pupils Viviani and Torricelli formed part of his household. Almost complete deafness afterward came upon him, and at last, while preparing for a continuation of his "Dialogues on Motion," he died of fever and palpitation of the heart.—Galileo was of middle size, well formed, with fair complexion and penetrating eyes. He was cheerful, frank, and amiable; frugal and abstemious, but fond of gay company and good wine, and profuse in his hospitality. He was unmarried, but left three natural children. His temper was quick, but placable, and his general accomplishments made him a favorite in mixed circles. His scientific writings were marked by a clear, elegant, and spirited style, which he owed to a careful study of the literature of his country. He was a great admirer of Ariosto, whose Orlando furioso, it is said, he knew by heart, and wrote several "Considerations on Tasso" (Venice, 1798), to show that author's imitation of his favorite poet.—The following is a list of his principal works which were printed separately:
- Opera de composso geometrico e militare (Venice, 1606);
- Difesa contro le calumnies ed imposture di Balt. Capra nella considerazione astronomica sopra la nuova stella del 1604 (1607);
- Sidereus Nuncius (Florence, Venice, and Frankfort, 1610);
- Discorso intorno alle cose che stanno in sull' acqua e che in quella si muovono (Florence, 1612);
- Epistola ad M. Velzera de Maculis Solaireus (1612);
- De Maculis Solaribus et Stellis circa Jovem errantibus accuratior Descrittio (Augsburg, 1612);
- Istorio e dimostrazioni intorno alle macchie solari e loro accidenti (Rome, 1615);
- Dissertatio de Cometa Anni 1619 (Florence);
- Il soggiatore (Rome, 1628); Discorsi e dimostrazioni intorno a systemi del mondo, Tolemaico e Copernicano (Florence, 1632); a Latin translation by Bernegger, entitled Systema Cosmicum, &c., Strasburg, 1683;
- Discorsi e dimostrazioni matematiche attinenti alla meccanica ed i movimenti locali (Leyden, 1688; an English translation under the title "Mathematical Discourses of Mechanic," by Thomas Weston, London, 1780);
- Epistola trea de Conciliations Sacra Scriptura cum Systemate Tellurique Mobile (printed with Gassendi's Apologia, Lyons, 1649).

Galileo's works were published at Bologna by Manolesi (2 vols. 4to, 1656); Florence, by Bottari (3 vols. 4to, 1708); Padua (4 vols. 4to, 1704); Milan (12 vols. 8vo, 1851); and in the complete edition, with the life by Viviani (16 vols., Florence, 1842–56).—For lives of Galileo see Viviani, Vita del Galilei, in the Fasti consolari dell' accademia Firentina; Frisi, Elogio del Galilei (Lohorn, 1775); Brenna, in Fabroni's Vita Italorum; Nelli, Vita e commercio letterario di Galilei Galilei (3 vols. 4to, Lausanne, 1799); Lord Brougham's "Life of Galileo" (1829); Livi, "Histoire de la vie et des ouvrages de Galilei Galilei" (Paris, 1841); Biot, in Michaud's Biographie Universelle; Drinkwater-Bethune, "Life of Galileo," in the "Library of Useful Knowledge;" Sir David Brewster, in Lardner's "Cabinet Cyclopaedia," reprinted with lives of Tycho Brahe and Kepler under the title "Martyrs of Science" (London, 1841). Among recent biographies are those of Philippe Charles (1862), Mädler (1893), Trouessard (1886), Panhappe (1886), and the "The Private Life of Galileo" (London and Boston, 1870); also Botta's "Italian Philosophy," in vol. ii. of Ueberweg's "History of Philosophy," translated by George S. Morris (New York, 1874).
Gall banished the refusal by forbidding Gall to celebrate mass during the abbot's lifetime. No sooner had Gall recovered from his illness that his mother, who with one exception had remained with him, left their abode at Bregenz, and selected a site for a new monastery on the steep banks of the Steinhach, not far from the southern shore of Lake Constance. By his eloquence and his command of the German tongue he was able to spread the knowledge of Christianity rapidly among the Allemann and Helvetii. Having cured miraculously, as it was said, the daughter of a chief or duke of the former, Thierry II., to whose son she was affianced, bestowed on the missionary all the land he wished to occupy between Lake Constance and the Rhetian Alps (about 612). Constance being created an episcopal see, Gall was chosen as its bishop; but he excused himself on account of the injunction of Columbanus forbidding him to perform sacred functions. In 615 the latter from his deathbed sent him a crozier as a token of forgiveness; and ten years later Gall was invited to assume the government of the great monastery of Luxeuil, but alleged his obligation of evangelizing the heathen tribes of southern Germany. The number of his disciples now increased wonderfully. Around the humble monastery his converts came to dwell, until the clustering huts grew in after years to be the city of St. Gall. At his death the territory occupied by the Allemann was a Christian province. His feast is celebrated on Oct. 16. A discourse pronounced at the consecration of the bishops of Constance is the sole relic which has reached us of all his learning. The life of St. Gall was written in the 9th century by Walafrid Strabo, and in Latin verse by the monk Notker in the 10th. See also the Bollandists' new Acta Sanctorum for Oct. 16, and Montalembert's Moines d’Occident.

Gall, Franz Joseph, the founder of phrenology, born at Tiefsbronn, near Pforzheim, in Baden, March 9, 1758, died at Montrouge, near Paris, Aug. 22, 1828. After literary studies at Baden and Bruchsal, he devoted himself especially to natural history and anatomy at Strasburg under Hermann, and passed thence in 1785 to the medical school of Vienna, where he attended the lectures of Van Swieten and Stoll, and in the same year received the degree of doctor. He gradually obtained success in his profession, with leisure for gardening and study. While a boy he had been struck with the differences of character and talents displayed by his companions, and after some time he observed, as he thought, that those students who excelled in committing pieces to memory all had large eyes. By degrees he suspected that the external peculiarities of the head corresponded to differences in the intellectual endowments and moral qualities, and disputed the theories of Aristotle, Van Helmont, Descartes, and Drelincourt, who fixed the soul respectively in the heart, the stomach, the pineal gland, and the cerebellum. He began to examine the heads of those who had exhibited any striking mental peculiarity, in diseases, convulsions, seats of learning, &c. He extended his observations to animals, and finally sought confirmation in the anatomy of the brain, of which he was the first to perceive the true structure. After 20 years he conceived that he had determined the intellectual dispositions corresponding to about 20 organs, that he had found the seats of these original faculties in the brain, and that they formed prominences or protuberances on the skull proportionate to their degree of activity. In 1791 he published the first volume of a general medical work, and in 1796 began to lecture on his peculiar theory in Vienna, where its novelty made a great sensation. The first written account of it appeared in a letter published in Der deutsche Merck of Wieland in 1798. About this time he gained his best disciple, Spurzheim, who gave great aid in the development and popular exposition of the doctrine. Dr. Gall continued his lectures till in 1802 they were interdicted by the Austrian government as dangerous to religion. He quitted Vienna in 1805, and in company with Spurzheim, who was his associate till 1818, travelled in central and northern Europe, lecturing in the principal, especially the university towns, and arrived in Paris in 1807. He established himself there as a medical practitioner, and delivered a course of lectures before a large audience. His principles, however, met with much opposition. He presented to the institute in 1808 his Recherches sur le système nerveux en général, et sur celui du cerveau en particulier, and published it in the following year. In 1823 he made a short visit to London, where the receipts from his lectures were less than the expenses. The most elaborate of his works is the Anatomie et physiologie du système nerveux (4 vols., Paris, 1810–19), a second edition of which was published in 6 vols., each bearing a different title. An English translation of the whole work by Winslow J. Lewis, Jr., M. D., was published in Boston (6 vols., 1865).

Gallagher, William D., an American journalist and poet, born in Philadelphia in Aug., 1806. He went in 1816 to Cincinnati, where in 1826 he entered the printing office of a newspaper. He wrote occasionally for the press, and became editor successively of the "Backwoodsman" at Xenia, O. (1830), the "Cincinnati Mirror" (1831), the "Western Literary Journal and Monthly Review" (1836), the "Hesperian, a Monthly Miscellany of General Literature" (1838), and in 1839 associate editor of the "Cincinnati Gazette," in which position he remained till 1856. He published three small volumes of poetry (1835–7), each entitled "Erato," the principal pieces in which are "The Penitent," "The Conqueror," and "Cadowallen." In 1841 he published a volume of "Selections from the Poetical Literature of the West," and in 1846 a select edition of his
poem. When Thomas Corwin became secretary of the treasury in 1800, Mr. Gallagher accompanied him to Washington as his confidential clerk. In 1858 he removed to Louisville, Ky., and became one of the editors of the "Daily Courier." He afterward took up his residence on a farm near the city, and employed himself in writing on agriculture. During the civil war he was again in the service of the treasury department.

GALLAIT, Louis, a Belgian historical painter, born in Tournay in 1810. He spent several years in studying his art in Paris. Among his pictures most celebrated and popular in Belgium are one illustrating the last honors paid to Egmont and Horn after their execution, which has been purchased by his native city, and one representing the last moments of Egmont (1858). His "Abdication of Charles V." is in the court of cassation of Brussels, and his "Montaigne visiting Tasso," which established his reputation in 1833, is in the possession of the king of Belgium. His "Temptation of St. Anthony" was presented by Leopold to Prince Albert. Many of his pictures have been exhibited and admired in Paris and London. In 1870 he was made an associate member of the academy of fine arts of Paris.

GALLAND, Antoine, a French antiquary and linguist, born near Montdidier, in Picardy, April 4, 1648, died in Paris, Feb. 17, 1715. He became attached to the French embassy at Constantinople in 1700, visited Jerusalem, and copied there a great number of inscriptions, several of which Montfaucon published in his "Palaographia Graeca." Returning to France in 1715, he made two voyages to the Levant to collect medals, coins, &c. He was afterward appointed antiquary to the king. In 1709 he became professor of Arabic in the royal college of France. His works are very numerous, but the most popular of them all is his translation into French of the "Tales of the Thousand and One Nights" (12 vols., 1704-'17, Ed. by Chainin de Perceval, 6 vols. 1810), the famous "Arabian Nights' Entertainments," which he introduced to the knowledge of Europe. For some time they were thought to be inventions of his own.

GALLAS, an African race, generally classed with the Ethiopian division of the Semitic family, inhabiting portions of Abyssinia and the regions S. of it to the equator. Their skin varies between light and dark brown; their hair is somewhat frizzled, but without being woolly; their faces are round, their eyes small, and their figures tall and broad. Many of them consider themselves Mohammedans, but have no well defined conception of the faith they profess. Some have been converted to Christianity, and the Roman Catholic church maintains among them a mission headed by a vicar apostolic. Those who inhabited the pagan part of the country make pilgrimages to sacred trees on the banks of the Hawash, on the S. E. boundary of Shoa, and elsewhere, but believe in a future state of reward and punishment. The Abyssinians narrate that this race descended from an Abyssinian princess who was given in marriage to a slave, and had seven sons who became founders of tribes. They first appear in history as traders of Abyssinia where they succeeded in establishing a permanent settlement. They are classed with the Semitic family on account of their language, though its Semitic character is not quite clearly defined. Whether they possess a graphic system has not been decided to a certainty. D'Abbadie sent a letter to Paris which he supposed to be written in Galla characters, but it has not been deciphered. Krapf has published an outline of the Galla language (London, 1842), in which he maintains that it does not contain a sound which cannot be expressed in English letters, even better than in Ethiopian. This assertion seems however doubtful, and Karl Tuteck has found it needful in his "Dictionary of the Galla Language" (Munich, 1844) to use several signs not found in our alphabet. The Gallas have, for instance, an entirely unaspirated ë which is nevertheless intermediate between ë and ã, and also a p and an t so peculiar that the English can hardly pronounce them.—See Brenner's description and map in Petermann's "Geographische Mittheilungen" (Gotha, 1868).

GALLAS, Matthias von, count, a German soldier, born in 1689, died in Vienna in 1647. He belonged to an ancient family of the district of Trent, and acquired military experience under Prince Bannfremont in the war between Spain and Savoy (1610). After the outbreak of the thirty years' war, he distinguished himself in Bohemia and in Tilly's campaign against Christian IV. of Denmark (1626), and became major general. Together with Altringer he captured Mantua in 1629, and they pillaged the city, most of the booty remaining in the possession of Gallus, who was made count and in 1621 field marshal. After having gained the confidence of the emperor, he appeared with him against Gustavus Adolphus near Nuremberg and at Lützen, he was said to have been the first to disclose to the emperor his chief's ambitious designs. It is certain that he was early aware of Wallenstein's impending disgrace, and was among those who refused to attend when he appealed to his officers at Pilsen. On Wallenstein's removal Gallus succeeded him, and was made duke of Friedland. When, after the assassination of Wallenstein (1634), the future emperor Ferdinand III. became his father's generalissimo, Gallus commanded under him, with Piccolomini, in the battle of Nördlingen; and the victory achieved there over Horn and Bernhard of Weimar reunited in the restoration of the S. W. part of Germany to the emperor's dominions. In 1637 he fought against Baner and Wrangel in Pomerania; but being obliged to retire the following year, he was removed from active service till 1648. He was again commander-in-chief for a short time in 1649, but without retrieving
his reputation. His male descendants became extinct in the middle of the 18th century, and Friedland, to which he had added large domain by marriage of his son with Count Clam, who took the name of Clam-Gallas.

GALLATIN. I. A N. county of Kentucky, separated from Indiana by the Ohio river; area, about 150 sq. m.; pop. in 1870, 5,074, of whom 800 were colored. It is diversified by well wooded hills, and abounds in blue or Trenton limestone. The Louisville and Cincinnati railroad traverses the S. part. The chief productions in 1870 were 46,075 bushels of wheat, 277,140 of Indian corn, 28,880 of oats, 92,070 of potatoes, and 187,050 lbs. of tobacco. There were 1,754 horses, 968 milch cows, 1,871 other cattle, 3,399 sheep, and 8,128 swine; 2 flour mills, 3 saw mills, and 1 distillery. Capital, Warsaw. II. A S. E. county of Illinois, drained by Saline creek, separated from Kentucky by the Ohio river and from Indiana by the Wabash; area, 810 sq. m.; pop. in 1870, 11,154. It consists mostly of forest land, has a fertile soil, and contains valuable salt springs. The chief productions in 1870 were 88,098 bushels of wheat, 509,491 of Indian corn, 27,164 of oats, 25,657 of potatoes, 18,051 lbs. of wool, 110,928 of tobacco, and 3,253 tons of hay. There were 3,016 horses, 2,085 milch cows, 2,980 other cattle, 7,304 sheep, and 14,985 swine; 3 manufactories of carriages and wagons, 3 of saddlery and harness, 1 of salt, 4 flour mills, 3 saw mills, and 1 tannery. Capital, Shawneetown. III. A S. county of Montana, bordering on Idaho and Wyoming, and intersected by Yellowstone river; area, 6,800 sq. m.; pop. in 1870, 1,578. Jefferson, Madison, and Gallatin rivers unite in the N. W. part and form the Missouri. It contains the most productive land in the territory. The chief productions in 1870 were 87,875 bushels of wheat, 69,520 of oats, 87,580 of barley, 13,868 of potatoes, and 2,905 tons of hay. There were 431 horses and 5,214 cattle. Capital, Bozeman.

GALLATIN, Albert, an American statesman, born in Geneva, Switzerland, Jan. 29, 1761, died at Astoria, N. Y., Aug. 12, 1849. His original name was Abraham Albert Alphonse de Gallatin. His father was a councillor of state, and a connection of the celebrated Necker. Albert graduated at the university of Geneva in 1779, and the next year embarked for America. He landed at Cape Ann and went to Maine, where he enlisted in the continental army, and was soon after placed in command of the fort at Passamaquoddy. In 1788 he taught French in Harvard college, and in 1794 he purchased a large tract of land in Virginia for the purpose of forming a settlement, but was deterred from his purpose by the hostility of the Indians. While surveying these lands he first met Washington, who also owned large estates in that region. Washington was seated in a land agent's log cabin, surrounded by a number of squatters and hunters, whom he was examining with a view to ascertain the best route for a road across the Alleghanies. Gallatin stood in the crowd looking on for some time, while Washington put his questions with slowness and deliberation, and carefully noted down the answers. It was soon evident to the quick-minded Swiss that there was but one practicable pass. He grew impatient at Washington's slowness in coming to a conclusion, and suddenly cried out: "Oh, it's plain enough that [naming the place] is the most practicable." The bystanders stared with astonishment, and Washington, laying down his pen, looked at him in evident displeasure, but did not speak. Presently he resumed his pen, put a few more questions, then suddenly threw down his pen, and, turning to Gallatin, said: "You are right, sir." After Gallatin went out Washington inquired about him, made his acquaintance, and urged him to become his land agent. Gallatin declined the situation, and in 1796, by the advice of Patrick Henry, he purchased land on the banks of the Monongahela in Fayette co., Pa., settled there, became naturalized, and devoted himself to agriculture. In 1798 he was a member of the convention to revise the constitution of the state, and in the two succeeding years was a member of the legislature, to which he was chosen as the candidate of the republican or democratic party. In 1798 the legislature elected him United States senator. He took his seat, but his right to it was contested, and at the end of two months he was declared to have been ineligible, on the ground that he had not been a citizen of the United States the nine years required by the constitution, as he did not take the oath of allegiance till 1795. Opposition to the excise laws having ripened in western Pennsylvania into the whisky insurrection in 1794, Gallatin was instrumental, at considerable personal risk, in bringing about a peaceful accommodation between the government and the people. In recognition of his services he was elected to the house of representatives as a people's candidate, and continued a member of that body from 1796 to 1801. On April 26, 1796, he delivered a speech in which he showed himself to be an unflinching republican. He even went so far as to charge Washington and Jay with having pu- sillanimously surrendered the honor of their country. As this speech came from a man whose accent betrayed that he was of foreign birth, and whose youth indicated that he could not have arrived in the country much before the termination of the war, it exasperated the federalists, one of whom remarked in reply that "he could not feel thankful to the gentleman for coming all the way from Geneva to accuse Americans of palming off as Americans." Mr. Gal- latin participated in all the important debates in the house, and soon became the acknowl- edged leader of his party. On his motion the committee of ways and means was first organ- ized as a standing committee of the house in
1795. He directed his attention particularly to financial questions, and besides maintaining his views in debate published two pamphlets, "A Sketch of Finances" (1796), and "View of Public Debt," &c. (1800). He made important speeches on "Foreign Intercourse," March 1, 1798; on the "Alien Law," March 1, 1799; and on the "Navy Establishment," Feb. 9 and 11, 1799. On May 18, 1801, he was appointed by President Jefferson secretary of the treasury, which office he held under him and Madison till 1818. He was eminently successful in his management of the treasury department, and soon attained a reputation as one of the first financiers of the age. His annual reports exhibit great ability, and had the highest influence upon the general legislation of the republic. He opposed the increase of the national debt, and prepared the way for its gradual extinction. He systematized the mode of disposing of the public lands, and was a zealous advocate of internal improvements, particularly the national road and the coast survey. He also exercised great influence on the other departments of the government, and on the politics of the country. In 1809 President Madison offered him the state department, which he declined. He was opposed to going to war with Great Britain in 1812, and as a member of the cabinet exerted himself strenuously to restore amicable relations with the British government. An offer having been made by the Russian government to mediate between the United States and Great Britain, President Madison, March 8, 1818, nominated as ministers to negotiate, Gallatin, James A. Bayard of the senate, and John Quincy Adams, at that time American minister at St. Petersburg. Gallatin and Bayard in May sailed for St. Petersburg in a private ship, with a cartel from the British admiral, granted at the request of the Russian ambassador at Washington. The senate, on meeting in extra session a few weeks later, refused to confirm Gallatin's appointment, because it was incompatible with his secretariaship. The attempt at mediation resulted in nothing, but in January, 1814, an offer was received from the British government proposing a direct negotiation for peace. President Madison nominated as commissioners John Quincy Adams, Henry Clay, Jonathan Russell, Bayard, and Gallatin. Gallatin was still abroad, and to obviate the objection of the senate on account of his holding the office of secretary of the treasury, he resigned that post definitively. It was finally decided that the negotiations should be conducted at Ghent. In the discussions which resulted in the treaty of peace, Dec. 24, 1814, and in the commercial convention with Great Britain in 1817, Mr. Gallatin had a very prominent and honorable share. In 1815 he was appointed minister to France, where he remained till 1823. During this period he was twice deputated on special missions of importance, to the Netherlands in 1817 and to England in 1818. While in this office he rendered some essential service to Mr. Alexander Baring in the negotiation of a loan for the French government. He was also pressed him to take a part of the loan, offering him such advantages in it that without advancing any funds he could have realized a fortune. "I thank you," was Gallatin's reply; "I will not accept your obliging offer, because a man who has had the direction of the finances of his country as long as I have should not die rich. On his return from France he refused a seat in the cabinet, and declined to be a candidate for vice president, to which he was nominated by the democratic party. In 1828 he was appointed by President Adams envoy extraordinary to Great Britain. After negotiating several important commercial conventions, he returned to the United States in December, 1829, and took up his residence in the city of New York. Soon after his return he prepared the argument in behalf of the United States to be laid before the king of the Netherlands as an umpire on the Maine boundary question. In 1830 he was chosen president of the council of the university in New York. In 1831 he published "Considerations on the Currency and Banking System of the United States," in which he advocated the advantages of a regular bank of the United States. He was a member of the free trade convention at Philadelphia in 1831, and prepared for that body the memorial which was submitted to congress. From 1831 to 1839 he was president of the national bank in the city of New York, and on resigning the office was succeeded by his son James Gallatin. The remainder of his life was devoted to literature, and especially to historical and ethnological researches. In 1842 he was one of the chief founders, and was chosen first president, of the ethnological society. He was president of the New York historical society from 1843 till his death. During the controversy with Great Britain on the northeastern boundary, he published a pamphlet on the "Oregon Question," distinguished by impartiality, moderation, and power of reasoning. He was strongly opposed to war, and during the war with Mexico he wrote a pamphlet of which 150,000 copies were printed, and which had a marked influence on public opinion. At an early period Mr. Gallatin turned his attention to the ethnological and philological characteristics of the American Indians. His first essay on this topic was written in 1823 at the request of Humboldt. He afterward published "Synopsis of the Indian Tribes within the United States, east of the Rocky Mountains, and in the British and Russian Possessions in North America," forming vol. ii. of the Archologia Americana (American antiquarian society, Worcester, 1836); and the subject was one of the last that occupied him in a work on the

GALLAUDET. I. Thomas Hopkins, founder of the first institution in America for instruction of the deaf and dumb, born in Philadelphia, Dec. 10, 1787, died in Hartford, Conn., Sept. 9, 1861. He was of Huguenot descent, early removed with his parents to Hartford, and graduated at Yale college in 1805. He entered the theological seminary at Andover in 1811, and was licensed to preach in 1814, but soon became interested in the instruction of deaf mutes, and was appointed to superintend the establishment of an institution at Hartford for that purpose. In 1815 he visited London, Edinburgh, and Paris, and returned in 1816 with Laurent Clerc as his assistant. (See Clerc.) The asylum went into operation in 1817 with a class of seven pupils. Dr. Gallaudet resigned his connection with it as principal on account of impaired health in 1820, but continued to be one of the directors. He afterward prepared various works to aid the education of the young, and in 1858 became chaplain of the Connecticut retreat for the insane, at Hartford, which office he retained till his death. He published a volume of "Discourses" (London, 1818), preached to an English congregation in Paris, a series of "Bible Stories for the Young," "The Child's Book of the Soul" (3d ed., 1850), "The Youth's Book of Natural Theology," and other similar works, and edited 6 vols. of the "Annals of the Deaf and Dumb" (Hartford). His biography, by Heman Humphrey, D. D., was published in New York in 1858.

H. Thomas, an American clergyman, son of the preceding, born in Hartford, Conn., June 8, 1832. He was a professor in the New York institution for deaf mutes from 1843 to 1858. In 1850 he received orders in the Episcopal church, and in 1852 founded St. Ann's church for deaf mutes and their friends, for which a church edifice and rectory, in 16th street, near Fifth avenue, were purchased in 1859. Through his efforts and example church services for deaf mutes have also been established in Philadelphia, Baltimore, Albany, Boston, and other places. Dr. Gallaudet is a frequent contributor to the "American Annals of the Deaf and Dumb" and other periodicals.

III. Edward Miner, LL. D., a deaf-mute instructor, brother of the preceding, born in Hartford, Feb. 5, 1837. He became a teacher in the Hartford asylum in 1856, and in 1857 organized at Washington, D. C., the Columbia institution for the deaf and dumb and the blind. This enterprise proved very successful, and in 1864 he initiated measures for the establishment of the national deaf-mute college, of which he became president and professor of moral and political science. In 1867 he visited the principal deaf-mute institutions of Europe, and on his return in 1868 published an elaborate report of his investigations.

GALL BLADDER, the pear-shaped membranous reservoir, situated in a slight depression on the lower surface of the right lobe of the liver, which contains the bile during the intervals of digestion. The larger extremity is directed forward and to the right; the body of the organ is adherent above to the substance of the liver by dense areolar tissue, free below, covered by the peritoneum, and resting upon the pylorus, duodenum, and right arch of the colon; the neck is narrow and continuous with the cystic duct, about an inch and a half long, which unites with the hepatic duct from the liver, of about the same length, to form the common bile duct (ductus communis choledocus of anatomists). It is composed of an external serous coat, a middle areolar contractile tissue, and an internal mucous membrane; the arteries are derived from the hepatic branch of the celiac axis, the veins from the hepatic plexus, and the veins empty their contents into the vena portae. The hepatic duct is formed by the junction of the two principal branches (one from each lobe), the result of the union of the numerous ramifications from the interior of the liver. During digestion the bile flows without obstruction into the duodenum, but in the intervals of this process, owing to the partial constriction of the common duct, a portion of the bile flows by the cystic duct backward into the gall bladder, whose office is essentially that of a reservoir, storing up a supply of the secretion in the intervals of digestion. The common duct is formed by the union of the hepatic and cystic ducts, and is about $\frac{1}{2}$ in. long, opening obliquely into the duodenum near its last curve, by an orifice in the middle of a slight elevation. The stimulus of the food opens the intestinal orifice, and bile is discharges both from the liver and the gall bladder during digestion, its passage being effected by the contraction of the walls of the gall bladder and the ducts. Ordinarily containing a few ounces, the gall bladder may be so distended as to contain several pints, and it may be so atrophied as to be little larger than a pea; these cases, and the fact of the absence of the reservoir in many animals, show that its physiological importance is not great. It is subject to osification, cancer, and acute and chronic inflammation from the irritation of gall stones or extension of diseases from the intestine; its diseases may end in ulceration, and obliteration of the ducts. From its smallness and protected situation it is rarely directly wounded, though it is sometimes ruptured by great external violence. The gall bladder is absent in invertebrates, in which the bile ducts open directly into the digestive cavity; it is present in most fishes, all reptiles, and most birds. There seems to be no general law regulating its presence or absence in mammals; it is wanting in many rodents (as the mouse), in the elephant, rhinoceros, tapir, camel, pecary, horse, stag, and dolphin; it is present in the monkeys, bats, carnivora, almost all edentates, and in many ruminants (as the ox, sheep,
goat, and antelope). In the *orycteropus* of the Cape of Good Hope, an animal related to the ant-eaters, there are two gall bladders. With the exception of the dolphins, it seems that all mammals in which it is absent are vegetable feeders.

**Galle**

Johann Gottfried, a German astronomer, born at Pabsthaus, near Wittenberg, June 9, 1812. He studied at Wittenberg and Berlin, and became a teacher and subsequently an assistant at the observatory in the latter city, of which Encke was director. In 1839—40, for the discovery of three new comets, he received medals from the king of Denmark and the Lalande prize from the French academy. A doctor's diploma was given to him after his publication in 1845 of *Triduum Roemerii*, relating to the observations of Ole Römer. In 1846 Leverrier applied to Galle for aid in searching for the planet which he supposed to exist beyond Uranus. With the assistance of a map just completed by Dr. Bemicker, Galle had the good fortune to be the first to detect this Leverrier planet, subsequently known as Neptune, on the evening of the very same day on which he had received the French astronomer's application (Sept. 22). Encke declared that theoretic astronomy had never before achieved so great a victory as on this occasion, and Galle received another Lalande prize from the French academy. In 1851 he was appointed professor of astronomy and director of the observatory at Breslau. Besides numerous contributions on the subject of astronomy and meteorology to scientific periodicals, he has published *Grundzüge der allseitlichen Klimatologie* (Breslau, 1857), and an extensive supplement to Encke's *Kometentafel* (1869).

**Galletty**

Johann Georg August, a German historian and geographer, born at Altenburg, Aug. 19, 1750, died in Gotha, March 18, 1828. He was a professor at the gymnasmum of Gotha from 1793 to 1818, and published several manuals of history. Among his larger works are *Kleine Weltgeschichte* (27 vols., Gotha, 1787—1819), and *Allgemeine Weltkunde* (Leipsic, 1807; 12th ed., Pesth, 1859—61).

**Galley** (Fr. *galerie*), a long, low, narrow vessel of war, propelled by oars and sails. The derivation of the word is uncertain, but it is generally supposed to be from *galesa*, a helmet, either because it was used sometimes as a figurehead, or because the basket-like construction at the head of the mast, for the use of archers and slingers, was shaped like a helmet. The name was first applied under the Byzantine empire to this class of vessels, which the ancients designated, according to the number of banks of oars in each, biremes, triremes, quadriremes, &c. The first galleys were merely at an anchor, with a mast set on each side, and sometimes with a single mast and a square sail. The rowers were placed amidship and the fighting men in the bow and stern. Platforms for combatants were soon built on the forecastle and stern, and bulwarks were raised for the protection of oarsmen; but it was not until the 3d or 4th century B. C. that the two platforms were connected so as to make a complete deck. The Egyptian war galleys of the 18th century B. C. differed very little in general construction from the Mediterranean galleys of the 17th century A. D. They were from 116 to 120 ft. long by 16 ft. wide, were propelled by both sails and oars, and were armed with a beak. They are represented sometimes with 23 oars on a side, always arranged in a single bank. According to Pliny, the Erythraeans were the inventors of the bireme, or galley with two banks of oars; Thucydides ascribes the trireme, with three banks, to the Corinthians; the quadrireme, with four banks, is said by Pliny and Diodorus to have been built first by the Carthaginians; and Mnesigerton ascribes the quinquereme, with five banks, to the Salaminians. In the times of Alexander the Great and the Ptolemies, galleys of 12, 15, 20, and even 40 banks of oars were built, according to ancient writers. A vast deal of learning has been expended in attempts to explain the method of arrangement of these oar banks, but it is still an unsolved problem. Some scholars maintain that the several banks were actually placed one above the other, and others that the benches were in rising grades, like stairs; but those familiar with naval construction reject these theories. A more plausible one is that of L'Escalier, who supposes that the three banks of the trireme were arranged, not one above the other, but all in a line, one amidship, one abaft the mainmast, and one forward of the foremost; and that in the quinquereme two banks, one above the other, were put amidship, two abaft, and one forward. The possibility of two superimposed banks is generally admitted, and some writers believe in three. On the column of Trajan is represented a trireme with three banks of oars one above another, but beyond this number we have no example. The Athenians used nothing but triremes for a long time, but in the 4th century B. C. quadriremes and quinqueremes were introduced. In the most flourishing state of their navy they seldom carried more than 10 fighting men in each galley, depending on superior seamanship and sinking an enemy by piercing him with the spar, rather than on overcoming him by a hand-to-hand conflict. The Romans adopted a different system when they built their first navy in the Punic wars. Of the 420 men in each quinquereme, 120 were combatants; and they fitted their galleys with a boarding bridge, by means of which an enemy's deck could be reached easily when the vessels were laid alongside of each other. Quinqueremes had usually two masts, each of which carried a square sail. The mainsail was lowered previous to going into action, and the galleys were manoeuvred by oars alone. In time experience proved the superiority of lighter vessels, and the trireme gradually supplanted other forms and came to be recognized as

344 VOL. VII.—87
the best type of the war galley. The Roman trireme was about 105 ft. long by 11 wide, and was manned by 170 rowers. After the time of Julius Caesar the trireme was 90 ft. by 10, differing from the Neapolitan and Maltese galleys, whose length seldom exceeded seven breadths. When propelled by both oars and sails their speed was very great, almost equaling at times of that of the modern steamboat. In the ancient galleys each oar was pulled by a single man. The rowers were guided by the word of command or by the sound of a trumpet, and appropriate cries were adapted to each manœuvre. The Greeks sometimes had musicians who regulated the movements by singing or by playing the flute or harp. In place of a rudder, galleys were furnished with a large broad oar on each side of the stern, and sometimes with two on each side. The galleys which under the eastern empire took the place of the trireme were of similar construction, but a little lower. They had two decks and two banks of 25 oars on each side, making 100 in all, were armed with a beak, and furnished with various engines for throwing darts and stones, or for dropping heavy weights on the deck of an enemy. After the invention of Greek fire, tubes for spouting this liquid were fitted to the bow, and the bulwarks and deck were sometimes covered with rawhide to protect them from that thrown by an enemy. England under Alfred the Great excelled in her galleys, which varied from 40 to 60 rowers on each side. The forces of William the Conqueror were transported across the channel in galleys so small that they carried no more than 30 armed men besides the rowers. When Richard Coeur de Lion went to the Holy Land in 1190, he had, besides other ships, 88 war galleys; and the Saracens fought him with similar vessels. They differed very little from those of the early eastern empire. Geoffrey de Vinsauf describes them as long and graceful, not high out of water, with two decks and two banks of oars, and armed with a wooden spur shod with iron. A smaller and lighter vessel, with one bank of oars, used for despatch boats and for throwing Greek fire, was called a galleon. From this time onward galleys again played an important part in the Mediterranean. They were much used also in the northern seas. In 1295 Eric, king of Norway, furnished Philip the Fair 200 galleys for use in the war with Edward I. of England. In the 14th century and after galleys were divided generally into three classes. The largest were 162 ft. long on deck and 183 ft. on the keel, with 32 ft. beam and a stern post of 23 ft. They had three masts with one large lateen sail on each, and 32 oars on a side, arranged in a single tier, each oar being pulled by six or seven men. The deck projected beyond the hull, so that the rowing benches were on the outside, where they were apt to be seen by republican enemies and were sometimes housed over and sometimes covered with an awning. The middle of the vessel from stem to stern was thus left clear. Galleys of the second class, or demi-galleys, were of similar construction, from 120 to 130 ft. long, 18 ft. beam, and from 9 to 10 ft. hold; they were furnished with two masts, and had 25 oars on each side. Quarter galleys had only from 12 to 16 oars on each side, and were of little utility excepting in fine weather. After the invention of gunpowder, the sharp beak for running down an enemy went out of use, and galleys were armed with cannon. The large vessels of the 15th century carried usually three batteries forward, in tiers, the lowest consisting of two 36-pounders, the second of two 24-pounders, and the highest of two small guns. Three 18-pounders were mounted also on each quarter. Demi-galleys carried five guns forward and a number of smaller ones on the sides and stern. The Venetian galeass (galeassae), one third larger than the ordinary galley, had a large towering structure on the stern, a castellated structure almost as massive on the bow, and was rowed by 300 galley slaves, whose oar benches were placed amidsthip. The galleon of this period was a sailing vessel. A small galley was called a galizot or galeotta. In 1540 Gustavus Vasa sent for Venetian workmen to build for him galeottas, galereas, and galeasses, which Olaus Magnus translates biremes, triremes, and quadriremes. Until near the close of the 18th century galleys made a part of the fleet of all maritime nations. They drew but little water, and were convenient for coast service; and in calms and light winds, which often prevail in the Mediterranean, they had the advantage over a sailing vessel, being able to keep on her quarter out of the range of her guns. The advancement in naval construction and in navigation, and the improvement in guns and gunnery, finally put an end to the use of this class of war ships, which had dominated the maritime world for more than 3,000 years. In the most ancient times, to row in the galleys was considered honorable. Among the early Greeks oarsmen were generally voluntary recruits, but at a later period prisoners of war were put to this service. The Carthaginians manned their galleys with captive Mauritanians. The Roman oarsmen were at first citizens of the lower class, but eventually prisoners of war and slaves were also employed. A single doubtful passage in Valerius Maximus has led to the supposition that criminals were sometimes condemned by the Romans to the galleys, but it is probable that they were first used for that purpose under the Byzantine empire. In the middle ages the galley rowers were convicts and infidel prisoners, who were chained to the benches on which they sat. The Turks and Barbary corsairs retaliated, and captured Christians were put to the same labor. In the 16th and 17th centuries France, Spain, and the Italian republics used galleys for punishment for condemned criminals, who were called by the French galériens, and by the
English galley slaves. In France, Richelieu ordered the courts of justice to sentence criminals to the galleys in preference to other punishments, and even those who had committed capital crimes were thus utilized. In the reign of Louis XIV. nearly all convicts were condemned to this service; and in 1778, it was seriously proposed that vagrants should be thus disposed of, but Colbert refused to sanction the measure. At a later date this was carried into effect, and confirmed mendicants, poachers, and those convicted of the smallest crimes, were sent to the galleys. Even these did not suffice to man the benches, and various other means were resorted to. Criminals were sometimes purchased from countries that kept no galleys, slaves were brought from the Turks, and negroes were imported from Guinea. The marquis de Denonville, governor of New France, kidnapped Iroquois Indians for this service. This excited against the French a spirit of hate among the savages which culminated in the massacre of Lachine, and Louis XIV. found it necessary to send back in 1689 all who survived. From the beginning of the 17th century to the early part of the 18th heretics were particularly sought out and condemned to the galleys. Galley slaves were subjected to the greatest cruelties and indignities. Their heads and faces were shaved, and they were entirely naked, wearing a uniform only when in port. They were seldom released even when their term of service was accomplished. Henry IV. ordered the captains of the galleys to retain prisoners for six years, although condemned for a shorter time; and under Louis XIV. galley slaves sentenced for only two or three years were retained often for 15 or more. Criminals preferred mutilation and even death to labor in the galleys. In the Italian republics many free oarsmen were employed, who in their engagements agreed to be chained like the slaves, but their heads were not shaved and they were permitted to wear the mountase. These were mostly former criminals. This system was not adopted in France because the bonнерoglies, as they were called, would not consent to be chained. In 1748 the officers of the French galleys, who had until then formed a separate corps, were merged in the royal marine. After this time convicts were employed at hard labor in the arsenals and on the public works, but it was not until 1791 that the detested name gallien went out of use.

GALLIA, a S. county of Ohio, separated from West Virginia by the Ohio river and drained by Raccoon and Symmes creeks; area about 420 sq. m.; pop. in 1870, 25,545. It has a rough surface, underlying which are beds of coal and iron. The soil is generally poor except in the vicinity of the Ohio. The chief production in 1870 were 192,558 bushels of wheat, 2,000,000 bushels of corn, 185,688 of potatoes, 488,628 lbs. of butter, 65,398 of wool, and 12,397 tons of hay. There were 4,889 horses, 4,944 milk cows, 8,943 other cattle, 23,740 sheep, and 13,698 swine; 8 manufactories of woollen goods, 1 of sashes, doors, and blinds, 1 of machinery, 1 of furniture, 1 of pig iron, 2 of iron castings, 2 tanneries, 2 curing establishments, 6 flour mills, 4 planing mills, and 8 saw mills. The county was settled by Frenchmen in 1790, whence its name. Capital, Gallipolis.

GALLIC ACID, a product of the decomposition of tannic acid or tannin, obtained in slender, silky needles or crystals. When pure, these are colorless, without odor, sour, and astringent. They are soluble in 100 parts of cold or 3 parts of boiling water, very soluble in alcohol, and less so in ether. Their solution decomposes by exposure to the air. The decomposition of the crystals dried at 212° F. is supposed to be represented by the formula C₂H₅O₆. Gallic acid is a useful reagent for detecting the presence of iron in solutions. It does not possess the property of the solution of galls of precipitating gelatine. The acid exists ready formed in the gall nut, in sumach, in valonia, and in a large number of other astringent vegetables, although the quantity in each is but small. Gallic acid is tribasic, and it forms three classes of salts: those of the heavy metals are generally insoluble. Several methods are in use for obtaining it, either directly from the galls or from the solution of tannic acid first extracted from them. The powdered galls are made into a paste with water, and exposed for some weeks to the air at a temperature of 70° to 75° F., water being occasionally added to keep the paste moist. The residue, after expressing the paste to free it from the liquid portion, is boiled in pure water, and filtered while hot; the crystals of gallic acid separate as the solution cools. They should be purified by redissolving and boiling with a little animal charcoal or filtering through the same. As the presence of the smallest quantity of sesquioxide of iron will cause the crystals to be colored, the charcoal should be purified, and the filtering paper be washed with dilute hydrochloric acid. Gallic acid is obtained from solution of tannic acid by precipitation with sulphuric acid, the mixture being heated to the boiling point, and allowed to stand a few days. When gallic acid is heated to 410° F. it is wholly volatilized and converted into pyro-gallic acid and carbonic anhydride. Pyro-gallic acid is used to remove free oxygen from gaseous mixtures and as a developer in photographic operations. When swallowed, gallic acid is rapidly absorbed from the stomach into the blood, and remains in the blood unchanged. When tannic acid is swallowed, it undergoes the decomposition indicated above, either before or after absorption, into gallic acid; so that tannic acid becomes gallic acid in the blood. Hence gallic acid is used as an astringent internally in preference to tannic, and also because it is less irritating to the stomach and more agreeable to the taste. It is rapidly eliminated from the system, chiefly
by the kidneys. Two or three hours after a
dose of it has been taken the whole or nearly
the whole of the amount has left the system,
so that to keep the patient steadily under its
influence, it should be administered every three
or four hours. It may be given in large and
frequently repeated doses, with advantage, to
check hemorrhages, especially those from the
chest or uterus. It has also been used with
good results in diseases of the kidneys and
bladder, the organs that are chiefly concerned
in its elimination. It is of very little value as
a local astringent or in cases of diarrhoea or
dysentery. The dose of it varies from 5 to 10
grs. five or six times a day. It is best given
dissolved in water. Those who prefer to do so
may take it dry on the tongue.

GALLICAN CHURCH, a name sometimes used
as merely signifying the Catholic church in
France, while more commonly it is applied
to that church only so far as it holds to cer-
tain national privileges, doctrines, and usages.
Those who have advocated these distinguis-
hing peculiarities, in opposition to Rome, have
therefore generally been called the Gallican
party, while their opponents were known as
the Roman, papal, or, in modern times, the
ultramontane party. In the church of France
there was from the beginning a strong feeling
of nationalism, the most important manifesta-
tion of which is found in the pragmatic san-
tion of St. Louis (Louis IX.), issued in 1266,
which forbade the levying of moneys for the
court of Rome without the royal consent, and
fixed, independently of the pope, the cases in
which appeals were allowed from ecclesiasti-
cal tribunals to the royal courts. The spirit
of independence was strengthened by the de-
crees passed in the fourth and fifth sessions
of the council of Constance, and those enacted
by the council of Basel while in open revots
against the pope. Although these decrees
were condemned by Roman pontiffs, they
were adopted by France at the assembly of
estates at Bourges in 1488, and promulgated
in the pragmatic sanction of Charles VII., the
fundamental law of the Gallican church. This
placed the general council above the pope, for-
bade the paying of taxes to the pope for ap-
pointing bishops and prelates, and abolished
the annates after the death of the then living
pope. This sanction was repealed by Louis
XI. in 1461, but restored by Charles VIII.,
and by Louis XII. through the edict of 1499.
Its most important points were again changed
by the concordat concluded in 1516 between
Francis I. and Leo X., which granted most of
the demands of the pope, and, notwithstanding
the protestations of the parliaments and pro-
vincial estates, remained valid until the revo-
lution of 1789. The Gallican church became
almost entirely dependent upon the kings, who
often found it to their interest to strengthen
the Gallican rather than the Roman tenen-
cies. Thus, some of the decrees of the council
of Trent were not received by France, being
held to be incompatible with the laws of the
kingdom and too favorable to the papal au-
thority. The most important event in the his-
tory of Gallicanism is the "Declarations of
the French clergy" (Declarationes Cleri Gal-
licani), which in 1602, by order of Louis XIV.,
was drawn up by Bossuet, and defined the
liberties and doctrines of the Gallican church
in the following four articles: 1, kings and
princes are in temporal matters subject to no
spiritual power, and the latter can never ab-
solve subjects from the oath of obedience; 2,
the pope is subject to the decisions of an ocu-
mencial council; 3, the power of the pope is
moreover limited, as far as France is con-
cerned, by the established prescriptions and
usages of the Gallican church; 4, also in mat-
ters of faith the decisions of the pope are not
infallible when not confirmed by the consent
of the whole church. These propositions were
proclaimed by a royal ordinance, to which all
the instructions of the theological schools were
to be conformed; but in Rome they were
publicly burned by the common executioner.
Louis XIV., in order to restore peace with the
head of the church, soon revoked them, but
his revocation was not received among the
laws of the French state or church, and the
articles therefore remained valid, and formed
the legal palladium of the Gallican party. The
French revolution overthrew the whole Cath-
olic church in France. Napoleon, as first con-
sul of the republic, reestablished it as a state
church by a concordat with Pius VII., in 1801.
To the concordat he added, April 8, 1802, or-
ganic articles, which enacted that the procla-
mation of papal decrees depends upon the di-
cretion of the government; that there shall
always be an opportunity for an appeal to the
council of state against the abuses of ecclesi-
asial power; and that the teachers in the
seminaries shall be always bound by the four
propositions of the Gallican clergy. The pope
and a majority of the bishops protested against
the validity of the organic articles, and a
synod convoked in 1811 at Paris refused to de-
clare the church of France independent of the
pope. Louis XVIII. concluded, June 11, 1817,
a new concordat, by which that of 1801 was
abolished, and that of 1816 restored. As,
however, the chamber of deputies refused to
ratify it, the new concordat never received
legal sanction. Although the clergy had no
opportunity to declare themselves in synods
and councils on the relation of the Gallican
church to Rome, it was generally known that
a majority were in favor of strengthening the
union with Rome, and opposed to defending
anything in the national church which was
regarded by Rome as un-Catholic. The July
revolution of 1830 had but little influence on
the inner development of the Gallican church.
Louis Philippe made as great concessions to
the hierarchy as the origin of his own au-
thority would allow. The bishops whom he
appointed were mostly opposed to the Gallican
tendencies. An attempt in 1881 by the abbé Châtel to establish a religious association under the name of the French Catholic church (église catholique française), was at once regarded by the Catholics as being not a movement within but a secession from the national church. The establishment of the republic in 1848 gave the church a liberty in ecclesiastical and educational affairs which she had not enjoyed for centuries. For the first time within more than 100 years the bishops held provincial and diocesan councils. It appeared that a difference of views still existed between them concerning the relation of the French church to Rome; but it was no longer the same party division as formerly, the Gallican party of old being found to be almost extinct. All the bishops agreed that it was desirable to strengthen the union between Rome and France, especially in order to give to the national church greater strength to resist the encroachments of the secular power. One of the clearest proofs of the spirit now prevailing is the gradual introduction of the Roman liturgy into every French diocese. Under Napoleon III. the bishops claimed the right to meet without previous authorization in provincial councils; and the government, in order to avoid a conflict, permitted them to do so without deciding the legal question. Thiers, who as leader of the dynastic opposition under Louis Philippe had often insisted on the maintenance of the Gallican liberties, had as president in 1871-8 political reasons to avoid all conflicts with the episcopate, which now more than ever is a unit in repudiating the principles of the old Gallicanism.

Only a few prominent theologians protested in the name of the Gallican church against the definition of the pope's official infallibility; but after the proclamation of the decrees of the Vatican council, the dissentient French prelates gave in their adherence.—Among the most important works on the Gallican church, its history and liberties, are: Count Joseph de Maistre, Du Pape (Lyons, 1819), and De l'Église gallicane dans son rapport avec le souverain pontife (Paris, 1821); Dupin, Les libertés de l'Église gallicane (Paris, 1824); and Frayssinous, Les vrais principes de l'Église gallicane.

**GALLIENUS, Publius Licinius Egnatius, a Roman emperor, son of the emperor Valerian, born about A. D. 255, died in 268. On Valerian's accession to the throne in 253 he immediately associated his son with himself in the government with the title of Caesar. The old emperor sent him, under the care of Postumus, governor of Gaul, to repel the incursions of the Franks and Alemanii on the upper Danube and the Rhine, where Gallienus displayed considerable ability and bravery. On hearing of his father's defeat and capture by Sapor, king of Persia (280), he made no effort to obtain his release, but succeeded with evident pleasure to his throne and title, and gave himself up to debauchery, viewing with like indifference the invasions of the empire by the barbarians and its dismemberment by usurpers. The Franks overran Gaul and Spain, and even crossed over to Africa; the Alemanii ravaged the provinces of the upper Danube; the Goths pillaged the cities of Asia on the southern shore of the Euxine; and the Persians, after taking possession of Mesopotamia, passed over to Syria and captured Antioch. This was followed by the plague. Nearly 80 of his armies in different parts of the empire each elected their general to be emperor, and the military anarchy which succeeded has been called the age of the 80 tyrants. When the legions of Ilyria in 268 proclaimed Aureolus emperor, he immediately marched on Rome. Gallienus, awakening from his apathy, marched against the usurper, defeated him in a battle near the Adda, and then besieged him in Milan, but was murdered by conspirators. Gallienus was a poet and rhetorician.**

**GALL INSECTS. See GALLS.**

**GALLINULE, a wading bird, of the suborder rallidae, and subfamily gallinulina; comprising the genera porphyrio (Brisa.), tribonyx (Dubul.) from Australia, gallinula (Brisa.), and fulica (Linn.); the last has been described in the article Coqs. In the genus porphyrio (Brisa.), or porphyrlca (Blyth), the bill is short, thick, and strong, with the culmen much elevated at the base, and dilated on the forehead, with a large frontal plate and compressed sides; nostrils nearly circular; the wings and tail are short and rounded, the second, third, and fourth quills nearly equal and longest; the tarsi long and slender, with broad transverse scales; the toes very long and free at the base, claws long and somewhat curved. More than a dozen species are described, richly colored, inhabiting warm and temperate regions in pairs or small flocks, on the borders of lakes, rivers, and marshes; they prefer land to water, walk in a dignified manner, run lightly and quickly, and from the length of the toes are able to glide over the surface of floating water plants; their food consists chiefly of fruit, seeds, aquatic roots, and small fish and mollusks; their nest is concealed in the high reeds near the water's edge, made of dry grasses, and the usual number of eggs is three or four. The only American species is the purple gallinule (P. Martinica, Linn.), with the head and lower parts fine bluish purple, darker and often nearly black on the abdomen and tibias; the sides and under wing coverts bluish green, and lower tail coverts white; upper part of body dark green shaded with olive, and tinged with brown on the back and rump; quills and tail brownish black, with green outer edging; bill bright red with yellow tip, frontal plate blue, iris bright carmine, tarsi, toes, and claws yellow. The length to end of tail is about 13 in., extent of wings 21,"},

diameter 24; weight about 8 oz. It is distributed over the southern states, and is accidental in the middle and northern; it is found also in South America. It runs, swims, dives,
and flies well; when travelling far its flight is high, but low and short in its feeding or breeding grounds; it alights with the wings spread upward like the rail; the rapid jerking motions of the tail when alarmed are very remarkable; it sometimes alights on ships 200 or 300 miles from land. Its flesh is not generally held in estimation. It breeds at the south, very early in the year; the nest is built of rushes, 2 or 3 ft. from the ground, and is about 10 in. in diameter on the inside; the eggs, from five to seven, are of a light grayish yellow, with blackish brown spots; the young, at first nearly black, are fully fledged by the first of June.—In the genus gallinula (Bris.) the bill is shorter and less stout, the tarsi are stronger, and the toes are margined by a slight membrane throughout their length, though in no way comparable to the pedal lobes in the coot. There are about 12 species in various parts of the world, living on the borders of slow and deep streams edged with reeds; they are more aquatic than the preceding genus, preferring water to land, swimming well and striking the water with the tail; they are excellent fliers and divers, and swim under water by means of their wings; they also walk well, flinging up their tails, and run swiftly among the reeds and through narrow places; they can pass lightly over the leaves of aquatic plants; they eat slugs, worms, insects, grains, &c.; the nest resembles that of Porphyrio, the number of eggs is eight to ten, and the young take to the water as soon as hatched. The American species is the Florida gallinule (G. galeata, Licht.), very closely resembling the G. chloropus (Linn.) of Europe; the principal differences seem to be that in the American bird the frontal plate is quadrate instead of acute, and the toes are longer. The head, neck, and under parts are deep bluish gray, blackish on the head and neck, and lighter on the abdomen; few feathers on the sides edged with white; lower lid, lateral lower tail coverts, edge of wing at shoulder, and outer edge of first primary, white; back and wings deep olive, darker on the rump; quills dark brown; tail brownish black; frontal plate and bill bright red, tipped with yellow; bare space on the tibia next to the feathers red; rest of legs yellowish green. The length to end of tail is about 13 in., extent of wings 29; weight 12 oz. The female is like the male. This species is common in the winter along the rivers, ponds, and lakes, from eastern Florida to Texas, whence it migrates in spring and summer to the Carolinas, and occasionally even to the middle and northern states; it is also found in South America. It is both nocturnal and diurnal in its habits, often seeking for food on land, walking and nipping insects and grass like the common fowl; it is rarely seen on salt water, but sometimes in the winter visits the banks of bayous in which the water is brackish. The nest is generally a few feet from the water, among the rankest weeds; the eggs, about an inch and a half long, are of a dull dark cream color, with reddish brown andumber spots and dots; when the female leaves her nest she covers the eggs to protect them from crows and other enemies, and both sexes incubate; if not disturbed, they will hatch several broods in a season.

GALLIO, Junius, a brother of the philosopher Seneca, adopted by the rhetorician Junius Gallio, whose name he assumed, died in A. D. 65. In 53 and 54 he was proconsul of Achaia under Claudius, and resided at Corinth, where he refused to listen to charges brought by the Jews against the apostle Paul on "a question of words and names, and of your law" (Acts xviii. 12-17). According to Jerome, he committed suicide. From him the name of Gallionism has been applied to indifference to diversities of religion.

GALLIPOLI (anc. Callipolis), a town of Turkey, in the vilayet of Edirneh, 120 m. W. S. W. of Constantinople; pop. about 60,000. It is on a peninsula at the N. E. extremity of the Dardanelles, and was formerly well fortified. Its streets are narrow, dirty, and ill built, but its bazaars are large and abundantly supplied with
GALLIPOLI

It has many mosques, fountains, Roman and Byzantine ruins and monuments, and manufactures of cotton, silk, and fine morocco leather. It has two harbors, and frequently receives the imperial fleets. It is the seat of a Greek bishop. Gallipoli was formerly of great importance as a centre of commerce and as the key of the Dardanelles. The commerce is still considerable in grain, wine, silk, and oil, chiefly in the hands of the Greeks. Gallipoli was captured by the Turks in 1857.

GALLIPOLI (anc. Callipolis or Anza), a fortified seaport town of Italy, in the province of Lecce, on an island in the gulf of Taranto, 29 m. W. S. W. of Otranto; pop. about 9,500. It is connected with a suburb on the mainland by a bridge, is well built, and has a castle, a fine cathedral, and several convents. The harbor is good, but difficult of access. Gallipoli has manufactures of woolen goods, muslin, and cotton stockings, and is the great mart for an inferior kind of olive oil known as Gallipoli oil, which is collected in large tanks excavated in the limestone rock. The town carries on a considerable trade, and the steamers plying between Ancona and Naples call here regularly. Many of the inhabitants are engaged in the tuna fisheries. Gallipoli is the seat of a bishop.

GALLIPOLIS, a city and the capital of Gallia co., Ohio, pleasantly situated on a high bluff on the Ohio river, 83 m. S. S. E. of Columbus; pop. in 1870, 3,711. It is surrounded by a fertile district, and contains manufactories of leather, woolens, and flour. There are several handsome public buildings, a bank, an academy, three weekly newspapers, and 17 public schools, including a high school. It was a depot of supplies during the civil war.

GALLISSONIÈRE, Roland Michel Barrin, marquis de la, a French admiral, born in Rochefort, Nov. 11, 1698, died at Nemours, Oct. 26, 1758. After rising through various grades in the navy, he was appointed governor general of Canada in 1747, that province being under the management of the navy department. He at once studied the resources, wants, and advantages of Canada, and maintained its defence till the peace of Aix-la-Chapelle. His precautions then to secure all doubtful limits for France showed his energy. He endeavored in vain to obtain from government the establishment of a printing press in Canada. In 1749 he returned to France and was made commodore. He defeated Byng at Minorca in 1756. He was an able naval commander, a wise governor, and a devoted student of science.

GALLITZIN, Galtitz, or Gallitz, a princely Russian family, numerous members of which have distinguished themselves as soldiers, statesmen, or authors. Their origin is traced to Gedemin, prince of Lithuania and the ancestor of the Jagiellons. Mikhail commanded in 1614 a Russian army against the Poles under Prince Ostrogski, was defeated, taken, and held in captivity for 88 years, together with his brother Dimitri, who died in the last year of their detention. Released by King Sigismond Augustus, Mikhail was received with distinction by the czar, but retired to a convent, where he died.

—VARISI defended Novgorod against the first pseudo-Demetrius, but soon followed the example of Basmanoff in espousing the cause of the pretender (1605); murdered the son and widow of Boris Godunoff, his late master; was rewarded by the usurper, but conspired against him, and contributed to his fall and violent death (see DEMETRIUS); partook also in the conspiracy which overthrew his successor, Basil Shuiski, and was a chief member of the deputation which offered the throne of Moscow to Ladislav, the son of Sigismond III. of Poland. Offended by the conditions of the offer, the Polish king held the Russian envoys in arrest at Kiev, where Vasili died before the termination of the war between the two states. —VARISI, surnamed the Great, born in 1638, received a classical education, fought against the Turks, Crimean Tartars, and Cossacks, and was made attaman of the latter; was active in bringing about the great reforms of Czar Feodor Alexeyevitch; was treated after the death of that czar with particular distinction by his sister, the princess regent Sophia; concluded in 1686 a favorable treaty with Poland; commanded in a new expedition against the Tartars of the Crimea; promoted the ambitious designs of Sophia against her brother Peter the Great, and fell with her. He was banished first to Yarensk in the government of Vologda, and then to a dreary district in the government of Archangel, where he died. —Mikhail, born in
1774, served in the guards of Peter the Great, and accompanied that monarch on his various campaigns; distinguished himself at the taking of Schlüsselburg; won a victory over the Swedes at Dobry in Lithuania (1708); defeated the reinforcements of Charles XII, under Gen. Löwenhaupt at Liesna; fought in the battle of Poltava (1709), and a few days after compelled the remnants of the Swedish army to surrender; accompanied the czar on his disastrous expedition to the Pruth (1711); and was sent as commander general to Finland, where he was victorious on land and sea, and remained till the peace of Nystadt (1721). He was made field marshal by Catherine I., was also distinguished during the reign of Peter II., and died in Moscow in December, 1730.—Alexander, son of the preceding, born in November, 1718, served under Prince Eugene on the Rhine (1738), fought in the seven years' war, commanded a Russian army on the Dniester in 1738, took Khotin, and died in 1738.—Dimitri, born in 1721, was ambassador to the court of Vienna, became by his will the founder of a magnificent hospital in Moscow, and died in 1793.—Dimitri, born about 1735, was sent as ambassador to France in 1768, and in 1773 to the Hague; wrote on natural sciences, and died in 1808. Among his works are a Description de la Tauride (1788), and a Traité de la mineralogie (1793).—Amalia, wife of the preceding, born in Berlin, Aug. 28, 1748, lived for a time in separation from her husband near the Hague, and subsequently at Münster in Westphalia, where she became the centre of a circle of Pietistic writers, being herself remarkable for literary accomplishments as well as personal attractions. She contributed not only to the peculiar religious development of her son Demetrius, but also to the conversion of Count Friedrich von Stoelberg to Catholicism. She died Aug. 24, 1790.—Semyon fought against the Turks, under Potemkin, against the Poles in 1794, and against the Austrians in Galicia in 1809, commanding the troops which assisted the Poles to drive back the archduke Ferdinand, when he died.—Emanuil, born in Paris in 1804, entered the Russian army, distinguished himself at the taking of Varna, returned to France, travelled through Russia and other countries, wrote, translated, and edited in French a number of works on Russia and its literature, especially descriptions of travels, and died at Paris in 1853.

Gallitzin. I. Demetrius Augustin, a Russian missionary priest, son of Prince Dimitri Alexejevitch Gallitzin and Amalia von Schmettau, born at the Hague, Dec. 22, 1770, died at Loretto, Pa., May 6, 1840. He and his sister Marianna were brought up by their mother, who was kept in prison till his coming was allowed by her husband to maintain a separate establishment in order to devote her whole time to their education and to indulge in her taste for metaphysical studies. As both parents possessed their unbelief in revelation, their son was at first reared in systematic ignorance of all religion. In 1788 a dangerous illness led the princess to examine the claims of Christianity, and in 1784 she was received into the Roman Catholic church by Dr. Overberg of Münster. In 1787 Demetrius also became a Catholic, and was first moved to be a priest by his intercourse with his young friend Caspar Maximilian and Clement August von Droste-Vischering. While yet a child he had been commissioned by Catherine II. as an officer of the imperial Russian guard, and all pains were taken to prepare him for the military profession. In 1792 he was sent to the United States both for the purpose of giving him a practical knowledge of free institutions, and with the hope of curing a natural timidity and nervousness amounting to disease. Accompanied by a former tutor in the Droste-Vischering family, Felix Brosius, he arrived in Baltimore Oct. 18, under the assumed name of Schmett or Smith. He was welcomed by Bishop Carroll, to whom he soon declared his determination to embrace the clerical profession for the benefit of the American mission. While awaiting the decision of his parents, he travelled through the country, visited the most distinguished American society, and applied himself to the careful study of the constitution, laws, manners, and geography of the United States. The opposition of both his parents did not alter his resolution; and after preparatory studies he was admitted a member of the congregation of St. Sulpicius in Baltimore in 1795, and in March, 1796, ordained priest. He exercised his priestly functions at Baltimore and at Conewago, Pa., till 1799, when he was sent at his own request to McGuire's settlement or Clearfield, in Cambria co., Pa. This settlement, then composed of a few Catholic families, was situated five miles from Summit, on the highest crest of the Alleghenies, and fought—hitherto unknown Philadelphia. On a plot of land given him by Capt. McGuire, an old revolutionary soldier, a substantial church arose, and by its side was built a log cabin for the missionary. He purchased in the immediate vicinity a large tract of land, destined to become the centre of a Catholic colony; it was divided into small farms and given to settlers at a nominal price. Thither he invited, in his own words, "families from Germany, Switzerland, Ireland, and different parts of America," and incurred great expense in establishing the most necessary trades. But at the death of his father the Russian court declared him disqualified to inherit the family estates; the remittances generously forwarded by his mother often miscarried, and the legacies she bequeathed to him in 1807 never reached him; while after the marriage of his sister Marianna her lands amounted justly due to him were appropriated by her husband. In spite of incredible difficulties he retained possession of his large property, on which he expended before his death $150,000. To his pecuniary embarrassments
were added bitter persecutions from a portion of his flock; but he still labored unweariedly for their temporal and spiritual welfare. He was repeatedly designated for the episcopal office, but declined in order to perfect his cherished work. In 1802 he became a naturalized citizen of the United States, under the name of Smith; but in 1809 an act of the Pennsylvania legislature authorized him to resume his original name of Gallitzin. In 1808 he bestowed on the hamlet springing up around his church the name of Loretto. Cambria county, which he had found a wilderness in 1799, he left at his death studded with thrifty settlements, one of which has since been named after him. In 1850 his remains were placed in a vault in front of the church, and a monument was erected over them; and in 1873 measures were in progress to replace it with one more suitable. Controversial letters published by him occasionally in the local papers have been several times reprinted in pamphlets entitled "Defence of Catholic Principles," "Letter to a Protestant Friend," and "Appeal to the Protestant Public." His life has been written in German by his assistant Henry Lemke, and in English by Sarah M. Brownson (New York, 1878). His mother's life was written by Katercamp. II. Elizabeth, a cousin of the preceding, born in 1796, died in St. James parish, La., Dec. 8, 1845. After becoming a member of the Roman Catholic church, she joined the society of the Sacred Heart in Rome, and in 1849 came to America to visit the houses of the order. In the same year she founded the first school of the Sacred Heart in Houston street, New York, and afterward a boarding school and novitiate at McSherrytown, Pa., and a house at Pottawattamie village, in the far west.

Gallon, an old English measure of capacity, subdivided into 4 quarts, or 8 pints, or 32 gills. Formerly there were gallons of different capacities, one for wine, another for ale or beer, and a third for grain and dry articles. The wine gallon, called also the standard gallon, contained 231 cubic inches, the ale gallon 282 cubic inches, and the corn gallon 268.3 cubic inches. In 1824 the imperial gallon was established by the British parliament, by a statute which came into operation Jan. 1, 1826; its capacity was 10 lbs. avoirdupois of distilled water, that weighed 259.458 grains to the cubic inch, thus making its contents 277.274 cubic inches = 4.54846 litres. The gallon of the United States is the standard English wine gallon of 231 cubic inches, and contains 8.3338822 avoirdupois lbs. or 58.3721754 troy grains of distilled water at 62° F., the barometer being at 30 inches. It is equal to 3.75207 litres. The gallon, the measure of New York wine, formerly of the capacity of 8 lbs. of pure water at its maximum density, or 221.184 cubic inches; but it is now the same as the New York gallon.

Galloway, Joseph, an American loyalist, born in Maryland about 1780, died in England, Aug. 29, 1803. He was educated for the bar, and practiced law successfully at Philadelphia. In 1764 he became a member of the Pennsylvania assembly, and joined Dr. Franklin in advocating the adoption of a royal government for the colony. In 1774 he was a delegate to the first congress, and proposed to settle the difficulties between the colonies and the mother country by vending the government in a president general of the colonies, to be appointed by the king, and a council to be chosen by the several colonial assemblies; the British parliament to have the power of revising the acts of the latter body, which in its turn was to have a negative on British statutes relating to the colonies. He abandoned the whigs after the question of independence had begun to be agitated, and thenceforth was known as a zealous Tory. He remained with the British army in Philadelphia and New Jersey till 1778, when he went with his daughter to England, where he passed the remainder of his life. Summoned in 1779 before a committee of the house of commons to testify on American affairs, he animadverted severely on the course of Gen. Howe and other British officers. A new edition of this "Examination" was published in Philadelphia in 1855 by the "Council of the Seventy-Six Society." His literary remains comprise a "Speech in answer to John Dickinson" (London and Philadelphia, 1784); "Candid Examination of the Mutual Claims of Great Britain and the Colonies" (New York, 1775); "Letters to a Nobleman" (1779); "Reply to Sir William Howe" (1780), &c.

Galls, or Natgalls, excreta growing on a species of small oak, quercus infectoria, inhabiting Asia Minor and the middle latitude of Asia. They originate from the puncture of a fly, which deposits its egg in the young boughs, the egg and afterward the fly being enclosed in the centre of the gall. The galls collected before the egg is hatched are called blue, green, or black, and are the most valuable. The white galls, which are collected later, are in-
jured by the insect. Galls reach the United States from Mediterranean ports and from Calcutta. They are nearly round, from the size of a large pea to of a large cherry, with a surface usually studded with small tubercles. The best are dark blue or green externally, lighter internally, hard and brittle, with a small cavity in the centre. Those of inferior quality are lighter in color, less hard, and contain a larger cavity communicating externally by a round hole through which the developed insect has escaped. Most if not all oaks contain a considerable amount of tannic acid, of that variety which precipitates the persails of iron, blue-black. This acid seems to be concentrated in these pathological formations, constituting more than one half of their weight, and they are accordingly the source whence gallo- or querco-tannic acid is most conveniently obtained. Galls have also been thought to contain smaller quantities of other allied acids, but it is probable that these are formed after the tannin and at its expense. All the soluble matter of galls is taken up by 40 times their weight of boiling water. Alcohol dissolves seven parts in ten, ether five. Galls are powerfully astringent, and may be used in medicine in the form of tincture or ointment, or in substance. For internal use, tannic or gallic acid is generally considered more convenient. The incompatibilities of galls are very numerous, since the tannates of nearly all metallic oxides, alkalies, alkaline earths, and alkaloids are only slightly soluble in water. Nutgall ointment may be applied with advantage to hemorrhoids, but should not be used when the latter are inflamed. The dry substance is sometimes sprinkled over the surface of indolent ulcers or sores, to induce a healthy action in them.

**GALL STONES.** See **CALCULI.**

**GALLUP, Joseph Adam,** an American physician and author, born in Stonington, Conn., March 30, 1789, died in Woodstock, Vt., Oct. 19, 1849. He received a good education, and in 1798 graduated in medicine at Dartmouth college. He practiced a few years in Harland and Bethel, Vt., whence he removed to Woodstock in January, 1800. His first writings appeared in 1802 in the "Vermont Gazette," published at Windsor, and attracted much attention. From 1820 to 1823 he was president of the Castleton medical academy, and was also for several years a lecturer in the medical department of the university of Vermont. He established the clinical school of medicine at Woodstock, and delivered his first course of lectures there in the spring of 1827. This school afterward became the Vermont medical college, and was incorporated in 1855. In 1815 he published "Sketches of Epidemic Diseases in New England: A Very Large Scale," and added "Remarks on Pulmonary Consumption," which was republished in England. He published in 1829 "Pathological Reflections on the Supertonic State of Disease," besides other pamphlets, and in 1889 his more considerable work in 2 vols., entitled "Outlines of the Institutes of Medicine."

**GALT,** a town of Waterloo county, Ontario, Canada, situated on the banks of Grand river, near the mouth of Mill creek, and on the Galt and Guelph branch of the Great Western railway, 54 m. W. W. of Toronto; pop. in 1871, 8,827. It is situated in a rich agricultural district, and contains many handsome buildings. The water power is extensive, and there are several large flouring and saw mills, iron founders and machine shops, and manufactories of agricultural implements, leather, paper, collars, hardware, woollens, &c.

**GALT. L. John,** a Scottish author, born in Irvine, Ayrshire, May 2, 1779, died in Greenock, April 11, 1889. After spending some years in mercantile life he began to study law, but in 1809 set out on a tour of nearly three years in southern Europe and the Mediterranean, publishing the results of his observations on his return in "Voyages and Travels" and "Letters from the Levant." He edited from Gibraltar to Malta with Lord Byron and Mr. Hobhouse. Soon after his return he married Elizabeth, daughter of Dr. Tilloch, editor of the "Philosophical Magazine," and proprietor of the "Star" newspaper, on which Galt was for some time employed. He had contributed in 1803-4 to "The Scots's Magazine" portions of an ambitious composition in octosyllabic verse. He next produced a volume of dramatic pieces, which Scott called "the worst tragedies ever seen," and this was followed by lives of Cardinal Wolsey and Benjamin West, "Reflections on Political and Commercial Subjects," a tragedy entitled "The Appeal," acted in Edinburgh for a few nights, and "The Earthquake," a novel. These works made no impression upon the public, but his "Ayrshire Legatees," which appeared in "Blackwood's Magazine" in 1820-21, turned the popular tide in his favor. Within in the next three years appeared "Annals of the Parish," generally esteemed his best work, "The Provost," which he himself preferred, "The Steamboat," "Sir Andrew Wylie," "The Gathering of the West," "The Enfall," "Ringh Gilhais," "The Spawife," "Rothelin," "The Omen," and "The Last of the Lairds," all novels of Scottish life, and all successful. In 1820 he visited Canada as the agent of the Canada company, a large landholding corporation; he founded the town of Guelph, but a difference with his employers having cast him adrift again, he returned to England in 1829, resumed his literary labors, and produced a number of novels and a variety of miscellanies, including a "Life of Lord Byron," the "Autobiography of John Galt" (2 vols., 1838), and "Literary Life and Miscellanies of John Galt" (3 vols. 1843) to which he added "Journey to Sardinia and Corsica," (1846), relating some of his experiences in the new world, is considered in his best vein. It was followed by "Southennan," "Bogle Corbet," "Stanley Buxton," "The Member," "The Radical," "Eben Erskine," and "The
Lost Child.” He died after 14 strokes of paralysis, having dictated compositions long after losing the use of every limb. His works are of very unequal merit, but are usually marked by an original quaintness and vigor and by defects of taste. IL Sir Alexander Tielec, a Canadian financier, son of the preceding, born in Chel- see, England, Sept. 6, 1817. At the age of 16 he entered as a junior clerk the service of the British American land company, of whose estates he was sole manager from 1844 to 1856, raising the company from a condition of insol- veney to one of prosperity. In conjunction with the Hon. A. N. Morin he established the Montreal and Portland railway, and was one of its chief managers until its union with the Grand Trunk railway. He has represented the city of Sherbrookes in the Canadian parlia- ment since 1853. From the beginning of his political career he advocated the confederation of the British North American provinces and the establishment of an intercolonial railway. He entered the Cartier cabinet as minister of finance in 1858, after having declined the premiership, established a tariff which raised the provincial credit, negotiated in England the Canadian loan, and consolidated the debt. In 1860 he advocated the establishment of a bank of issue, but afterward withdrew his scheme, and succeeded in opening free ports at Gaspé and Sault Ste. Marie. He resigned with the Cartier ministry in 1862, returned to office with them in 1864, and retired in 1866. He was one of the commissioners sent to London to pro- mote the confederation of the provinces, and was created in 1869 a knight commander of the order of Sta. Michael and George.

GALTON, Francis, an English traveller and au- thor, born at Dudderton, near Birmingham, in 1822. He studied medicine at Birmingham, and afterward at King’s college, London, and graduated at Trinity college, Cambridge, in 1844. In 1848 he travelled in north Africa and on the Nile, with Mr. Niles, subsequently making a journey of exploration from Woolwich bay through the western regions of south Africa. For his account of this journey he received the gold medal of the royal geographical society in 1852, and subsequently became secretary and later vice president of that society. From 1865 to 1868 he was general secretary of the British association, and he is now (1874) one of the managing committee of the meteorological office. He has published “Travels in Tropical South Africa” (1858); “Meteorographia, or Methods of Mapping the Weather” (1863); “Art of Travel, or Shifts and Contrivances available in Wild Countries” (1867); and “He- reditary Genius, its Laws and Consequences” (1869). He has also edited “Vacation Tourists and Notes of Travel in 1860–58” (3 vols., Cambridge, 1862).

GALUPPI, Balassare, an Italian musician, sur- named Buranello, born on the island of Bu- rano, near Venice, in 1708, died there in January, 1785. He received instruction from his father and from the composer Lotti, became chapelmaster of the church of St. Mark and president of the conservatory of the incurabili, and spent some time in St. Petersburg. He produced his first comic opera in 1721 without success, but applied himself with greater zeal to composition, and his opera La fede nell’ inconstanza, performed in 1729, made him famous. He composed more than 70 operas, and has been called the father of Italian comic opera; he also composed many masses, oratorios, &c.

GALUPPI, or Galuppi, Pasquale, an Italian philosopher, born at Tropea, Calabria, April 2, 1770, died in Naples, Dec. 18, 1846. He studied at the university of Naples, and was professor of philosophy there for many years. He was a spiritualist in psychology, and was the first among the modern philosophers of Italy to coincide with Kant in considering the promptings of the moral law as paramount in ethical psychology. He rejected the doctrine of Helvétius, which bases morality on the desire for pleasure, and the theories of Wolf and Romagnosi, who find the essence of it in the yearning after perfection. His principal works are: Saggio filosofico sulla critica della conoscenza (Naples, 1819–’23); Lettere filosofiche sulle vicende della filosofia intorno ai principi della conoscenza umana da Cartesio fino a Kant (1827; 2d ed., 1888); Elementi di filosofia (4th ed., 5 vols., 1835–49); Lezioni di logica e di metafisica (5 vols., 1832–8; new ed., 1842); Considerazioni sull’ idealismo trascendentale e sul razionalismo assoluto (1841); and Elementi di teologia naturale (4th ed., 1844).

GALVANI, Alessio or Luigi, an Italian physician, born in Bologna, Sept. 9, 1737, died there, Dec. 4, 1798. He was educated for the priest- hood; but his tastes inclined toward the natural sciences, and abandoning theology he took the degree of M. D. at the university of Bologna in 1760. Soon afterward he was appointed medical lecturer at the institute of Bologna, and published treatises on the urinary organs and the organs of hearing in birds. In 1786 accident led him to his great discovery in phys- ical science (see ANIMAL ELECTRICITY, and GALVANISM), and in 1791 he published De Viribus Electricitatis in Motu Musculari Commentarius. Having refused to swear allegiance to the Cisalpine republic in 1797, he was deprived of his offices, and his health began to decline. The death of his wife also afflicted him greatly. Under the weight of these misfortunes he sank rapidly, and although his offices were subse- quently restored to him, he died before resuming their duties.

GALVANISM, or Vettale Electricity (so named from its discoverers, Galvani of Bologna and Volta of Pavia), that form of dynamical electricity which is developed by chemical action. An account of the discovery of Galvani is given under ANIMAL ELECTRICITY, and also a notice of the controversy which was carried on be- between these philosophers, Galvani maintaining that the peculiar phenomena which he produced...
were owing to electricity developed in the animals on which he experimented, and Volta contending that they were due to the contact of dissimilar metals. Galvani may therefore be regarded as more particularly the discoverer of animal electricity, while Volta, who did not invent the celebrated pile which bears his name till 1799, the year after the death of Galvani, is entitled to most of the credit of the discovery of chemical or galvanic electricity. The term dynamical electricity is often applied to galvanism, but it has a wider meaning, and embraces the phenomena of all electrical currents, irrespective of their origin. Volta’s theory that the galvanic current was produced by the contact of two dissimilar metals is not held by the majority of the scientific world at the present day. The earlier experiments which seemed to support that doctrine were imperfectly performed, and when chemical action or other external force is strictly excluded, no electrical effects can be produced. Fabroni of Florence is said to have been the first to suggest chemical action as a principal cause of the phenomena, an opinion formed from observing the rapid oxidation which took place in the zinc plates of the voltaic pile. This opinion was supported by Sir Humphry Davy in England, who soon after the publication of a letter of Volta to Sir Joseph Banks in 1800, giving an account of his battery, made numerous interesting experiments. Wollaston advocated the chemical theory, and also showed the identity of the electricity of the pile and that of the frictional machine by reducing the electrodes of the latter to small points, and causing the current which passed through them from a large machine to produce chemical decomposition and other similar effects. In 1807 Davy obtained the metals potassium and sodium by electrolysis, and in 1809 Deluc made dry piles of gold and silver paper, which were afterward improved by Zamboni. In 1819 Oersted discovered the deflection of the magnetic needle by the galvanic current, and soon afterward Ampère announced a theory which explained its action. (See Electro-Magnetism.) In 1827 Ohm of Munich enunciated the celebrated law which bears his name, and developed a strictly mathematical theory. Faraday in 1831 discovered the induction of galvanic currents by means of magnetism, and continued his investigations till near the close of his life, making many remarkable discoveries, among them the law of definite electro-chemical decomposition. From 1836 to the present time many improved modifications of galvanic batteries have been devised by Daniell, Grove, Bunsen, and others, which, although of minor importance when compared with discoveries and applications of great principles, have been of much advantage in the prosecution of various branches of scientific research and in the arts.—The ordinary phenomena of galvanism may be observed by the following simple experiments: If a plate of commercial zinc is placed in a glass vessel containing dilute hydrochloric acid, chemical action will take place, accompanied with the evolution of bubbles of hydrogen gas upon the surface of the plate, which successively form and rise to the surface of the liquid, and upon examination chloride of zinc will be found in solution. If a plate of copper is placed in the liquid near the zinc and brought into contact or connected by a wire with it, as shown in fig. 1, the evolution of hydrogen upon the surface of the zinc plate will mostly cease and be transferred to the surface of the copper; but chlorine will continue to unite with the zinc, which metal, if weighed, will be found to have lost weight, while the copper will neither have lost nor gained. If, in the first place, when the zinc plate alone was immersed in the acid, pure metal had been used, there would not have been so much chemical action; but upon the introduction and connection of the plate of copper there would have been more, and the evolution of hydrogen gas would have been entirely confined to the surface of the copper. If a plate of iron is placed in dilute hydrochloric acid, it will dissolve with evolution of hydrogen and the formation of chloride of iron, the action being the same as with the employment of zinc; and if a copper plate is connected with it, the action will still be similar to that which is obtained between the zinc and copper; but if a zinc instead of a copper plate is placed near the iron and connected with it, the action upon the respective plates will be reversed. The hydrogen will continue to be evolved at the surface of the iron, but this metal will cease to combine with chlorine, the chemical action being transferred to the zinc plate. In either of these experiments, when chemical action takes place wholly or principally upon one metal, if a magnetic needle is brought near the connecting wire it will be observed that a peculiar force is exerted upon it, tending to make it take a position at right angles to the wire, turning one way or the other, according to the position of the latter, and the relative connections of the copper and zinc plates. If a very fine platinum wire forms a part of the connection, its temperature will be raised; and if the apparatus works energetically, it may become incandescent, or even fused. If contact is broken in any part of the connecting wire, a minute spark, especially if the room is darkened, may be observed at the point of separation, which resembles the miniature frictional electrical machine, and may be shown to have similar properties. After separation the plates will not present the same appearance as during connection; but the evolution of hydrogen gas on the surface of the
copper will cease, and if the ends of the wires are examined with a delicate galvanoscope or electroscope, they will be found to contain a small charge of static electricity, the one connected with the copper plate being in a positive, and the one connected with the zinc plate in a negative condition. If the disconnected ends of the wires are dipped near to each other in a small cup containing a solution of iodide of potassium, the salt will be decomposed; a fact which offers strong evidence against the contact theory. If, in the above experiments, sulphuric instead of hydrochloric acid is used, the same phenomena will appear; but instead of chloride, sulphate of zinc will be found in solution. A system consisting of two metals immersed in a fluid which chemically acts upon one of them, is called a simple galvanic or voltaic couple, or element. When the plates are disconnected the couple is said to be open, and when connected by a conductor it is said to be closed, forming a circuit, which is also spoken of as open or closed. When the circuit is closed it is assumed that a current of positive electricity passes through it from the zinc to the copper in the liquid, and from the copper to the zinc out of the liquid. It is assumed that the current passes in this direction because when the end of the wire which is connected with the copper plate is examined with the electroscope, positive electricity is found upon it; and also from the fact that the needle of a galvanometer, when one of the electrodes of the instrument is connected with the copper and the other with the zinc plate, is deflected in the same direction as when they are respectively connected with the prime conductor and rubber plate of an ordinary glass-plate electrical machine. It may be assumed, moreover, that a current of negative electricity passes at the same time in the opposite direction; but for convenience of explanation this assumed action is not taken into consideration. The use of the word current has its advantages, and helps to convey ideas which are in accordance with observed effects; but the actual passage of a fluid in either direction is a matter of doubt, and in the opinion of Faraday does not take place, he believing that the resulting phenomena are caused by a polarization of the molecules of the medium. The action which is called a voltaic current does not require that one of the metallic elements shall not be at all acted upon by the liquid, but only that the action shall be greater upon one than upon the other; the metal most acted upon being the positive or generating plate. Generally the polarization which results from the connection of two metals when immersed in a dilute acid or saline solution, although either might be acted upon by it separately, causes one to become more and the other less positive, or in other words, more negative, so that it becomes protected. On this principle iron is often protected from corrosive action by coating it with zinc, and the copper bottoms of ships have been in a similar manner protected from the action of sea water by coating them with a more positive metal. The force which results from a difference in chemical action of a liquid on two metals is called the electromotive force, and its quantity depends not only upon the relative attraction of the metals for constituents of the liquid, but also upon the distance of the plates from each other. That metal which has the strongest affinity for oxygen is usually the most electro-positive, and one metal may therefore bear an electro-positive relation to a second, while it is electro-negative when compared to a third. Potassium is the most electro-positive of all bodies, but its attraction for oxygen is so violent as to make it practically useless as an element in the galvanic circuit. Among those which can be usefully employed as electro-positive elements, zinc ranks first, while platinum is the most highly electro-negative metal. But the relative electrical condition of several of the metals changes when immersed in different liquids; thus if an iron and a copper plate be connected with the electrodes of a galvanometer and immersed in dilute sulphuric acid, the needle will be deflected in one direction; while if the plates are immersed in a solution of sulphite of potassium, the deflection will be in the opposite direction. The following table shows a few of the results obtained by Faraday:

**Comparison of Different Metals in the Presence of Different Liquids.**

The order in each column places the most positive metal in regard to the fluid at the bottom, and the most electro-negative at the top. It has been demonstrated by Poggendorff that the electromotive force between any two metals is equal to the sum of the electromotive forces between all the intervening metals. The theory of the production of the galvanic current is as follows: When a zinc and a copper plate are immersed in dilute acid, they immediately become polarized, assuming opposite electrical states, that end of the wire, as has been observed, connected with the copper plate showing positive, and that in connection with the zinc negative electricity, whilst those portions of the copper and zinc plates which are in the liquid are respectively in a negative and a positive state. The compound molecules of the liquid are also supposed to assume a highly polarized condition; one constituent becoming
negative and attracted by the zinc, and the other positive and attracted by the copper plate. Let us suppose the liquid to be hydrochloric acid; the electrical condition and chemical action which take place may be represented as follows:

\[ \text{Copper plate} + \text{Zinc plate.} \]

The polarization of the molecules of the acid becomes intensified by the presence of the two oppositely electrified metals; and conversely, the two metals have the difference in their electrical states intensified by the action of the acid molecules. When the copper and zinc plates are connected by a wire out of the fluid, their polarity becomes so intensified that the constituents of the molecules of hydrochloric acid are drawn asunder, the negative chlorine being attracted by the positive zinc, and the positive hydrogen by the negative copper plate. Union takes place between the chlorine and zinc, forming chloride of zinc, which dissolves in the water; but the hydrogen which is attracted by the copper plate does not unite with it, but rises in bubbles along its surface to the top of the liquid. This evolution of the hydrogen at the copper plate, and not at the point where the chlorine leaves the acid and unites with the zinc, can only be explained by supposing that when this action takes place there is at the same time an interchange of constituents in the intervening chain of molecules lying between the two plates, such as is represented in the diagram above. When the exciting liquid is dilute sulphuric acid, it was formerly supposed that water was the electrolyte or body decomposed, its oxygen uniting with the zinc to form oxide of zinc, which subsequently united with sulphuric acid to form sulphate of zinc, while the hydrogen of the water escaped at the surface of the copper plate; thus:

\[ \text{Copper plate} + \text{Zinc plate.} \]

But it is now believed that it is the sulphuric acid, now written $\text{H}_2\text{SO}_4$, which is the subject of decomposition, the action being as follows:

\[ \text{Copper plate} + \text{Zinc plate.} \]

Modern theory regards the zinc as combining directly with the body $\text{SO}_4$ or oxy sulphur, without preliminary oxidation. In electrolysis where the two plates form the electrodes of a battery, and are composed of metals neither of which combines with the liquid, the case is different, and both water and sulphuric acid are decomposed, as will be subsequently shown.—

**Voltaic Batteries.** A battery consists of a combination of two or more couples for the purpose of increasing the electromotive force, each additional couple adding its force to that of the battery. This idea presented itself to Volta when he invented the pile which bears his name. It may be constructed by laying upon a bottom piece of wood a disk of copper, and upon this a disk of cloth moistened with dilute acid or a solution of some salt, and upon this a disk of zinc, and repeating this order to an indefinite extent, one end of the battery terminating in a copper and the other in a zinc disk; the order of the elements being copper, fluid, zinc, copper, fluid, zinc, in one direction, and zinc, fluid, copper, zinc, fluid, copper, in the other; so that it is immaterial whether the pile is commenced with copper or with zinc, the positive current, when the terminal plates are connected by a wire, always flowing from the copper to the zinc through the wire, and from the zinc to the copper through the layer of cloth. The copper and zinc plates should be soldered together around the edges, to prevent the acid or exciting liquid from getting between them except where they are separated by the cloth, because the chemical action which would ensue would tend to urge a current in the opposite direction. Soon after constructing the pile Volta made a different arrangement, which he called the **couronne de tasses**, or crown of cups. This was formed of a number of cups, each containing dilute acid or a solution of salt, and a plate of copper and one of zinc, a short distance apart; the copper in one cup being connected by a wire with the zinc plate in the next, instead of lying directly upon or against it. This mode of connection answered the same purpose, allowing electrical polarity to be induced with equal facility when the connecting wires were of sufficient sectional area. When the number of cups, which was indefinite, was completed, the circuit was closed, as was the pile, by connecting the terminal plates with a wire. The cups were joined together in the following manner: Commencing at the positive pole or electrode of the battery, there would be a plate of copper in the first cup, bearing a binding screw at its top, by which it could be connected with a wire; then opposite it, in the same cup, a plate of zinc, connected by a wire or strip of copper with the copper plate in the next cup, and so on; the last plate in the last cup being zinc, connected with a
wire, which latter, when joined to the wire connected with the copper plate in the first cup, closed the circuit. In Volta's cup battery, as well as in the pile, the terminal plates were connected with plates of the opposite metal, a method adopted in accordance with the contact theory; but these additional plates have been discarded as useless. Cruikshank in 1803 modified the form of the pile by using a trough and omitting the separating pieces of cloth, which then became unnecessary. In this battery, which is represented in fig. 8, a plate of zinc and one of copper are placed together in pairs and held in vertical grooves, all the zinc plates facing in one and all the copper plates in the other direction. The connection between the pairs of plates should be impervious to the fluid in the trough, for the same reason that a similar condition must be observed in the construction of the pile. It is plainly observable that Cruikshank's battery is only a horizontal voltaic pile, possessing but little originality, and not the novelty or convenience of Volta's crown of cups. Useful modifications of it, however, have been made. A common form, sometimes still employed, consists of a wooden trough divided into separate compartments containing the existing fluid, into each of which are suspended a zinc and a copper or a zinc and a platinum plate, from a horizontal wooden beam, the opposite elements in each compartment being connected together. The beam slides in vertical grooves in posts at the end of the trough; by which means the plates may be raised out of or lowered into the liquid. (See fig. 4.) They may also be easily removed from the beam and cleaned or amalgamated with mercury, an operation which it is essential to perform with zinc plates which are not of pure metal; and it not being practical to procure this, the operation of amalgamation is therefore universal. It consists in applying metallic mercury to the cleared surface of the zinc plates, by which the pure zinc becomes dissolved and brought to the surface where the action of the acid is confined. In impure unamalgamated zinc, local polarization takes place, forming local currents which greatly diminish or annul the electromotive force. A modification devised by Wollaston consisted in having a sheet of copper brought around one end of a zinc plate and separated from it by pieces of cork. Any number of couples can be united by using a trough divided into compartments, or by employing a number of glass or earthen cups such as are represented in fig. 5. Smeet's battery is formed of couples which are the reverse of Wollaston's, there being a middle plate of platinum, or silver covered with finely divided platinum (the latter form increasing the surface and giving an element of strength), with a plate of zinc on each side, not bent, however, around the end of the middle plate as in Wollaston's. It is found that this arrangement is better than to have the positive element in the middle. A powerful form of battery for heating purposes, in consequence of the immense quantity of electricity it generates, was constructed by Prof. Hare of Philadelphia, and consists of one, or only a few simple couples, having a great metallic surface. A large sheet of zinc, of several hundred square feet of surface, and a similar one of copper, are separated by a piece of felt or cloth saturated with acidulated water and then rolled together in the form of a cylinder. (See fig. 6.) On account of its extraordinary heating power, it is called Hare's calorimotor or deflagrator. All these forms of batteries, which employ two metallic elements and one fluid, when used for any considerable length of time, are found to be defective on account of the enfeeblement of the current, which is due to several causes, the principal being: 1, decrease in chemical action in consequence of the gradual separation of the acid by the one end of the zinc or positive element, and the accumulation of the salt which is thereby formed; 2, the formation of local currents in the positive plate, in consequence of impurities contained in it, and interfering with the general current; 3, the production of secondary currents which flow in a contrary direction to the general
current, and which after a length of time became equal to it, rendering its action null. The nascent hydrogen which is evolved on the surface of the negative plate has a remarkable power, under the circumstances, of decomposing the salt in the fluid. When copper and zinc plates and dilute sulphuric acid are used, for instance, after a time sulphate of zinc, ZnSO₄, accumulates, and the hydrogen tends to deprive the oxysulphur, SO₄, of a part of its oxygen, thus loosening its hold upon the zinc constituent, which being attracted by the copper plate is deposited in a metallic state upon it; and this action may continue until the surface of the copper is covered, when of course there will be, in place of the original arrangement of two opposite metals immersed in an exciting liquid, two plates of the same kind, and having therefore little or no electromotive force. Electricians have therefore devised several different forms of batteries with the intention of obviating these difficulties, which, because of their more continuous and equable action, have been called constant batteries. The first of these was constructed by Becquerel, and consisted of a sheet of copper in the form of a cylinder enveloped in a bladder containing a saturated solution of sulphate of copper. The bladder is surrounded by a cylindrical sheet of zinc, and the whole is placed in a vessel containing dilute sulphuric acid or common salt. The battery of Daniell, constructed in 1836, is a modification of Becquerel’s in which a porous earthenware cup is substituted for the animal membrane. It is still regarded as the most constant of batteries, although it is not the most powerful. Fig. 7 represents one cell of a Daniell’s battery. A glass jar contains dilute sulphuric acid, in which is placed a zinc plate cast in the form of a cylinder; within this is a porous earthenware cylindrical cup; and within this, again, a copper plate in the form also of a cylinder. The porous cell contains a saturated solution of sulphate of copper, and crystals of this salt are placed in the liquid upon shelves, or in a copper-wire basket. Sulphuric acid permeates all the cells, but the porous partition offers a great hindrance to the transfusion of the saline solutions. The nascent hydrogen which is evolved at the surface of the copper plate decomposes the sulphate of copper in the same way that it does the sulphate of zinc in the ordinary zinc and copper couple. The action of a Daniell’s battery may be explained as follows: In the diagram a zinc and a copper plate are represented, having a porous earthenware partition between them; solution of sulphate of copper (Cu₉SO₄) being the active fluid in the presence of the copper, and sulphuric acid (H₂SO₄) the active fluid in the presence of the zinc plate. The polarization of the molecules in both fluids which is effected by connecting the terminal plate with a wire is represented in the following diagram:

An interchange of particles follows this polarization, the terminal negative constituent, SO₄, going to the positive or zinc plate and combining with it, and the terminal positive constituent (its electrical state heightened by induction) going to the negative or copper plate, and being deposited upon it. It will be observed that the action here is somewhat different from that which obtains in a simple cell containing dilute sulphuric acid as the exciting liquid. In that case hydrogen is liberated at the surface of the copper plate, while in the Daniell’s cell it is substituted by metallic copper. The hydrogen constituent of sulphuric acid is separated from it at the porous cell, but is immediately reunited to the salt radical, oxysulphur, SO₄, the electro-negative constituent of the sulphate of copper. An interchange of molecules is thus effected throughout the whole chain of particles of sulphate of copper and of sulphuric acid lying between the copper and zinc plates; a copper molecule, charged with positive electricity, being at one end deposited upon the copper plate, which within the fluid is charged with negative electricity, and a molecule of the salt radical, SO₄, charged with negative electricity, uniting at the other end with the zinc plate, which within the fluid is charged with positive electricity. If the molecules of copper after they are deposited could retain their electro-positive condition, a state of polarization of the plate would result similar to that which takes place from the deposition of a film of hydrogen in the ordinary sulphuric acid battery, and having the effect of a deposit of metallic zinc; but as soon as the deposition takes place the polarity of the deposited molecule changes from positive to negative, a necessary result of its becoming a part of the copper plate. When the solution of sulphate of copper becomes dilute, hydrogen is liberated upon the surface of the copper plate, from decomposition of water or of sulphuric acid, and has not been determined which. To preserve the constancy of the battery, it is therefore necessary to keep the solution of sulphate of copper saturated. The sulphuric acid resulting from the decomposition of the sulphate of copper tends to replenish the loss sustained by the formation of sulphate of zinc, but the accumulation of the latter salt weakens its action, so that it is necessary from time to time to add...
fresh quantities of acid. Two ways have been devised to remedy this difficulty, one of which is using a siphon connected with the bottom of the cell, by which the strong solution of sulphate of zinc which settles may be discharged when fresh quantities of sulphuric acid are poured in. The other method, devised by Buff, consists in an arrangement by which the zinc plate is gradually made to sink in the fluid at a rate sufficient to counterbalance the loss sustained by diminished chemical action. Grove's battery is a modification of Daniell's, in which nitric acid takes the place of sulphate of copper, and a plate of platinum that of copper. Fig. 8 represents a cell of Grove's battery. A glass or earthen vessel, A, containing dilute sulphuric acid, receives a cylinder of zinc, within which is a porous earthenware cup, V, containing strong nitric acid, and in which there is immersed a platinum plate, P. A cover attached to it confines the fumes of hyponitric acid, N₂O₄, which are liberated by the decomposing nitric acid, N₂O₅. The chemical action is shown in the following diagram:

\[

Zinc plate. 
\end{array}
\]

Bunsen's battery is a modification of Grove's, which was devised by Bunsen, then professor of chemistry at Marburg, in 1843. The platinum element is replaced by carbon, which is an excellent conductor, and more electro-negative than platinum. The graphite carbon taken from the retorts of gas works is often used; or a cake may be formed by calcining in an iron mould a mixture of coke and bituminous coal. The electrolytic fluids may be the same as in Grove's; but others are often used, as bichromate of potash, sulphuric acid, and common salt. A battery may be charged with these fluids in the following manner: Two ounces of bichromate of potash are dissolved in 20 ounces of hot water, and when cold 10 ounces of sulphuric acid are added. When the heat caused by the addition of the acid has subsided, the solution is placed within the porous cup, and a saturated solution of common salt poured into the outer compartment, which is occupied by the zinc plate. The chemical action when these solutions are used is rather more complex than that which has been given for other fluids. The action of the sulphuric acid on the bichromate of potash produces sulphate of potash and chromic acid. Hydrogen is evolved, and acting upon the chromic acid reduces it to chromic oxide, water being at the same time formed, while the chromic oxide combines with sulphuric acid, forming sulphate of chromic. The electromotive force resulting from these reactions is very great, and the batteries in which these fluids are used are now generally preferred where compactness is desired. Lacleanche's battery consists of a carbon electrode packed in a mixture of peroxide of manganese and carbon or coke in coarse powder in a porous cell, and outside of this a cup containing a zinc electrode immersed in a solution of sal ammoniac. Its electromotive force is about nine tenths of that of Daniell's. The comparative values of the electromotive forces of several forms of batteries are as follows: Bunsen's, 839; Grove's, 829; Daniell's, 470; Smeel's, 210; Wollaston's, 208.—Electricity developed by the Action of Solutions upon one another. If two vessels, one containing a solution of potash and the other of nitric acid, are connected by a bundle of asbestos, as represented in fig. 2, and two platinum plates are connected with the wires of a galvanometer, a galvanic current will pass through the latter instrument from the acid to the alkali. Davy supposed that this effect was due to the difference in action of the two liquids upon the platinum; but if two cups, each containing a solution of the same salt, as nitre, are placed on either side of the first named cup, and connected with them by bundles of asbestos, and the platinum slips connected with the galvanometer are placed in the solution of nitre, a current will be produced flowing in the same direction as in the first instance, but it will be weaker, because of the increased resistance offered by the additional liquid. The action of one acid upon another will also generate galvanic currents. Let strong nitric acid be placed in one branch of a U tube, and strong sulphuric acid be carefully introduced into the other so as not to mix (for which purpose a dividing membrane may be used), and platinum strips connected with the wires of a galvanometer be placed one in either branch; a current will thus be generated, passing from the sulphuric acid through the galvanometer to the nitric acid. Fig. 10 represents a galvanic couple composed of two liquids and one metal, devised by Becquerel, and called an oxygen circuit. A bottle, d, contains nitric acid, and into its mouth is inserted a tube containing a solution of caustic
potash, and having a cork in the top through which passes a wire. The bottom of the tube is stopped by a piece of linen cloth, which is covered with clay, and this with cotton wool, to prevent the clay from mixing with the liquid. The wire connects two plates of platinum, a and p, and the connection may be made through the coil of a galvanometer if it is desired to measure the strength of the current. The two liquids meet each other in the clay, and a current of considerable strength is generated, which passes through the wire from the acid to the potash solution, and through the clay from the potash solution to the acid; the latter answering to the copper, and the potash solution to the zinc plate of an ordinary couple. The water in the potash solution is decomposed, its oxygen escaping in bubbles, and its hydrogen going to the nitric acid, which it reduces to nitrous acid. The current which is generated is of constant strength, and the plates do not become polarized. The power is increased by making the plate in the potash solution of amalgamated zinc, which being attacked by the nascent oxygen produces polarization in the direction of the current. A simple couple of this kind is sufficient to effect the electrolysis of water, and several couples form a powerful battery.—Dry Piles. A modification of the voltaic pile was made by Deluc in 1809, and improved by Zamboni in 1812, which is remarkable for generating electricity of very high tension, approaching in character that of the frictional machine. The dry pile of Zamboni is made by covering a sheet of porous paper on one side with tin foil, and on the other with a paste made of powdered peroxide of manganese mixed with moistened gelatine, starch, or British gum. When the paste is dry the paper is cut into circular disks about an inch in diameter. These are placed one above the other in a glass tube, the tin-foil faces all turned one way, and the peroxide of manganese ones the other, so that one end terminates in tin foil and the other in manganese. Several hundred or thousand of these couples may be formed into a pile. They should be sufficiently pressed together to effect good contact, each end being fastened by a metallic cap, and one end provided with a knob, the other standing upon a metallic plate. The peroxide of manganese end shows positive, and the tin end negative electricity. Within the pile, therefore, tin corresponds to zinc, and peroxide of manganese to copper, in the ordinary pile or battery. It must not be supposed that the pile will act if it is perfectly dry; it requires, and under ordinary circum-stances possesses, a certain degree of moisture. It does not produce a continuous current, but after being discharged requires a certain time for the electricity to acquire sufficient tension to pass through the paper from the tin to the peroxide of manganese. A pile of several thousand disks causes strong divergence of the leaves of the electroscope and will decompose water. Its principal use is in the construction of Bohnenberger’s electroscope, represented in fig. 11. Two piles stand with their opposite poles upon a metal plate, and from the top of a bell glass which covers the piles a strip of gold leaf is suspended from a conductor which passes through the top and terminates in a knob. The gold leaf hangs between the two knobs of the piles, and the instrument is so delicate that whenever a body only slightly electrified is brought within a few feet of it, the gold leaf will move toward one or the other of the piles. A pith ball suspended by a silk thread between them will oscillate as long as the chemical action of the pile continues, which may be for two or three years. —Galvanometers. It has been stated that if a magnetic needle is brought near a wire through which a galvanic current is passing, it will be deflected; the direction depending upon the relative position of the wire to the needle, and upon the direction of the current. Upon this peculiar action depends the construction of an instrument which is used for measuring the strength of a galvanic current, called a galvanometer. If the wire is held above the magnetic needle, and parallel to it, and a current is passed in the direction of its north end, that end will be deflected to the left, as represented in fig. 12, when the observer is looking downward and to the north. If the wire is held under the needle, and the current passed in the same direction, the north end will be deflected to the right; but if the current is passed from north to south, the needle will be deflected in the same direction as when the current passed above it from south to north. If, therefore, the wire is turned upon itself, as represented in fig. 13, two forces will act upon the needle, tending to deflect it in the same direction; and if the wire is formed into a flat coil, the deflect-
The sensitivity of the instrument is increased by using what is called an astatic needle, which is constructed by placing two magnetic needles upon the same axis, but with their north and south ends in opposite directions, and suspending them horizontally by a delicate fibre of silk. If their axes are perfectly parallel, and they have precisely the same magnetic force, they will form a system which is astatic; that is, they will when acted upon only by the earth's magnetism point indifferently in any direction. It is however impossible to place them perfectly parallel, and it therefore follows that when they have equal magnetic force they will only come to rest when at right angles to the plane of the magnetic meridian. It is usual, however, except in the most delicate tests, to have one of the needles slightly stronger than the other, so that there shall be a slight directive tendency north and south to the system. If a wire carrying a current is held between the two needles, they will both be deflected in the same direction; and if the wire is formed into a coil, the force will be multiplied. An astatic galvanometer is represented in fig. 15.—Resistance to Current. Every galvanic circuit offers a certain resistance to the passage of a current, both in the wires connecting the terminal plates, and in the fluids in the cells. From Ohm's law there may be deduced many of the conditions upon which the strength of the galvanic current and the resistance offered to it depend. The primary force by which a galvanic current is set in motion is called the electromotive force, and this, upon the chemical theory, resides principally at the surface of the positive metal, and is generated by the chemical combination which takes place there. The quantity of current which is developed in a voltaic circuit depends upon the electromotive force and the resistance which it has to overcome in passing through the conductors, both solid and liquid, which are contained in the circuit. Ohm's law may be stated as follows: The strength of a galvanic current is equal to the electromotive force divided by the resistance, and is expressed by the equation \( C = \frac{E}{R} \) where \( C \) represents the strength of the current, \( E \) the electromotive force, and \( R \) the resistance. In an ordinary couple there are two resistances offered to the current: 1, that of the liquid conductor between the plates, called the internal or essential resistance; and 2, that offered by the conductor connecting the two plates outside of the liquid. This conductor may consist of one or of several materials; as a wire, or two or more wires having their ends placed in one or more liquids. The resistance offered by such external conductors is called the external or non-essential resistance. The strength of the current produced by increasing the size and number of the plates of a battery may be found by using the equation given above. Let the internal resistance be represented by \( s \), and the external resistance by \( t \); then in one couple \( C = \frac{E}{s + t} \). Let \( n \) represent the number of couples in a battery; then \( C = \frac{nE}{ns + nt} = \frac{E}{s + t} \), which expression, if \( t \) is very small, as when the connection between the terminal plates is made by a short, thick copper wire, has very nearly the same value as \( \frac{E}{s + t} \); that is, the strength of the current is not sensibly increased by increasing the number of couples when the circuit is closed by a good conductor. But if the external resistance is very great, as when the current passes through a long telegraph wire, or through a liquid, its strength will be increased by increasing the number of couples. If the size of the plates is increased, then, according to the chemical theory, the electromotive force will be increased, and therefore the strength of the current, provided the conductors do not oppose too much resistance. According to the contact theory, increasing the size of the plates, and therefore the section of the liquid conductor between them, proportionately diminishes the internal resistance. If, therefore, the size of the plates is increased \( m \) times, \( C = \frac{E}{s + t} = \frac{mE}{s + mt} \). If the value of \( t \) is very small, the latter expression has nearly the same value as \( \frac{mE}{s + t} \), or the
strength of the current then increases very nearly in proportion to the increase in the size of the plates; but if the external resistance is great, the strength of the current will not be increased in proportion to the increase in the size of the plates. Hence, in magnetizing soft iron by passing a current around it through a coil of stout wire, it will be of advantage to use a small number of large couples; but in passing a current through a long wire or an electrolyte, or any poor conductor, a large number of couples is to be preferred. The coupling to overcome external resistance is represented in fig. 16, which is the arrangement adopted in telegraph batteries and in galvanoplastic operations, and is called coupling in series. Coupling for quantity, or, as it is sometimes called, coupling in multiple arc, is represented in fig. 17, where plates of the same metal are grouped together. It has the same effect as the employment of one pair of plates having an equal area of surface; increasing the sectional area of the internal or fluid conductor, and correspondingly diminishing the internal resistance; also increasing the quantity of current through the external conductors when they are of sufficient capacity, or when they offer enough resistance, of generating an equivalent quantity of heat. The tension of galvanic is far less than that of frictional electricity, but by greatly multiplying the number of pairs in a battery the tension of frictional electricity may be approached. Thus, a battery constructed by M. Gassiot of 8,530 zinc and copper pairs, having electrodes $\frac{1}{2}$ of an inch apart, gave a series of sparks across the interval which lasted for several months. It is usual to say that the quantity of frictional electricity is small and its tension great, while the quantity of a galvanic pair is great in proportion to its tension. An experiment of Faraday's showed that two wires, one of zinc and one of platinum, each $\frac{1}{2}$ of an inch in diameter, immersed in aceticulated water $\frac{1}{2}$ of a second, had a greater effect on a magnetic needle than that of 25 turns of the large electrical machine of the royal institution. The physiological effects of galvanic electricity vary with intensity and quantity; they are treated in the article Medical Electricity. The astatic galvanometer cannot be used to measure currents of much strength, on account of its too great delicacy. For this purpose the tangent galvanometer and the sine galvanometer are employed. The tangent galvanometer consists of a vertical circle made of a band of copper the two ends of which are connected with the poles of a battery. In the centre of this vertical circle a small magnetic needle is placed, in length about $\frac{1}{2}$ of the diameter of the circle. When the needle is no longer than this, the tangent of the angle of deflection will be proportional to the strength of the current. In using the instrument the plane of the vertical circle is placed in the plane of the magnetic meridian. The sine galvanometer, invented by Pouillet, is represented in fig. 19. A longer magnetic needle may be employed in this in-
instrument, because it is kept at right angles to the axis of the coil through which the current passes. A horizontal, graduated circle, containing a declination needle, is fixed within the vertical circle, the two turning on a vertical axis which passes through the centre of a lower stationary, horizontal, graduated circle, an index being used to measure the arc of revolution. A stout copper wire, covered with silk, is passed one or more times around the rim of the vertical circle, according to the strength of the current which is to be measured. For weaker currents the coils are increased. In using the instrument the plane of the vertical circle is placed in the plane of the magnetic meridian. The needle and index will then each stand at 0, respectively on the upper and lower horizontal circles. If a current is now sent through the wire, the needle will be deflected; and if the vertical circle is rotated till the needle lies in its plane, and therefore again points to 0, the deflection will be marked by the index on the lower circle. The deflecting force of a current acting at right angles to the axis of the needle exactly balances the magnetic force of the earth, which is proportional to the sine of the angle which the needle makes with the magnetic meridian. An instrument called a differential galvanometer is sometimes used to measure at the same time the difference in strength of two currents. For this purpose two separate coils of the same sized wire are passed an equal number of times around the same needle. When two currents are sent in contrary directions through the coils, the amount of deflection produced will indicate the difference in strength between them. Sir William Thomson's mirror galvanometer (fig. 20) measures a delicate galvanic current with more precision than any other instrument that has been invented. A magnet is suspended within a coil of wire which varies in size and length according to the size and length of the conductor through which the current has already passed. If it has passed through long circuits containing bad conductors, the coil should be long and of fine wire, because the current will have been so much weakened that a fine long wire is now sufficient to conduct it, and therefore it may be used to induce a considerable magnetic force. The coil is placed within the cylinder mounted upon the rectangular box shown in the figure, and to one side of the magnet suspended within it there is attached a mirror which reflects a ray of light upon a horizontal graduated screen in front of it, and behind which there is placed a lamp which sends a ray of light through an orifice. A slight deflection of the magnet, which together with the mirror weighs only a few grains, gives the reflected ray a wide range over the graduated screen. A bar magnet, S, placed in the magnetic meridian, is used to counteract the earth's magnetism and thereby increase the delicacy of the instrument. Another bar magnet, T, perpendicular to the magnetic meridian, is used to adjust the instrument to zero when no current is passing. An instrument called a rheostat, invented by Wheatstone for the purpose of comparing resistances, is represented in fig. 21. Two cylinders of equal diameters turning upon their axes are held in a frame. One of them, A, is of metal, and the other, B, of some non-conductor, as vulcanite or baked wood. There is a spiral groove in the non-conducting cylinder in which a wire, connected with the binding screw C, is wound for an indefinite distance, and then transferred to the other cylinder and wound upon it to its further end. By turning the crank connected with one of the cylinders the wire may be all transferred from one to
the other. A binding screw connects with the metal cylinder, and when this and the other binding screw are connected with the electrodes of a battery a galvanic current will pass through the wire which is wound upon the non-conductor, and also through the metal cylinder, so that it will be easy to interpose in the circuit any desired length of wire having any desired area of cross section. Establishing a certain length of a certain sized wire as a unit of measure, a comparison may be made between the resistances of various media. To measure the resistance of any conductor, the rheostat and sine galvanometer may be used in the following manner: In fig. 22, let m be a conductor whose resistance is to be measured or compared. One end of it is dipped in a cup of mercury, b, which is also connected with one pole of a battery, T. The other end of m dips into a second cup of mercury, a, which is connected with one of the binding screws of the rheostat. A wire attached to the other binding screw is connected with one end of the wire which passes around the vertical circle of the galvanometer, the other end of which connects with the other pole of the battery. The rheostat wire is all wound on the metal cylinder, and the circuit being closed, the deflection of the galvanometer may be noted. Then the conductor m is removed from the circuit, and the two wires at a and b are joined. Enough of the rheostat wire is now wound on the non-conducting cylinder to cause the same deflection in the needle as before. That portion of the rheostat wire through which the current passes will have the same resistance as that of the conductor m, whose amount is therefore found by comparison. The results obtained from numerous experiments upon the conductivities of various metals show that silver, gold, and copper are the three best conductors, and that impurities greatly increase resistance, as will also an increase of temperature. It has been shown by Forbes that metals have proportional conductivities for heat and for electricity, and that impurities also proportionately increase the resistance for each. The following table gives E. Becquerel’s determinations of specific electrical resistances at 15° C, regarding that of silver at 0° as 100:

By comparing this table with that of the heat-conducting powers of the same metals in the article Heat, it will be seen that the numbers which here indicate electrical resistances are inversely proportional to those in that table which indicate heat conductivities. The resistance offered by liquids to the passage of a galvanic current can be determined with the rheostat and galvanometer in a manner similar to that for solid conductors. Plates of metal at A and B, fig. 23, are placed one above another in a vertical cylindrical vessel and connected by wires, one with a pole of a battery, and the other with the rheostat, the galvanometer being introduced as before. The terminal plates must be of metal whose relations to the fluid will not excite any electromotive force. The best liquid conductors except mercury offer vastly greater resistance than metals. The resistance offered by dilute sulphuric acid is about 1,000,000 times that of silver, and that of water many times greater. If the strength of a series of currents passing through a wire, as measured by the tangent or the sine galvanometer, is represented by the numbers 1, 2, 3, the quantity of heat developed in the same time will be expressed by the numbers 1, 4, 9; therefore the heat generated by a galvanic current is proportional to the square of the strength of the current. With an equal strength of current the heat generated is in proportion to the external resistance. If currents of equal strength are passed through silver and platinum wires of the same length and thickness, the latter will be heated ten times as much as the former, because the resistance offered by platinum is ten times as great as that offered by silver; but it will require more electromotive force to send the current through the platinum.—Electrolysis. The decomposition of substances by the galvanic current when there is no consumption of either electrode, as in the cases we have been considering, is called electrolysis, although it differs but little from the decomposition which takes place in the cell of a battery couple, the decomposed fluid in either case being, strictly speaking, an electrolyte. The first decomposition of substances by passing through them currents from the electrodes of a battery was effected by Nicholson and Carlisle, who decomposed water in the year 1800, soon after the construction of the voltaic pile. The electrolysis of water is commonly performed with Faraday’s voltmeter, a modification of which is shown in fig. 24. Two platinum electrodes, p and n, pass through sealed orifices in the bottom of a shallow vessel, and over them are placed inverted test tubes, O and H,
which are filled with water acidulated with sulphuric acid, the same fluid being contained in the shallow vessel. The electrodes are placed as near together as practicable, in order to reduce the resistance. The electrolysis of

\[
\text{H}_2 \quad | \quad \text{SO}_3 \text{H}_2 \quad | \quad \text{SO}_3 \text{H}_2 \quad | \quad \text{SO}_3 \text{H}_2 \quad | \quad \text{O} \quad +
\]

pure water is difficult, and it is doubtful if it occurs in the presence of sulphuric acid, except at the surface of the positive electrode, it being more probable that the chain of molecules of sulphuric acid lying between the electrodes have their elements displaced and rejoined in the following manner:

\[
\text{K} \quad | \quad \text{I} 
\]

Other binary compounds are very readily decomposed by electrolysis, as for instance iodide of potassium, KI, in this manner,

\[
\text{K} \quad | \quad \text{I} 
\]

the negative element of the compound molecule, iodine, going to the positive, and the positive element, potassium, going to the negative electrode. By means of a battery of 220 couples Sir Humphry Davy decomposed the alkalises potash and soda, showing them to be oxides of two hitherto unknown metals, potassium and sodium. The electrolysis of potash may be accomplished by placing a globule of mercury in a cavity made in a piece of caustic potash, which being moistened lies upon a piece of platinum foil. The latter is connected with the positive electrode of a Grove’s or Bunsen’s battery of six or seven cells, and the point of a wire, connected with the negative electrode, is placed in the mercury globule, which then attracts the positive element, metallic potassium, of the caustic potash, while the negative element, oxygen, is attracted by the plate of platinum. The potassium on being liberated forms with the mercury an amalgam, which on being subjected to distillation yields metallic potassium. Any substance which is separated into component parts by electrolysis is called an electrolyte, and must be in a fluid condition so as to admit of displacement of the molecules. Although it is believed at the present time that the molecules of solid bodies do not touch each other, still it must of necessity be a condition that they are held by their polarity in such fixed relations that no external force is sufficient to release them until the attraction is diminished by heat or by some solvent. From the nature of molecular combination, one constituent of a molecule is electro-positive, and the other electro-negative; therefore, when subjected to the influence of electrical attraction, one of the constituents will be drawn to the positive and the other to the negative electrode of the battery. The positive electrode of a battery was named by Faraday the anode, and the negative the cathode, the former referring to the upward and the latter to the downward direction of the current. The elements or constituents of the electrolyte he called ions, the one going to the anode the anion, and the one going to the cathode the cation. Potassium, which is the most electro-positive of all bodies, is therefore always a cation, and oxygen, the most electro-negative body, is always an anion. As a general rule, the metals, or those constituents which contain them, are cations, while the non-metallic constituents are anions; but some elements may be sometimes cations and sometimes anions. In chloride of sodium, NaCl, for instance, chlorine is an anion, while in chloric acid, ClO₃, it becomes a cation, or electro-positive element. In the electrolysis of ternary salts, which were formerly supposed to be constituted by the union of an acid with an oxide of a metal, it was held that there was a separation of this oxide from the acid, and then a subsequent separation of the oxygen and the metal, and their appearance respectively at the positive and negative electrodes; but this theory was only adapted to the one entertained with regard to the constitution of a salt. It is now held that ternary salts have in reality a binary constitution, the metal forming the electro-positive, and the salt radical the electro-negative constituent. The electrolysis of a salt may be shown by using a U-shaped tube as represented in fig. 25. A solution of the salt colored with sirup of violets is introduced into the tube, and the platinum electrodes of a battery are placed one in each leg. After the current has passed for a time the fluid will have a red color about the positive, and a green color about the negative electrode, the red being caused by the action

FIG. 24.—Voltameter.

FIG. 25.
of the acid, and the green by that of the alkali, those bodies being formed subsequently to the electrolytic decomposition of the salt by the union of the metal with the oxygen of the water, and the union of the body SO₄ with the hydrogen. It was the appearance of these acids and bases at the electrodes which led to the old theory of saline compounds. In electrolysis there is not merely a separation and recombination of constituents in the chain of molecules between the electrodes, but there is an actual passage of one to the positive and of the other to the negative electrode. This action was demonstrated by Davy in the following manner: A solution of sulphate of soda was placed in two vessels and connected by a bundle of asbestos moistened with the same solution. The electrodes of a battery being placed in the cups, it was after a time found that the cup connected with the positive electrode contained all the sulphuric acid, while the soda was all found in the other. If one of the cups contains a solution of sulphate of soda, and the other a solution of chloride of sodium or of potassium, both metallic bases will after a time be found in the cup connected with the negative electrode, and the acid radicals in the other; and this transference of molecules will take place with any number of solutions, and through any number of cups which will not offer too great resistance to the passage of the current, provided that all the compounds which are formed by the interchange of molecules are soluble. If, however, an insoluble compound is formed by the union of any of the constituents in any of the vessels, it will be precipitated and thus finally eliminated from the solution. Thus if a solution of sulphate of potash is placed in A, fig. 26, connected with the negative electrode of a battery, distilled water in C, connected with the positive electrode, and a solution of caustic baryta in B, all being connected by threads of moistened asbestos, the passage of a current will effect no transference of sulphuric acid to the positive electrode, but a precipitate of sulphate of baryta will be formed in the cup B.

The researches of Faraday have established the following laws of electrolysis: 1. Electrolysis cannot take place unless the electrolyte is a conductor. Water cannot be decomposed when in a state of ice, and other substances, as oxide of lead and chloride of silver, require for electrolysis to be fused to give them conducting power. 2. The energy of electrolytic action is the same in all parts of the current. 3. The same quantity of electricity decomposes chemically equivalent quantities of all the electrolytic constituents through which it passes. That is to say, the same current will in the same time decompose 166 parts of iodide of potassium, 101 of nitrate of potash, 69 of chloride of sodium, and 9 of water. The decomposition which takes place in electrolysis creates a resistance to the current, and tends to generate a current in an opposite direction; the action being similar to what would be the case if one of the cells of the battery were to be reversed, so that the current would be forced to pass through the liquid from the copper to the zinc. This is in agreement with the doctrine of conservation of forces. A certain amount of the power generated by the consumption of the positive element of the battery, that is to say, by the combination of the acid with the zinc, may be expended in one way or another in the conductors which are traversed by the current. A certain amount of decomposition or electrolysis may be effected in one part, a certain amount of heat in another, and a certain quantity of mechanical power in another; the sum of all the forces expended being precisely equal to the original electromotive force.—Polarization of Electrodes. After protracted electrolysis, if the electrodes are disconnected from the battery and placed in a conducting liquid and connected externally by a wire, a current will flow in a direction opposite to that which was generated by the battery. Suppose, for instance,
num, which is suspended by a platinum wire passing through the top of the tube, which is closely sealed, are filled with dilute sulphuric acid, and their lower ends, which are open, are placed in the same liquid in the vessel a a. The platinum strips are then connected with the poles of a battery, and by electrolysis hydrogen is collected in one tube and oxygen in the other. Upon removing the battery and connecting the platinum strips either through a galvanometer or an easily decomposed electrolyte, as iodide of potassium, a current will flow from the oxygen to the hydrogen tube, and in the opposite direction to that produced by the battery used in evolving the gases, while during the action the gases in the tubes will gradually disappear; the hydrogen twice as soon as the oxygen. Ritter's secondary pile is constructed upon the same principle. A number of disks of the same metal are separated by pieces of moistened cloth. After passing for a time a galvanic current through the system, on removing the battery and connecting the ends of the pile a current will be found passing in the opposite direction to the battery current.—Prof. Clausius proposes a "molecular theory of electrolysis," which may be briefly stated as follows. An electromotive force urges the constituents of the compound molecules of an electrolyte in opposite directions. The components being joined together in pairs by chemical force, an electrolytic force sufficient to tear them asunder is hardly conceivable, and therefore an additional power is sought for. The molecules of an electrolyte, as of all bodies, are constantly in a state of more or less intense vibration. In electrolytes, which are fluids, the molecules, which exist in pairs, are constantly striking against each other. Sometimes the components of a pair are separated, and it is at this time, according to Clausius, that the electromotive force causes the molecules of one kind to move in one, and those of the other kind in the opposite direction.—The identity of frictional electricity and galvanism is regarded as established, but the expression is rather indefinite when it is considered that at the same time a wide difference in the phenomena is recognized. That the particles of ponderable matter, or of ether, whichever may be the media of electrical action, assume motions of an entirely different character, and which may also be transformed one into another in accordance with the laws of the forces and conditions, is not only probable, but is a view whose acceptance can scarcely be resisted. Moreover, having accepted the doctrine that ethereal heat vibrations are communicated to ponderable matter, and from ponderable matter again to the ether, it is natural to believe that electrical motion in ether may propagate or generate motion in ponderable matter, which we recognize as another form of electricity. The production of light by the passage of the electric current through a resistless conductor, as a fine metallic wire, is caused, as is generally believed, by a correlation of forces, that is, by the electric force generating heat vibrations in the conductor, which in turn propagate themselves in the ethereal medium, and increasing in rapidity finally produce the phenomenon of light. Although the passage of a galvanic current through a resisting conductor generates heat, the two phenomena differ decidedly in character. The electrical condition is not retained by the wire when it is disconnected with the battery, but the heat which is developed continues for a considerable time. Again, statical electricity resides upon the surfaces of bodies, whereas heat is contained within them and has a tendency to diffuse itself equally. If a hollow vessel is electrified, its interior will exhibit no signs of electrical excitement, but heat will pass with equal facility to the interior or to the exterior.

—Electrical Potential. The doctrine of electrical potential has not been discussed here or in the article Electrivity, because for its explanation and application more space would be required than the limits of the articles would allow. It was introduced by Green, and has been recently generally adopted in the application of mathematical methods of the discussion of electrical phenomena. The definition given by Jenkin affords, perhaps, as clear an idea of the meaning of the term as may be communicated in a few words: "Difference of potentials is a difference of electrical condition in virtue of which work is done by positive electricity in moving from a point at a higher potential to that of a lower potential, and it is measured by the amount of work done by the unit quantity of positive electricity when thus transferred." Electrical potential is, therefore, a relative quantity, and relates to the difference in electric quantity or electric force between two points or two surfaces. If it has any positive value, it is that given by a difference in electrical condition between a given body and the earth, whose potential is usually regarded as constant. This is, however, not strictly so, as must be evident from the fact that electrical currents of different intensities must produce different potentials. For an explanation of the doctrine of electrical potential the reader is referred to special treatises on electricity and magnetism, such as those of Clerk Maxwell and Fleming Jenkin—Galvanoplasty, or Electrino-metalurgy, the art of forming metals from their chemical compounds and causing them to be deposited in their elementary condition upon surfaces in various forms by the agency of dynamical electricity. Its principal divisions are electropa-
ting and gilding, and electrotyping. In electroplating and gilding the deposited metal is usually retained upon the surface it is deposited upon, while in electrotyping it is subsequently removed from such surface, which is used as a mould of which the deposit forms a reverse copy.—*Electroplating and Gilding*. Gilding was formerly done by covering the metal to be gilt with an amalgam of gold and mercury and volatilizing the latter metal, and the same process was employed in silvering. Brugnatelli, a pupil of Volta, is said to have been the first, in 1808, to gild the baser metals by means of the galvanic current; but de la Rive was the first to make the process successful. Its present state of perfection, however, is due to Elkington, Ruolz, and others. The processes of electroplating and electrogilding are almost identical, and depend upon the power of inducing an electro-negative condition upon a surface, usually metallic, which causes it to attract the electro-positive or metallic constituent of a salt; and also of inducing an electro-positive condition in a neighboring surface, causing it to attract the electro-negative or non-metallic constituent. The positive plate in a battery, or the one upon which the chemical action takes place, and which is connected with the negative electrode, must therefore be joined by the latter to the plate upon which it is desired to deposit the metal, the other or negative battery plate being connected with the plate in the bath upon which an electro-positive condition is to be induced. The tendency in the bath, as the liquid is called which contains the metallic salt from which by electrolysis the metal is deposited, is usually to create an electromotive force acting in a direction contrary to the battery current; therefore the electromotive force of the latter must be sufficient to overcome the former, and also to effect decomposition. In choosing a bath solution, therefore, it is desirable to take one the tendency of whose action is to create as little opposing electromotive force as possible, and this is usually done by choosing an alkaline instead of an acid solution. It requires a powerful battery to cause a deposit of metallic gold to be formed from a solution of the chloride upon the perfect metallic surface of an iron plate; but by employing a cyanide of the metal dissolved in cyanide of potassium, the deposition is practicable with the use of a small battery or a single couple. If a clean piece of iron is dipped in a solution of sulphate of copper, it becomes coated with a film of the latter metal; but this is not an example of true electroplating, the copper not being deposited upon the clean metallic surface of the iron, but upon a film of the oxide or of the sulphate of that metal which is formed by the action of the sulphuric acid contained in the sulphate of copper. No chemical action must be suffered to take place upon the iron plate; but while in a clean condition it must have negative electricity induced upon it sufficient to cause it, instead of attract-

![Fig. 80.—Simple Bath.](image-url)

...ing the acid, to attract the metallic constituent of the solution. It is usual in practice, in electro-silvering or gilding iron, to first deposit a thin coating of copper, which is more easily attached to the iron than the more precious metals, and forms a better surface for their deposition. An article of copper, which may be a cast of some object, or a piece of iron or one of the baser metals, after having been first electroplated with copper from a solution of the sulphate or of the cyanide, is plated with silver in the following manner: Cyanide of potassium being carefully added to a solution of nitrate of silver, a precipitate of cyanide of silver, AgC\(_2\), is formed, which, being washed in distilled water, is dissolved in a solution of cyanide of potassium, by which there is formed a double salt of cyanide of silver and potassium, AgKCY\(_3\); or lime water may be added to the solution of nitrate to precipitate oxide of silver, which may then be dissolved in cyanide of potassium. Another mode of forming the solution is to add a solution of common salt to that of nitrate of silver, and dissolve the chloride in cyanide of potassium. In either case AgKCY\(_3\) is formed. The object to be plated is connected with the negative electrode of a battery or a magneto-electric machine and suspended in a hot solution of the cyanide, and a plate of silver connected with the positive electrode is suspended near it, as represented in fig. 80. The object to be plated, now forming the negative electrode of the electrolyte cell, attracts the metallic silver of the cyanide; the potassium, the most electro-positive of the three bodies, remaining combined with the cyanogen, the two forming the electro-negative constituent of the compound AgKCY\(_3\). The reactions which take place may be represented in the following diagram:

\[
\text{Copper or iron plate} \, \, \, \left[ \begin{array}{c} \text{Ag} \, \, \, \text{KCY}_3 \, \, \, \text{Ag} \, \, \, \text{KCY}_3 \, \, \, \text{Ag} \, \, \, \text{KCY}_3 \, \, \, \text{Silver} \end{array} \right] \text{plate.}
\]

The body KCY\(_3\), which is liberated upon the surface of the silver plate, immediately combines with that metal, and thus the solution is continually replenished with the double cyanide. For gilding, a solution of auro-cyanide of gold, AuKCY\(_3\), corresponding to the silver cyanide, may be formed in a similar manner. A plate of gold forms the positive, and the object which is to be coated the negative electrode.
GALVANISM

A number of objects may be suspended upon one rod, the positive electrode being enlarged so as to offer a sufficient surface for the action of the cyanide of potassium; or the compound cell system may be adopted, as represented in fig. 81, where the bath is divided into separate cells, like those of a trough battery, the negative plate in one cell being connected with the positive plate in the next. This arrangement requires the addition of electromotive force to the battery, and is moreover found not to be so manageable or economical as the simple cell system. Electroplating in nickel has recently been introduced by Dr. Isaac Adams of Boston. The following bath has been found to work well: Add one part of a solution of neutral tartrate of ammonia to 20 parts of a solution of the double sulphate of nickel and ammonia, both solutions being in water and standing at 70° Baumé. After mixing and standing a few hours, the bath is ready for use. A plate of nickel forms the positive electrode. Several applications of nickel-plating have been patented; as to gas burners to protect the tips from oxidation; to culinary utensils for the same purpose; to facing printing type, to harden the surface and prevent the action of colored inks; and for covering portions of firearms. It is also used in plated surgical instruments. Electroplating is not confined to the deposition of one metal upon another, but alloys may be coated with one metal, or a single metal may be coated with an alloy. Brass and bronze, with careful management, and by the use of positive electrodes of the alloy, may be successfully deposited upon copper plates.—Electrotyping, which consists in making a cast of a metal upon a mould by galvanic action, is performed as follows: The "form," containing the type, woodcut, or other engraving which is to be electrotyped, is cleaned and slightly dusted with finely powdered black lead. It is then laid face upward on a bed plate of a hydraulic or toggle-joint press of great power. A brass case in the form of a shallow pan, and rather larger than the form, has turned into it about a half inch thickness of melted beeswax, which after cooling is placed over the form, and the two are powerfully pressed together. This forms a wax mould, which after being separated from the form is built up, in places which are to be blanks, by running on more wax with a building iron; an elevation upon the mould, of course, forming a depression in the electrotype plate. The surface of the mould is now coated over with fine black lead powder, to give it a conducting surface for the galvanic current, in which operation is performed with a kind of stippling brush of badger's hair, moved by machinery in a box containing black lead dust. When a good surface has been formed the loose particles are blown off, and it is washed with a weak solution of sulphate of copper, after which it is dusted with fine iron filings, by which means a film of metallic copper is deposited over the black lead surface, which increases its compactness and conducting power. It is then suspended in a bath composed of sulphate of copper and sulphuric acid, in the proportion of two of the salt to one of the acid, in enough water to stand at about 14° Baumé, and is connected with the negative electrode of a battery or of a magneto-electric machine. Opposite the face of the mould there is suspended a sheet of copper, connected with the positive electrode. From its greater constancy Daniel's battery is usually preferred, but others may be used, and where great rapidity is required powerful magneto-electric machines like that of Wilde (see Magneto-Electricity) are employed. A series of moulds may be suspended back to back, the copper sheet being placed between opposite pairs. When the circuit is closed the sulphate of copper is decomposed, the metallic copper, the positive constituent, going to the negative plate, which is the plumbago surface of the mould, while the body SO₄ unites with the copper plate, forming sulphate of copper. The arrangement of bath and battery is similar to that shown in fig. 30. The moulds may be made of gutta percha instead of wax. The time required to form the electrotype plate depends upon the strength of the solution and the electromotive force of the battery or magneto-electric machine. With a sulphate of copper, and a machine requiring a six-horse power to drive it, several large plates may be made in less than one hour. After the shell, as the deposit is called, is taken off the mould, it is placed in water to protect it from oxidation until the workmen are ready to perform the operation of backing. A shell is laid upon its face in a shallow vessel having a plane bottom, and its back is washed with a solution of chloride of tin, called soldering fluid. A sheet of tin foil is then laid over it, and heat applied to the bottom of the pan until the foil melts and spreads over the surface. A fusible alloy of tin and zinc or type metal is then melted and turned upon the back to the thickness of about an eighth of an inch. After cooling the plate is taken out, cleaned, and polished with marble dust and benzine, or with clay and soft soap; and it may be faced with nickel if desired.

GALVANIZED IRON, a name given to iron coated with zinc, or zinc and tin. The pro-
cess is a French invention, and was not intro-
duced into England till 1837, when a patent
was obtained by Mr. Crawford. The opera-
tion is not performed with a galvanic battery,
as is often supposed, but by immersion in the
melted metal. By Mallet’s process the sheets
are first cleansed by immersion in a warm
bath of equal parts of sulphuric or hydrochloric
acid and water, followed by scrubbing with
emery and sand. They are then placed in a
preparing bath of a saturated solution of hy-
drochlorate of zinc and sulphate of ammonia;
and from this they are removed to a metallic
bath composed of 302 parts by weight of mer-
cury and 1,392 parts of zinc. To every ton
weight of the amalgam one pound of potas-
sium, or better of sodium, is added. At the
temperature of 680° F. the compound fuses,
and the zinc is deposited upon the iron sheets;
the iron at the same time is attacked so strong-
ly, that in a few seconds a plate an eighth of
an inch thick would be dissolved if allowed
to remain. Small articles are most advan-
tageously treated after the strength of the
mixture has been somewhat spent upon larger
ones. Crawford’s method was to plunged the
cleansed sheets of iron into a bath of melted
zinc covered with sal ammoniac, and stir them
about for some time. Undiluted commercial
acids are also used for cleaning the surface of
the iron, in which case some bits of zinc are
immediately added, which dissolves and is
directly precipitated, forming a film upon the
iron. When coated the articles may be ap-
piled to use, or they may be made still more
effectually to resist the action of oxidizing
agents by next dipping them in a bath of melt-
ed tin. This metal then forms the exterior
coat, and adheres much more firmly than if it
had been applied directly to the iron.

GALVESTON. I. A S. E. county of Texas,
including the island of the same name; area,
680 sq. m., of which 274 sq. m. are water; pop.
in 1870, 15,290, of whom 8,536 were colored.
The main portion of the county occupies the
W. shore of Galveston bay, and is separated
from the island, lying in the gulf of Mexico,
by West bay. N. E. of the island, and sepa-
rated from it by a channel 1 or 2 m. wide, is
Bolivar peninsula, forming a part of the county,
and lying between the gulf and East bay, an
arm of Galveston bay. The surface is gener-
ally level and the soil sandy. The chief pro-
ductions in 1870 were 2,905 bushels of Indian
corn, 16,205 of sweet potatoes, and 213 tons
of hay. There were 960 horses, 717 milch
owes, 3,140 other cattle, 666 sheep, and 719
swine on farms. The number of manufactur-
ing establishments was 91, employing 538
hands; capital invested, $710,950; value of
products, $1,314,814. II. A part of entry, seat
of justice of the above county, and the chief
city of Texas in point of population and commerce,
situated at the N. E. extremity of Galveston
island, at the mouth of the bay of the same
name, the entrance to which is through the
channel between the city and the S. W. point
of the peninsula of Bolivar, where a lighthouse
has been erected, 180 m. E. S. E. of Austin, and
290 m. W. by S. of New Orleans; lat. 29° 19’ N.,
lon. 94° 46’ W.; pop. in 1850, 4,177; in 1860,
7,307; in 1870, 18,818, of whom 8,007 were colored
and 3,614 foreigners. The population at the beginning of 1874 was
estimated by the local authorities at from 25,000
to 30,000. The city is laid out with wide and
straight streets, bordered by numerous flower
gardens. Besides the churches, the public
buildings include the custom house, post office,
United States court house, county court house,
city and county prison, city hall, opera house,
2 theatres, 3 concert halls, 4 other public halls,
18 hotels, and 3 market houses. Oleander park
occupies 50 acres, and the city park 25 acres.
There are 8 public squares, an esplanade 2 m.
long, and 3 public gardens. Magnolia Grove
cemetery comprises 100 acres, and the city
cemetery 10 acres. There are 9 m. of street
railroad in operation. The island is about 28
m. long and from 1½ to 3½ m. wide, intersected
by many small bayous, diversified by several
fresh-water ponds, and bordered through its
whole length by a smooth hard beach, which
forms a pleasant drive and promenade. The
bay is an irregular indentation, branching out
into various arms, and receiving Trinity and
San Jacinto rivers and Buffalo bayou. It ex-
tends 35 m. N. from the city to the mouth of
Trinity river, and has a breadth of from 12 to
18 m. The harbor is the best in the state,
and has 18 ft. of water over the bar at low tide.
The city is provided with good wharves, and
large storehouses adjoining them. The chief
business is the shipping of cotton. The south-
eastern cotton press company owns 14 brick ware-
houses, each occupying 2½ acres, and the Texas
cotton press company 3 more brick warehouses
covering 7¾ acres. The receipts and shipments
in bales since 1868, for each year ending Sept.
1, have been as follows:

| YEARS | Receipts. Ship-
ments. | YEARS | Receipts. Shipment.

In 1878 170,711 bales were shipped to Great
Britain, 6,100 to France, 82,584 to other Euro-
pean countries, 18,880 to New Orleans, 67,038
to New York, 18,756 to Boston, and 14,784 to
other coastwise ports. The receipts of hides
were 460,884; shipments, 459,582; receipts of
wool, 8,973 bags; shipments, 8760 bags. The
value of pine lumber received was $324,000;
cypress, $480,000; total, $1,104,000; head of
cattle shipped, 50,699. The total value of ship-
ments was $85,333,747, including cotton to the
value of $22,425,806; of receipts, $29,511,881.
The number of immigrants during the year was
44,014. The value of imports from and exports
to foreign countries since 1870, with the amount
of duties collected, for each year ending July 31, is shown in the following table:

The number of vessels belonging to the port was 297, with an aggregate tonnage of 28,448, including 198 sailing vessels of 18,818 tons, 38 steamers of 6,709 tons, and 34 barges of 3,940 tons; built during the year, 10 sailing vessels of 165 tons, and 1 barge of 57 tons. There is a daily line of steamers to New Orleans and another to Indianapolis and Corpus Christi; a weekly line to Havana, and another to New York; and a semi-monthly line to Liverpool. The Galveston, Houston, and Henderson railroad connects the city with Houston and the diverging railroads, crossing West Bay on a bridge nearly 2 m. long. The depot and warehouses cover 20 acres. The Galveston Wharf railroad enables the company to load its cars directly from the vessels. A canal, 10 m. long, opens an avenue for commerce to the Brazos river. The chief manufactories are two iron foundries, six machine shops, and the gas works. The New York and Texas beef-preserving company kill and can 48 cattle per day. There are two national banks, with an aggregate capital of $800,000; a savings bank, with $175,000 capital; two banking and insurance companies, and four insurance companies, including a life insurance company. The whole number of joint-stock companies is 32, having an aggregate capital of $12,211,000. The city is divided into four wards, and is governed by a mayor and a board of 12 aldermen. Water works are in process of construction, and there is an efficient health department. Of streets 17 m. have been shelled, and 26 m. filled and graded. The assessed value of property for the year ending Feb. 28, 1873, was $18,500,000; bonded debt, $300,700; estimated receipts for the year ending Feb. 28, 1874, $282,986; estimated expenditures, $273,785. The principal charitable institutions are the house of refuge, having grounds 88 acres in extent, an orphan asylum, and three hospitals, one of which is supported by the city. The Roman Catholic university of St. Mary was founded in 1854, and in 1872 had 8 professors and 35 collegiate and 115 preparatory students. The Galveston medical college, founded in 1884, has six professors. The Ursuline convent, containing 36 nuns, has a female academy connected with it, and 120 pupils. There are two other female seminaries, with about 350 pupils. The six public schools in 1872 had 16 teachers and 700 pupils. The whole number of pupils in public and private schools, &c., is about 3,500. The mercantile library contains about 9,000 volumes, and has a reading room. There are 15 churches, and 5 daily (1 German), 3 tri-weekly, 1 semi-weekly, and 6 weekly (1 German) newspapers. The island of Galveston was occupied by the pirate Latitte in 1817, and continued to be his headquarters until his settlement was broken up in 1821. The growth of the city dates from 1887. During the civil war it was occupied by the federal forces, Oct. 8, 1862, but was retaken by the confederates, Jan. 1, 1863.

Galvez, Bernardo, count de, a Spanish soldier and statesman, born in Malaga in 1766, died in Mexico, Nov. 30, 1786. He was the son of Don Matias de Galvez, his predecessor as viceroy, and nephew of José de Galvez, marquis of Sonora, visitor of Mexico from 1781 to 1789, and subsequently minister general of the Indies. He served in France and in the Algerine expedition, rose to the rank of colonel, and was made governor of Louisiana July 10, 1776. During the American revolution he gave the Americans aid for operations at a distance from Louisiana, on the frontiers of Virginia and Pennsylvania and on the northwest, but did not permit them to operate against any English posts near him. When Spain joined in the war, Galvez in 1779 raised an army and took from the English Fort Mancha, Baton Rouge, and Fort Panmure at Natchez. In March, 1780, he took Mobile, and on March 18, 1781, he appeared before Pensacola with Solano's fleet, bearing an army of 5,000 men, and on May 10 compelled Gen. Campbell to surrender. He was created a count, and in 1784 appointed captain general of Cuba, Louisiana, and the two Floridas; but as his father's death in 1784 left his post vacant, he was made viceroy of Mexico, retaining the captain-generalcy of Louisiana and Florida. He was so regardless of stiff official Spanish dignity that he gave offense in Spain, and his erection of the palace of Chapultepec excited suspicion, and led to such vexations and annoyances that he fell sick and died of chagrin after a brief administration.

Galway. I. A maritime county of Connaught, Ireland, bordering on the Atlantic and Galway bay, and on the counties of Mayo, Roscommon, Kings, Tipperary, and Clare; area, 2,242 sq. m.; pop. in 1871, 248,227. It is separated from Lough Corrib into two divisions, differing in geological formation and physical appearance. The eastern division rests on a limestone basis, and is in general level and fertile, except the central parts, which contain large quantities of wet bog, nearly unproductive.
The western part, comprising the district of Comemara, rests upon granite, and is barren, rugged, and mountainous, but contains valuable mines of copper, lead, and manganese, and quarries of marble and other stones. Agriculture is in a very backward state. The southern parts produce some fine wheat, but oats and barley are the principal products elsewhere. Flax is also cultivated, but less extensively than formerly. Grazing is much attended to. The coast fisheries have diminished in importance; but a company has recently been formed for carrying on deep-sea fisheries. There are some manufactures, among which are woolen hosiery, coarse linens and friezes, and felt hats. The production of kelp was formerly one of the great sources of profit on the western shores, and is still carried on to some extent. Celtic cromlechs and Anglo-Norman castles are frequently to be met with. The chief towns are Galway, Tuam, Longhrea, and Ballinasloe. It is a town port, and parliamentary borough, and capital of the county, near the head of Galway bay, 117 m. W. of Dublin, with which it is connected by railway; pop. in 1871, 18,184. The greater portion of the town is built upon a tongue of land, bounded E. by Lough Atalies, an arm of the sea, and W. by the Corrib river. The other and smaller part is on the opposite bank of the river, and is connected with the former by one wooden and two stone bridges. In the old town the streets are narrow, irregular, and dirty, but in the modern part they are in general spacious, handsome, and clean. The chief public edifices are the Queen's college, the collegiate church of St. Nicholas, the Franciscan convent, and two handsome court houses. Galway was formerly the principal emporium of Ireland, and for several centuries enjoyed the monopoly of the trade with Spain. It was then surrounded by walls, of which only a few fragments now exist. The principal exports are corn, flour, kelp, marble, woof, and provisions. The chief imports are timber, wine, salt, coal, hemp, tallow, and iron. The harbor has an extensive line of quays, and is connected with Lough Corrib by a canal. It has a floating dock, which admits vessels of 14 ft. draught. On Mutton island, in front of the harbor, is a lighthouse 88 ft. above high water.

GAMA, Vasco da, a Portuguese navigator, born at Sines, died in Cochin, India, Dec. 25, 1524. Bartholomew Dias, a Portuguese explorer, having visited the cape which he called Cabo Tormentoso, or Stormy cape, brought back such interesting accounts of his discoveries that the Portuguese sovereign Emanucl determined to urge discovery beyond the point where Dias left it, and if possible to reach by sea the countries of the Indies. Accordingly an expedition was placed under the command of Vasco da Gama, a gentleman of the king's household, and a skilful and experienced mariner. The fleet consisted of the São Gabriel, flag ship, of 120 tons, the São Rafael of about 100 tons, a caravel of 50 tons, and a store ship, with a total force of 160 men. On July 8, 1497, the expedition departed from Lisbon for the Cape Verd islands, whence it set sail on Aug. 9 southward along the African coast. Delayed by storms, it was not till Nov. 7 that they reached the bay of St. Helena, near the cape. Departing on the 16th, they encountered a succession of tempests such as had gained for the southern promontory of Africa the name of the cape of Storms. The courage of Gama's companions failed, and they besought him to put back, which he not only refused to do, but put the ringleaders of the movement in irons, and held on his course into the stormy sea. When they were beating about off the promontory, Gama fancied that he saw the spirit of the cape. Camaens has sung this incident as a fact, while moderns, less poetical, say that the apparition could have been nothing more than that peculiar cloud whose sudden envelopment of the cape is the forerunner of a storm. On Nov. 20 (according to Barros, but more probably on the 22d) they doubled the cape of Storms, or, as Emanuel himself had named it ere the expedition set out, the cape of Good Hope. Proceeding along the coast, they touched at various points, among others at Natal. Further N. they discovered Mozambique, and came upon a country which exhibited a high stage of commercial advancement, the inhabitants having regularly built ports, with mosques. The natives were Mohamme
dans, carrying on a trade in pearls, rubies, silver, linen, and spices with Arabia and India. Gama took with him a pilot from this place. On April 1, 1498, the explorers discovered the island of Acoutado, so named by Gama from a flogging he gave his pilot there; and on the 7th the island of Mombasa, where the inhabi
tants were bravely apparelled in silken stuffs and jewelry. As these men tried to cut his
cable, Gama seized a boat containing 17 of them, and carried them off to Melinda, 3° S. of the equator, where the king of the place entered into friendly relations with the Portu
guese, and gave them a pilot to conduct them across the Indian gulf. Melinda was described as a regularly built city, with wide streets, and houses of more than one story. The Melindese pilot is supposed to have been acquainted with
the astrolabe, compass, and quadrant. Under his guidance the voyagers steered 750 leagues across the open sea. In 28 days they arrived off the Malabar coast, and on May 20, 1499, they reached Calicut, the object of their search. Their mission was thus accomplished, and a new route to the East established. Gama met with a cordial reception at the court of Samoudri Rajah (abbreviated to Zamorin); but the Arabs at that place, foreseeing that the Portuguese would eventually take the trade with the East out of their hands, instigated Zamorin against them, and Gama narrowly escaped. He immediately set sail on his homeward voyage, calling at Melinda on the way to take on board an ambassador to Emanuel’s court, and arriving in the Tagus on Aug. 29, 1499, after an absence of 26 months. He brought back only 55 men and one ship, a caravel which he had chartered at Cape Verd. The San Rafael had been lost on the coast of Africa, the store ship burned according to Gama’s instructions, the Sao Gabriel condemned at Cape Verd, and Niclaao Coelho had slipped away with the remaining vessel, in order to be the first to tell the great news in Portugal. The king received Gama splendidly, and permitted him to bear the title of “lord of the conquest of Ethiopia, Arabia, Persia, and India.” Emanuel immediately fitted out a second fleet of 18 ships, with 1,200 men, under the command of Pedro Alvarez Cabral, to establish trading posts. The most remarkable incident of the voyage was the accidental discovery of Brazil. From there Cabral got to India, and established a factory at Calicut; but on the departure of the fleet the inhabitants massacred all the Portuguese who had been left behind. The Portuguese government now sent out a fleet of 20 ships under command of Gama, which sailed early in 1502. On reaching the Indian sea Gama made a treaty with the kings of Cofoala and Quila, the latter agreeing to pay tribute to Portugal. Determined now to strike terror into the hostile kings of the Indian coast, he seized a large ship containing 300 male and female pilgrims of the highest rank and of various nationalities on their way to Mecca, and killed them all, excepting 20 children, whom he saved to bring up in the Christian faith, as an atonement for one of the Portuguese who had apostatized to Mohammedanism. This affair at once opened to him the port of Cananore, whence he sailed to Calicut, seizing on the way 50 of the natives. 

Here he demanded the right to trade, with immediate reparations for past indignities, and, not receiving it promptly, he hung his 80 prisoners at the yard arm and burned the town. Thence he proceeded to Cochin, where he entered into friendly relations with the king, and presented him a golden crown from the court of Portugal. The Calicut Zamorin, however, made war on Cochin for his alliance with the strangers. Gama, leaving five ships to cruise on the coast, returned home with 18 ships, having a battle on the way with the Calicut fleet, which he utterly routed. On his return the king created him admiral of the Indian ocean and count of Vidigueira. For the next 31 years Gama lived in retirement. In 1524, the Portuguese dominion having largely expanded in the East, John III. appointed him viceroy of the Indies. He proceeded to his seat of government, but died at the close of the year. In 1528 his body was brought to Portugal and interred with honor. Barros has published an account of his voyages, and Canoens celebrates them in his “Lusia.”

GAMALIEL, a Jewish doctor of the law, member of the sanhedrim, and teacher of Saul, the future apostle Paul, died about A. D. 52. In the Talmud he is surnamed Hazzaken, “the Elder,” to distinguish him from his grandson, who after the destruction of Jerusalem presided over the sanhedrim at Jannia. He was grandson of Hillel, the renowned teacher of the Mishnah. He held a seat, and probably the presidency, in the sanhedrim during the reigns of Tiberius, Caligula, and Claudius, being succeeded by his son Simeon. When Peter and the other apostles were brought before the council in Jerusalem (Acts v.), he recommended to “let them alone, for if this counsel or this work be of men, it will come to nought; but if it be of God, ye cannot overthrow it: lest haply ye be found even to fight against God.” He was the author of many religious and civil reforms, and remarkable for humanity, charity, and tolerance. He was the first to be distinguished by the title rabban (our master). The respect with which his opinions are always quoted by the rabbis is irreconcilable with the tradition that he was converted to Christianity.

GAMBETTA, Louis, a French statesman, of Genoese-Jewish descent, born in Cabors, Oct. 80, 1838. He studied law, and became a member of the Paris bar in 1860. In 1863 he acquired eminence as an ultra liberal, in 1865 became still more famous by his denunciations of the arbitrary measures of Louis Napoleon, and in 1889 he was elected deputy by the so-called party of “irreconcilables” for Paris and Marseilles. He meant to take his seat for Marseilles, but was prevented by illness until the beginning of 1870, when he protested in the corps législatif against the imprisonment of his friend and colleague Bochefort (Feb. 7), and shortly after against Louis Napoleon’s new plébiscite, which he declared to be a violation of the constitution. On the news of the surrender of Louis Napoleon at Sedan he proposed to depose the imperial dynasty, and was among the first to proclaim the republic, Sept. 4; and on the 5th he became minister of the interior in the provisional government of national defense. He took measures for convening the electoral college, but Paris being invested by the Germans, no election could take place. Early in October he escaped in a balloon to join his colleagues at Tours. Here, and afterward at Bordeaux, he assumed the general direction of movements outside the
capital, taking charge of the interior, war, and finance departments. He made desperate efforts to organize new armies, issuing unfounded reports of victories, and understating the importance of the defeats, which he generally ascribed to treason, especially the surrender of Metz by Bazaine. When all his efforts to raise the siege of Paris had failed, and his colleagues in that capital had concluded the armistice, and convoked all electors without regard to political parties to elect a constituent assembly, he issued a decree at Bordeaux, Jan. 31, 1871, disfranchising all functionaries and official candidates of the second empire, and all members of royal dynasties, and announced his determination to continue the war to the last. Though his decree was declared null and void by his colleagues in Paris, of whom Jules Simon went to Bordeaux to put an end to his arbitrary proceedings, he persevered in active opposition, but finally tendered his resignation, which only increased his popularity with the masses of the people. On Feb. 8 he was elected to the national assembly by ten departments, including those destined to be partly annexed to Germany. He gave the preference to that of Bas-Rhin, though it was certain that he would lose his seat by the detachment of Alsace from France. On July 2 he was reflected in the departments of the Seine, Var, and Bouches-du-Rhône, and took his seat for the last named department, which he had formerly represented. In November, 1871, the Républicque Française appeared as his special organ in the press, and he was generally recognized as the leader of the radicals. During the political excitement in the early part of 1872 he visited southern France, stirring up the populace everywhere, and his appearance at Marseilles was the occasion of disturbances which were put down by the police. In the latter part of the year he agitated the public mind in S. E. France, especially by his speech at Grenoble (Sept. 26), in which he attacked Thiers, and denounced the Bonapartists and the national assembly, and insisted upon the removal of the government from Versailles to Paris. A number of officers who had attended the banquet at Grenoble in honor of Gambetta were sentenced to 60 days' arrest, and then transferred to another regiment. In 1873 he promoted the election of Barodet and Ranc to the national assembly, in opposition to the candidates supported by Thiers, whom he afterward vainly strove to uphold in his presidency, when the majority in the assembly had determined on his overthrow. His opposition to the prolongation of the powers of Marshal MacMahon, the new president, proved equally futile.

Gambia, a British colony of W. Africa, occupying both banks of the river whence it derives its name, and consisting of the island of St. Mary, the ceded mile on the Barra Shere, and MacCarthy's island, 180 m. up the river; area, 21 sq. m.; pop. in 1871, 14,190, of whom 86 were white, 186 colored, and the remainder black. The chief settlements are Bathurst, Fort James, and Fort George. Bathurst and Fort James are situated in St. Mary's island; Fort George on McCarthy's island. The climate is generally considered unhealthy. In summer the heat is excessive, the thermometer frequently rising to 106° and 108° in the shade. The soil is rich and alluvial, and liable to periodic inundation. The principal exports are beeswax, ground nuts, and hides, and the imports cotton goods, tobacco, amber, rum, &c. The revenue of the colony in 1870 was £18,969, and the expenditures £21,987. The value of imports was £91,997, of exports £143,518. The total tonnage of vessels entered and cleared in 1870 was 113,914.

Gambia, a large river of W. Africa, rising in the interior of the continent, and, after a course of more than 600 m., discharging itself into the Atlantic ocean at Bathurst, in lat. 12° 30’ N., lon. 16° 40’ W. It is 9 m. broad at its mouth, and is navigable for vessels of 800 tons for 90 m. inland.

Gambier, a village of Knox co., Ohio, on the Cleveland, Mt. Vernon, and Columbus railroad, 50 m. N.E. of Columbus; pop. in 1870, 581. It occupies a beautiful site on a high ridge nearly surrounded by Kokosing river, and is the seat of two Episcopal institutions, Kenyon college and the theological seminary of the diocese of Ohio. They were established in 1826, under the auspices of Bishop Chase, with funds collected in England, and are richly endowed. The largest contributor was Lord Gambier, from whom the village is named. The corporation owns 14 buildings. On the college grounds are Ascension hall and Rosse hall, of stone, the church, a fine piece of architecture, and six dwellings; about a mile N. of the college is Bexley hall, in the Elizabethan style, occupied by the theological seminary; and in other parts of the village, Milnor hall, for the preparatory school, and three residences for the professors. The college has a preparatory and a collegiate department. The course in the theological seminary is three years. The number of volumes in the libraries is about 18,500, viz. theological, 7,000; college, 2,800; college societies, 9,600. In 1871 there were 6 graduates in the theological seminary and 10 in the college. In 1871-2 the number of theological students was 9; collegiate, 50; preparatory, 32; professors in the theological seminary, & in the college, 10.

Gambier, James, baron, a British admiral, born in the Bahamas islands, Oct. 18, 1756, died at Iver, near Uxbridge, April 19, 1823. He was of a French Protestant family, expatriated by the revocation of the edict of Nantes. Early entering the naval service, he obtained in 1778 the rank of post captain, and as commander of the frigate Raleigh was engaged in the reduction of Charleston in 1780, and in repelling the French attempt upon Jersey in 1781. In 1793 he was appointed to the command
of the Defence, of 74 guns, under Earl Howe, and in the engagement with the French fleet under Villaret de Joyeuse (June 1, 1794) his ship was the first to break through the enemy’s line. Advanced to the rank of rear admiral in 1795, and of vice admiral in 1799, he became third in command of the channel fleet in 1801, and in the following year was entrusted with the government and defence of Newfoundland. In 1807 he commanded the fleet in the expedition against Copenhagen, bombarded the city (Sept. 2–5) and captured the Danish fleet, and was rewarded with the dignity of baron, and with the offer of a pension, which he declined. In 1808 he was appointed to the command of the channel fleet, drew up a code of signals and the general disciplinary instructions for the navy, and in April, 1809, attacked the French squadron in the Aix roads and burned five of the ships. Lord Cochrane had command of the British fire ships (catamarans), and in consequence of a disagreement between him and Lord Gambier, the latter requested a court martial, by which he was honorably acquitted. In 1814 he was appointed at the head of the commissioners to conclude a peace with the United States, and the treaty was signed at Ghent on Dec. 24. He afterward lived in retirement, and was made admiral of the fleet on the accession of William IV.

GAMBIR, or Gambier, one of several astringent vegetable extracts, much used in tanning, dyeing, &c. Like the allied catechin and catech, it consists largely of a modification of tannic acid, and is similar to them in properties and uses; indeed, the three names are often applied to the same article, and when used distinctively are not always given to the same product by different dealers and writers. When first introduced its origin was unknown, and being supposed to be a kind of earth it was called terra Japonica or Japan earth, a name which it in a measure retains in the arts. Gambir is the product of a tree formerly called uncearia gambir, but which is now placed in the genus nauclea, of the family rubiaceae, to which the Peruvian bark trees belong; it is a native of the East Indian archipelago, and is largely cultivated, especially in the island of Bintang; in its wild state it is a strong climber, but in cultivation it is pruned to form a bushy shrub seven or eight feet high; its leaves are ovate-lanceolate and smooth on both sides, and its green and pink flowers are borne in globular heads in the axis of the upper leaves; the flower stalks at the lower leaves are abortive, bearing no flowers, but are converted into hooked spines. Gambir is obtained by boiling the bruised leaves and young shoots of the tree in water and evaporating the decoction to a thick extract, which is poured into oblong moulds; the masses thus formed are cut into squares, and the drying is completed in the sun. During evaporation starchy matters, and probably other adulterants, are sometimes introduced. It is imported in cane baskets lined with palm leaves. The best qualities are so light as to float upon water, and when broken present a dull porous surface of a light yellowish brown color.

GAMBOGE, or Gamboge, a gum resin of Siam and Cochin China, and produced also in Ceylon. The tree from which it is obtained is the hebradenron cambogiodes of Dr. Graham of Edinburgh. The gum was first carried to Europe by the Dutch in 1608. It is imported into the United States only from Canton and Calcutta. The manner of collecting it in Siam is to catch in leaves or coconunet shells the yellow milky juice which exudes from the fractured shoots and leaves of the tree, and, transferring this to earthen vessels, leave it to thicken. It is poured when semi-fluid into the hollow joints of the bamboo, and thus receives the cylindrical form and the shape of pipes or hollow cylinders by contraction in solidifying. It is also made into lumps or cakes of several pounds weight; these are commonly more or less mixed with bits of wood and other impurities. Farinaceous matters are also employed to adulterate it, their presence being detected by the green color communicated to the decoction by adding iodine. The inferior kinds are known in commerce as coarse gamboge. Those of finer quality are brittle, with conchoidal fracture, of reddish orange color in the mass, but bright yellow in powder, or when rubbed with water. It is without odor, and its taste, very slight at first, is soon followed by an acrid sensation in the throat. Its emulsion with much water affords films, which are good microscopic objects for the observation of active molecules. It is wholly taken up by alkaline solutions and by strong acids. Its resinous portion is dissolved by sulphuric other; the whole by the successive action of ether and water. Dr. Christison gives the following analyses of the different qualities of gamboge:
The resinous portion is obtained by evaporating the ethereal tincture. It has a deep orange color, and gives a yellow tint to 10,000 times its weight of alcohol. It is entirely insoluble in water. Johnston named it gamboge acid, and gave its composition $\text{C}_4\text{H}_6\text{O}_5$. This is said to be an active purgative in the dose of 8 grains, without the drastic and nauseating character of the gum resin. Gamboge is employed as a water color, and also as a medicine. In large doses it is an acrid poison, a single draught having produced death. It is best used in combination with other and milder cathartics, and is then found an excellent remedy for obstinate constipation. It is also employed in the treatment of apoplexy and dropsy. It is so rarely used except in combinations that its medicinal action is practically confined to these combinations.

**GAME LAWS**, statutes which declare what birds and beasts are to be considered game, and impose penalties on those who unlawfully kill or destroy them. The game laws of England had their origin in the ancient forest laws, under which the killing of one of the king’s deer was equally penal with murdering one of his subjects. From the Norman conquest to the present day game has constantly been a subject of legislation in England. In 1389 the possession of property was made a specific qualification for the privilege of killing game, and it was enacted that "no manner of artificer, laborer, nor any other layman who hath not lands and tenements to the value of 40 shillings by the year, nor any priest nor other clerk if he be not advanced to the value of 10 pounds by the year," should keep hunting dogs, or use other methods of killing game, upon pain of one year’s imprisonment. In 1606 the qualification to kill game was increased to £40 a year in land and £200 in personal property. In 1670 the qualification was limited to persons who had a freehold estate of £100 per annum, or a leasehold for 99 years of £150 annual value. Persons who had not these qualifications were not allowed to have or keep game dogs. In 1785 an act was passed requiring persons qualified to kill game to take out a certificate to that effect. The property qualification was abolished in 1881, and the certificate itself, which cost £3 13s. 6d. annually, was made a qualification. By statute 28 and 24 Victoria (1860–61), c. 90, the certificate is abolished, and an excise tax substituted, which is 26 or 22, according to the portion of the year for which the privilege is desired. There are many restrictions upon the right which the payment of the tax gives to kill game. It must not be killed on Sunday, nor on Christmas, nor at the season of the year when the pursuit of each kind is prohibited. Poachers and unauthorized persons who destroy game by night are severely punished. No one may trespass on the land of another in pursuit of game, and the unlawful pursuit and killing or wounding of deer kept in enclosed land is felony, punishable with two years’ imprisonment. Lords of manors are authorized to appoint gamekeepers to preserve or kill game within the manors. Gamekeepers are authorized to arrest poachers, and to seize all dogs, nets, and other implements used for killing game by unlicensed persons. The sale of game in England is also subject to strict regulations. In the United States, laws have been enacted by several of the states to protect game from pursuit during certain seasons in order to prevent its entire destruction. But apart from these restrictions, any person who chooses is at liberty to kill or capture as best he can any wild animal, bird, or fish, anywhere in the United States, subject to the usual law against trespassing on the grounds of others.

**GAMING**, the playing together of two or more persons at some game, whereby one shall lose and the other win money or other property staked upon the issue. The game may be one of chance, as that of faro or a game with dice, or one of skill only, as chess, or of skill and chance together, as whist or backgammon. There is nothing immoral in playing for mere amusement; but if money be staked, it becomes easily, and perhaps necessarily, a sport carried on for the sake of the money in a greater or less degree, and then most moralists have agreed that it deserves reprobation. When this is carried to an extreme degree, and important sums are played for, it is obviously wrong, and deemed so to be universally. But the common law never interfered with gaming, by any kind of prohibition or restraint, so long as there was no fraud. If there was fraud, it operated here as it does elsewhere in law; it avoided all contracts, and money paid in fraud could be recovered back, because no title passed to the payee. And if one cheated at gaming, as by false cards, dice, or other implements, or indeed in any way, he might be indicted as a cheat at common law. Both in England and in the various states of the Union, statutes have been passed for the prohibition or restraining of gaming, or, as it is as commonly called, gambling. Here, all gambling, that is, all playing for money, is prohibited, and therefore it is held that one cannot recover back money lost at play, because the playing itself is illegal; and it makes no difference whether the playing was honest or cheating. But a loser may recover his money from a stakeholder, by charging it to the money which he pays it over to the winner. It has been held in
Indians that winning any sum of money, however small, at cards, is an indictable offence; and in Tennessee the common form of lottery called "gift enterprises," in which the purchaser of an article is entitled to the chance of winning a prize, has been held to be gaming and indictable. But it has been said in New York, that playing to see who shall pay for the use of the implements, as a billboard, is not gambling.

Gammell, William, an American author, born in Medfield, Mass., Feb. 10, 1812. He graduated at Brown university in 1831, and soon afterward was appointed a tutor in the university; in 1835 he was chosen assistant, and in 1836 full professor of rhetoric. In 1850 he was transferred to the professorship of history and political economy, which chair he resigned in 1864. In 1869 he received the degree of LL. D. from the university of Rochester, and in 1870 was made one of the fellows of the corporation of Brown university. He has published various orations and discourses on literary and historical subjects; also numerous articles in reviews and magazines, especially in the "Christian Review," of which for several years he was one of the editors. He has written a life of Roger Williams, and one of Governor Samuel Ward, for Sparks's "American Biography;" and a "History of American Baptist Missions," at the request of the board of the American Baptist missionary union.

Gando. I. A kingdom in Africa, lying on both sides of the principal branch of the Niger. It consists of several rich provinces, comprising the western half of Kebb, Murai or Arewa, Zaberna, Dengina, a great part of Goorma, a small portion of Borgoro, a large portion of Yoruba, Yaari, and Nuif. Much of the territory is well inhabited, and presents a luxuriant vegetation, embanked long. On the island, the date, and the banana. The inhabitants are of the Foulah race, and most of them Mohammedans. King Khaliloo, whom Barth visited in 1858, lived in almost monastic seclusion, leaving the administration in the hands of one of his brothers, in consequence of which the provinces were plunged into anarchy and mutual hostilities.

II. A town, the residence of the king, in a narrow valley surrounded by hilly chains, in lat. 12° 20' N., lon. 4° 50' E., 385 m. N. E. of Cape Coast Castle. It is intersected from N. to S. by the broad and shallow bed of a torrent, the borders of which are covered with luxuriant vegetation, and is adorned with trees, among which the banana is prominent. The onion of Gando is superior in size and quality to any produced in the neighboring districts. The inhabitants prepare cotton cloth of excellent quality, but their dyeing is inferior.

Ganges (Hind. Gangā, stream), one of the great rivers of British India, rising on the S. slope of the Himalayas mountains, and flowing southerly and easterly into the northern portion of the bay of Bengal. The river Bhagirathi, usually regarded as its true source, has its origin in the territory of Gurhwal, 10 m. from the temple of Gungootree, a favorite resort of Hindoo pilgrims. It flows from a cave in a perpendicular ice wall at the extremity of a glacier, as a torrent about 40 yards wide, not far from lat. 30° 54' N., lon. 79° 7' E., at an elevation of 18,800 ft. above the sea. The surrounding mountains are upward of 20,000 ft. in height. It is not until the Bhagirathi is joined by the Alunkunda, 120 m. from its source, that the stream is called the Ganges. At Hurdwar, 47 m. further down, the river reaches the great plain of India, here 1,024 ft. above the ocean level. Thence to Allahabad, where it joins the Jumna, a distance of 486 m., the course of the Ganges is S. S. E., with an average fall of 29 in. to the mile. Its most important affluent between these two cities is the Ramgange, an eastern tributary. From its confluence with the Jumna, the Ganges pursues a winding course eastward, 563 m., to the head of the delta. In this portion of the river the falls are about 5 in. to the mile. Among the important tributary streams are the Goonsee, on which Lucknow is situated, the Gogra from the northwest, the Gundak flowing from the west and the Ooey or Oosy from the east of Katmandu, the distant capital of Nepal, and the Son from central India. The head of the delta of the Ganges is about 80 m. below Rajmahal, and 216 m. in a straight line from the bay of Bengal. At this point the first arm is given off; it flows southward, and is known as the Bhagiruti. Further to the southeast the main stream throws off another branch to the south called the Jellinghi, and still another called the Mata-Bunga. These three western offshoots unite to form the Hoogly, the great branch of the Ganges, on which Calcutta is situated at a distance of about 100 m. from the sea. The embouchure of the Hoogly is in lat. 21° 40' N., lon. 88° E. The principal stream, still retaining the name of Ganges, continues to flow in a southeasterly direction, sending out other branches southward, which combine and form the Haringotta, arm of the delta. Finally, it partly intermingles its waters with those of the Brahmapootra, and falls into the bay of Bengal near that river, but by a separate mouth. The average descent of the Ganges from the head of the delta is 8 in. per mile. The entire length of the Ganges is between 1,500 and 1,600 m. Its depth and width and the rapidity of its flow vary greatly at different seasons. There is an annual rise of its waters, generally beginning at the end of May and attaining its height in September. The rise is 7 ft. at Calcutta, without taking into account the tide, and from 29 to 45 ft. at Allahabad. The average width of the Ganges on its whole course is estimated at 1 m. in the dry season. The section between Hurdwar and Allahabad abounds in shallows and rapids, but is navigable by small boats throughout its whole extent, and by steamers for passenger traffic over the lower four fifths of its length. At Allahab-
bad it is a mile wide, while the width of the Jumna is but 1,400 yards. From this city down to the head of the delta the river is navigable throughout the year for vessels drawing 18 in. of water. The greatest breadth ordinarily attained at Benares, 75 m. below Allahabad, is 1,000 yards and the maximum depth 78 ft.; in the dry season these figures are reduced to 1,400 ft. and 85 ft. respectively. The course and current of the river, especially in its lower portion, are extremely subject to change. Old channels are filled up and abandoned for new ones which the action of the water has excavated; new islands are formed around sand bars or sunken objects which serve as nuclei for mud deposits; and at the same time old islands are being swept away. The Hoogly is the only arm which can be ascended by large ships for any considerable distance. Opposite Calcutta it is about 1 m. wide at high water.—The coast region of the delta of the combined rivers Ganges and Brahmapootra consists principally of a vast labyrinthine network of salt-water streams and creeks. Fresh-water channels, however, communicating with the Hoogly, intersect the extensive wilderness of wooded islands along the coast, known as the Sunderbunds. This pestilent tract has an area of more than 7,000 sq. m., and is haunted by innumerable crocodiles, tigers, and other wild animals. In the Sunderbunds the ordinary rise and fall of the tide is between 7 and 8 ft. When the Ganges is low, the tidal current extends as far inland as the head of the delta, but in the flood season it is overcome by the increased volume and velocity of the river, and is imperceptible except near the coast. The whole delta district is subject to inundation during the annual rise of the river. A tract of the Lower Provinces 100 m. in width is then completely covered with water, which recedes in October, when the rice crop is planted. These inundations become very destructive if the descending current of the river flood happens to be checked by high tides and strong gales in the bay of Bengal. The quantity of fine mud and sand brought down by the Ganges and Brahmapootra is so large that it discolors the sea to a distance of from 60 to 100 m. from the delta. At Ghazipoor, 500 m. from the sea, 600,000 cubic feet of water per second flow down the Ganges during the four months of the flood season, and about 100,000 cubic feet per second during the rest of the year. In 1831–2 the total amount of solid matter suspended in the water thus flowing down was estimated to be 6,388,077,440 cubic feet in a year. Lyell’s estimate of the entire quantity of mud borne down to the bay of Bengal in one year by the Ganges and Brahmapootra is 40,000 millions of cubic feet. In this calculation he assumes that the annual water discharge of the latter river is equal to that of the Ganges, and that the proportion of sediment in both rivers is about a third less than the Ghazipoor estimate. Geological borings at Calcutta indicate that a general subsidence of the delta has taken place. To this subsidence is attributed the fact that the fluvialite mud which is deposited by successive inundations does not increase the elevation of the plains of Bengal.—Three well marked species of crocodile infest the Ganges in great numbers. The gavial, which is the characteristic Gangetic crocodile, lives only in fresh water and feeds exclusively on fish. Its range extends from the delta to the northern branches of the river, 1,000 m. from Calcutta. The other kinds, known as the
The Ganglion is a small indolent fluctuating tumor, developed in the course of the tendons, containing a semi-fluid secretion enclosed in a cyst, generally communicating with the tendinous sheath. It is a dropey of the synovial sheath, caused by friction, some wrench or tension of the tendon, or the sequence of some rheumatic or gouty disease; the light of a candle may be seen through it. The most common situation is about the wrist and fingers, though it may occur in the course of any tendon. When there is no inflammation, the best treatment is to puncture the tumor by the subcutaneous method, in order that the contained fluid may escape into the surrounding areolar tissue and be absorbed; pressure on the tendons and phalanges should not then be applied. If this fails, stimulating liniments and even blisters may be tried, to induce absorption. When unconnected with a tendinous sheath, the tumor may be dissected out, punctured like an abscess, or

Ganglion

Gr. γάγγλιον, a little swelling, in anatomy, a small rounded or elongated nervous mass, of a reddish gray color, situated in the course of the nerves. There are two kinds of nervous ganglia, one forming part of the cranial system of nerves, the other part of the sympathetic system; the first kind are situated near the origins of many of the cranial and of all the vertebral nerves, and on the posterior or sensory root of the latter; the second are generally placed along the sides of the anterior surface of the spinal column, from the head to the coccyx, the two great semilunar and cardiac ganglia coming near the median line. They are composed of two substances, one white like the medullary substance of the brain, the other reddish gray, somewhat resembling the cerebral cortical substance; the internal medullary filaments are the continuation of the nerve upon which the ganglion is situated. The sympathetic system of ganglia is considered by some as a series of more or less independent centres, giving off nerves to the organs of nutrition or communicating branches to the cerebro-spinal system; according to others, these ganglia and their associated nerves form a special system with numerous ramifications, the sympathetic system presiding over the involuntary contractions of the heart and digestive apparatus, and all the processes concerned in secretion, nutrition, and exhalation, and in disease conveying different sympathetic phenomena from one part of the organism to another. Strictly speaking: all the nervous centres in the highest vertebrates may be called ganglia; even the hemispheres of the human brain may properly be styled cerebral ganglia. The principal ganglia of the head are the ophthalmic, which sends branches to the iris and the vascular apparatus of the eyeball; the otic, intimately connected with the organ of hearing; Meckel’s or the spheno-palatine, ministering to the senses of smell and taste; the submaxillary, whose branches proceed almost entirely to the gland of that name; the Gasserian, of the fifth pair of nerves; and those near the roots of the pneumogastric and glossopharyngeal. In the neck are the superior, middle, and inferior ganglia of the sympathetic, and the origins of the cardiac plexus which supplies the heart; in the chest, the 12 thoracic ganglia on each side, from which originate the splanchnic nerves which go to join the semilunar ganglia and the solar plexus; in the abdomen, the latter sends branches which accompany all the divisions of the sorta. There are besides these the lumbar and sacral ganglia on each side of the spine, distributing their branches to the organs in the pelvis. The so-called lymphatic ganglia are glandular, and not nervous masses. In the invertebrata ganglia are the highest form of nervous centres, and occur either isolated or connected together by single or double longitudinal cords; they perform the functions both of the cerebral and spinal centres of the higher animals. In surgery, a ganglion is a small indolent fluctuating tumor, developed in the course of the tendons, containing a semi-fluid secretion enclosed in a cyst, generally communicating with the tendinous sheath. It is a dropey of the synovial sheath, caused by friction, some wrench or tension of the tendon, or the sequence of some rheumatic or gouty disease; the light of a candle may be seen through it. The most common situation is about the wrist and fingers, though it may occur in the course of any tendon. When there is no inflammation, the best treatment is to puncture the tumor by the subcutaneous method, in order that the contained fluid may escape into the surrounding areolar tissue and be absorbed; pressure on the tendons and phalanges should then be applied. If this fails, stimulating liniments and even blisters may be tried, to induce absorption. When unconnected with a tendinous sheath, the tumor may be dissected out, punctured like an abscess, or
transfixed with a seton; the subsequent thickness may be removed by the vapor or steam bath and douche; any rheumatic taint requires to be corrected by appropriate remedies. A popular way of treating these tumors is to rupture them by a strong and sudden blow; those on the back of the wrist and hand may thus be scattered without danger.

Gangrene (Gr. γάγρινος), the loss of life in any of the soft parts of the body, without extinction of the vital powers in the rest of the organism. The term sphacelus has been applied to the condition in which gangrene may terminate, the utter and irrecoverable death of a part, while in some stages of gangrene the circulation may not be completely arrested, the sensibility of the nerves not entirely gone, and recovery of the local loss of action not impossible. The death of the bony tissue is called necrosis. When gangrene is the consequence of violent inflammation or of the obstructed return of venous blood, the affected parts are gorged with fluid, constituting humid gangrene; while dry gangrene generally arises from a deficient supply of arterial blood or from constitutional causes, accompanied by very slight or by no inflammation, the mortified part becoming dry and hard; the gangrenous portion in the former case is called a slough, in the latter an eschar. The local predisposing causes are congestion and deficient circulation; the constitutional are weakness from disease, old age, or privation. The exciting causes are mechanical and chemical injuries, especially gun-shot, lacerated, and poisoned wounds; insufficient supply of arterial or obstructed return of venous blood, as in the gangrene from ossified arteries in the first case, and that from heart disease and varicose veins in the second; and injury or division of nerves. The areolar tissue is most subject to gangrene; after this come tendons and ligaments, denuded bone, the skin, and the muscles, in the order of enumeration. Gangrene spreads slowly or rapidly, according to the accompanying inflammation or the energy of the vital processes. When inflammation is about to end in gangrene, the redness becomes livid, with diminution of pain and sensibility, though the swelling may be increased; the parts become soft and cold, and emit an odor of decomposition; the livid color, when the disease is spreading, is gradually lost in the surrounding skin, but when the dead portion is to be cast off, a bright red line separates the healthy from the gangrenous tissue, called the "line of demarcation," in a healthy person there may be high accompanying fever, but in a debilitated constitution the symptoms will be those of prostration and typhoid. The indications of treatment are to diminish the inflammation by general and local means; to support the strength by tonics and stimulants, when the gangrene is extensive or the system debilitated; to quiet restlessness and nervous irritability by opium; and to facilitate the separation of the dead parts by warm and stimu-
for his system of chorlic inhalation for catarrh. He is best known, however, by his process for embalming, for which he received the same prize. It consists in injecting a solution of sulphate of aluminium into the carotid artery.

**GANNET**, a web-footed bird, of the family **sulidae** and genus **sula** (Briss.). The genus is characterized by a bill longer than the head, strong, straight, and broad at the base; the sides compressed and grooved toward the tip, which is slightly curved, with the lateral margins obliquely and unequally serrated; the nostrils basal, linear, in a lateral groove, and almost invisible; the wings long and pointed, the first and second quills longest; the tail long and graduated; the tarsi short and stout, rounded in front and keeled behind; the toes long, all four connected by a full membrane; the claws moderate and rather flat, the middle one serrated, and the hind one rudimentary; beneath the lower mandible is a naked sac, capable of moderate distention. There are about ten species described, in various parts of the world, of which two are natives of the western hemisphere, the booby (S. %fater, Linn.), treated under its own title, and the gannet, or solan goose (S. bassana, Briss.). The gannets are usually found in immense numbers on desert and rocky islands near the mainland, migrating southward in small parties on the approach of cold weather; they sometimes float lightly on the sea, but are generally seen on the wing, their flight is powerful, rapid, buoyant, and long sustained; their food consists of fishes which swim near the surface, upon which they dart headlong from a considerable height, making a great splash, and sometimes remaining under water a minute or two; they swallow the fish head foremost, and their gullet is so expanable as to take in the largest herring. The common gannet (S. bassana) has a close dense plumage, of a general whitish color, buff yellow on the head and hind neck, and primaries brownish black; the bill is pale bluish gray; bare space about the eye and on the neck blackish blue; iris white. The length to end of tail is 40 in., to end of wings 85, the extent of wings about 6 ft., and the bill 4 in.; the weight is 7 lbs. The female is like the male, but smaller. The young are brown and white above, and grayish white below. This species breeds in great numbers on the rocky islands near the coast of Labrador, and after the breeding season, in May and June, is found all along the Atlantic states to the gulf of Mexico; it is entirely maritime, and never seen inland unless forced in by violent gales. The flight, when travelling, is low, performed by 30 or 40 flaps of the wings, and then by sailing for an equal distance with extended neck; the walk is exceedingly slow and awkward. The nest is a hole in the earth surrounded by weeds and sticks matted together for a height of 10 to 20 in., and only a single pure white egg, about 3 in. long, is laid in it; the young are hatched in about a month; the males assist in incubation. They congregate on the same rock in vast numbers, and are quarrelsome during incubation, being fond of stealing from each other the materials for the nests, which are sometimes brought a distance of 30 miles. A young gannet, with its large head, closed eyes, thin neck, small wings, large abdomen, naked skin, and bluish black color, is a most uncouth and disagreeable object. When shot at or wounded, gannets disgorge their food like vultures. They have very few enemies among birds or beasts; the eggs and young are sometimes devoured by the larger gulls. According to Audubon, the feathers on the lower parts are very convex externally, giving the appearance of light shell work.

**GANNETT, Ezra Stiles**, an American clergyman, born in Cambridge, Mass., May 4, 1801, died from a railroad accident at Revere, Mass., Aug. 26, 1871. He studied at Phillips academy, Andover, entered Harvard college in 1816, and graduated in 1820; studied the three following years in the divinity school at Cambridge; received ordination as colleague with William Ellery Channing, June 30, 1824, in the Federal street church, Boston; and upon Dr. Channing’s death in 1842 he became sole pastor. The congregation subsequently removed to Arlington street, and Dr. Gannett continued to be its pastor until his death, a period of 47 years, with only an intermission of two years, during which he resided in Europe on account of his health. He published many occasional sermons and addresses, and from 1844 to 1849 was one of the editors of “The Christian Examiner.”

**GANNOIDS** (Gr. γάννοις, splendor), in MÜLler’s classification, an order of fishes, having either enamelled scales, bony plates, or a naked skin; fins generally, but not always, colored externally, as well as internally, by spiny plates (pulvra); the internal skeleton sometimes osseous, as in the gar pike, or partly cartilaginous, as in the sturgeons; the vertebral column occasionally extending to the end of the upper caudal lobe; nasal apertures
double; gills free and lying in an operculated cavity, with or without an opercular gill, a pseudo-branchia, and blowing holes; the arterial trunk always with numerous valves; no decussation of the optic nerves, and the ventral fins abdominal; there is always an air bladder, and a duct communicating with the oesophagus; the eggs are conveyed from the abdominal cavity by tubes; like the shark family, they have a thymus gland, and often a spiral valvular fold in the intestine. Müller divides the ganoids into four families: 1, containing the American gar fish; 2, the Polypterus of Africa; 3, the omia, or mud fish of America; and 4, the sturgeons; these will be described under the first, third, and fourth titles respectively. Prof. Agassiz is inclined to elevate the ganoids from an order to a class, separate from ordinary bony fishes, and superior to them in organization, though inferior to the selachians (sharks and rays); he makes them the third class of the branchiostegates, with the third order of the osteichthyes, acipenseroids (sturgeons), and sauroïds (gar fish), with three additional doubtful orders of siluroids, plectognaths (balistes, ostracion, and poronope fishes), and lophobranchs (hippocampus, pipe fish, and pegasus).—The remainder of this article will be devoted to the consideration of fossil ganoids, and to the interesting questions connected with their structure and geological distribution. Ganoid fossil scales, whether angular, rhomboidal, or many-sided, are imbricated like the slates of a roof, and formed of an outer plate of enamel, an inner porcelain layer, and an intermediate reticulated structure analogous to the diplost between the tables of the human skull. The fin rays of the ganoids are bare enamelled bones, each consisting of a plate of enamel on each side and a lemnisc of bone between them; the necessary flexibility of such rays is secured by joints which extend through the rigid enamel, leaving the central bony plate undivided, on the principle of the half-sawed moulding which the carpenter wishes to bend at an angle or around some curved surface. The dermal or external skeleton of the ganoids is so remarkably developed, that in many instances it has served to determine the forms of genera and species in the old red sandstone and carboniferous strata, every other portion having perished, as their internal skeletons were either very slight or entirely cartilaginous; enamelled plates represent the head, enamelled imbricated scales indicate the form and proportions of the body, and enamelled rays show the position and outline of the fins. The instances of great development of the outer skeleton in higher animals are few, being limited principally to the armadillo and pangolin among mammals, the tortoises and crocodiles among reptiles, and the gar pikes and sturgeons among fishes. The earliest fishes, those of the Silurian epoch, seem to have been all placoids; in the following age, that of the old red sandstone, the ganoids appeared in great numbers, and with the placoids formed the entire class of fishes for unknown millions of years, that is, through the old red sandstone, carboniferous, Permian, triassic and oolitic periods, down to the cretaceous epoch, when ordinary bony fishes were brought into existence; the age of these two orders corresponding nearly to the reign of the ferns, palms, coniferous trees, and their allies among plants. When the bony fishes became the prevailing type, the other orders diminished in proportion, so that at the present time the gar pikes and the sturgeons are the chief representatives of the old powerful and numerous ganoids. In the human family we see similar instances of nations reaching their culminating point, and then disappearing or lapsing into barbarism; the Aztecs of Central America and the Copts of Egypt are the remnants of the great races which built the mounds of the Mississippi valley and the Egyptian temples and pyramids. In the words of Hugh Miller: “But in the rivers of these very countries, in the bed of one of the Nile or the lepidostenus of the Mississippi, we are presented with the few surviving fragments of a dynasty compared with which that of Egypt or Central America occupied but an exceedingly small portion of either space or time. The dynasty of the ganoids was at one time coextensive with every river, lake, and sea, and endured during the unreckoned eons which extended from the times of the lower old red sandstone until those of the chalk.” Among ganoids are found some of the strangest ichthyic forms, having a structure and placoid affinities no longer seen in nature; these gigantic and strange fishes were of the first rank in their class, and, being then the only representatives of the vertebrates, exhibited characters belonging to the higher class of reptiles, of which they were the prophetic types. These reptilian fishes attained their greatest number and largest size during the carboniferous period, and were remarkable both for their formidable offensive weapons and their strong defensive armor. This remote age was as fully characterized by bloodshed and destruction of animal life as any since the creation of man; indeed, no animal ever had more powerful teeth than the ganoid rhinodus of the coal fields, sharper than and four times as large as the biggest living crocodile possesses; the dorsal and caudal spines of some of the contemporary placoids far exceeded in size and destructive powers those of any living shark or ray; where such weapons were employed, defensive armor was necessary; hence the enamelled scales of the ganoids. In the lepidoid or acanth family, confined chiefly to the old red sandstone and carboniferous strata, the teeth are small, brush-like, and in several rows, or obtuse and in a single row; the scales are flat, rhomboidal, parallel to and wholly covering the body; all those occurring in strata earlier than the Jurassic have the tail heteroceratal or with the spine prolonged into its upper lobe; it has no representative among living fishes. Among the most
interesting genera is *dipterus*, in which *D. macrolepidotus* of the old red sandstone resembles a fish carved in ivory, crusted with enamel, and thickly dotted with minute puncturings; with circular scales, thickly enamelled fin rays, strong angular pectorals, scale-protected ventrals like the hind fins of the ichthyosaurus, and a long dorsal and anal, the former consisting of two pis, also British Devonian, has two anus alternating with two dorsals, large and rounded pectorals, small ventrals, large mouth, and scales of moderate size. Among the genera most numerous in the coal measures are *palaeoniscus*, a small, handsome, and well-proportioned fish, with moderate-sized fins and scales, a single dorsal opposite the space between the ventrals and anal, and all with small rays at their margins—about 80 species in North America and northern and central Europe; *eurynotus*, a flattened and brean-shaped species, with large dorsal, ventrals, pectorals, and head; and *anthodes*, with lengthened body, very small scales, dorsal opposite anal, no ventrals, large pectorals, and very wide mouth, in proportions resembling the conger eel or ling. Among those most numerous in the Jurassic age are *tetragonolepis*, with a broad flattened body, rapidly decreasing to the tail, rounded head, moderate fins, and pointed teeth—about 80 species in Europe; *lepidotus*, with body shaped like a carp’s, large rhomboidal scales, and caudal fin almost square—about 80 species; and *pholidophorus*, resembling the herring, but with rhomboidal scales, homocer- cal or equal-jelbod tail, and small teeth—more than 80 species.—In the family of cephalaspids, which contains the extreme acanth forms for a long time not recognized as fishes by palaeontologists, the body and head are covered with a few non-imbricated plates or shields; the heterocerical tail, covered with imbricated scales, has no true caudal fin; and in place of pectorals are two long bony appendages or sti-
abdomen and ribbed and groined arch of the back add to the strength of the armature without increasing the weight—the creature resembling a "subaqueous boat, mounted on two oars and a scull;" and this strange fish is a characteristic organism of the old red sandstone. The genus _cocconetus_ has not the pectoral appendages of the preceding animal, and the head and anterior part only of the trunk are covered with a bony helmet and cuirass, the caudal portion being naked; it has one dorsal and one anal fin; the mouth is furnished with small, equal, conical teeth. The most remarkable peculiarity in this fish, unique among vertebrated animals as far as known, is that the jaws possessed both the usual vertical motion, and also a horizontal movement as in crustaceans, indicated by the two sets of teeth, one on the upper edge of the jaw and the other on the line of the symphysis, the latter of which, if brought into action at all, could only be so by the lateral movement of the jaws. The jaws of _cocconetus_ are also interesting, as presenting the most ancient internal bone which has displayed its structure under the microscope. The jaw of this ancient fish shows the Haversian canals, the lacunae and osseous cells, as in the bones of man at the present time; showing the extension of the same plan through the most distant ages, and by a fair inference to the beginning of vertebrate existence. The genus _cephalaspis_, or buckler-head, had a thin triangular body, and crescent-shaped head covered with a singular shield-like plate, with lateral prolongations extending along the sides; body covered by vertical rows of scales; no ventrals nor pectorals, and two dorsals. It lived at the same time with large placoids, armed with dorsal spines (of which the spines only remain), and with a gigantic lobster-like crustacean more than 4 ft. long; it belongs to the middle portion of the old red sandstone.—The family of sanrooids, of which the _garpike_ is one of the few living representatives, had pointed conical teeth alternating with small brush-like ones; the skeleton bony; the scales flat, rhomboidal, and completely covering the body; those living before the Jurassic age had unequal-lobed tails, while the homocercal genera flourished at a more recent period. The genus _megatichthys_ was a formidable fish of large size; the scales of the body and the plates of the head had such a brilliant enamelled surface, "that they may still be occasionally seen in the shale of a coal pit, catching the rays of the sun, and reflecting them across the landscape, as is often done by bits of highly glazed earthenware or glass." The genus _diploterus_ was of smaller size, with an elongated tapering body, flat head, rounded muzzle, two dorsals, two anals, and the caudal fin truncated almost vertically, the lobes coming off laterally from a prolongation of the vertebral column; their scales were of great brilliancy, and must have flashed brightly through the woods of the coal period, as they leaped into the air in sport or in pursuit of prey. The genus _pygopterus_ had the fins greatly developed, and a heterocercal tail. _Aepidorhynchus_ had a much elongated body, homocercal tail, the upper jaw prolonged into a beak and extending beyond the lower; the scales large. The former belongs to the coal and magnesian limestone formations, and the latter to the Jurassic.—The coalseam family is characterized by having all the fins rays and bones hollow, a peculiarity not found in other ganoids; and the fin rays are stiff, articulated only at their bases, and supported on interosseous small bones; they occur in all the ages from the lower Devonian to the chalk formations, most numerous in the red sandstone and coal strata. In the genus _asterolepis_, one of the earliest and largest of the ganoids, the bony plates of the head are ornamented with star-like markings, and the scales of the body are delicately curved; Hugh Miller says its cranial bucklers have been found in the flag stones of Caithness, "large enough to cover the front skull of an elephant, and strong enough to have sent back a musket bullet as if from a strong wall." It must have equalled in size the largest alligator, and its teeth throughout the jaw had the reptilian peculiarity of being received into deep pits opposite, causing them when the mouth is shut to lock like the serrations of a bear trap. The genus _holoptychius_ was of very large size, with rough scales several inches in diameter, the cranial bones sculptured like those of the crocodile, and conical teeth larger than those of any living reptile. The _H. (rhipidus)_ Hiberni, the largest of about 20 described species, was of such a giant size that the words applied in Job to leviathan might appropriately be given to it; this reptilian fish must have been 40 ft. in length, with teeth three times larger than those of the largest crocodile, and covered with an impenetrable coat of mail. There were several smaller holoptychians in the red sandstone, even more strongly armed than this giant of the coal period.—For further details...
on fossil ganoids of these and other families, see the great work of Prof. Agassiz on "Fossi-
il Fishes;" and for a popular description of the most interesting genera, the writings of Hugh Miller, especially "The Testimony of the Rocks," "Footprints of the Creator," "Old Red Sandstone," and "Popular Geology."

GANS, Eduard, a German jurist, born of Jew-
ish parents in Berlin, March 23, 1798, died there, May 8, 1859. He studied successively at the universities of Berlin, Göttingen, and Heidelberg, and became early associated with Hegel, whose philosophical opinions he adopted, and through whose influence he conceived a strong antipathy to the historical school of jurisprudence, then supported by the great names of Savigny and Hugo. In 1820 he be-
came a doctor of law and published his Scholien zum Gajus. In his great work Das Erb-
recht in sozialgeschichtlicher Entwicklung (4 vols., Stuttgart, 1824-35), he assails the sci-
entific principles of the historical school of ju-
risprudence, and aims at treating the science of law according to the Hegelian philosophy. He visited France and England in 1825, and in 1836, having become nominally a convert to Christianity, was appointed professor extraor-
dinary in the university of Berlin. His clear and vivacious manner of lecturing was stri-
kingly in contrast with the monotonous gravity usual in German universities, and gained for him crowded audiences. He began a course in 1835 upon the history of the last 50 years, but was obliged by the government to suspend it. He was among the most active of those who prepared the posthumous edition of the complete works of Hegel, of which the Philo-
osophie der Geschichte was in great part elabor-
ated by Gans.

GANSEVOORT, Peter, an American soldier,
born in Albany, July 17, 1749, died July 2, 1812. In 1775 he received the appointment of major in the second New York regiment, and joined the army which under Montgomery invaded Canada. In March, 1776, he was made a lieutenant colonel, and at a later period of the same year he was appointed to the com-
mand of Fort George. In 1777 he was placed in command of Fort Stanwix, which he gallantly defended against a vigorous siege of 20 days by British and Indians under St. Leger, whose cooperation with Burgoyne he thereby prevented, and received the thanks of congress. In 1781 the state of New York raised him to the rank of brigadier general. He was successively commissioner of Indian affairs, commis-
sioner for fortifying the frontiers, and military agent. In 1809 he was appointed brigadier general in the United States army.

GANYMED (Gr. Γαυνυμέδος), a Trojan prince, son of Tros and brother of Ilius, was the most beautiful of mortals, and was carried off, ac-
tording to the legend, by the eagle of Jupiter, to succeed Hebe as cup-bearer to the gods on Olympus. Astronomers have placed him among the constellations under the name of Aquarius, or the water-bearer. He is represented in the fine group of statuary in the Pio-Clementine museum at Rome, and in the group of "Hebe and Ganymede" by Crawford, in Boston.

GAP (anc. Vapineum), a town of France, capital of the department of Hautes-Alps, 47 m. S. E. of Grenoble, at the confluence of the Bonne and the Luys, affluents of the Durance; pop. in 1866, 8,219. It is situated in a valley shut in by mountains, on which the vine flourishes to the height of 2,000 ft., and is of great strategi-

cal importance. It is badly built, but contains a handsome Gothic cathedral. It has been much improved within the present century, and among the new public works are an extensive aqueduct and reservoir. It trades in grain, fruit, cattle, leather, and wool, and has manufactories of linen, silk, and woollen. The town is of Celtic origin, and was at first called Vap. It became a bishop's see in the 5th century. In the 10th century the bishops received the title of prince, of which they were deprived by Francis I.

GARAKONTHE, Daniel, an Onondaga chief, died at Onondaga, N. Y., in 1675. For many years he exercised great influence over the Five Nations, and was esteemed by the English of New York and the French of Canada. He was the chief negotiator of the league, and de-

GARAT, Dominique Joseph, a French writer and politician, born at Ustaritz, near Bayonne, Sept. 8, 1749, died Dec. 9, 1833. He was a contributor to the Encyclopédie méthodique and the Mecanique. He published a cata-
logue on L'Hôpital in 1778; was elected to the constituent assembly in 1789, and reported the sittings of the assembly in the Journal de Paris; succeeded Danton as minister of jus-
tice, and informed Louis XVI. of the sentence of the convention. From the ministry of jus-
tice he was transferred to the home department. He cooperated with the enemies of the Girondists, tried in vain to save some of the latter, and left office in August, 1793. Under the directory he was sent as ambassador to Naples, where he was ill received. In 1805 he received a mission to Holland. On the down-
fall of Napoleon he tried every means of pro-
pitating the Bourbons, but in 1816 was ex-
cluded from his seat in the institute. He now wrote one of his most interesting books, Mémo-\nires historiques sur la vie de M. Swartz, and no long afterward retired to his native moun-
tains, where he led an obscure but religious life.

GARAY, János, a Hungarian poet, born at Szekszárd, in the county of Tolna, in 1812, died in Pesth, Nov. 5, 1868. His chief produc-
tions are the epic poems "Casatár," “Sophia Borzói,” "The Winds of Frapóspán," and "St. Ladislas," that dramatizes "Arboeck," and "Elizabeth Báthory;" "The Arpads," a collection of ballads on the history of that Hungarian dynasty; and Balatoni kágyók ("Shells from the Balaton"). He also wrote numerous other poems, sketches in prose, and contributions to literary periodicals. His historical ballads are particularly popular. His poems have been collected by F. Ney (5 vols., Pesth, 1838). A selection of them has appeared in a German translation by Kertbeny (2d ed., Vienna, 1857).

GARCIA. I. Manuel de Pupiños Vicente, a Spanish composer, born in Seville, Jan. 21, 1775, died in Paris, June 9, 1832. Having acquired celebrity as a tenor singer in Spain, he made his début in Paris in 1808, and for many years was a reigning favorite. He wrote a number of operas, of which "The Tomb of Baghdad" proved the most successful. In 1825 he came to the United States with an opera troupe, including his wife and his daughter Maria Felicia, afterward celebrated as Mme. Malibrán. The enterprise proved so successful that Garcia extended his visit to Mexico. On the road between Mexico and Vera Cruz he was robbed of all his earnings, and returned to Paris impoverished. His voice having been impaired, he established a school of vocal instruction. He was equally accomplished as an actor and a vocalist. II. Manuel, a musician, son of the preceding, born in Madrid in 1808. He accompanied his family in their travels, was a teacher of music in the Paris conservatory from 1835 to 1850, and afterward in London, and is one of the best teachers in Europe. He has written Mémoire sur la voix humaine (2d ed., 1847); École de Garce, traité complet de l'art du chant (3d ed., 1851; remodelled in 1856 under the title of Nouveau traité, &c.); and Observations physio. logiques sur la voix humaine (in French and English, 1855). (See Malibrán, and Viaudot.)

GARCILASO (Garcés Lasso) DE LA VEGA. I. A Spanish lyric and pastoral poet, born in Toledo in 1585, died in Nice in November, 1586. His father was councillor of state to Ferdinand and Isabella, and his mother was the daughter of Fernan Perez de Guzman. At an early age Garcilaso entered the service of the emperor Charles V. He was in the campaign in the Milanese in 1631, and distinguished himself by his valor at the battle of Pavia in 1635. In 1630 he married Donna Helena de Zuniga, an Aragonese lady; and in 1652 he followed Charles in his Hungarian campaign against the Turks. While at Vienna he incurred the displeasure of the empress by promoting the marriage of one of his nephews with a lady of the imperial household, and was imprisoned on an island in the Danube, where he wrote a poem contrasting his own desolate situation with the beauty of the surrounding scenery. He was soon released and taken into greater favor than ever. In 1635 he accompanied the emperor on the expedition to Tunisia, in which he was severely wounded; and in the succeeding year he followed him in the disastrous invasion of the south of France. In an attack upon a small castle on a hill near Fréjus, Garcilaso was struck on the head by a stone and fell into the ditch beneath. He was carried to Nice, where he died three weeks afterward. The emperor avenged the death of his favorite by hanging all the defenders of the castle. Garcilaso left an only son, who fell in battle against the Dutch in 1659. Garcilaso's poems were found by the widow of his friend the poet Boscán among her husband's papers, and published with them. They consist of 87 sonnets, 5 canciones, 2 elegies, an epistle in versi scolici, and 8 pastorals. He is considered one of the finest poets of his nation, and is often designated as the Spanish Petrarch. The best edition of his poems was published in Madrid in 1765, edited by José Nicolás de Azara. The oldest edition known is that of Venice, 1568. There is an English translation, with a life and an essay on Spanish poetry, by J. H. Wiffen (London, 1823). II. Sebastian, a Spanish soldier, one of the conquerors of Peru, born in Badajoz, died in Cuzco in 1559. He was of the same family with the preceding, and went to Mexico with Pedro de Alvarado. After the invasion of the kingdom of Quite, and Alvarado's return to Guatemala, Garcilaso remained in Peru and attached himself to the fortunes of Francisco Pizarro, and after his death to those of his brother Gonzalo. In the decisive battle of Xaquiszazana, April 9, 1648, he rode over to the royal side at the turning point of the contest, was received with pardon and favor by the viceroy, and appointed governor of Cuzco, an office he held till his death. Garcilaso was noted for his humanity to the Indians, and for the efforts he made to ameliorate their condition. He married an Indian princess of the blood royal, the niece of Huayna Capac, and granddaughter of the renowned Tupac Inca Yupanqui. III. Surnamed the Inca, a Spanish historian, son of the preceding, born in Cuzco about 1540, died in Cordova, Spain, about 1620. About 1560 he went to Spain, where he ever afterward resided. He entered the army, and served as a captain under Don John of Austria, in the war with the Moriscos. After the war ended he retired to Cordova, and devoted himself to literature. He began by translating the Dialoghi di Amore, by Leone Abravanel. This work was soon placed on the Index Expurgatorius. His La Florida del Ynca (Lisbon, 1605) is chiefly devoted to the adventures of Fernando de Soto. In 1609 he published the first part of his great work, Comentarios reales, que trata del origen de los Ynca reyes, que fueron del Peru (Cordova, 1617; corrected ed., 17 vols., Madrid, 1800—3), relating the history of Peru under the inca. Shortly before his death he finished the second part, comprising the story of the conquest by
the Spaniards. This work gives by far the fullest account of Peru under its native kings, and in fact the sources of almost all our knowledge upon the subject. The author was proud of his descent from the inca, and obtained much of the material for his history from his mother's family. His "Commentaries" are interesting and valuable, though they contain much that is mere gossip and not a little fable. They have been translated into many languages. An English translation, in 1 vol. fol., by Sir Paul Rycaut, knight, was published at London in 1688, which, though containing numerous errors, is still a favorite with book collectors.

GARCIN DE TASSY, Joseph Hélie rode, a French orientalist, born in Marseilles, Jan. 20, 1794. He studied in Paris, and at the recommendation of his teacher, Sylvestre de Sacy, a new chair was established for him in the school of living oriental languages. In 1829, he continued to fill in 1873. His principal work is Histoire de la littérature hindoue et hindoustani (2 vols., 1887; new ed., 1878). A second edition of his Études de la langue hindoustani appeared in 1868, and a 4th edition of his Poésie philosophique et religieuse chez les Persans in 1864.

GARD, a S. E. department of France, in Languedoc, bounded S. by the Mediterranean and E. by the Rhône, and by the departments of Hérault, Aveyron, Lozère, Ardèche, Vaublanc, and Bouches-du-Rhône; area, 2,256 sq. m.; pop. in 1872, 420,181. It derives its name from the small river Gard or Gardon, which rises in the Cévennes, runs through its centre, and falls into the Rhône a few miles N. of Beaucaire. The Cévennes mountains send ramifications to its centre, while in the southeast there is a considerable extent of level country, broken by pools and marshes. Iron, argentiferous lead, antimony, zinc, and manganese are mined; coal mines are also worked, and there are valuable salt marshes on the coast. The arable lands, which comprise scarcely one fourth of the department, are generally poor, and agriculture is backward. The wines are highly esteemed, and olives are produced; but the culture of the mulberry is of paramount importance. Other fine fruits are also abundant. This department ranks among the most industrious in France, and is especially distinguished for its manufactures of silk, besides which it has cotton and woollen mills, tanneries, distilleries, and soap-making establishments. It is divided into the arrondissements of Nimes, Alais, Uzès, and Le Vigan. Capital, Nimes.

GARD, Pest a. See Aquinor, vol. i., p. 618.

GARDA, Lake (anc. Benacus Lacus), the largest of the Italian lakes, between the provinces of Brescia and Verona, and projecting at its N. and narrowest part into the Tyrol. It is 83 m. long from N. to S., from 3 to 11 m. broad, and 326 ft. above the sea; area about 150 sq. m. The Sarca and several smaller streams discharge themselves into it from the north; the Mincio flows from its S. E. extremity. The lake is about 1,000 ft. deep, in many places, the water is very pure, and it is noted for its fish, especially salmon trout and sardines, the latter being an important article of commerce. The surrounding hills are planted with vines, olives, and fig trees, and several handsome villages overlook the lake, among them Garda, Salo, and Maderno. The Tyrolean town of Riva is at the N. W., and the Italian fortress of Peschiera at the S. E. extremity.

GAUDELA, or Garcela, a town of Algeria, in the province of Algiers, situated in the oasis of the Beni Mzab, on the Wady Mzab, in the Sahara, about lat. 32° 30' N., lon. 4° E.; pop. about 60,000. It is well fortified, having a wall with battlements and nine large towers, each of which is capable of holding from 800 to 400 men. Ten gates give entrance to the town, which contains a mosque of vast size and five smaller ones, besides four synagogues. The chief administration rests with the French bureau arabes; the details of it are left to the native chiefs, who are generally little more than the mouthpiece of the high priest, whose advice has all the force of law. A flourishing trade is carried on with Tunisia, Algiers, Bou Saada, &c., in corn, butter, groceries, oil, pottery, and negro slaves. The suburbs of the town contain extensive vineyards and orchards. Rain is almost unknown, but there are numerous wells, some of which are 900 ft. deep. On a neighboring eminence are the remains of a large tower supposed to have been built by the Romans. The oasis in which Garda is situated submitted to French rule in 1868.

GARDEN. See Horticulture.

GARDEN, Alexander, a British physician and naturalist, born in Scotland in 1728, died in London in 1799. He studied philosophy in the university of Aberdeen, and medicine under Dr. John Gregory, and emigrated to South Carolina near the middle of the century. He acquired a fortune by the practice of medicine in Charleston, and a high reputation by his studies in botany and other sciences. In 1754 he declined a professorship in the college recently established in New York city. He was a correspondent of Linnaeus, who gave the name of Gardenia to one of the most beautiful and fragrant of flowering shrubs. He published accounts of the pink root (Epigelia Marilandica), of the Helicia, of the cochineal insect, of the mud igna, or siren of South Carolina, an amphibious animal, of two new species of tortoises, and of the Gymnotus electricus.

GARDEN, Alexander, an officer of the American revolution, in Lee's famous legion, born in Charleston, S. C., Dec. 4, 1757, died there in 1839. He was for a time aide-de-camp to Gen. Greene. He wrote "Anecdotes of the Revolutionary War in America, with Sketches of Character of Persons the most distinguished in the Southern States for Civil and Military Services" (1st series, Charleston, 1832; 2d series, 1838), which is one of the authorities
for the history of the period. It was republished in 2 vols. 4to, Brooklyn, 1885.

**GARDINER**, a city of Kennebec co., Maine, on the W. bank of the Kennebec river, 10 m. below Augusta, at the head of summer navigation, and on both sides of the Cobbosseecontee; pop. in 1870, 4,497. A bridge 900 ft. long connects it with Pittston on the opposite bank of the Kennebec; and the Augusta division of the Maine Central railroad passes through the city. It is largely engaged in manufactures, for which the falls of the Cobbosseecontee afford great advantages, and it
contains six saw, shingle, lath, and clapboard mills, three large paper mills, a woollen factory, two foundries, three machine shops, a tannery, an axe factory, three carriage factories, two manufactories of sashes and blinds, &c. Considerable shipping is owned here. There are two hotels, three national banks with an aggregate capital of $250,000, a savings bank with $1,050,000 capital, two weekly newspapers, 16 school houses (including a high school building), an almshouse, a mechanics' association with a small library, a public library, and nine churches. Gardiner was settled in 1760, incorporated as a town in 1808, and as a city in 1860.

**GARDINER, James**, a Scottish soldier, born at Carriden, Linlithgowshire, Jan. 11, 1688, killed Sept. 21, 1745. At the age of 14 he obtained a commission in the Dutch service. He afterward entered the English army, and was present at the battle of Ramillies. In 1730 he was made lieutenant colonel, and in 1745 commanded a regiment at the battle of Prestonpans, where he was slain. His death is described in Scott's "Waverley." In his youth he led a dissipated and reckless life, but was, as he believed, converted through a supernatural vision, and became an exemplar of Christian piety and worth. His life was written by Dr. Doddridge.

**GARDINER, Stephen**, an English Roman Catholic prelate, born at Burry St. Edmund's in 1488, died Nov. 12, 1555. He was educated at Cambridge, became secretary of Wolsey, and was soon in high favor with Henry VIII. In 1527 he was sent to Italy to procure the pope's consent to the divorce of Queen Catharine. His mission proved unsuccessful, but while at Rome he rendered important services to Wolsey. On his return he was intrusted with the conduct of the divorce case, and successively made secretary of state and (in November, 1581) bishop of Winchester. He endeavored to convince the king of the impolicy of breaking with the pope, and of the propriety of punishing those who denied the bodily presence of Christ in the eucharist. The downfall of Cromwell, who had succeeded Wolsey as favorite, added for a time to the influence and power of Gardiner. But the king began at length to lean toward the reformers, and the refusal of Henry to permit the arrest of Catharine Parr for religious contumacy demonstrated the decline of Gardiner's power. On the accession of Edward VI., Gardiner, refusing to approve of the articles and injunctions issued by the new council, was committed first to the Fleet prison, and then, after a short release and new provocation, to the tower, where he was confined till the reign of Mary, when he was restored to liberty and raised to still greater power than ever, being made lord chancellor. The Protestant persecution which took place during his administration has been generally ascribed by Protestant writers to his counsel, but, according to Lingard, "more from conjecture and prejudice than from real information." He is said to have exclaimed on his deathbed: *Erravi cum Petro, sed non flevi cum Petro* ("I have erred with Peter, but I have not wept with Peter").

**GARDINER, L. Sylvester**, an American physician, born in Kingston, R. I., in 1707, died in Newport, Aug. 8, 1788. He studied medicine in London and Paris, subsequently practiced his profession in Boston, and opened there a drug establishment, from which the New England colonies were chiefly supplied. He was one of the early promoters of inoculation for the smallpox, and a liberal contributor for the erection of King's chapel, Boston. He became possessed of large tracts of land in Kennebec co., Me., and about the middle of the century was instrumental in establishing there the settlement of Pittston, a portion of which was subsequently set off into a separate town, under the name of Gardiner, where he built and endowed Christ church. He retired from Boston on its evacuation by the British troops, but returned to the United States at the close of the revolutionary war, and passed the rest of his life here. II. John, an American advocate, son of the preceding, born in Boston in 1731, drowned off Cape Ann in October, 1798. He studied law at the Inner Temple, London, and was admitted to practise in the courts at Westminster hall. He formed an intimacy with Churchill and Wilkes, and was junior counsel of the latter at his trial in 1764, and also appeared for Beardmore and Meredith, who for writings in support of Wilkes had been imprisoned on a general warrant. In 1766 he procured the appointment of attorney general in the island of St. Christopher, where he remained until after the American revolution, when he returned to Boston. After residing there a few years, he removed to Pownalborough, Me., which place he represented in the Massachusetts legislature until his death. As a legislator he distinguished himself by his efforts in favor of law reform, particularly the abolition of special pleading, and the repeal of the statutes against theatrical entertainments. In connection with the latter subject he published a "Dissertation on the Ancient Poetry of the Romans," and an accompanying speech. The abolition of the law of primogeniture in Massachusetts was due to his efforts. He was one of the most influential of the early Uniti-
riars of Boston, and participated in the transformation of King's Chapel from an Episcopal into a Unitarian Congregational church. Hill John Sylvester John, an American clergyman, son of the preceding, born in Haverford West, South Wales, in June, 1775, died in Harrowgate, England, July 29, 1880. He accompanied his father to the West Indies, and subsequently studied in Boston, and in England under the celebrated Dr. Farr, with whom he remained six years. Returning to America, he was in 1797 ordained by Bishop Provost of New York. In 1805 he became rector of Trinity church, the chief Episcopal parish in Boston. He wrote the "Jacobinad," a satire on the republican clubs of Boston.

GARDONI, Italo, an Italian vocalist, born in 1830. He first appeared at the opera of Paris in 1844 as Earl Bothwell in Maria Stuart, and was applauded as almost equal to Mario, and in 1848 he removed to America. After a visit to Europe he returned to America, and in 1851 he gave his voice in the grand opera, of Boston. In 1845 he won new laurels as Don Sanche in Balfe's Étoile de Sevilla, and in 1846 in Frotet's Amo en pena.

GARFIELD, James Abram. See supplement.

GAR FISH, or Gar Pike (Lepisosteus), a ganoid fish, belonging to the same order as the polypterus of Africa, the mud fish (camas) of North America, and the sturgeon family; it is the only genus of its family, and there are more than 30 species, all American. As in other ganoids, the body is covered with smooth, enamelled scales, of a rhombic form, arranged in oblique rows, and so hard that it is impossible to pierce them with a spear; this enamel is like that of teeth, and the scales contain the fluorine and lacunae of ordinary bone structure. The internal skeleton is bony; the snout is elongated, varying in width according to the species; both jaws and nasal bone are covered with small teeth, with long and pointed ones along the edge; the teeth are in double rows of unequal size, the larger resembling those of reptiles, and the smaller fish-like, the front ones of the lower jaw being received into sheath-like cavities in the skull bone as in the alligators; their structure resembles that of the labyrinthodont reptiles, having processes of the pulp cavity radiating toward the circumference; the vertebrae also present a reptilian arrangement in having ball- and-socket articulations, the anterior surface of each bone being convex and the posterior concave; this gives greater flexibility to the spine, and enables this genus (alone among fishes) to move the head independently of the trunk, and also to retain the posterior part of the body in a curved position. The gills on the four arches have a perfect bifoliate structure, and behind the last and the hyoid bone there is the usual fissure; there is a respiratory opercular gill as well as a pseudobranchia, but no blow-hole; branchiostegal rays three, the membrane passing from side to side, undivided. The anterior edge of all the fins is protected by hard spiny scales, and all the fin rays are articulated; the dorsal and anal fins are far back, and nearly opposite one another; the caudal fin is abruptly truncated, and its rays are inserted partly at the end of and partly beneath the extremity of the spine. There are the usual numerous valves in the arterial bulb, no decussation of the optic nerves, and abdominal ventral fins; the stomach is continued without ceasing to a slender twice-folded intestine, which has a slightly developed spiral valve, but numerous pancreatic ceca; the long air or swim bladder is muscular, freely supplied with blood from the aorta, divided into cells like the lung of a reptile by muscular bundles, and opening into the throat by a wide duct and long slit guarded by a sphincter muscle; the ovaries are saeciform, with oviducts issuing from their middle. Gar fish are not uncommon in the western rivers and northern lakes communicating with the Gulf of Mexico and the St. Lawrence, and probably every separate basin and watershed has its peculiar species. They frequent shallow, reedy, or gravelly places, basking in the sun like the pike, and devouring living prey with great voracity. The manner of seizing prey differs from that usually observed in fishes, and resembles that of reptiles; instead of taking their food at once with open mouth and swallowing it immediately, they approach it slowly and sideways, and then, suddenly seizing the fish or other animal, hold it until by a series of movements it is placed in a proper position for being swallowed, in the manner of alligators and lizards; the ball of food is also seen to distend the body as it passes downward, as in snakes. This reptilian fish, like the ichthyoid reptiles, is in the habit of approaching the surface of the water, and of apparently swallowing air; at any rate, a large amount of air escapes from the mouth, most of which had probably been previously swallowed, and a part of which may have been secreted by the lung-like air bladder. As in the membranous and other fish-like salamanders, this air bladder doubtless performs certain respiratory functions, and perhaps more than in the naked-skinned reptiles; at any rate gar pikes live longer out of water than fishes generally, and to a degree not explicable by any arrangement of the gills. The gar pike and the African polypterus (described below) are the only two existing genera of a type of sauroid fishes which were very numerous in the secondary geological epoch, extending also in diminished numbers through the paleozoic age at a time when true pector fishes did not exist; they are found from the lower Silurian strata to the present time, gradually diminishing through the tertiary to the two existing genera; they present one of the first steps in the geological succession of bony fishes, at a time when the tetonoids and cycloids had not appeared; after the rhizodont reptiles and the common osseous fishes were created, the ganoids began to diminish. The common gar fish (Lepisosteus, Linn.), called also bony
pike and Buffalo fish, attains a length of 5 ft. The color is umber brown on the back and head, the sides yellow, and the belly white; there are circular black spots on the caudal, dorsal, and anal fins. It is found in Lakes Erie, Huron, and Champlain, the Ohio and its tributaries, and other western rivers. The great length of its jaws will distinguish it from other species; it is often seen apparently sleeping on the surface, and gently carried round in an eddy for an hour at a time; it leaps often out of water in pursuit of its prey, and is so swift and strong a swimmer as to stem the most furious rapids. The alligator gar fish (Lepisosteus) has a shorter head, the jaws forming not quite half the length, broad and flat above; the skin is rough, the scales imbricated and sculptured; teeth numerous, strong, and prominent; the upper jaw, as in the preceding species, expanding into a knob at the end; the color is yellowish brown. It inhabits the Mississippi and Ohio rivers and their tributaries, and is usually from 4 to 6 ft. long; according to Rafinesque, it attains a length of 12 ft., and is a match for an alligator; its impervious coat of mail, strong teeth, size, strength, and agility must make it a very formidable fish, though probably not superior to the equally well armed and powerful alligator. It may well be called the shark of fresh water, though not belonging to the placoid group of fishes. There are several other species described, more or less resembling the above; but these will serve to give an idea of the general characters of this singular fish, the living type of the dominant family of its class during the carboniferous period. The allied genus Polypterus (Geoffr.), from the Nile, Senegal, and other African rivers, is characterized by similar enamelled scales, and by a number of finlets extending from the middle of the body to the tail; the throat is covered with hard, nearly immovable plates, which would greatly embarrass respiration were it not for two openings on the top of the head, which answer the purpose of blowholes and allow the water to pass through them; the lobes of the tail are of unequal size; the abdominal organs occupy a very small space, being packed close to the spine; the upper jaw is not in several pieces, but the mandibles and skull are as in osseous fishes generally; there is no opercular gill, nor pseudo-branchia; the nostrils are very complicated, with labyrinthine gill-like folds; the stomach is cecal, the intestine provided with a well marked spiral valve, and there is a single pancreatic osculum; the air bladder is double, communicating with the throat by a duct opening on the ventral side, and its arteries are formed by the union of the blood vessels coming from the last gill, carrying therefore oxygenated blood. The lepidosteus is by far the best known and most interesting of the saurid fishes, and has been of such value to paleontologists that it has been well said by Hugh Miller, in his "Lectures on Geology," that "it would almost seem as if the lepidosteus had been spared, amid the wreck of genera and species, to serve us as a key by which to unlock the marvels of the ichthyology of those remote periods of geologic history appropriated to the dynasty of the fish." (See GANOIDEA.)

GARBANO, Manto (anc. Garganus Mona). See APIENTINES.

GARIBALDI, Giuseppe, an Italian patriot, born in Nice, July 4, 1807. His father educated him to his own profession, that of a mariner. His second voyage was to Rome, when the condition of that city made a deep impression on his mind, and led him into those revolutionary views which, in February, 1844, resulted in his exile from Italy. He first went to Marseilles, whence he made voyages to various ports. He made one to the Black sea, passing Constantinople, where he had some years before spent a short time, and another to Tunis, and from there sailed for Rio de Janeiro. At Rio he met Rosetti, with whom he entered into an unsuccessful commercial partnership. About this time Zambecari arrived there from Rio Grande, which had declared her independence; becoming acquainted with Garibaldi and Rosetti, he persuaded them to espouse the cause of that republic, and Garibaldi, with 20 companions under his command, embarked in a small craft which he named the Mazzini. In an engagement with two launches, which he beat off, he received a gunshot wound in the neck, which nearly proved fatal. He landed at Gualagray on neutral soil, where he was treated to a certain extent as a prisoner, being prohibited from moving more than a short distance from the town. He endeavored to escape, but was retaken, brought back, and tortured nearly to death with the view of extorting from him the names of those who had favored his flight. Two months later he contrived to reach Montevideo, where he found Rosetti, and the two returned to Rio Grande and joined a land expedition, under Bento Gonzalez, president of the republic, against the Brazilians who were infesting the neighborhood of the city. Until the end of the year he was employed in the service of the short-lived republic, chiefly at sea, though sometimes
on land. Prior to the cessation of hostilities Garibaldi married a South American woman, who, until her death in 1849, was the companion of all his dangers and privations by sea and land. After the war he settled in Montevideo and taught mathematics, till Rosas, the dictator of Buenos Ayres, declared war against Uruguay. The commencement of the war was disastrous; Montevideo was besieged, and the minister of war Vidal robbed the treasury and fled. Garibaldi organized a flotilla, and recommended the formation of an Italian legion, which, though especially charged with the defense by sea, he frequently commanded. Montevideo was saved. In the spring of 1848 Garibaldi sailed from South America with a portion of the Italian legion, and on arriving in Piedmont placed himself at the disposal of Charles Albert, by whom he was coldly received. The king being defeated a few days later, Garibaldi with a few resolute republicans prolonged the resistance until forced across the frontier by a superior Austrian detachment. He crossed the Po, and reached Ravenna, but papal troops were ordered against him. On the flight of the pope the new executive gave Garibaldi a command, sending him to watch the Neapolitan frontier near Rieti, where he remained till the spring of 1849, when Avezzano, the new minister of war, called him to Rome. The French expedition to restore the pope having appeared before Rome on April 30, Garibaldi was, with 1,200 men, posted in some villas outside the gates. Notwithstanding the great disparity of numbers, he attacked the right wing of the French, when Avezzano, who commanded in chief, seeing from the city wall the peril of the Italians, despatched 1,500 men to his succor. Garibaldi then charged the French, put them to flight, pursued them several miles, and returned with 300 prisoners. The Neapolitans now threatened Rome, and were beaten by Garibaldi at Palestro and at Velletri. The French, strongly reinforced, having on June 30 gained a footing inside the wall, the resistance soon became hopeless, and the republican triumvirate, Mazzini, Saffi, and Armellini, abdicated. Garibaldi, whose men fought bravely to the last, resolved to continue the struggle in the open country. He left Rome to try to penetrate to Venice with about 4,000 men, of whom 800 were mounted, and marching by Tivoli to Terni met the second Italian legion, which was awaiting him. The enemy, in immensely superior numbers, never accepted a general engagement; Garibaldi so adroitly manuevering as to extricate himself and leave his enemy behind him every time he appeared to be surrounded. On July 80 he reached San Marino, his force being reduced by the sack from which he was rescued by a fresh Austrian army in addition to the 18,000 pressing on his rear. Terms were now offered, to the effect that there should be a general amnesty and all should return home, the arms being surrendered to the republic of San Marino. Such conditions would have been accepted had a few French belonging to the second legion been permitted to return to Switzerland; but as it was insisted that they should be sent to Rome, the offer of the Austrians was rejected, and at night about half the force (the rest chose to surrender) made their way toward Cesena; and though vigorously pursued, the remnant, 290 in number, embarked from Cesenatico in some fishing boats on Aug. 2. Toward nightfall they were descried by the Austrian fleet; some were captured, and the rest scattered. In the boat with Garibaldi were his wife and a few of the most compromised; these gained the shore and dispersed in twos and threes. Two days later Anna Garibaldi, who had refused to leave her husband, being worn out by fatigue, died. Garibaldi made his way from the east to the west coast, while the punishment of death was decreed for whosoever gave him bread, water, or shelter. At Chiavari he was arrested and conducted to Genoa. Banished from Sardinia, he arrived at New York in the summer of 1860, declined a public reception offered him, and earned a living by making candles in a manufactory on Staten Island till an opportunity occurred of resuming the occupation of a mariner. He made some voyages in the Pacific, and in about three years returned to New York in command of a Feruvian bark. Having lost his mother, to whom he had confided the care of his three children, he accepted an invitation to return to Nice, where he lived in retirement. In the beginning of 1869, on the breaking out of the war with Austria, he was invited by the Sardinian government to form a corps, which became celebrated as the "Hunters of the Alps" (Cacciatori delle Alpi). Detached from the rest of the army, he crossed into northern Lombardy with a small force, beat several Austrian detachments, and rendered important services to the Italian cause throughout the war. In May, 1860, with about 1,000 volunteers, he sailed from Genoa for Sicily, landed at Marsala, took Palermo and Messina, and became dictator of the island. He then crossed the strait, in September entered Naples, won a victory on the Volturro, and was joined by the Sardinian army, which had advanced from the north, and completed the overthrow of King Francis. The kingdom of the Two Sicilies was now merged in that of Italy, Garibaldi resigning the dictatorship and retiring to the small island of Caprera. In 1861 he was elected a member of the chamber of deputies. In April, 1862, he was appointed general-in-chief of the national guard. While he was engaged in enlisting volunteers, he published on July 26 an appeal to the Hungarians to rise against Austria... This blow fell into collision with his own government; several of his officers and men were arrested and disarmed, and he retired to Caprera and began to plan for an attack on Rome. Napoleon III. sent vessels to blockade the Sicilian coast to...
GARIBALDI

prevent Garibaldi from passing to the mainland. He however succeeded in crossing with a force of about 2,200 men, nearly all of whom were captured, Aug. 28, near Aspromonte, where Garibaldi was seriously wounded and made a prisoner. He was released in October, and was permitted to return to his island. He retired from the chamber of deputies in January, 1864. In 1866 he commanded a corps of volunteers against the Austrians, and engaged in some operations in the Tyrol; but the war was brought to a close before he had much opportunity to distinguish himself, and he returned to Caprera. In 1867 he organized another army for the conquest of Rome, but the government resolving to suppress the movement, Garibaldi was arrested, and, after a short detention as a prisoner, was sent to Caprera, where he was watched by a ship of war to prevent his escape to the mainland. This watch he endured, and in October, he was again in Florence. A week after he joined the insurgents on the Roman frontier. Four days later (Oct. 26) he defeated the papal troops at Monte Rotondo; but on Nov. 8 he was defeated by the French and papal forces at Mentana. On his way back to Caprera he was arrested and imprisoned. His protest as an Italian deputy and an American citizen effected his release after a few weeks. From this time for a considerable period he lived in retirement in his island home. In October, 1870, on the establishment of the French republic, he arrived in Tours, and offered his services to the government of the national defence. On the 16th he was made a general of division in the French army and placed in command of the irregular forces in the Vosges; but he had little opportunity to distinguish himself in the field. In February, 1871, he was elected for Paris and several departments as deputy to the national assembly; but at the preliminary meeting of that body at Bordeaux on the 12th, he resigned his seat and his command in the army, and returned to Caprera. Garibaldi has appeared as a novelist in Canti di volon- tario (1870), and in Ciletia, ovevo il governo menene: Roma del secolo XIX. (1870). The latter has been translated into English, under the title "Rule of the Monk, or Rome in the 19th Century" (1870). In 1878 he published a poem, I mille di Marsala.—See his "Autobiography," edited by Alexandre Dumas, translated into English by W. Robson (London, 1860); "Life of Gen. Garibaldi, written by Himself, with Sketches of his Companions in Arms," translated by Theodoro Dwight (New York, 1860); and "Garibaldi at Caprera," by Col. Vecchi, with a preface by Mrs. Gaskell (London, 1862).—MENOTTI, one of his sons, took an important part in the Italian movements. At Aspromonte, Aug. 28, 1862, he as well as his father was wounded, and both were carried as prisoners to Spezia, but were soon released. In 1867, during the march on Rome, he commanded the Garibaldis in the absence of his father. He went with him to France in 1870, and like him received a French command; but his action during the war was comparatively unimportant.—Riouquet, a younger son, who had also served under his father in Italy, was perhaps more successful than either his father or brother during the war of 1870-71. He made a successful attack on the German garrison of Châlillon-sur-Seine, Nov. 18, 1870, and, in conducting operations under his father's command, gave evidence of considerable military talent.

GARLAND, a county of Arkansas. See Hot Springs.

GARLIC, the bulb of the Allium sativum, a plant of the same genus as the onion (A. cepa) and the leek (A. porrum). The plant is perennial, and grows wild in the southern parts of Europe, but its native place is not certainly known. In most countries it is cultivated, and has been esteemed from the remotest times as an article of food or as a condiment. The plant has flat leaves, somewhat like those of the leek, and at the base a bulb which is made up of five or six bulblets, called "cloves," which are of an oblong shape, flattened, and pointed at the apex; they are enclosed in numerous layers of thin, papery skin, which is usually white, but in one of the garden varieties rose-colored. The flower stem is about 18 inches high, and bears an umbel of pink or purplish flowers, which are often intermixed with small bulbs. The bulbs are taken up attached to the stem, and when dried in the sun are tied together in bunches like onions. Garlic has a strong peculiar odor called alliaceous, and a bitter and acrid taste. A highly viscous juice may be expressed from it, so tenacious that when dried it makes a cement for porcelain. By distilling the bulb with water a very volatile essential oil is obtained, which possesses in a high degree the peculiar properties of the bulbs. It is of so acrid a nature that it will even raise blisters upon the skin. Sulphur is detected in this oil, combined with a radical called allyle, consisting of CH₃S. When garlic is used as food or medicine, and even when applied externally, this oil is rapidly absorbed, and its presence is soon perceived in the breath and in the secretions of the body. Its moderate use is thought to be beneficial for its stimulant properties in quickening the circulation, exciting the nervous system, &c. As a medicine it is most employed in external applications, as a sedative in fevers, and in nervous and spasmodic disorders of children.—A number of species of Allium are indigenous to this country, and are known as wild garlic and wild leek; one (A. uncial), introduced from Europe, is now thoroughly naturalized in the older states, and is a troublesome weed. It grows frequently in pastures, and imparts a most disagreeable odor to the milk and butter from the animals that eat it; when it occurs in wheat fields it seriously injures the flour unless the grain is cleaned with great care. A. molý,
called garden garlic, has long been cultivated as an ornamental plant. It bears an umbel of large golden yellow flowers about a foot high; its treatment is the same as that of tulips and other spring-flowering bulbs.

GARNET, in which is represented a Canadian historian, born in Quebec, June 15, 1809, died Feb. 3, 1866. He was admitted as a notary in 1830, and became clerk of the legislative assembly, member of the council of public instruction, and city clerk of Quebec, holding the last named office from about 1845 till his death. His Histoire du Canada depuis sa découverte jusqu'à nos jours (3 vols. 8vo, Quebec, 1845-6; 3d ed., 1859) has been translated into English. He also published a volume of travels in England and France.

The garnet, a mineral species, presenting many varieties; also applied by Dana to designate a section of the silicates; and in geology it is the name of a rock made up of some variety of the mineral. The garnet is supposed to have been sometimes included by the ancients in their names carboruncus and Ayacanthus. Its mode of perfect form is a gem, and when cut and polished bears some resemblance to the ruby in color, transpareny, and lustre. Some of the precious varieties are distinguished by the names Syrian and oriental, and also almandine, from Alabanda, the place where in the time of Pliny they were cut and polished. These and the black varieties also have been much used in Europe, strung together like beads for necklaces. Those most esteemed in jewelry are obtained from Ceylon, Pegu, and Greenland. A single crystal of only 84 lines by 64 has been sold for about $700. Its crystals are rhomboidal and trapezoidal dodecahedrons and variously modified forms. Its hardness is from 6 to 7:5; specific gravity 3:15 to 4:3. It is met with in various colors, as red, brown, black, yellow, white, and green, and with a vitreous or resinous lustre. According to the figures of the mineralogist, there are divided into six sub-species, all of which pass into one another by insensible shades of difference; they are all silicates of different proctoxides or peroxides; as: 1, the alumina-lime garnet, a silicate of alumina and lime, of which the cinnamon stone or essonite is an example; 2, the alumina-magnesia garnet; 3, the alumina-iron garnet, a silicate of the proctoxide of iron and lime, as almandine and a variety of the common garnet; 4, the alumina-manganese garnet, called also manganese-garnet; 5, the iron-lime garnet, composed of silicates of the proctoxide of iron and of lime, as the black garnet and a variety of the common garnet; 6, lime-chrome garnet, as the emerald-green ouvarovite of Russia. The silicic acid in these varies from 34 to 44 per cent. Their composition is represented by the general formula R₃X₆(SIO₄)₂, 3R₂O₆, 8SiO₂, or 3RO₆, 8SiO₂. In the ratio of RO₆ to borax the proctoxides that may be present, and R₂O₃, either the alumina (Al₂O₃), or the peroxide of iron (Fe₂O₃), or of chrome (Cr₂O₃). According to Odling, the formula is R₃VSIO₄, in which R = Ca, Mg, Fe, or Mn, and V = Fe, Al, or Mn. Garnets are easily melted by the blowpipe; and some varieties, as the melanite or black garnet found in the lavas of Vesuvius, appear to be a direct product of the fusion of their ingredients. The iron-lime garnets, of which this is a variety, containing from 80 to 80 per cent. of peroxide of iron, and about the same proportion of lime, might be advantageously employed both as iron ore and flux in the manufacture of iron, mixed with other ores more rich in iron and deficient in silica. They frequently occur in the vicinity of iron ores, and in beds of great extent, forming a true garnet rock, and from their highly ferruginous appearance have in some instances been mistaken for iron ores. Crystals of garnet are common in the granite rocks and the metamorphic slates and limestone in almost all localities where these are found; but when most abundant and large, they are commonly rough and unsightly. In the gold region they abound in the slates, and in some instances where the rock that contained them has crumbled away they are left loose upon the surface, so that they might easily be shovelled up by cart loads.

GARNIER, Adolphe, a French eclectic philosopher, born in Paris, March 27, 1801, died in May, 1864. He aided Jouffroy in translating the works of Thomas Reid, was in 1827 appointed professor of philosophy in the college at Versailles, and afterward promoted to a chair in Paris. He meanwhile published his Précis de psychologie, and a complete edition of the philosophical writings of Descartes. In 1838 he succeeded Jouffroy as lecturer on philosophy at the Sorbonne, and in the following year produced his Comparaison de la psychologie et de la phrénologie. He published in 1850 a Tracté de morales sociales, and in 1855 a Tracté des facultés de l'âme, which won a prize from the French academy. His last work, De la morale dans l'antiquité (1868, with an introduction by Prévost-Paradol.

GARNIER, Charles George Thomas, a French author, born in Auxerre, Sept. 21, 1748, died there, Jan. 24, 1795. He was educated at the college of Plessis, and became an advocate, though the weakness of his voice did not permit him to speak in public. In 1770 he began to publish in the Mercure de France, under the nom de plume of "Mademoiselle Raigner de Montalaine," dramatic proverbs, whose ingenuity and sprightliness attracted the attention of the governness of the young princes of Condé, and Garnier was soon engaged to write proverbs to be acted for the special amusement of the princess at the abbey of Panthemont. In 1791 he was made commissaire du roi at Paris, and in 1793 was sent by the revolutionary government to his native city as commissioner, which post he held till the fall of the monarchy. Among his works are Nouveaux proverbes dramatiques (8vo, Paris, 1784), and various novels. He also collected and edited the Cabinet des
fies (41 vols. 8vo, Paris, 1785) and *Voyages
temporaires, songes, visions et romans mervel-
leys;* (89 vols. 8vo. Paris, 1787).

**GARNIER, Jean Louis Charles,** a French archi-
tect, born in Paris, Nov. 6, 1825. He entered
the school of fine arts in 1843, and studied
under M. Léveil and Hippolyte Lefebre. He
took the grand prize in 1848, and continued
his studies in Italy and Greece. In 1859, his
designs having been twice preferred in com-
petition with the most distinguished architectes
in France, he was appointed architect of the
new opera house in Paris. He has published
a volume of miscellanies entitled *À travers les
arts* (1869).

**GARNIER-PAGÉS, Louis Antoine,** a French poli-
tician, born in Marseilles, July 18, 1808, died
Nov. 1, 1878. While employed as a merchan-
dise broker in Paris he attended the sittings
of the secret associations which aided in the
resolution of July 14, 1830, and in which his
brother Étienne Joseph Louis (1801-41) acted
an important part. In 1832 he was elected to the chamber of deputies, and became at once
one of the staunchest members of the opposi-
tion, and in 1847 was one of the most active
promoters of the reform agitation. He was
conspicuous among those who in February,
1848, appeared at the banquet of Paris, in
spite of the prohibition of the government.
On Feb. 34 he was appointed a member of the
provincial government, then mayor of Paris,
and on March 5 he succeeded M. Goudchaux
as minister of finance. He decreed as such
the unpopular additional tax of 45 centimes,
which greatly contributed toward the over-
throw of the republic. As a member of the
constituent assembly, he submitted a remark-
able report on the financial situation, and in
May left the finance department to enter the
executive commission of five appointed by the
assembly. On the insurrection of June this
commission had to resign its power to
Gen. Cavaignac; and Garnier-Pagés, after
the expiration of his term as deputy, rendered
unpopular by the tax of 45 centimes, was not
reflected. The democratic party nominated
him again in 1867, but he was defeated by
Émile Ollivier. In 1884 he became a member
of the corps législatif, and devoted his labors
specially to questions of finance and foreign
relations. At the downfall of the empire in
1870 he was one of the deputies sent to the
hôtel de ville, and was installed a member of
the government of national defence. At the
elections of Feb. 8, 1871, he failed to gain a
seat, and retired to private life. He published
*Un épisode de la révolution de 1848, l'impôt
des 45 centimes* (1850); *Histoire de la révolu-
tion de 1848* (5 vols. 8vo, 1860-92); a contin-
uation, entitled *L'Histoire de la commission
exécutive* (Paris, 1869); and in December, 1878,
the completion of the work.

**GARONNE** (Anc. Garumna), a river of S.
France, which derives its name from its two
head streams, the Gar, which rises in the
Spanish valley of Aran, and the Onne, which
descends from the glaciers of Aò in the Pyre-
nees. Flowing N.W., it enters France at a
place called Pont-du-Roi, in the department of
Haute-Garonne. It runs thence N. E. to
Toulouse, whence it flows generally N. W.
It passes the towns of St. Béat, Montrejeau,
St. Martory, Cazères (where it becomes navi-
gable), Carbonne, Muret, Toulouse, Verdun,
Agen, Marmande, and Bordeaux, a few miles
below which it is joined by the Dordogne and
forms the estuary or river known as the Gi-
ronde. Its chief affluents on the right bank
are the Ariège, Tarn, and Lot; on the left,
the Save, Gimone, Gers, Baise, and Ciron.
Its length, including the Gironde, is about 860
m., of which 260 are navigable; but includ-
ing its feeders, which communicate with 12
departments, the total river navigation of its
basin is about 1,000 m. Large vessels ascend
to Bordeaux, where it forms a large basin.
At Toulouse it is joined by the canal du Mi-
di, by means of which and by this river the
Mediterranean is connected with the bay of
Biscay. The basin of the Garonne includes
a tract of country about 185 m. in average
length and breadth. The upper part of its
course lies through narrow defiles and is
much obstructed; from Toulouse it is broad
and shallow, and navigation is more or less
impeded by the débris which it brings down
as far as Marmande, about 50 m. above Bor-
deuve. Its banks are fertile and picturesque.

**GARONNE, Haute.** See HaUTE-GARONNE.

**GARRARD,** a central county of Kentucky,
bounded N. by the Kentucky river and W. by
Dick's river; area, 250 sq. m.; pop. in 1870, 10,878, of whom 3,404 were colored. It has a
hilly or rolling surface, and a fertile soil. The
chief productions in 1870 were 88,880 bushels
of wheat, 25,207 of rye, 587,687 of Indian
corn, 84,456 of oats, 86,842 lbs. of butter, and
32,115 of tobacco. There were 3,185 horses,
1,442 mules and asses, 7,605 cattle, 4,410 sheep,
and 16,518 swine; 6 carriage factories, and 4
distilleries. Capital, Lancaster.

**GARRATT, the W. county of Maryland, bor-
dering on Pennsylvania and West Virginia,
from which it is separated on the S. by the
Potomac river, formed in 1872 from Allegany
co.; area, 690 sq. m.; pop. in 1872, 10,897.
It is watered by the Youghiogheny and afflu-
ents of the Potomac. The surface is very
mountainous, and is covered with extensive
forests. Bituminous coal, iron ore, limestone
suitable for the manufacture of cement, and
fire-brick clay abound. The high glade lands
are suitable for pastures, and are productive
of hay, grain, and potatoes. The county is
traversed by the Baltimore and Ohio railroad.
Capital, Oakland.

**GARRATT, Elizabeth,** an English physician,
born in London in 1837. She began to study
medicine at Middlesex hospital in 1860, and
after perfecting her knowledge at St. Andrew's,
Edinburgh, and the London hospital, she re-
ceived the diploma of L. S. A. in 1865, and the degree of M. D. was granted to her in 1870 by the university of Paris. She acquired a considerable practice in London as a physician for women and children, and also became known as a writer on medical and social questions, and as an advocate of women's rights. She was general medical attendant of St. Mary's dispensary from 1866 to 1870, when she became a visiting physician of the East London hospital for children and dispensary for women. At the first election of members of the metropolitan school board under the new education act, at the close of 1870, she received in the district of Marylebone upward of 40,000 votes, being 20,000 votes more than any other candidate in any other part of London. Among the other successful candidates were Miss Davies, Prof. Huxley, and Lord Lawrence. Since her marriage with Mr. Anderson in 1871 she has been known as Dr. Anderson-Garratt.

**GARRICK, David**, an English actor, born in Hereford, Feb. 20, 1716, died in London, Jan. 20, 1779. His grandfather Garrick, or Garrique, was a French Protestant who took refuge in England after the revocation of the edict of Nantes. His father, a captain in the English army, settled at Lichfield on half pay, and with difficulty maintained a family of seven children. At the age of 10 David was sent to a grammar school. He was a great mimic, and at 11 acted before a select audience with great applause. He was manager of the company, and applied to Johnson for a prologue, but without success. In 1738 or '39 he went to Lisbon to visit an uncle, a considerable wine merchant, where he amused dinner parties by repeating verses and popular speeches. He returned the next year to England, and attended the theatres at London during occasional visits there. At 18 he was one of the three scholars at Dr. Johnson's academy. In March, 1738, he settled out with his master for London. Johnson and Garrick entered the metropolis with little money and a single letter of introduction. Garrick began to study law, but poverty interrupted his course. His uncle soon after died, leaving him £2,000, and he next commenced business as a wine merchant, in connection with his brother, but the partnership was soon dissolved. He was now constant at the theatres, wrote theatrical criticisms, practised declamation, and in the summer of 1741 made his first appearance as an actor at Ipswich, under the assumed name of Lyddal, taking the part of Aboan in the play of "Oroonoko." His face was blackened, and he trembled with diffidence; but the provincial audience was delighted. He soon tried comic parts, and as Harlequin his success was complete. But when he applied for employment to the managers of Drury Lane and Covent Garden, both rejected him. He made his first appearance in London at a little playhouse in Goodman's fields, Oct. 19, 1741, acting Richard III. with great effect. His name spread rapidly; the great theatres were deserted, and all the fashion came to Goodman's fields. He next made an engagement at Drury Lane for £500 a year. In 1742 he went to Dublin, and was received with great enthusiasm. In 1748 he gained the friendship of Pitt, afterward earl of Chatham, and of Lyttelton. Pitt wrote him complimentary verses, and Lyttelton praised him in his "Dialogues of the Dead." Garrick was now the first of English actors; he excelled in comedy, farce, tragedy, and pantomime. In 1746 he again visited Dublin, and was for a time joint manager there with Sheridan. In 1747 he bought a half interest in Drury Lane theatre, and on Sept. 20 opened his management with the famous prologue written by Johnson. He soon after brought out Johnson's "Irene" with considerable profit to the author. In 1749 Garrick married the German dancer Mile. Violette, who is said to have brought him £6,000. She was accomplished, intelligent, and a faithful wife, and survived him till 1822, when she died suddenly at the age of 98. In 1758 Garrick brought out "The Gamester," by Edwin Moore; he refused Home's "Douglas" in 1756. He was singularly sensitive, trembled before adverse criticism, and assiduously courted the critics. In September, 1763, he went to the continent, and was received everywhere with attention and respect. He returned in 1765, and in November reappeared in "Much Ado about Nothing," at the command of the King, amid unbounded applause, having opened the performance with an address to the public which was called for on the ten succeeding nights. In September, 1769, he arranged a jubilee in honor of Shakespeare at Stratford-on-Avon, which continued three days, and which he afterward represented for 92 successive nights at Drury Lane. In 1773, his partner, Mr. Lacy, having died, the whole management of the theatre fell to his charge. His health failing, he now seldom acted; and on June 10, 1778, after having played a round of his old and favorite characters, he took his leave of the stage in the part of Don Felix, in the comedy of "The Wonder," the performance being for the benefit of the fund for the relief of decayed actors, which he had originated. Having amassed a very considerable fortune, he retired to his villa at Hampton, which was adorned with all the charms of luxury and taste. Bishops and
princes visited the retired actor, and Hannah More here passed many agreeable hours. His later years were filled with suffering. The gout and gravel, to which he had long been subject, returned upon him with increasing severity. He was buried on Feb. 1, 1779, beneath the monument of Shakespeare. His talents were singularly versatile. He wrote farces and comic pieces, conversed well, and was a member of the literary club. He succeeded in every kind of acting. His comic turn led him to delight in broad farces, in feats of dexterity, and ludicrous transformations. As Hamlet he filled his audience with horror and melancholy; as Lear he rose to the height of tragic power. He was of middle size, delicate in form, and quick in movement, wanting that dignity of appearance which has distinguished so many other actors. His memory, too, sometimes failed him, and he would repeat a line before he could recover himself. But his voice was melodious and clear, his countenance animated, and his sensitive temperament, even in his absence, governed the spectator. His thrills of feeling communicated themselves by looks, gesture, and position. He was somewhat vain, but good-humored and placable, and a kind friend. In spite of a certain want of dignity in his manners, and a constant affectation, he was respected and liked.—See “Life of Garrick,” by P. Fitzgerald (2 vols., London, 1868).

GARRISON, William Lundy, an American abolitionist, born in Newburyport, Mass., Dec. 12, 1804. His parents were natives of the province of New Brunswick. His father, Abijah Garrison, was master of a vessel engaged in the West India trade, and a man of some literary ability and taste; but he became intemperate, and abandoned his family while his children were young. The mother, left in utter poverty, became a professional nurse, and in 1814 went to Lynn. William was at first apprenticed to a shoemaker, but afterward sent to school at Newburyport, partly supporting himself by aiding a wood Sawyer. In 1815 he went with his mother to Baltimore, where he remained a year in the capacity of an errand boy, and then returned to Newburyport. In 1818 he was indentured to Ephraim W. Allen, editor of the “Newburyport Herald,” to learn the art of printing, and when only 16 or 17 years of age began to write up political and other topics for the “Herald,” carefully preserving his incognito, and once received through the post office a letter of thanks from his master, with a request that he would continue to write. He soon commenced writing also for other journals, and a series of articles which he wrote for the “Salem Gazette,” under the signature of “Aristides,” attracted much attention in political circles. He became the editor of a journal in his native town, called the “Free Press,” which proved unsuccessful. He then worked for a time as a journeyman in Boston. In 1827 he became the editor of the

“National Philanthropist” in that city, the first journal ever established to advocate the cause of “total abstinence;” and in 1828 he joined a friend in the publication of the “Journal of the Times” at Bennington, Vt. This journal supported John Quincy Adams for the presidency, and was in part devoted to peace, temperance, anti-slavery, and other reforms; but it failed to receive an adequate support. During his residence in Bennington he produced considerable excitement upon the subject of slavery, not only in that place but throughout the state, in consequence of which there was transmitted to congress an anti-slavery memorial more numerous signed than any similar paper previously submitted to that body. Benjamin Lundy, an advocate of the gradual abolition of slavery, was then engaged in publishing the “Genius of Universal Emancipation” at Baltimore. He had met Mr. Garrison during the previous year in Boston, and received from him timely assistance in bringing his cause to the notice of the people of that city. Wishing for a coadjutor, he went to Bennington and engaged Mr. Garrison to join him in the editorship of his journal. On July 4, 1829, Mr. Garrison delivered in Park street church, Boston, an address which excited general attention by the boldness and vigor of its assault upon slavery. In the autumn he began his labors in Baltimore as joint editor with Mr. Lundy of the “Genius of Universal Emancipation,” and in the first number issued under his supervision he made a distinct avowal of the doctrine of immediate emancipation as the right of the slave and the duty of the master. Mr. Lundy did not concur with him in this doctrine, but as each of them appended his initials to his articles, the difference interposed no barrier to hearty cooperation. The journal, by its bold and uncompromising tone, produced considerable excitement among the supporters of slavery, while Mr. Garrison’s denunciation of the colonization society aroused the hostility of some who, upon other grounds, were inclined to sympathize with him. An event soon occurred which resulted in a dissolution of his connection with the paper. The ship Francis, owned by Francis Todd of Newburyport, having taken a cargo of slaves from Baltimore to Louisiana, Mr. Garrison denounced the act as a “domestic piracy,” and declared his purpose to “cover with thick infamy” all those implicated therein. Baltimore being then the seat of an extensive domestic traffic in slaves, his denunciation produced a great deal of feeling, and he was in consequence indicted and convicted, in the city court, May term, 1830, for “a gross and malicious libel” against the owner and master of the Francis, and sentenced to pay a fine of $50 and costs of court. Being unable to pay the fine, he was committed to jail. Mr. Todd, in a civil suit for damages, subsequently obtained a verdict against him for $1,000; but the judgment, probably on account of his well known power-
ty, was never enforced. His friend Lundy and a few other Quakers were the only persons who visited him in jail to express their sympathy. The press at the north generally condemned his imprisonment as unjust, and his letters to different newspapers excited a deep interest. The manumission society of North Carolina protested against his imprisonment as an infraction of the liberty of the press. He remained in jail 40 days, when Arthur Tappan, a merchant of New York, paid the fine and costs, and he was set at liberty. It subsequently appeared that Mr. Tappan had in this act anticipated by a few days the generous purpose of Henry Clay, whose interposition had been invoked by a mutual friend. His next step was to issue a prospectus for an anti-slavery journal, to be published in Washington; and with a view to excite a deeper interest in his enterprise, he prepared a course of lectures on slavery, which he subsequently delivered in Philadelphia, New York, New Haven, Hartford, and Boston. In Baltimore his attempts to obtain a hearing were unsuccessful. Private efforts to secure a suitable place for the delivery of his lectures in Boston having been made in vain, he advertised in one of the daily journals that, if a meeting house or hall were not offered before a certain day, he would address the people on the common. An association of persons calling themselves infused thereupon proffered him the gratuitous use of a hall under their control, and, no other offer being made, he delivered his lectures in the place thus opened; taking care, at the same time, to avow his faith in Christianity as the power which alone could break the bonds of the slaves. His lectures were attended by large audiences, and awakened in some minds a permanent interest in the anti-slavery cause. His experiences as a lecturer, however, convinced him that Boston rather than Washington was the best location for an anti-slavery journal, and that a revolution of public sentiment at the north must precede emancipation at the south. Accordingly he issued the first number of the "Liberator" in Boston, Jan. 1, 1831, taking for his motto, "My country is the world, my countrymen are all mankind;" and declaring, in the face of the almost universal apathy upon the subject of slavery: "I am in earnest. I will not equivocate; I will not excise, I will not retreat a single inch, and I will be heard." Mr. Isaac Knapp was his partner in the printing and publishing department. As they were without capital or promise of support from any quarter, they were unable to open an office on their own account. The foreman in the office of the "Christian Examiner," being a warm personal friend of Mr. Garrison, generously gave the new journal a space as soon as his time allowed, taking their labor as compensation in part for the use of his types. Mr. Garrison, after working mechanically in the daytime, spent a large portion of the night in editorial

labor. Having issued one number, they waited anxiously to see whether they would find encouragement to proceed. The receipt of $50 from James Forten, a wealthy colored citizen of Philadelphia, with the names of 25 subscribers, was the first cheering incentive to perseverance, and the journal was issued without interruption from that day. At the end of three weeks they opened an office for themselves; but for nearly two years their resources were so restricted that they made the office their only domicile. The "Liberator" attracted general attention, not only at the north, but at the south. The mayor of Boston, Harrison Gray Otis, having been appealed to by a southern magistrate to suppress it if possible by law, wrote in reply that his officers had "ferreted out the paper and its editor, whose office was an obscure hole, his only visible auxiliary a negro boy, his supporters a very few insignificant persons of all colors." Almost every mail, at this period, brought letters threatening Mr. Garrison with assassination if he did not discontinue his journal; and in December, 1831, the legislature of Georgia passed an act, offering a reward of $5,000 to any person who should arrest, bring to trial, and prosecute to conviction, under the laws of that state, the editor or the publisher. On Jan. 1, 1832, he secured the cooperation of eleven other persons in organizing the New England (afterward Massachusetts) anti-slavery society, upon the principle of immediate emancipation. This was the parent of those numerous affiliated associations by which the anti-slavery agitation was for many years maintained. In the spring of 1832 he published a work entitled "Thoughts on African Colonization," &c., in which he set forth at length the grounds of his opposition to that scheme. He went immediately afterward to England, as an agent of the New England anti-slavery society, to solicit the cooperation of the people of that country in measures designed to promote emancipation in the United States, and to lay before them his views of the colonization project. He was warmly received by Wilberforce, Brongham, and their associates. In consequence of statements made by Mr. Garrison, Wilberforce and eleven of his principal coadjutors issued a protest against the American colonization society, pronouncing its plans delusive, and its influence an obstruction to the abolition of slavery. He also succeeded in inducing Mr. George Thompson, one of the most prominent champions of the anti-slavery cause in Great Britain, to come to the United States as an anti-slavery lecturer. Soon after Mr. Garrison's return, the American anti-slavery society was organized at Philadelphia, upon the principles of which he was the champion. The "Declaration of Sentiments," issued by the association—an article of 27 pages—went forth its principles, aims, and methods—was prepared by him. The agitation previously excited was now greatly intensified, and at length awakened a resistance which manifested it-
GARRISON

self in a mobocratic spirit, so much that for several years the holding of an anti-slavery meeting almost anywhere in the free states was a signal for riotous demonstrations, imperilling property and life. Mr. Thompson's arrival from England in 1844 inflamed the public mind to such a degree that at length, by the advice of his friends, he was induced to desist from his labors and return to his native land. In October, 1848, a meeting of the female anti-slavery society of Boston was riotously broken up by a collection of persons, described in the journals of the day as "gentlemen of property and standing." Mr. Garrison, who went to the meeting to deliver an address, after attempting to conceal himself from the fury of the mob in a carpenter's shop in the rear of the hall, was violently seized, let down by a rope from the window to the ground, and partly demed of his clothing, dragged through the streets to the city hall; whence, as the only means of saving his life, he was taken to jail by order of the mayor, upon the nominal charge that he was "a disturber of the peace." He was released on the following day, and, under protection of the city authorities, escorted to a place of safety in the country. These scenes of violence were followed by a discussion of the peace question, in which he took an earnest part as a champion of non-resistance; and in 1838 he led the way in the organization of the New England non-resistance society. About this time the question of the rights of women as members of the anti-slavery societies began to be mooted. Mr. Garrison contending that, so far as they wished to do so, they should be permitted to vote, serve on committees, and take part in discussion, on equal terms with men. Upon this question there was a division of the American anti-slavery society in 1840; and in the "World's Anti-Slavery Convention," held that year in London, Mr. Garrison, being a delegate from that society, refused to take a seat because the female delegates from the United States were excluded. In 1848 he was chosen president of the society, and continued to hold the office till 1865, when slavery having been abolished, he resigned, deeming the time had come for the dissolution of the society. In 1846 he made his third visit for anti-slavery purposes to Great Britain. In 1848 a small volume of his "Sonnets and other Poems" was published in Boston; and in 1862 appeared a volume of "Selections" from his writings. He was ever earnestly opposed to the formation of a political party by the abolitionists, from a conviction that such a measure would inevitably corrupt the purity of the movement and postpone the day when emancipation might be secured. He never sought or contemplated the abolition of slavery in the states by congress or any other branch of the national government, his views as to the powers of that government over the subject being the same that were generally held by statesmen of all parties at the north, as well as by many at the south. His first idea was that slavery might be abolished by moral influence, with such incidental aid as the national government could constitutionally afford, and without disturbing the union of the states; but upon this point he at length changed his opinions, his observation of the movements of political parties and his reflections upon the provisions of the constitution relating to the subject leading him to the settled conclusion that some of the conditions of compact between the free and the slave states were immoral, and that a dissolution of the Union was necessary to the freedom of the north and the emancipation of the slaves. He continued to urge this opinion until the breaking out of the civil war in 1861 changed the entire aspect of the slavery question, and he saw clearly that the system must inevitably be overthrown by the exercise of the war powers of the national government. Thenceforth he bent his energies to the work of hastening that consummation; and in April, 1865, by invitation of the secretary of war, he joined the party of northerners who went to South Carolina to see the flag of an emancipated Union raised upon the battlefields of Fort Sumter. The first number of the "Liberator," issued in 1831, found the whole nation asleep over the wrongs and dangers of slavery; the last number, issued on the last of December, 1865, after 35 years of conflict with the slave power, recorded the ratification of an amendment to the constitution of the United States, for ever prohibiting the existence of slavery. The paper was thus discontinued at the very moment when the object for which it was established was fully consummated. Soon after the close of the war, a large number of persons, including some of the most eminent in the land, united in presenting to Mr. Garrison the sum of about $30,000, in token of their appreciation of his unremitting labors for the abolition of slavery. In 1867 he once more visited Great Britain, where the most distinguished citizens and statesmen united in honoring him for his devotion to the cause of the oppressed.

GARROTE, a mode of execution practised in Spain and the Spanish colonies. The criminal is seated, and leans his head back against a support prepared for it. An iron collar closely encircles the throat, and the executioner turns a screw, the point of which penetrates the spinal marrow where it unites with the brain, and causes instantaneous death. Formerly the garrote was merely a cord put round the neck and suddenly tightened by the twisting of a stick inserted between the cord and the back of the prisoner's neck. Hence the name of this mode of execution, garrote in Spanish signifying stick. Its origin may probably be traced through the Moors or Arabs to the oriental punishment of the bowstring, which in its primitive style it exactly resembled. Afterward an iron collar was used by which the criminal was suddenly strangled. The piercing of the spinal
marrow is a later addition. The term garroting is also applied to a mode of strangulation practised by thieves and highway robbers. An English law of 1681 subjected garroters to penal servitude for life, or for any term not less than three years, and in 1805 it was ordered that male garroters should, at the discretion of the judge, be once, twice, or thrice privately whipped.

**GARROW (or Gare) HILLS,** an elevated district of British India, situated in the bend of the Brahmapootra, where that river turns from its westerly course southward, between lat. 25° and 26° N., and lon. 90° and 91° E.; area, 3,890 sq. m.; pop. 50,000. The district is a square tract of hills, plateaues, and mountains, rising from the adjacent lowlands to heights of from 8,000 to 4,000 ft. The prevailing geological formation is red and white granite, overlaid with clay and sand of like colors. It is separated from the Cossay or Kosia hills on the east by a band of wood and jungle, 18 m. wide, running along the 91st parallel. The Garroo hills form a spur of the Burmese mountains overhanging the valley of the Brahmapootra, but reaching the river itself. The country is finely wooded, well watered, and exceedingly fertile, principally yielding cotton. The climate is extremely unhealthy. In respect to its rainfall the Garrow and Cossay region is one of the most remarkable localities on the globe, from 500 to 500 in. of rain having been known to fall on the 6th slope of the mountains in one year. The name of the district is derived from the appellation of its inhabitants, concerning whom very little is known. They have maintained a singular isolation during the whole period of British supremacy in India, and no effectual jurisdiction was exercised over their territory till 1865, nor has their country ever yet been thoroughly explored. They are an active, dark-skinned race, usually clasped with the aboriginal sub-Himalayan tribes; ethnologically they are believed to be closely connected to the Gonds of central India. They are addicted to hereditary blood feuds. The district is now under the supervision of the Bengal government, being included politically in the non-regulation division of Assam. American missionaries maintain eight schools in it.

**GARTER, Order of the,** the highest British order of knighthood, and one of the oldest and most illustrious of the military orders of knighthood in Europe, commonly said to have been instituted by Edward III. of England, about 1350. The precise date of its foundation has been much disputed. In Rastell's "Chronicle" it is stated that the order was devised in 1192 by Richard I., who made 26 of his knights wear blue thongs of leather around their legs in a ball fight with the Saracens on St. George's day. One account says that Edward in order to give his knights the signal of a battle (supposed to be that of Crécy) which was crowned with success; and being victorious on land and sea, and having as prisoner David, king of Scotland, he instituted this order, April 23, 1349, in memory of these exploits. According to Selden, the order was established April 23, 1844; according to Nicolas, in 1347; according to Ashmol, in 1348. In Burke's "Peerage" it is said that "the most noble order of the garter was instituted by Edward III. about August, 1348." In the accounts of the great wardrobe the garters of the order are first mentioned in 1348. Most writers, however, agree that its institution dates from a tournament at Windsor, held April 23, 1344, to which Edward invited the most illustrious knights. It was founded in honor of the Trinity, the Virgin Mary, St. George, and St. Edward the Confessor; and St. George, who was already the tutelar saint of England, was considered its especial patron and protector. An ancient tradition connects the emblem of the order with the story popularly told of Edward and the countess of Salisbury. When she happened at a ball to drop her garter, the king took it up and presented it to her, at the same time exclaiming, with reference to those who smiled at the action: *Honi soit qui mal y pense* ("Evil to him who evil thinks"). Edward added "that shortly they should see that garter advanced to so high an honor and renown as to account themselves happy to wear it."—The habit and insignia of the order are: The garter, of dark blue velvet, edged with gold, bearing the motto in golden letters, with buckle and pendant of gold, richly chased, worn on the left leg below the knee; the mantile, of blue velvet, lined with white taffeta, with a star embroidered on the left breast; the hood, of crimson velvet; the surcoat, likewise of crimson velvet, lined with white taffeta; the hat, of black velvet, lined with white taffeta; a plume of white ostrich feathers, having in the centre a tuft of black heron's feathers, all fastened to the hat by a band of diamonds; the collar, of gold, con-
sisting of 26 pieces, each in form of a garter, enamelled azure; the George, or figure of St. George, on a silver and enamelled dragon attached to the collar, and the lesser George pendent from a broad dark blue ribbon over the left shoulder; the star, of eight points, silver, upon the centre of which is the cross of St. George, gules, encircled with the garter; and the ribbon of the order, garter blue. By a statute passed Jan. 15, 1805, the order is to consist of the sovereign and 25 knights companions, together with such lineal descendants of George II. as may be elected, always excepting the prince of Wales, who is a constituent part of the original institution. Special statutes have since at different times been proclaimed for the admission of sovereigns and extra knights, the latter of whom have, however, always become part of the 25 companions on the occurrence of vacancies. The last sovereign elected was the sultan Abdul Aziz, who was invested by the queen on board of her yacht at the naval review, July 17, 1867. The knights are designated as K. G., "knights of the garter;" their strict designation, however, is equites aurea periscelidisa, "knights of the golden garter." At the beginning of 1878 there were, besides the queen and the prince of Wales, 47 knights of the garter. They were: the duke of Edinburgh, Prince Arthur, and Prince Leopold, sons of the queen; the ex-king of Hanover and the duke of Cambridge, members of the royal family; the ex-emperor of the French, the king of Italy, the emperor of Germany, the king of Portugal, the king of Denmark, the king of the Belgians, the emperor of Austria, the emperor of Russia, the sultan of Turkey, and the emperor of Brazil; the crown prince of Germany, and 7 other German dukes and princes, and 24 British peers. The officers of the order were: the bishop of Winchester, prelate; the bishop of Oxford, chancellor; the garter principal of arms, and the usher of the black rod.

GARTH, Sir Samuel, an English physician and poet, born in Yorkshire, died in London, Jan. 18, 1718. He studied medicine at Cambridge, settled in London in 1693, and soon secured an extensive practice, and became noted for his classical taste, liberality, and social habits. A quarrel had existed for some years between the physicians who advocated and the apothecaries who opposed the establishment of a free dispensary for the poor. Garth aided with the former, and wrote in their support "The Dispensary," a satirical poem of 2,000 lines in imitation of Bolleau's Latrina (1689; 9th revised ed., 1700). Garth was the leading whig physician of the time, and a member of the Kit-ost club. He wrote several short poems, and partly made a translation of Ovid's "Metamorphoses" (1717), to which Dryden, Addison, Gay, and many others contributed. He was knighted by George I. in 1714.

GARTHNER, Joseph, a German botanist, born in Calvin, Württemberg, March 25, 1782, died July 18, 1791. He studied at Tübingen and Göttingen, travelled in Italy, France, England, and Holland before proceeding to Smyrna, arrived at Tübingen in 1781, and of botany at St. Petersburg in 1788. He returned to Calvin after two years, where he devoted himself for the remainder of his life to the study of botany, making several long journeys for that purpose. His labors are important in the history of this science, since he was the first to observe that plants are naturally divided into classes by their carpological features. His principal work is De Fructibus et Seminibus Plantarum (2 vols., Stuttgart, 1789-91).

GARVE, Christian, a German philosopher, born in Breslau, Jan. 7, 1742, died there, Dec. 1, 1798. He succeeded Gellert as professor of philosophy at Leipsic in 1769, but ill health compelled him to return to Breslau in 1772. Kant appreciated his rare psychological genius and his benevolent nature. His numerous writings, some of which are in Latin, relate chiefly to the philosophy of history and of life, and to ethics and literature. He translated works of Aristotle, Paley, and Adam Smith, and Cicero's De Officiis, the last at the suggestion of Frederick the Great, of whom Garve was an enthusiastic admirer, as evinced in his Fragmenta relating to that monarch.

Gas (Sax. gas, Ger. Gas, Dutch geest, spirit), a generic term used to designate any aeriform fluid which is neither liquefied nor solidified at ordinary temperatures and pressure, introduced by Van Helmont in the early part of the 17th century. Excepting the atmosphere, little was known of aeriform bodies by the ancients; but, under the name spiritus or Natus, artificial gas had been referred to by writers between the 14th and 17th centuries. It seems, however, to have been generally believed that such gases were only impure atmospheric air. Paracelsus noticed the evolution of gas by the action of oil of vitriol on iron as an eruption of air, but seems to have attached no special importance to it. Van Helmont was the first to attempt any systematic examination of gases, and to make a distinction between them and vapors; but his knowledge was necessarily imperfect, as he was not aware of the fact, long afterward demonstrated by Faraday, that most gases are condensable as well as vapors. The different gases are described under their respective titles. Most of their physical properties, and their absorption by liquids and solids, are treated of in the articles Heat, Pneumatics, Atmosphere, and Absorption, together with notices of the principal discoveries pertaining thereto. The laws of their chemical combination are treated of in the article Aromatic Taxonomy. In the present article will be considered the general management and the diffusion of gases, and illuminating gas. I. Management of Gases. The collection and preservation of gases for experiment and observation may be effected by one of three methods, depending upon the nature of the gas and the mode of its genera-
tion. 1. It may be received in an exhausted vessel by means of a tube and stopcock. This method usually requires that the vessel be several times filled with the gas and exhausted, to remove the residual air which always remains at the first exhaustion in consequence of inability to produce a perfect vacuum. Bags, which may be very nearly emptied of their contents, are often conveniently employed in this method of collection. 2. By displacement.
This is done by filling a bell glass with water in a pneumatic cistern, placing it on the shelf, and bringing the mouth of the tube delivering the gas beneath it, as represented in fig. 1. When the gas to be collected is easily absorbed by water, some other liquid is chosen, usually mercury. A modification of this plan, often used in collecting gases slightly absorbable by water, as hydrogen and oxygen, for ordinary experimental purposes, is to use a gas-holder, consisting of a copper cylindrical vessel, A, fig. 2, open at the top, in which is received a cylinder, B, closed at the top and open below, and counterbalanced by a weight attached to a cord passing over pulleys. By filling the outer cylinder with water, opening the stopcock c in the upper one, and depressing it, all the air may be forced out. Then, by attaching the delivering pipe to the stopcock d in the outer cylinder, the gas will ascend into the inner one, which will rise as the pressure is restored to its interior.

When a strong jet is required for use, weights may be laid upon the inner cylinder and the counterbalance weights removed. Another form of gas-holder is represented in fig. 3. A drum of copper, A, has mounted upon it a shallow vessel, B, communicating by two tubes with stopcocks, g and h, one of the tubes passing near the bottom of the cylinder, while the other only enters the top. A water gauge, e, f, shows the height of water in the drum; an opening at a at the end of the tube supplying the gas and a stopcock at e for its exit. To use the apparatus, open the stopcocks, close the opening f with a plug, and pour water into the vessel B until the drum is filled; then close the stopcocks and remove the plug from the opening f. Atmospheric pressure prevents the water from flowing out. Introduce the end of the tube supplying gas; it will ascend in the drum, displacing an equal volume of water, which flows out at t. When sufficient gas has been introduced, close the opening t, and open the stopcock g. The gas in the drum will then receive a hydrostatic pressure equal to the height of the column of water in the tube and upper vessel above the level of water in the drum. The stopcock c may then be connected with any apparatus to which it may be desired to deliver the gas.

The forms of apparatus of this kind may be varied indefinitely, but these examples will suffice for illustration. When it is desirable to separate mixed gases, which are absorbable in different degrees by different liquids, or when it is desired to saturate a liquid with a gas, an apparatus called Woulfe's bottles (fig. 4) is often used. The gas is made to enter each bottle at a and to pass out at e. A safety and supply tube, a, passes through a middle neck below the surface of the liquid. A cup at the upper end is for the purpose of receiving a portion of liquid which may be forced up the tube by any sudden expansion. The number of bottles employed may be varied according to the requirements of the case. II. Diffusion of Gases. All gases, when mingled together mechanically in any proportion, tend to diffuse themselves uniformly, regardless of their specific gravities. Thus, if two bottles are connected together by an upright glass tube 10 or 12 inches long and about 1/4 of an inch in calibre, and the upper bottle is filled with the lightest of all gases, hydrogen, and the lower one with oxygen, whose specific gravity is 16 times that of hydrogen, or with carbonic acid, which is 22 times as dense, after the lapse of two or three days the two gases will be found to have the same proportion to each other in both bottles. This was the original experiment of Dalton, published in vol. xxiv. of the "Phil-
The same result was obtained by Berthollet with a tube 10 inches long and one fifth of an inch in calibre, when the apparatus was placed in a position which secured a uniform temperature, so that no motion could be communicated to the gases. When the upper vessel contained hydrogen, the time occupied in diffusion was about 12 days; but when it contained air, oxygen, or nitrogen, several weeks were occupied in the complete diffusion. If a cylinder is filled with any gas and placed in a horizontal position, and an open tube bent at right angles is inserted at one end, turned upward if the gas is lighter than air, and downward if heavier, after a time the gas will escape from the cylinder and its place be occupied by air. The results given in the following table were obtained by Graham, and show the proportions of different gases which escaped from 100 volumes in four and in ten hours:

It is here seen that the lighter gases are the more readily they escape, and that this tendency to diffusion is nearly in the inverse proportion of the square root of their densities. If the cylinder contains a mixture of gases, those which are the lightest and therefore the most readily diffusible will escape with the greatest rapidity. Vapors also diffuse themselves among one another and among the permanent gases in accordance with the same law. If the mouth of the tube in the apparatus mentioned above, is closed with a porous substance like plaster of Paris or wood, and the cylinder is filled with hydrogen, this gas will escape much faster than the air will enter. It appears, therefore, that the smaller the calibre of the orifices through which the diffusion takes place, the greater will be the proportional rapidity of the transfer of the lighter gas; a fact having a close relation to the phenomena of osmose, which it greatly aids in explaining. Graham has made extensive experiments on the diffusion of gases. By using an instrument called a diffusion tube or diffusometer, by means of which exact measurement could be made of the rate at which interchange took place, he found that diffusion through porous septa followed the same law as when the communication was by tubes of sensible diameter; that is, that the diffusibility of gases is in proportion to the square roots of their densities.

The diffusimeter used by Graham (fig. 5) consists of a glass tube of about one inch calibre and one foot in length, and a vessel partly filled with mercury. One end of the tube is stopped with a plug of plaster of Paris, one fifth of an inch thick, which is formed by mixing the plaster into a paste with water, introducing it while in a plastic state, and allowing it to set and dry. When the tube is filled with hydrogen and its open end placed in the vessel of mercury, diffusion takes place through the porous plaster plug, the atmospheric air passing in and the hydrogen passing out; but the latter action is so much the more rapid that in three minutes the mercury will rise in the tube three inches above its level in the outer vessel, and in 30 minutes all the hydrogen will escape. Graham afterward used compressed graphite, such as is used in making writing pencils, in place of the plaster of Paris, and considered it superior; but the results which he obtained with it did not alter the conclusions arrived at in the first series of experiments.—*Atmosysis, or the Separation of Gases by Diffusion.* When a mixture of gases passes through a graphite plate into a vacuum, a rapid separation takes place, in proportion to the difference of pressure. This method of separation may be performed with an apparatus called an atmometer (fig. 6). A porous earth-ware pipe, a, passes from a bag, b, containing the mixed gases, to the receiver c, over a pneumatic cistern. A large tube, d, surrounds the smaller one, and the space between them is kept as nearly vacuous as possible by means of an air pump exhausting through the tube e. A slight pressure upon the bag causes the gases to flow through the tube a, but the lighter ones will to a great extent pass through the sides of the tube and be removed by the air pumps. In an experiment made in this manner with atmospheric air, the proportion of oxygen was increased to 24.8 per cent. When a mixture of oxygen and hydrogen is used, the separation is much greater. In one experiment, an explosive mixture of one volume of oxygen with two of hydrogen, after atomysis, contained only 9.8 per cent. of hydrogen, in which a taper burned without producing explosion. The diffusion of gases through one another was regarded by Dalton as a necessary consequence of the self-repulsive property of the particles of gasous bodies, by reason of which each gas expands into the space occupied by the other as it would into a vacuum. But although the velocities with which they diffuse into each other are in proportion to those with which
they rush into a vacuum through an aperture in a thin plate, still they do not strictly act as vacua to each other; for the diffusion of one gas into another is vastly slower than its passage into a vacuum. III. ILLUMINATING GAS. This is to a limited extent obtained from natural sources, but the great supplies are made from the following substances: 1, coal; 2, wood; 3, peat; 4, resin; 5, petroleum; 6, oils and fats; 7, water and coke. There are many localities where combustible gases have long been known to issue from the earth. Gas has been used in China for centuries, conveyed in bamboo tubes from fissures in salt mines in excavations from 1,500 to 1,600 ft. in depth. Near the Caspian sea in Asia there are several so-called eternal fires caused by gas issuing from the soil. In the Szalatsna salt mine in Hungary illuminating gas constantly issues from a muddy clay contained between rock-salt strata. The village of Fodoma, N. Y., is lighted by gas which issues from bituminous limestone interspersed among the slates and sandstones of the Portage group. This gas consists of a mixture of marsh gas, CH₄, and hydride of ethyl, C₂H₅. A flow of natural gas issued from a well which was sunk in 1866 at West Bloomfield, Ontario co., N. Y., for the purpose of obtaining petroleum. Its composition, according to Froth, Stilman and Wurtz, is: marsh gas, 82.41; carbonic acid, 10.11; nitrogen, 4.81; oxygen, 0.28; illuminating hydrocarbon, 2.94. It was carried in a wooden main to the city of Rochester, a distance of 24 miles, in 1870, for the purpose of illuminating the city, but the experiment was a failure. Such gas has also been known to issue from beneath peat bogs, as that of Chattnoe, near the Manchester and Liverpool railway in England. These natural gases are of various composition, light carburetted hydrogen or marsh gas being usually the principal constituent.—Coal Gas. The first artificial production of illuminating gas from coal is due to Dr. Hales or the Rev. John Clayton, rector of Crofton, Wakefield, Yorkshire, England. Dr. Hales describes in a book published in 1727, called “Vegetable Statics,” an experiment by which he obtained 180 cubic inches of inflammable air from 188 grains of Newcastle coal. In 1859 Mr. Thomas Shirley communicated a paper to the royal society on an inflammable gas which issued from a well near Wigan in Lancashire; and the Rev. John Clayton nearly a century later, in examining the locality, found that the gas issued from a bed of coal. The experiment of subjecting the coal to heat was made, with the result of obtaining an illuminating gas, which, being collected in bladders, could be burned in jets. An account of these experiments was communicated to the royal society in 1739. Dr. Rickel, professor of chemistry at Wurzburg, in 1786 lighted his laboratory with gas made by the dry distillation of bones; and in the same year Earl Dunonald of Scotland, in obtaining tar from the distillation of coals, also collected an illuminating gas, with which he lighted Culross abbey by way of experiment. The first practical attempt at gas lighting is however generally accredited to William Murdoch, who in 1792 used coal gas for lighting his workshops at Redruth in Cornwall. His invention remained unknown until about 1809, when it was introduced at the Soho foundry of Boulton and Watt, near Birmingham. In the mean time Lebon, a Frenchman, used gas made from wood for lighting his house, and was therefore considered by the French as the inventor of gas lighting. In 1804 Mr. Murdoch lighted the mills of Phillips and Lee at Manchester with gas which yielded an amount of light equal to that of 8,000 spermaceti candles. In 1813 London bridge was lighted with gas, and about the same time it was introduced into the streets in that part of the city; but it was not introduced into Paris till 1820.—Bituminous coals, such as English coal, the coal and bed heads of Ohio canal, and the caking coals of Pennsylvania, Maryland, and Virginia, are used in this manufacture. The following may be considered as the average composition of caking and cannel coals:

There are also small quantities of sulphur and iron, mostly in the form of iron pyrites. The nitrogen has its origin in the organic matter from which the coal is derived. When bituminous coal is heated to redness in the presence of air, it is principally converted into gases which unite with oxygen; but if air is excluded, as when the coal is confined in retorts, the gaseous products, unable to unite with oxygen, may be collected in receivers and burned in tubes. The products of the destructive distillation of bituminous coal consist of a great number of gases, liquids, and solids, which may be conveniently included under the following heads, according to an analysis by Bunsen:

| Coke        | 68-98 | Olefiant gas | 0-78 |
| Tar        | 12-28 | Sulphuretted hydrogen | 0-75 |
| Water      | 7-46  | Gas           | 0-75 |
| Marsh gas  | 7-04  | Hydrogen      | 0-50 |
| Carbonic acid | 1-07 | Nitrogen      | 0-50 |

The olefiant gas here represents not pure heavy carburetted hydrogen or ethyl, but a mixture, in variable quantities, of acetylene, C₂H₂, ethyl, C₂H₅, trityl, C₃H₅, dity强烈的, C₄H₈, and several hydrocarbon vapors. There are also small quantities of cyanogen and sulphonycyanogen. (See Distillation, destructive.) — Upon the temperature to which the coal is subjected depend the products of distillation, which are formed by a rearrangement of the elements of the coal. The lower the heat,
the less will be the weight of coke or carbonaceous residue in the retort, and therefore the greater will be the quantity of carbon which remains combined with hydrogen; but the hydrocarbons so formed will be mostly liquid and solid, and not gaseous. On the other hand, the higher the temperature the greater will be the weight of solid carbonaceous residue; and the proportion of permanent gases will be increased, and their levy also, in proportion to the heat, so that they may be almost entirely composed of hydrogen and carbonic oxide. A mean temperature has therefore to be employed by the gas manufacturer, and this will also depend upon the quality of the coal or other material used. Practically it is impossible to subject the entire mass of coal to the most favorable conditions, because the different portions contained in a retort are necessarily subjected to different degrees of heat.—The manufacture of gas from coal, as well as from wood, petroleum, or resin, consists of three processes: 1, the distillation of the crude gas; 2, its separation from tarry and other condensible matters; 3, its purification from other deleterious and unpleasant gases. The distillation is performed in fire-clay retorts placed in furnaces, from five to ten retorts being placed in one furnace in large works, which may contain 100 furnaces. They are usually of a semi-cylindrical shape, somewhat like that of a sole drain tile, about 9 ft. in length, and from 16 to 20 in. in diameter. They were formerly made of cast iron, as fire clay was too porous and allowed the gas to escape; but since the introduction of apparatus for relieving the pressure, which will be described further on, fire-clay retorts are found sufficiently tight, and are much more durable. Moreover, they may be glazed and rendered more impervious than iron. A longitudinal section of a furnace and two retorts is shown in fig. 7, and also a plan of the different parts of a gas works, so arranged as to give an idea of the process of manufacture, but not showing the parts in their actual position, as this would be impossible in one figure. The two retorts, of a set of five, are shown at a, a, the furnace at b, the chimney at c. The retorts are first raised to a red heat, and then charged about two thirds full with coal by means of a kind of scoop having somewhat the form of the retort, and about the same length, which is introduced by two men, turned over, and withdrawn. The operation is called stoking, and the men who perform it stokers. Machinery is now being introduced in this country and in Europe, by which it will be performed by steam power. From 100 to 200 lbs. are usually introduced at one charge. A lid is then fitted to the mouthpiece of the retort with bolts and a luting of gypsum mixed with iron filings, and a heat of about 2,200° continued for about five hours. The constituents of the coal are thus converted into the products given in the above table, and those portions, comprising all except the coke, which are volatile at that temperature, pass into the tube d, called the stand pipe, which ascends from the mouth of the retort and is inserted into the hydraulic main, a transverse section of which is shown at e. This is a long tube, usually semi-cylindrical, and from 18 to 24 in. in diameter, running the whole length of a row of furnaces, which may be 100 or 200 ft. When the operation of distillation commences, the main is partly filled with water, into which the stand pipes leading from the retort dip and discharge all the gases and vapors, a considerable portion of which, from the reduction of temperature, are there condensed, forming tar and ammoniacal liquor, which would soon fill the main were it not drawn off from time to time. In this way the fluid contents are kept at about the same level, and there is no necessity of adding water after the first supply. A large pipe, f, carries the still uncondensed gases and vapors to the cooler and condenser g, through which they
pass in a series of \( \pi \)-shaped pipes, surrounded with water which is supplied from a cistern, entering at the bottom of the condenser and passing out at the top. This arrangement is not represented in the diagram, which also only shows a small portion of one condenser, of which there are usually three, through which the gas passes successively, being reduced in temperature in each. At the base of each condenser are chambers into which the legs of the \( \pi \)-shaped pipes pass, the descending one, or that which carries the gas downward, extending to near the bottom, beneath the surface of the tar and ammoniacal liquor, which then collects and passes off by suitably arranged pipes into the tar well. These tarry matters, together with those collected in the hydraulic main, are the materials from which the beautiful aniline colors used in dyeing are made. (See ALEXANDER, ANILINE, ANTHRACENE, and COAL PRODUCTS.) From the condensers the gas is conducted into another apparatus for further separation of impurities. This is sometimes made of a box containing lumps of coke or fire brick moistened with water, and is then called a scrubber. At the Manhattan gas works, New York, a box, partially shown at \( \delta \), called a washer, is used; it consists of several separate vertical chambers, through which the gas is made to pass, under one partition and over the next, and during its passage subjected to the action of jets of water thrown into spray. In this way nearly all condensable and soluble impurities are abstracted; but there remain several deleterious gases, the principal of which are sulphuretted hydrogen and carbonic acid, which must be removed before the gas is fit to be delivered for consumption. Several methods have been devised for this purpose, such as passing the gas through milk of lime, which is called the wet-lime process, or through layers of moistened slaked lime, and also through layers of mixed protocloride of iron and quicklime, or sulphate of iron and slaked lime, the ferruginous salts being very effective in removing all traces of sulphuretted hydrogen. These slaked-lime purifiers are placed in large rooms, and require great care in management, as well for safety as for effectiveness, the gas being liable to escape into the room and form an explosive mixture with the air; and serious accidents have resulted from this cause. A single purifier is represented at \( \delta \) in the diagram. It consists of a tight double-sided tank from 4 to 6 ft. high and about 20 ft. long by 12 wide. A deep gutter runs around the upper edge, which is nearly filled with water for receiving the edges of the lid, \( \delta \), by which means the apparatus is effectively sealed. It is usual to conduct the gas successively through three of these purifiers. In small works, especially those connected with the larger ones for experiment, the gas is forced from the retorts, by the pressure there created, through all the different pieces of apparatus; and formerly this was the only means of urging the gas onward in all of them. The pressure thus created in large works would so retard the flow of the gas from the retorts that it would suffer much decomposition with production of graphitic carbon; and if clay retorts were used, much would escape through their walls. The difficulty is avoided by using what are called exhausters to take the gas from the washers and deliver it to the lime purifiers. These machines may be in the form of a rotary fan blower, or of a cylinder and piston blowing machine. The lime purifiers have several lattice-work shelves, placed one above another and covered two or three inches in depth with freshly slaked lime. The gas entering at the bottom ascends through these layers of lime, which absorb the carbonic acid and sulphuretted hydrogen and other impurities by the time it reaches the chamber beneath the lid. In the figure a pipe is seen passing from the bottom of the washer directly to the lime purifier. It has, however, been explained that the exhauster is placed between these two pieces of apparatus. A drawing of the machine has been omitted in the cut from want of room, but the reader can supply the omission. In the latter there is an orifice from which a pipe conducts the gas to the meter, from which it passes through the pipe \( \sigma \) to the large reservoir, a small part of which is shown in the figure. In the following table of the constituents of purified coal gas, that in the first two columns is ordinary coal gas from Chemnitz, Saxony; in the third column, ordinary London coal gas; and in the fourth, London cannel coal gas:

There are other heavy hydrocarbon gases besides slayl, or olefiant gas, as acetylene, trityl, and diteryl, and also a small quantity of hydrocarbon vapors, which yield light; but the illuminating power of the gas may be regarded as depending principally upon the amount of olefiant gas (heavy carburetted hydrogen) which it contains, the bulk of other gases being carriers rather than light-producers. The olefiant gas is separated by ignition into marsh gas (light carburetted hydrogen) and carbon, the solid particles of which become incandescent and emit white light, which is observed in the luminous cone of a gas flame, and which has the same constitution as that of a candle. (See Flam) Of the impurities, tar is separated in the hydraulic main and the condenser; ammonia in the hydraulic main, condenser, and washer; sulphuretten hydrogen, cyanogen, and carbonic acid in the washer and lime and iron purifier,
a small quantity of the last named gas remaining. The luminosity of a gas flame depends both upon the percentage of heavy hydrocarbons it contains, and the amount of atmospheric air or oxygen mixed with it. Sometimes in passing it through many purifying processes a small amount of air is absorbed, the oxygen of which, combining with the carbon at the moment of ignition, causes an increased production of heat but diminution of light on the principle of a Bunsen's burner. The illuminating power may therefore be estimated by analysis; but the practical method is to burn it in comparison with some light-producing body of known power, as a sparmaceti candle. This test is made with an instrument called a photometer.

![Bunsen's Photometer](image)

A common form of which is shown in fig. 8. An argand burner which consumes a certain number of cubic feet per hour (in experiments usually 10 feet) is placed at a, and a candle at c. Between them there is a horizontal graduated scale which supports a slide, b, bearing a ground glass screen having a figure in the centre more transparent than the rest of the plate. When this screen is moved to a point on the scale where the figure appears equally bright on each side, the light received from each source will be equal. If two candles are used, placed side by side, and the distance between them and the screen is one eighth that between the latter and the gas-burner, it will show that the light from the burner is equal to that of 16 candles. A simple screen may be used, or it may have a mirror placed upon each side at the further edge, at such an angle that the two will reflect images of the figure toward the observer, so that a comparison may be made at the same instant. Gas as usually furnished is estimated, when burning at the rate of five cubic feet per hour, to produce a light equal to that given in the same time by 16 or 18 standard sperm candles, each burning at the rate of 120 grains per hour. — The illuminating power of gas depends much upon the form of the burner. It is a matter of common observation that gas may be nearly deprived of its illuminating power if made to issue from the burner with great velocity, or if burned in a tall chimney which produces a very rapid current of air. Very small or thin flames also do not afford conditions of economical expenditure. The smaller or thinner the flame, the greater is its exposure to the oxygen of the air, and consequently the more rapid the consumption of the solid particles of carbon; in other words, the more nearly are the conditions present which cause the flame of a Bunsen's burner to be nearly non-luminous. The conditions to be sought for in an illuminating flame are those which are most conducive to high heating of the carbon particles and to the keeping of them for the longest possible time in an uncombined state, but eventually insuring their complete combustion. A certain thickness of flame is therefore desirable. A poor gas, if burned in a jet issuing from a wide slit, may be made to yield a better light than a rich gas burned in a very thin flame, which is frequently the fault of the fish-tail burner. According to Prof. Silliman, the illuminating power of a given sample of gas burned in an argand burner is not in the proportion of gas consumed, but more nearly in the proportion of the square of the quantity. — A ton of 2,000 lbs. of good cannot coal, carefully distilled, will yield about 8,000 cubic feet of purified illuminating gas. Other bituminous coals yield from 6,000 cubic feet up to this amount. Every section of a gas works has one or more meters for measuring the volume of gas before it passes into the reservoirs. They are in the form of cylinders, usually about 12 ft. in diameter and from 8 to 12 ft. long. Fig. 9 is a transverse section showing the principle upon which they act. The outer cylinder or drum is stationary. The inner cylinder, turning upon a hollow axis, is divided by the partitions a, a, a into five compartments, one in the centre of the hollow axis, and four, d, d, d, d, spiral in direction, exterior to this; slits being left open at e, e, e, e for the passage of the gas from the inner cylinder to the space between it and the outer one, from which it has exit. The apparatus is a little more than half filled with water. A tube, c, passing through the axis of the cylinder, rises a little above the surface of the water, and delivers gas to the central compartment, from which it passes into each outer compartment successively through the openings g, g, g, g. The movement of the inner cylinder is in the direction of the hands of a clock, and it will be seen that the gas can only pass through the slit e when it is above the water. The gas constantly passes into that compartment which is on the left in the figure. As this fills it raises that side, and consequently the opening of the compartment above, out of the water, from which the gas flows till it is submerged and emptied at the opposite side. A large pipe conveys the measured gas to the reservoirs or gas-holders, the large cylindrical structures so conspicuous about gas works, and which are constructed much upon the principle of the gas-holder for experimental purposes.

![Gas Meter](image)
shown in fig. 2. From the reservoir it is carried in cast-iron main pipes through the streets, and in small wrought-iron pipes into buildings, where it is measured to each consumer in small meters, which were formerly of a similar construction to the one above described; but of late years the wet has almost entirely been replaced by the dry meter, which was invented by Mr. James Bogardus of New York in 1889, and is one of the most ingenious of mechanical contrivances. It was fraudulently patented in England by a person who had been employed by Mr. Bogardus, and afterward adopted in the United States without due credit to the inventor. His invention consists of a double bellows having four chambers, which, alternately moved by the pressure of the gas which is admitted upon one side or the other by the opening and closing of valves by such movements, communicates motion to a series of arms and levers by which a rotary motion is given to an index that registers the number of cubic feet passing through the different chambers of the bellows. As these have a measured capacity, the volume of gas passing through the machine is therefore shown. Instead of a double bellows with four chambers, a triple one with six was at one time constructed; but the machine was essentially the same, the arrangement of the arms and levers, the most ingenious parts, having almost the same form and acting upon the same principle as the double bellows with four chambers.

—Wood Gas. It has been said that Le Bon, a Frenchman, made gas from wood about the end of the 16th century; but the invention did not prove practicable, as the gas had not sufficient illuminating power to compare with that made in England from coals. The reason of its failure, as explained by Dumas, was that the heat employed was too low to produce the heavier hydrocarbons. In 1849 Prof. Pettenkofer of Munich made experiments showing that the gases evolved from wood at a heat sufficient to carbonize it consist almost entirely of carbonic acid, carbonic oxide, and marsh gas (olefiant gas being burnt absent); but that the tarry matters and vapors at the same time produced are, by the application of a much higher heat, capable of yielding a large quantity of heavy hydrocarbon gas. The manufacture of wood gas therefore requires retorts for converting the wood into empyreumatic vapors, and others for converting these into permanent gases. The wood should be thoroughly dried before distillation. According to the experiments of Reissig, 50 kilograms of sapen wood yielded 592 cubic feet of purified gas and 10 kilograms of charcoal, and the same quantity of fir wood 648 cubic feet of gas and 9.5 kilograms of charcoal. Pettenkofer's analysis of crude gas is as follows:

<table>
<thead>
<tr>
<th>Hydrocarbons</th>
<th>67-91</th>
</tr>
</thead>
<tbody>
<tr>
<td>Marsh gas</td>
<td>15-70</td>
</tr>
<tr>
<td>Carbonic acid</td>
<td>20-80</td>
</tr>
<tr>
<td>Carbonic oxide</td>
<td>40-50</td>
</tr>
</tbody>
</table>

The carbofonic acid is removed by hydrate of lime. Reissig's analysis of the purified gas is as follows:

<table>
<thead>
<tr>
<th>Hydrocarbons</th>
<th>7-24</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hydrogen</td>
<td>81-84</td>
</tr>
<tr>
<td>Marsh gas</td>
<td>83-98</td>
</tr>
<tr>
<td>Carbonic acid</td>
<td>35-42</td>
</tr>
</tbody>
</table>

The illuminating power of the hydrocarbons in wood gas is one half greater than that of an equal volume of olefiant gas. Its specific gravity is about 0.7, which is rather greater than that of average coal gas, for which reason it requires burners with larger orifices. Wood gas is successfully made in Germany.—Peat Gas. Peat yields in dry distillation, according to an analysis by Vohl of a sample from Zürich, the following proportions of gaseous, liquid, and solid matters:

<table>
<thead>
<tr>
<th>Gases</th>
<th>17-222</th>

</tr>
<tr>
<td>Aquosus distillate</td>
<td>52-300</td>
</tr>
<tr>
<td>Peat coke</td>
<td>35-000</td>
</tr>
</tbody>
</table>

The same apparatus is used as for wood gas. Reissig used a fat peat obtained near Munich, 154 lbs. of which yielded 837 cubic feet of gas of good quality, having the following composition:

<table>
<thead>
<tr>
<th>Hydrocarbons</th>
<th>9-28</th>

</tbody>
</table>

—Resin Gas. Resin yields a gas of high illuminating power, but its use is necessarily restricted by its limited supply. Several years ago it was successfully employed at the Philadelphia works to increase the richness of coal gas, and is now used in several southern towns.

—Petroleum Gas. Petroleum is used in small works for making illuminating gas in this country, and very largely in Germany, Austria, and Russia. The crude oil is conducted from a reservoir continuously into red-hot cast-iron retorts, from which it passes through purifying apparatus, one vessel of which contains hydrochloric acid. One hundred weight of Pennsylvania oil yields about 1,600 feet of gas, which when purified consists, according to Holley, of:

<table>
<thead>
<tr>
<th>Hydrocarbons</th>
<th>50-4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Light hydrocarbons</td>
<td>40-0</td>
</tr>
</tbody>
</table>

It has a specific gravity of about 0.7, and is the richest that can be made. It is used in burners which consume only from one half to two cubic feet per hour, and it is estimated that 200 cubic feet are nearly equal in illuminating power to 1,000 feet of coal gas. The New York mutual gas light company own a patent for a process of making illuminating gas from the naphtha which passes over in the first part of the distillation of petroleum, and mingling it with coal gas, by which it is said that the latter is greatly enriched. The naphtha is waterized in a separate boiler, and sent into retorts of similar construction to those for coal, where by the application of
cherry-red heat it is converted into a gas rich in heavy hydrocarbons, mostly of the character of those made in using crude petroleum. The gas is conducted into a reservoir common to it and the coal gas, where the two mingle, in accordance with the law of the diffusion of gases.

-Oil Gas. The fixed oils are excellent gas materials. Rape oil, according to Lefort, has the formula C_{19}H_{34}O; hemp oil, C_{19}H_{32}O. All the fatty oils yield by dry distillation principally olefiant gas, a small quantity of carboxic acid, and no sulphuretted hydrogen; and if pure oil were used, it would require no purification, and apparatus only of the simplest kind. Under such circumstances perhaps a lamp is the most economical; but the gas may be made of impure oils and fats, in which case some purification is required. On the continent of Europe gas is made from sun, or the fatty materials contained in the soap ends after washing wool and yarns. The liquid is mixed in cisterns with milk of lime and left to stand 12 hours, when a kind of lime soap is formed, which is made into bricks and dried. These are subjected to dry distillation, and yield a gas of high illuminating power. The wash water of a woollen mill of 20,000 spindles will yield annually enough of this substance to produce over 1,100,000 cubic feet of gas; and if the time of burning is 1,200 hours, this quantity will supply 500 burners, each consuming nearly two cubic feet per hour, and giving a light more than sufficient for the mill.

-Water Gas. When steam is forced through retorts containing red-hot coke, charcoal, or anthracite, there are produced hydrogen, carbonic oxide, carbonic acid, and a small amount of light carburetted and of sulphuretted hydrogen gases. The carbonic acid and sulphuretted hydrogen may be removed by lime, or lime and oxide of iron. The remaining gases, principally hydrogen and carbonic oxide, may be used for heating purposes, or may be made available for lighting in two ways: 1, by heating coils of platinum wire in the flame; 2, by impregnating it with the vapors of various hydrocarbons, as benzole or naphtha, or mingling it with permanent hydrocarbon gases, the latter being preferable, as it has been found very difficult to convert the lighter hydrocarbon oils into products which will not cause a deposit in the distributing pipes. Many hundred patents have been issued to inventors for making this kind of gas. That of Selligue, a French gas engineer, proposed to him by Jobard of Brussels, consisted of a furnace and three vertical cylindrical retorts, the first two filled with charcoal or coke. Steam was passed into the first, causing evaporation of the gases above mentioned, which were passed into the second retort, where the red-hot coal or coke converted the carbonic acid into carbonic oxide. The gases were then passed into the third retort, which was two thirds filled with red-hot iron chains, upon which a stream of oil from bituminous shale was made to flow. Mr. White of Manchester patented several years ago a process by which the water gas was passed into another retort, in which illuminating gases were being generated, in such a manner as to sweep the latter out of the retort as quickly as possible, to remove them from the decomposing action of the intense heat. The retorts and settings were similar to those in use for ordinary coal gas, except that the retorts had a horizontal partition, dividing them into two chambers, extending to within a foot of the back. White's method is known as the English hydrocarbon process. Experiments show that anthracite can be used with greater advantage in producing water gas than coke or charcoal.

-In 1877 the six permanent gases (so called because they had hitherto resisted all efforts to reduce them), hydrogen, oxygen, nitrogen, nitric oxide, carbonic oxide, and marsh gas, were successfully liquefied by M. Callietet of Paris and M. Raoul Ficet of Geneva, working separately. Both accomplished the same end by different ingeniously contrived apparatus, each combining an exceedingly low temperature with great compression. M. Callietet also reduced common air to liquidity, thus demonstrating the accuracy of the views of Lavoisier as to its possibility. The experiments confirm the inference of the English physicist, Thomas Andrews, that there exist critical points of pressure and of temperature, which must be united to insure the liquefaction of these gases.

GASCOIGNE, George, an English poet, born about 1587, died in Stamford, Oct. 7, 1677. He was educated at Cambridge and began to study law; but having fallen into irregular habits, he was deprived by his father of as much of his inheritance as possible, and took service in Holland under the prince of Orange, where he remained two years and distinguished himself for his courage. He made a free translation of I Supposizii di Ariosto, which was performed by the gentlemen of Gray's Inn in 1566 under the name of "The Supposes." Use was made of it by Shakespeare in "The Taming of the Shrew," and it is the earliest extant prose play in the English language. In 1575 Gascoigne joined the court of Queen Elizabeth, and wrote an account of the pageantries exhibited at Kenilworth, entitled "The Princely Pleasures of Kenilworth Castle." His satire in blank verse, "The Steele Glasse," first printed in 1576, and his other poems, were collected and published with the title "The Whole Workes of George Gascoigne, Esquire" (4to, black letter, London, 1687).

GASCONADE, an E. county of Missouri, bounded N. by the Missouri river, and intersected by the Gasconade river; area, 540 sq. m.; pop. in 1870, 10,093, of whom 80 were colored. The surface is much broken, but well timbered, and there is good water power. Iron ore is found in abundance, sulphur and saltpetre are obtained, limestone and bluestone are quarried, and copper has been discovered on Bourbeuse creek.
The Pacific railroad of Missouri passes through the N. part. The chief productions in 1870 were 222,860 bushels of wheat, 280,176 of Indian corn, 168,717 of oats, 31,728 of potatoes, 88,600 lbs. of butter, 128,917 gallons of wine, and 3,264 tons of hay. There were 3,270 horses, 8,311 milch cows, 4,801 other cattle, 3,398 sheep, and 17,057 swine. Capital, Hermann.

**GASCONY** (Fr. Gascoigne), an old province in the S. W. corner of France, bounded N. by Guienne, E. by Languedoc and the county of Foix, from which it was partly separated by the upper Garonne, S. by the Pyrenees and Bearn, and W. by the Atlantic (the gulf of Gascony). It was originally inhabited by a population of Iberian blood, and received from the Romans the name of Novempopulana or Aquitania Tertia, which was changed to that of Gascony about the middle of the 6th century, when it was occupied by the Vascons, a tribe of northern Spain, whom the Goths had driven across the Pyrenees. It was more than once invaded by the Merovingian kings, but was never entirely subjugated until the time of Charlemagne. The supremacy of the French crown being finally established, the country was placed under the direct sovereignty of the duke of Aquitaine. Through the marriage of Eleanor of Aquitaine, ex-queen of France, with Henry Plantagenet, Gascony, in conjunction with the whole country which that princess held south of the Loire, fell to the crown of England in 1195. For 300 years it remained under the same allegiance, and returned by conquest to France in 1453. It formed afterward, with Guienne, one of the great governments of that country, and is now mainly comprised in the departments of Hautes-Pyrénées, Gers, and Landes.

**GASCOTTE, William,** the inventor of the micrometer, born in England about 1821, killed fighting for Chalons against Draper Moor, July 2, 1864. The instrument, as constructed by him, consisted principally of two parallel wires or metallic plates, capable of being moved, which were placed in the focus of the eye glass of the telescope. The image was comprehended between these, and by means of a scale for the measure of angles its diameter was determined. Gascotte used his instrument in various astronomical observations, and in determining the magnitude or distance of terrestrial objects.

**GASKELL, Elizabeth Gogher,** an English author, born at Chelsea about 1810, died at Alton, Hants, Nov. 19, 1865. Her maiden name was Stevenson, and she was the wife of a Unitarian clergyman, who was for some time a resident of Manchester. Her first novel, "Mary Barton," published in 1848, is a striking picture of the daily life of a large manufacturing town. The pathetic power of many of the scenes delineated, and the literary merit of the book, gave Mrs. Gaskell at once a position among the first writers of fiction of the day. She afterward became a contributor to "Household Words" and "All the Year Round," and her tales, after having appeared in these journals, were republished in book form. Her principal works of fiction besides the one already mentioned were: "Maryland Cottage" (1850); "Ruth" (1853); "Cranford" (1853); "North and South" (1855); "Lizzie Leigh"; "Round the Sofa" (1859); "Right at Last" (1860); "Sylvia’s Lovers" (1863); and "Wives and Daughters" (1866). Most of them were republished in this country and translated into French. The work, however, which attracted the greatest attention was "The Life of Charlotte Brontë" (2 vols. Svo, 1857). It was written in a charming style, and, as Mrs. Gaskell had been a personal friend of the author of "Jane Eyre," she was able to furnish many interesting details of her private life.

**GASPARDIN.** 1. **Adrien Étienne Pierre,** count de, a French statesman and agriculturist, born in Orange, June 29, 1733, died there, Sept. 7, 1862. He entered the army, but was soon compelled by illness to give up military life. After the revolution of 1830 he was made successively prefet of the departments of Loir and Ile-sur-Loire, and in 1831 of Rhône; and for his promptness in suppressing an insurrection at Lyons in 1834 he was raised to the peerage. He became minister of the interior in 1836, and gave his attention especially to prison reforms and the establishment of hospitals. He occupied the same position in the short-lived cabinet of March, 1839. In 1848 he accepted the management of the National Agricultural Institute at Versailles, which was abolished in 1852. He published a large number of papers and several extended works on agricultural subjects, the principal of which is *Cours d’agriculture* (6 vols., Paris, 1848–59). II. **Agée Étienne,** count de, a French publicist, son of the preceding, born in Orange, July 10, 1810, died in Geneva, May 14, 1871. He was employed in the interests of public instruction and the interior, under Guizot and his father, and in 1842 was elected to the chamber of deputies for Bastia, Corsica. He was a conservative, but advocated parliamentary reform, the emancipation of slaves in the colonies, and the rights of the Protestant church, of which he was a member. His independence was not relished by the government; and his sympathy for Protestantism not being shared by his constituents, he failed of reelection to the chamber in 1846, and retired from political life. He was in the East when the revolution of 1848 took place. When solicited to declare himself in favor of the new constitution, he refused. His disapprobation of the form afterward given to the government by Louis Napoleon was even stronger, and he permanently removed to Switzerland. In the winter he resided near Geneva, and delivered courses of lectures on economical, historical, and religious subjects, many of which were subsequently published: During the civil war in the United States he published two works warmly sustaining the Union cause: *Les États-Unis en 1861: un grand peuple qui se révolte*
(1861), translated and published in New York under the title "The Uprising of a Great People. The United States in 1861," and L’Amérique devant l'Europe (1862), translated under the title "America before Europe." During the Franco-German war he addressed an appeal to the French people urging them not to persevere in it. His death was hastened by his exertions in the care of refugees from Bourbaki's army, whom he received into his house. Besides the works already mentioned, and numerous articles in the Journal des Débats and the Revue des Deux Mondes and other publications, he published De l'amour et l'amitié (1843); Élégie et triste (1848); Intérêts généraux du protestantisme français (1843); Christianisme et paganisme (2 vols. 8vo, 1846); Des tableaux tournants, du surnaturel en général et des esprits (2 vols. 12mo, 1846; translated into English); La question du Neufohdist (1857); Le Jésus, ses devoirs, ses joies et ses douleurs (2 vols. 12mo, 1868); and Le libertés morales (1868). His Vie d'Innocent III, was published posthumously in 1878, and his Le bon vieux temps in 1874.—His wife, Valérie Boursier, born about 1815, has been conspicuous as an opponent of religious and social innovations, and has published several volumes of travels and works on religious subjects. Two of these obtained the prize of the academy: Le mariage au point de vue chrétien (1842; 3d ed., 1858), and Il y a des pauvres à Paris et ailleurs (1845).

GASPÉ, an E. county of Quebec, Canada, bordering on the river and gulf of St. Lawrence, indent by the bay of the same name, and including the Magdalen islands; area, 4,578 sq. m.; pop. in 1871, 18,729, of whom 12,956 were of French, 2,804 of Irish, 2,321 of English, and 453 of Scotch origin or descent. It has a mountainous surface, diversified by many fertile valleys and traversed by St. Anne, Dartmouth, and other rivers. The inhabitants are engaged chiefly in the lumber trade and fisheries. The settlements are confined almost wholly to the coasts, which are lined with excellent harbors. The Gaspesians, a part of the Micmac tribe of Indians, reside in Gaspé, at the mouth of the St. Lawrence. They are treated as a distinct tribe by the missionary Le Clerq in his Gaspéiste, but are almost always included among the Micmacas. The use of hieroglyphics among them can be traced back to the 17th century. (See Micmaca.) Capital, Percé.

GAIS, Friedrich Wilhelm Heinrich Joachim, a German theologian, born in Breslau, Nov. 29, 1818. After studying at the principal universities, he became professor of theology successively at Breslau, Greifswald, Gliessen, and Heidelberg, where he has been since 1868. His principal work is Geschichte der protestantischen Dogmatik im Zusammenhange mit der Theologie überhaupt (4 vols., Berlin, 1854–67).

GASSENDI, Pierre, a French philosopher, born at Chamtrecier, Provence, Jan. 22, 1692, died in Paris, Oct. 24, 1655. After having studied philosophy at Aix, he was appointed at the age of 16 professor of rhetoric at Digne. When 20 years of age he was simultaneously elected to the two chairs of philosophy and theology at Aix, of which he chose the latter. While in this office his leisure was employed in the study of anatomy, astronomy, and even astrology, a science which he afterward condemned as a delusion. He resigned his professorship in 1628. In 1624 he published at Grenoble the Exercitaciones Paradoxicas adversus Aristotelis, in which he was the first to point the distinction between the church and the scholastic philosophy. He designed to complete the work in five books, but only two were ever written. About the same time he was appointed provost of the cathedral at Digne, but the appointment was contested, and was not confirmed until ten years later. Meanwhile he travelled for a time, and entered into correspondence with Galileo, to whom he expressed his concurrence with the Copernican system. Returning to Digne, he continued his ecclesiastical duties, and in 1630 wrote a treatise against the mystical and alchemical doctrines of Robert Fludd. He was a constant correspondent of Kepler, who before his death had publicly announced that Mercury and Venus would pass over the disk of the sun on Nov. 7, 1631. Gassendi was the first to observe the passage of Mercury, and wrote a minute account of the phenomenon. On the appearance of the Discours de la méthode and the Méditations of Descartes, a controversy arose between the two philosophers. The daring and original genius of Descartes was in striking contrast with the erudition and critical acumen of his opponent, who excelled him in caution and courtesy. In 1645 Gassendi received from Cardinal Richelieu the appointment of mathematical professor in the royal college of France; and two years later he published at Lyons his historical treatise, De Vita, Mortibus et Plactitis Epicuri, which was followed by his Syntagma Philosophiae Epicureae (Lyons, 1649). They form together a complete review of the life, edology of the character, and reconstruction of the philosophical system of Epicurus. The Epicurean ethics and physical theory of atoms and a vacuum are elaborately vindicated, and conformed to the principles of Christianity and the discoveries of modern science. His feeble health obliged him to resign his professorship, and he retired to Toulon, where he was occupied for two years with the preparation of another great philosophical work. In 1658 he returned to Paris, and there completed the work the Syntagma Philosophicum, an encyclopedic view of the entire circle of science, and the most complete and learned statement of his opinions. It was not published until after his death, and forms the first two volumes of his complete works, edited by Montmor and Sorbière (6 vols., Lyons, 1658). It is divided into three parts, logic, physics, and ethics, is elaborated with great learning and minuteness of criticism, and contains an eclectic philosophy.
formed by the union of ideas borrowed from various schools rather than a new system. His system is akin to that of Locke rather than that of the French followers of Locke, and even a part of his phraseology, as the *actiones reflexive*, anticipates that of the “Essay on the Human Understanding.” It does not appear, however, that Locke was acquainted with his writings. Not only as a metaphysician, but as an astronomer, geometer, anatomist, Hellenist, historian, and elegant writer, Gassendi merits distinction. He was the personal friend of most of the learned men of his time, the first disciple in France of Bacon, and the precursor of Newton. The aurora borealis, the parhelia, the conjunctions of Venus and Mercury, the occultations of the satellites of Jupiter, and the properties of the magnetic needle were among the subjects of his researches. He wrote the lives of the principal astronomers of his age, and in the preface gave a brief and admirable history of astronomy. By those who knew him he was beloved for his amiability and modesty. The latest complete edition of his works is that edited by Averani (6 vols., Florence, 1729). An abridgment by Bernier (Paris, 1878) has been several times republished. His life has been written by Sorbière (for the first edition of his collected writings, Lyons, 1658), and by Bougerel (Paris, 1837).

**Gastein**, a valley in the Austrian duchy of Salzburg, famous for its romantic scenery and for its mineral springs. It is about 80 m. long and 2 m. broad, is surrounded by mountains in some parts about 8,000 ft. high, and is traversed by the Ache, which forms several cascades. There are three villages. Hofgastein, 40 m. S. of Salzburg, has a resident population of about 1,000. It contains a church, poorhouse, military hospital, and a statue of the emperor Francis I. of Austria. Gold and silver mines were formerly worked here. Dorfgastein, 6 m. to the north, is a mere hamlet. Wildbad Gastein, or Bad Gastein, about equally distant to the south, is one of the most celebrated watering places in Europe. It is about 2,000 ft. above the sea. In the centre of the village the Ache forms a cataract, which is spanned by a covered bridge 400 ft. long. There are about 35 houses, among which is a villa built by the late archbishop John of Austria. The climate is cool and wet even in summer. In 1880 an aqueduct was constructed under the auspices of the emperor Francis to convey the mineral waters to Hofgastein, but Wildbad still continues to be the principal watering place in the valley. The accommodations for visitors are very limited, but it is annually resorted to by about 3,000 persons. The hot springs, which have a temperature of 117°F., spring from the granite rocks at the foot of the mountain, one of which is now the middle of the cataract. They furnish about 100,000 cubic feet of water in 24 hours, the principal mineral ingredients of which are Glauber salts and carbonate of lime. The baths are chiefly useful in nervous affections, general debility, paralysis, chronic diseases of the skin, and disorders arising from wounds. These springs have been known since the 7th century, and have long been a favorite resort for the noble and royal families of Germany. —A convention was held here in August, 1865, between the emperor Francis Joseph and King William of Prussia, and their respective ministers, in which the affairs of the duchies wrested from Denmark in the preceding year were settled. (See *Austria*, vol. ii., p. 149.)

**Gasteropoda** (Gr. *gastrón*, belly, and *pòdè*, foot), a class of the mollusca distinguished by the under side of the body forming a single muscular foot, on which the animal creeps or glides. The snails, limpets, and chitons are examples of this class. They are divided into two natural groups, one breathing air (*pulmonifers*), the other water (*branchiifer*). These form the four orders of *prosobranchiata*, *pulmonifera*, *opisthobranchiata*, and *nucleo-brachiata*. The shell is usually spiral and univalve, but sometimes tubular or conical; in the chiton it is multivalve. Some marine species, as the *doris* and *eolis*, have no shells. Most are provided with a horny or shelly operculum, which forms the bottom of the foot, and when withdrawn closely shuts the aperture of the shell, to which it is firmly held by the strong muscles of this part of the body. In some species, as the limpet and patella, the animal uses the expanded surface of the foot for attaching the shell firmly to rocks and other surfaces. Almost all are symmetrical, the body being coiled up spirally, and the respiratory organs of the left side usually atrophied. A few, like the snails, are viviparous, but most are oviparous. The shells are nearly all right-handed; the cavity is a single conical or spiral chamber, never many-chambered like the nautilus and the cephalopods; the apex is almost always directed backwards. The lines between the whorls or turns of the shell are the sutures, the last or the body whorl being usually very large; the aperture is entire in most vegetable feeders, but notched or elongated into a canal or siphon which is respiratory in its office; there is sometimes a posterior or anal canal.

**Gaston**, a S. W. county of North Carolina, bordering on South Carolina, bounded E. by Catawba river and intersected by Catawba creek; area, about 850 sq. m.; pop. in 1870, 12,602, of whom 4,172 were colored. It has a diversified surface and a fertile soil. Gold has been obtained. It is traversed by the western division of the Wilmington, Charlotte, and Rutherford railroad. The chief productions in 1870 were 64,486 bushels of wheat, 388,028 of Indian corn, 7,717 of oats, and 763 bales of cotton. There were 3,816 mules and asses, 2,709 milch cows, 4,706 other cattle, 7,362 sheep, and 12,856 swine; a cotton factory, and a quartz mill. Capital, Dallas.
GASTON, William, an American jurist, born in New Berne, N. C., Sept. 19, 1778, died in Raleigh, Jan. 28, 1844. He graduated at Princeton, N. J., in 1796, with the highest honors, studied law, and was admitted to the bar at New Berne in 1798. Two years later he was elected to the senate of North Carolina, and subsequently to the house of commons, of which he was speaker in 1808. In the same year he was chosen by the federalists a presidential elector, and in 1813 he was elected to congress, where he served for four years, and became one of the most influential leaders of the federal party. He opposed the loan bill, which proposed during the war with Great Britain to place $55,000,000 at the disposal of the president, as was generally understood for the conquest of Canada. His speech, which was widely read and greatly admired, embraced a thorough discussion of the policy, object, and management of the war. In 1817 he retired from congress to devote himself to his profession, in which he soon attained the foremost rank in North Carolina. In 1835 he was a member of the convention to revise the state constitution, took a leading part in all important debates, and in a great measure guided the business of the convention. He spoke and voted against the proposition to deprive free colored men of the right of suffrage, which at that time they possessed, but which was taken from them by the new constitution. In 1834 he was appointed a judge of the supreme court of North Carolina; but he was a Roman Catholic, and by the constitution of that state, as commonly interpreted, was therefore incapable of holding any state office. Such, however, was the universal regard for his character and ability that the clause in the constitution against the Catholics became a dead letter. He continued in this office till his death, which was sudden.

GASTON DE FOIX, duke of Nemours, a French general, born in 1489, killed at Ravenna, April 11, 1512. He was the son of Jean de Foix, viscount of Narbonne, and of Marie d'Orléans, sister of Louis XII. In 1505 he was made duke of Nemours. In the beginning of 1512, at the age of 28, he was appointed commander of the French army in Italy, to carry on the war with Venice, the pope, and King Ferdinand of Spain, who had formed a "holy league" against Louis XII. He raised the siege of Bologna, defeated the Venetian army under the walls of Brescia, and on the same day carried that city by storm. A few weeks later, on April 11, he brought the allied army to a decisive action under the walls of Ravenna, and, in one of the most hotly contested battles ever fought, defeated them with a loss on both sides of 20,000 men. Flushed with victory, he was exasperated at the deliberate manner in which the Spanish infantry left the field of battle, and in person, followed by Bayard and about 20 other knights. He broke their line, but his horse was wounded, and fell in the midst of the enemy. When Bayard reached him he was already dead. His loss so disheartened the French that they reaped little advantage from their great victory. A monument near Ravenna marks the place where he fell.

GATES, Sir Henry, an English ecclesiastic, born in London, Sept. 4, 1574, died June 27, 1654. He wrote several works illustrative of the Scriptures. In 1642 he was chosen member of the assembly of divines at Westminster. In 1648 he remonstrated, in conjunction with 47 of his brethren, against the proceedings of the long parliament in relation to the king. In 1652 he published a critical edition of Marcus Aurelius's "Meditations," with notes, and an introductory discourse on the philosophy of the Stoics. The best edition of his works is that of Utrecht, 2 vols. folio, 1698.

GATCHINA, a town of Russia, in the government and 38 m. S. S. W. of the city of St. Petersburg, on a small lake formed by the Izhora river; pop. in 1867, 8,387. It is the private property of the emperor, and is famous for the imperial palace, built by Prince Gregory Orlof, and purchased on his death by Catharine II., who presented it in 1784 to her son, the grand duke Paul. The latter made it his favorite residence, and in 1797 granted municipal franchises to the town which grew up around the palace. The grounds are extensive and well laid out, and the park is intersected by lakes and streams which abound in trout. The emperor maintains a kennel here, but the palace is rarely inhabited by the present imperial family, and many of the paintings have been removed to the Hermitage. There are manufactures of porcelain, cloths, and hats.

GATES, a N. E. county of North Carolina, bordering on Virginia, bounded S. W. by Chowan and Nottaway rivers, the former of which is here navigable; area, 888 sq. m.; pop. in 1870, 7,724 of whom 3,207 were colored. The soil is generally level and well watered; it is covered with oak and pine timber. TheDISMAL swamp occupies the extreme N. E. part. The principal exports are tar and lumber. The chief productions in 1870 were 158,070 bushels of Indian corn, 54,186 of sweet potatoes, and 161 bales of cotton. There were 774 horses, 1,538 milch cows, 2,521 other cattle, and 11,411 swine. Capital, Gatesville.

GATES, Horatio, an American soldier, born in England in 1758, died in New York, April 10, 1806. He early entered the British army, and was an officer under Braddock, at whose defeat in 1755 he was severely wounded. After the peace of 1763 he purchased an estate in Virginia, where he resided till the organization of the continental army in 1775. Appointed adjutant general with the rank of brigadier, he accompanied Washington to Cambridge in July, 1775, and received him rank in person, followed by Bayard and about 20 other knights. He broke their line, but his horse was wounded, and fell in the midst of the enemy. When Bayard reached him he was already dead. His loss so disheartened the French that they reaped little advantage from their great victory. A monument near Ravenna marks the place where he fell.
GATESHEAD

GAUCHOS

considerable detachment, and in March, 1777, in effect superseded Schuyler in the command of the northern army, and was superseded by him in May. When, however, Schuyler was obliged to retreat down the Hudson by the disasters which followed the loss of Ticonderoga, Gates was reinstated in the command by congress, Aug. 4, 1777. The surrender of the British army at Saratoga, which followed, gave him a brilliant military repute, though it was in some measure due to the previous operations of Schuyler. In the winter of 1777–78 "Conway's cabal" intrigued to wrest the supreme command from Washington to bestow it upon Gates. The latter was engaged in no important military operations till in June, 1780, he was appointed to the command of the southern forces. The disastrous battle of Camden (Aug. 16) lessened his military fame, and he was superseded by Gen. Greene. His conduct was scrutinized by a committee of congress, and after the surrender of Cornwallis he was restored to his military position. On the conclusion of peace he retired to his estate in Virginia, whence, after emancipating all his slaves, he removed in 1790 to the city of New York.

GATESHEAD, a municipal and parliamentary borough of Durham, England, on the right bank of the river Tyne, opposite Newcastle, with which it is connected by a fine railway viaduct and by a stone bridge; pop. in 1871, 45,592. Its manufactures are closely connected with those of Newcastle, and comprise ships, anchors, chain cables, nails, hemp, wire ropes, iron castings, locomotive engines, boilers, &c. There are extensive collieries and grindstone quarries in the vicinity.

GATE, one of the five chief cities of Philistia, often mentioned in the history of David and his successors. The giant Goliath, who was slain by David, was either a native or an inhabitant of Gath. It was for centuries alternately under the power of the Jewish kings or independent, bearing the name of a more powerful city under Syrian rule. In the time of Jerome it was a "very large village." There is much dispute as to its site, three different places being suggested. The one now considered most probable is Tel es-Safih, 10 m. S. E. of Ashdod, and 25 m. S. W. of Jerusalem, where are considerable ruins.

GATLING, Richard Jordan, an American inventor, born in Hartford co., N. C., Sept. 12, 1818. While yet a boy he assisted his father in perfecting a machine for sowing cotton seed, and another machine for thinning cotton plants. Subsequently he invented and patented a seed-sowing machine for sowing rice. Removing to St. Louis in 1844, he adapted his invention to sowing wheat in drills. For several winters he attended medical lectures at Lapore, Ind., and at the Ohio medical college in Cincinnati; and in 1847 he made a tour of the southern states, when he engaged in real estate speculations and railroad enterprises. In 1850 he invented a double-acting hemp brake, and in 1857 a steam plough, which however he did not bring to practical results. In 1861 he conceived the idea of the revolving battery gun which bears his name. (See ARTILLERY, vol. i., p. 797, and CANNON, vol. iii., p. 718.) He made his first gun at Indianapolis in 1862, and in the fall of that year he made six of the guns at Cincinnati, which were destroyed by the burning of the factory. He subsequently had 12 manufactured, which were used by Gen. Butler on James river. In 1865 he further improved his invention, and in the year following, after satisfactory trials at Washington and at Fortress Monroe, the arm was adopted into the United States service. It is also made in Austria and England, and has been adopted by several governments of Europe. During the past ten years Dr. Gatling has devoted himself to the perfection of this invention, spending much time abroad in testing his gun in public; and he now (1874) resides in Hartford, Conn.

GAUCHOS, horsemen of the plains in the Argentine and other South American republics. They are generally of pure Spanish race, having mingled but little with the aborigines. They are usually tall and graceful; their hair is black and frequently worn long, with full beards and moustaches. Their dress consists of a loose flowing shirt, at times fancifully embroidered; wide drawers, the lower extremities of which are commonly of open work and terminated with a fringe; a quadrangular piece of stuff passed between the legs and bound to the waist, one end in front and the other behind, by means of a belt, so as to fall in folds far below the knees; boots of the skin of a colt's hind legs; a poncho, worn only in wet or cold weather; and finally a small round hat, with a narrow brim. To shield the back of the head and neck from the rays of the sun, the gaucho makes use of a handkerchief fastened to the crown of the hat, falling down behind, and secured by drawing the two lower corners beneath the chin. When seated upon the saddle, the handkerchief lies loosely upon the shoulders, with a sailor's knot in front. To these are added a long knife, the trador, which performs the double office of purse and girdle, and a pair of huge spurs. The dress of the women, most of whom are remarkably handsome, is composed of a low-cut tightly fitting bodice and short skirt, with a shawl so drawn around the head as barely to leave the face and front hair visible, but completely covering the neck and shoulders. The arms are rarely encumbered by any garment; and the hair is secured by a large comb. When on horseback the women often wear European dresses with body and sleeves, and a handkerchief like that of the men. The gaucho dwellings are rude huts, with walls of alternate layers of willow and mud, the roof being thatched. The furniture is extremely scanty; in fact it consists of a wooden bedstead, with a mattress of skin bound to the sides with thongs; two ropes stretched parallel to each other from wall to wall.
wall over the bed, serving as a cradle for the children, who are lashed to them; a kettle in which to make the mate or Paraguayan tea, and a few cups with tin pipes through which it is sucked. Around the walls hang the bolas, lasso, and other hunting implements. In hot weather the hut is deserted night and day, as the owners sleep in the open air. Their food is chiefly composed of beef, which they roast in huge pieces. The gauchos are admirable horsemen, and are expert in the use of the bolas and lasso. (See Bolas, and Lasso.) This dexterity is acquired only by uninterrupted practice almost from infancy, the gaucho passing his life on horseback. Their occupations are breaking in wild horses, watching herds, and marking and slaughtering the animals. They are polite and hospitable, but indolent and vindictive, and addicted to gambling and intemperance. In breaking out of the civil war he retained his preferments, submitted to the Presbyterian discipline, omitted the liturgy from the church service, and subscribed to the covenant. Meanwhile he secretly wrote a "Protestation" against the king's trial, a "Just Invective against those who murdered King Charles I.," and other similar papers. They were published after the restoration, when he declared himself a royalist, and was appointed chaplain to Charles II., afterward bishop of Exeter, and in 1662 of Worcester. His death is said to have been hastened by his not getting the rich see of Winchester, on which he had set his heart. The "Bibliothèque; the Portraiture of his Sacred Majesty K. Charles I. in his Solitudes and Sufferings," which is attributed to him, was at first supposed to have been written by Charles himself, and went through 50 editions, at home and abroad, in a single year (1648–9). After carefully examining the evidence, Sir James Macintosh came to the conclusion that Gauden was really the author of the book.

GAUDICHAUD-BEAUPRÉ, Charles, a French botanist, born in Angoulême, Sept. 4, 1780, died in Paris, Jan. 26, 1854. In 1817 he accompanied, in the capacity of pharmacetical botanist, the scientific expedition of Freycinet. His vessel, the Uranie, was wrecked upon the Falkland islands in the spring of 1820, and of the 4,175 botanical specimens which he had collected upward of 2,500 were lost. After his return to France he prepared the botanical history of the voyage. In 1830–38 he took part in the expedition which explored the coast of South America in the Hermine, and subsequently circumnavigated the globe again in the Bonite. He was a member of the institute and connected with the museum of natural history, where he passed the remainder of his life, devoted to the classification of his specimens and the preparation and publication of his notes; and he carried on an acrimonious controversy with Mirbel on the subject of the process of vegetable growth. Among his numerous publications were: *Voyage de la Bonite (botanique)* (4 vols. 8vo); *Recherches générales sur l'organographie, la physiologie et l'organogenie des eétuats* (4to, 1841); *Recherches générales sur la physiologie et l'organogenie des eétuats* (4to, 1842–7); and *Mémoires et notices diverses sur l'anatomie et la physiologie des eétuats* (3 vols. 8vo, 1851).

GAUGING, the operation of measuring the capacity of any receptacle, as for example that of a cask, barrel, or vat. It may be performed either by measuring the dimensions of the receptacle and then calculating its capacity upon geometrical principles, or, without the necessity of any calculation, by means of a gauging rod suitably adjusted for the purpose. Though the contents of a vessel cannot ordinarily be ascertained in practice with absolute accuracy by these methods, the art is of service in the collection of excise duties, inasmuch as the contents of a vessel are ascertained by means of

GAUL (Lat. Gallia), the name applied by the Romans to two great divisions of their empire, Cisalpine and Transalpine (in regard to Rome). L. Cassius Gallo (Gallia Cisalpina or Cisalpinia), comprising the north of Italy to the confines of Etruria and Umbria, was divided by the Po (Padus) into Cispadane and Transpadane. It was also called Gallia Togata, or Romanized Gaul, from the inhabitants wearing togas like the Romans. It was bounded N. W. and N. by the Alps, E. by the Athesis (now Adige), S. E. by the Adriatic, S. by the Rubicon, the Apennines, the Maews (Maera), and the mountains of Liguria. Both divisions of this portion, like all Transalpine Gaul, were inhabited mostly by people of Celtic race (Gaelic and Kymeric), called by the Romans in general Gauls (Galli), by the Greeks Κάλλος or Κάλλαι; the Tuscan and some other elements of the population in Cisalpine Gaul, and the Celto-Teutonic, Teutonic, Celto-Iberian, Iberian, and Greek in Transalpine Gaul, were comparatively small. (See Cisalpine Gaul.) It is generally believed that the Gauls, who are undoubtedly a branch of the great Indo-European family, left their Asiatic homes before the dawn of European history, and occupied the western regions on the Rhine, Seine, Rhône, and Garonne, Ebro, and Tagus, as well as the islands of Britain, when the Roman state was still in its infancy. Turbulent, roving, and warlike, some of the tribes entered northern Italy, according to Livy, under Bellovesau, a nephew of King Ambigatus, in the time of Tarquin the Elder. Others are said by the same historian to have returned eastward toward the Hercynian forest, under Sigovesus, another nephew of Ambigatus. Still others appeared later, though it is uncertain whence they came, in Macedonia, Thrace, and Greece, where they were reported at Delphi, 278 B. C.; and even in Asia Minor, where they founded Galatia or Gallo-Gruscia (see Galatia), in Syria, and in Egypt. There are no precise historical dates for the consecutive invasions of Cisalpine Gaul by the Celts; they are supposed to have occupied several centuries. Tribe followed tribe, and finally we find the Salassiens settled in the vicinity of Ivera (Eperia), the Insurians about Milan (Mediolanum), the Cenomani in the region of Verona and Mantua, the Boii in the country lately forming the duchies of Parma and Modena and about Bologna (Bononia), the Ligones about Ravenna, the Senones, who came last, in the S. E. part of Cispadane Gaul, and other tribes in various other parts of the country. It was not long after the conquest of Veii by the Romans that this people came in contact with the Gauls. These invaders had settled themselves in the midst of the Etruscan confederacy while the Romans were making their attacks on its southern districts. They had pushed the Umbrians southward, taken Melpum (about 396 B.C.), crossed the Apennines under one of their Brenni, as their chiefs were called, and advanced as far as Clusium. The Tuscan of this city sought aid from the Romans, who sent no army to their assistance, but despatched the Fabii as envoys to deter the barbarians. The envoy, and partly provoked them, and excited their hostility against Rome. Brennus broke up the camp before Clusium, crossed the Tiber, routed the Romans on the Allia, entered Rome through open gates, and pillaged it; but after an obstinate siege of the capitol, he sold his conquest for gold and retired with his army. Subsequent invasions proved disastrous to the barbarians. In 287 they were routed near Alba by Marcus Camillus. In 281 another host, like the first of the Senonian tribe, encamped before the Anio bridge, but marched further toward Campania before fighting a battle. Shortly after returning from Campania they renewed their ravages, and fought unsuccessfully against the dictators Aha la and Petites. In 260 they again encamped before Rome, keeping it in perpetual terror; but in the following year L. Furius Camillus, a nephew of Marcus, compelled them to retire. When in a later period the Gauls assisted the Umbrians and Etruscans against the advancing Romans, they were routed in the battle of Sentinum (295), where many of them fought on war chariots, and near Lake Vadinmon (283). These disasters, suffered chiefly by the Senonian and Boian Gauls, put an end to Gallic wars in Italy for nearly 60 years. The Romans, who had conquered Umbria, founded their first colony in Cispadane Gaul, in the land of the Senones, calling it Sena Gallica (now Sinigaglia); Ariminum (Rimini) was founded afterward. The Gauls were too much weakened to offer any opposition. Being strengthened by the arrival of large bodies from beyond the Alps, they took up arms again in 225, and crossed the Apennines, but were soon compelled to retreat, and were routed at Telemon. The Romans continued the war with great vigor, conquered the land of the Boii, crossed the Po, on the opposite banks of which they soon after founded Cremona and Placentia (Piacenza), and subdued the Insurians (292). When Hannibal crossed the Alps (218) he was eagerly joined by numerous Gauls, but after his final defeat Cisalpine Gaul became an easy prey to the victorious legions. It was made a Roman province at the beginning of the following century, received numerous new Roman colonies, became civilized, industrious, and flourishing, and finally obtained the privileges of Roman citizenship. Of the eleven divisions of Italy, as established under Augustus, it formed the last four. The Salassiens, who revolted under the same reign, were nearly exterminated. The Romanization of the province was slow; but by this time its history becomes identified with that of the Roman empire. II. Transalpine Gaul (Gallia Transalpina or Ulterior) was bounded
W. and N. by the sea, E. by the Rhine, S. E. by the Alps, and S. by the Mediterranean and the Pyrenees. Gaul comprised not only the whole of modern France and Belgium, but also parts of Switzerland, Germany, and Holland. Upon its southern coast Phoenicians, Rhodians, and Phocaeans had at various remote periods planted colonies and introduced some rudiments of civilization, the arts of writing, mining, and working metals, and the olive and vine. The Romans first entered this portion of Gaul at its S. E. angle. In 166 B.C. the Maritime Alps were first crossed by Roman legions, who defeated the tribes of the western slopes. In 164 they defended Massilia (Marseilles), a colony of Phocaeans, and herself, the mother of numerous colonies, against the Ligurians. Twenty years later they fought against the Salyes, a Celto-Ligurian tribe. Soon afterward they founded Aquae Sextiae (Aix), and subdued the Allobroges, who lived between the Rhone (Rhodanus) and the lake (Tarancum), and were assisted by the Arverni (121). This new course of Roman conquests was interrupted by the great Cimbro-Teutonic movement (see Cimmerii), but the two victories of Marius at Aquae Sextiae (102) and on the Raudian fields (101), over the Teutons and Cimbri, saved both the Transalpine and Cisalpine possessions of Rome. The former, eventually extending from the Alps to the Pyrenees, and embracing the modern provinces of Dauphiny, Languedoc, Provence (from the Roman Provincia), Roussillon, and Nice, were called Gallia Bracosta or Comata, from the wide trousers (braccae) or the long hair (coma) of the inhabitants. The internal development of the main parts of Transalpine Gaul, during the times when the Cisalpine country was successively Gallicized and Romanized, cannot be traced in historical records. When the Romans, in the last period of their republic, finally entered the northwest, they found the country occupied by various tribes, ruled by nobles, priests, and chiefs or kings. Caesar, the conqueror of the people and historian of their last struggles for independence, comprehends all of them under the general name of Gauls, dividing them into three large groups: Belgians, in the northeast, between the Rhine, Seine (Sequan), and Marne (Matrona); Celts, or Gauls proper, in the centre and west, between the Seine, Marne, and Garonne (Garumna); and Aquitanians, in the southwest, between the Garonne and the Pyrenees. In the first of these groups Kymric and Belgic elements seem to have prevailed, in the second Gallic, in the third Iberic and other non-Celtic elements, though the divisions of Caesar do not fully coincide with the lines of distinction drawn by modern ethnologists. Among the more important tribes were the Batavi, near the mouths of the Rhine; the Nervii, in the southwest of modern Belgium; the Eburones, about Liege; the Ambiani, about Amiens; the Morini, "the remotest of men," about Boulogne; the Atrebates, in Artois; the Belovaci, about Beauvais; the Snuessiones, about Soissons; the Parisii, about Paris (Lutetia); the Remi, in Champagne (Rhenae); the Treveri, about Treves; the Teutonic Triboci, Ubii, and Nemetae, on the Rhine; the Eburones, about Evreux; the Centomani, in Maine; the Armorican Nannetes (Nantes), Veneti (Vannes), and Redones (Rennes), the chief representatives of the Kymric race, in Brittany; the Turones, in Touraine; the Andes or Andegavi, in Anjou; the Carnutes, about Chartres and Orleans; the Lingones, about Langres; the Senones, about Sens (Agendicus); the Lemovices, in Limousin; the Santones, in Saintonge; the Pictones, in Poitou; the Arverni, in Auvergne; the Helvii, in Vivarais; the Gabali, in Gévaudan; the Édui, in the region of Autun (Bibracte); the Mandubii, about Alise Ste. Reine (see Alesia); the Insulaires, in Lyons; the Bituriges, in earlier times a leading tribe, about Bourges (Avaricum); the Sequani, about Besancon (Vesontio); the Helvetii, in Switzerland; the Bituriges Vivisci, about Bordeaux (Burdigala); and the Tarbelli, in Béarn. At the time of Caesar's invasion, the Gauls had towns, and used the art of fortification with success; they had long known the arts of embroidery and working metals, and were regarded as the inventors of various implements of husbandry; the Armoricians possessed a navy; the Gallic country was reputed to be the richest in Europe. But their manners were rude, their speech was rough, milk and swine's flesh were the principal aliments, their villages were disfigured with inhuman trophies, the treatment of captive or slain enemies was barbarous, bloody fights and duels were customary, hounds were used in war, polygamy was not prohibited, and females were little more than slaves; the polytheism which prevailed among the common people, especially among the Gaul, was coarse, and human victims were sacrificed to the gods. (See Drusus, and Bard.) The remains commemorative of Gallic culture are extremely scanty. The details of Caesar's conquest of Gaul may be read in his "Commentaries." Its chief events are the defeat of the Helvetians near Bibracte, and the expedition against the Suevi under Ariovistus, undertaken on the call of the Édui, in 58; the conquest of Belgic Gaul, in 57; the invasion of Armorica or Brittany by land and sea, the submission of Aquitania, and the reduction of the wild tribes on the N. W. coast, in 56; the sudden and successful attacks of the Eburones under Ambiorix, and their annihilation, in 54 and 55; the great rising of central Gaul under Vereingotorix, the double blockade at Alesia, and the fall of Avaricum, the last stronghold of the natives, in 52. The loss of the Gauls in these struggles, in which genius and discipline conquered unbridled and tumultuous valor, was little less than a million men. The whole Transalpine country was divided by Augustus into four provinces: Gallia Narbonensis (Narbonne),
the former Provincia Romana, Gallia Aquitania, Gallia Lugdunensis, and Gallia Belgica, to which were added the later divisions Germania Superior or Prima, and Germania Inferior or Secunda, on the Rhine. Other subsequent divisions are less important. For more than two centuries after its conquest by Cesar, Gaul remained almost entirely quiet, and its Romanization proceeded rapidly, the national habits and religion retreating by degrees toward the N. W. coast, and eventually finding refuge in the islands beyond it. The history of the country in the times of the Roman emperors, under the latter of whom it was Christianized, belongs to that of Rome. Civil wars and dissensions in the 5th century, and later the invasions of the Alemanni, Franks, Burgundians, Visigoths, Huns, and other barbarians, brought about its decay. Clovis made it Frankish. (See FRANCE.)—See Desjardins, Géographie de la Gaule, d'après la table de Peutinger (Paris, 1870.)

GAUME, Jean Joseph, a French author, born at Fusa, Doubs, in 1802, died March 22, 1869. He received holy orders at an early age, was appointed in 1827 professor of theology in the seminary of Nevers, and became successively director of that institution, canon of the cathedral, and vicar general. He is chiefly known as having led in the vehement opposition to the teaching of the pagan classics, which arose in France on the publication of his Le vrai rongeur des sociétés modernes (Paris, 1831). In this work he traces all the social evils of the last 400 years to the revival of pagan art and literature. In the angry controversy which ensued, he was successfully opposed by Bishop Dupanloup. In 1852 appeared Lettres à Mgr. Dupanloup sur le paganisme dans l'éducation. In furtherance of his idea that no Latin or Greek authors should be read in the schools save such as are posterior to the 4th century, he began forthwith to issue Bibliothèque des classiques chez les Gaulois et les Francs (50 vols., Paris, 1852-59), and Poëtes et proseurs profanes complètement expurgés (2 vols., 1857). He was made a knight of St. Sylvester in 1841 by Gregory XVI., and a prothonotary apostolic by Pius IX. in 1854. Of his many other works, the most important are: Catéchisme de persévérance (8 vols. 8vo, 1883); abridgment, 16mo, 20th ed., 1884, translated into English); Histoire de la société domestique chez tous les peuples (3 vols., 1844); and Les trois Rome (4 vols., 1848).

GAUSS, Karl Friedrich, a German mathematician, born in Brunswick, April 30, 1777, died in Göttingen, Feb. 23, 1855. He early displayed such remarkable capacity for mathematical calculation, that the duke of Brunswick took charge of his education. At the age of 18 he solved a problem which had occupied geometers for 2,000 years of the time of Longinus of the division of the circle into 17 equal parts. In 1801 he published his Disquisitiones Arithmetica, treating of indeterminate analysis or transcendental arithmetic, and containing, besides many new and curious theorems, a demonstration of the famous theorem of Fermat concerning triangular numbers. This gave him at once a distinguished place among scientific men. He was one of the first to calculate by a new method the orbit of the newly discovered planet Ceres, and afterward that of Pallas, for which he received from the French institute in 1810 the medal founded by Lalande. In 1807 he was appointed professor of mathematics and director of the new observatory at Göttingen, a position which he retained till his death. Having undertaken for the government of Hanover in 1821 the measurement of an arc of the meridian for trigonometrical purposes, he introduced important improvements in geodesy. To render the angles visible at as great a distance as possible, he invented the heliotrope, which accomplishes the object by reflecting the rays of the sun, and devised a method for the correction of the errors which occur in an extensive system of triangulation. After the arrival of Weber in Göttingen in 1831 Gauss employed his leisure principally in the investigation of magnetism. He invented the magnetometer for ascertaining the variations of the magnetic needle, and became member of the Magnetic Society, through the instrumentality of which valuable observations on terrestrial magnetism were made and the results published (6 vols., Göttingen, 1837-43). His works mark an era in the history of science. As a mathematician he was pronounced by Laplace the greatest in Europe. Among the more important of his works are: Theoria Motus Corporum Celestium (Hamburg, 1809; translated into English by C. H. Davis, Boston, 1857, and into German by Haase, Hanover, 1865); Intensitas Via Magnetica Terraeis (Göttingen, 1838); Atlas des Erdmagnetismus (8 vols., Leipzig, 1840); Die optischen Untersuchungen (Göttingen, 1841); and Untersuchungen über Gegenstände der handl. Geodäsie (1845-7).}

GAUTIER, Jean François Eugène, a French composer, born at Vaugirard, near Paris, in 1822. He became an excellent violinist, and produced many comic operas, the most successful of which, Flos et Zéphire, was performed at the Théâtre Lyrique in Paris in 1862.

GAUTIER, Théophile, a French author, born in Tarbes, Aug. 81, 1811, died in Paris, Oct. 29, 1872. He was educated at the college of Charlemagne, on leaving which he entered the studio of Riolto to study painting; but, discouraged at the feebleness of his first attempts, he turned to literature, and became an ardent disciple of the school of Victor Hugo. His first volume of poetry, published in 1880, was followed in 1882 by Albertus, a legend in verse. He then wrote a series of articles on the poets of the time of Louis XIV. of which a selection was translated and published in 1844 under the title of Les grotesques. In 1838 he began to write the articles on theatres and fine arts in the Prasse, and
at the same time was a contributor to the Revue de Paris, the Musée des familles, and other publications. He also wrote numerous novels, poems, and books of travel. The most celebrated of his novels are Madame de Mansin (1835), Fortunio (1838), Les rois innocents and Miltion (1847), Le capitaine François (1849), Le jeu de l'oiseau (1865), Le spirituel (1866), and Ménagerie intime (1869). Besides the poems already mentioned, he published La comédie de la mort (1888) and Émaux et camées (1883). Among his books of travel are Trois Montes (1849), Étayage (1849), and Constantinople (1854). He made three visits to Russia by the invitation of the emperor Alexander II., and prepared, in collaboration with M. Richebourg, Trésors d'art de la Russie ancienne et moderne, published under the auspices of the Russian government (fol., with photographs, 1860–63). He wrote the librettos for the ballets Giselle (1841), La Fée (1849), Gounod (1854), and Sardanaplus (1858). His connection with the Prasse as dramatic and art critic continued for 20 years, and at its end he became (1866) literary editor of the Moniteur Universel, and in 1869 of the Journal Officiel. His best critical articles were collected and published in 1869 under the title Histoire de l'art dramatique en France depuis vingt-cinq ans (6 vols.). He received a pension in 1865, but was repeatedly refused admission to the academy.—See Théophile Gautier, souvenirs intimes, by Ernest Faye (Paris, 1874).

GAVARNI, the pseudonym of Sulphur Guillaume Paul Chevalier, a French caricaturist, born in Paris in 1801, died at Auteuil, Nov. 28, 1866. He was employed as an engineer as draftsman at Tarbes, and borrowing a name from the village of Gavarnie in that region, subscribed to it sketches of the costumes and scenery of the Pyrenees. These brought him into notice, and he began the publication of the designs which made him celebrated. He first represented various types of eccentric life in Paris, and afterward attempted with equal success scenes of domestic life. Some of his series in the latter style were entitled Les enfants terribles, Les fourberies de femmes, Les mariés vengés, Les nuances de sentiment, &c. Among the books which he illustrated were the Juif errant of Sue and the Diable à Paris of Balzac. His Œuvres choisies, with letterpress by Jules Janin, Théophile Gautier, Balzac, and others, were published in 1845 (4 vols.). Two volumes more appeared in 1860, under the name of Pères et patures. In 1869 was published Manières de voir et façons de parler: recueil des écrits de Gavarni, edited by Charles Yriarte; and in 1878 a Catalogue des lithographies de Gavarni, and Gavarni, a biography, by Edm. de Chatel and de Goncourt.

GAVAZZI, Alessandro, an Italian preacher and political agitator, born in Bologna in 1809. He joined the order of the Barnabites in 1825, and afterward officiated as professor of rhetoric at Naples. He was in Rome at the outbreak of the revolution in Lombardy in 1848, delivered in the Pantheon a funeral oration on those who had fallen in that struggle, and made passionate appeals in behalf of the independence of Italy. The pope appointed him almoner of the Roman legion which was despatched to Vienza, and he was called by the people the Pietro Eremita, or Peter the Hermit, of the national crusade. In Venice he addressed immense crowds in St. Mark's place, and thus gained means for furthering the movement. Pius IX., however, alarmed at the spread of the revolution, recalled his troops to Rome. Gavazzi repaired to Florence, and, after his expulsion from that city, to Genoa; but he was recalled to Bologna, where he was received with great enthusiasm by the people who had risen against the papal government. He was appointed by the republican government chaplain in chief of the army, and after the French occupation of Rome (July, 1849) he found an asylum in England, and subsequently lectured in Great Britain, the United States, and Canada, against the church and government of Rome. In 1861 he published in London his Life, Sermons, and Lessons. He afterward returned to Italy, and in 1860 accompanied the expedition of Garibaldi to Sicily. In 1870 he again visited Great Britain, and in 1873 he solicited funds in the United States for the maintenance of Protestant churches in Italy.

GAVELHOOD, a tenure in England by which the estate descends, not to the eldest son, as by common law, but to all the sons, or if there be no sons, to all the brothers. The word is said by some persons to be derived from the English words "given to all the kindred;" but other derivations are suggested. It prevails throughout the English county of Kent, but is seldom met with in other counties. The best authorities, including Selden, believe that this was the general custom of England before the Norman conquest.

GAVIAL, or Gharial, a crocodilian reptile of Asia and Africa, of the genus Gavialis (Geoffroy), characterized by its very long, straight, and narrow jaws, somewhat enlarged at the extremity. The number of teeth is greater than in other crocodilians, being 100 to 120 in all, from 60 to 60 in each jaw; the upper mandible is not pierced for the passage of the lower teeth, but has two grooves in each side for the reception of the first and fourth under teeth, the anterior being deep and in the front of the jaw; the five or six anterior pairs, both above and below, are larger than the rest of the teeth, the largest being the first, third, and fourth above, and the first, second, and fourth below, and all are of a conical form, slightly depressed from before backward. The division of the lower jaw into two branches, each about the 29th tooth of the series of 26. The bony opening of the nasal fossae is triangular, and this is closed in the males by a large oval cartilaginous sac, whose cavity is supposed to serve as a reservoir of air when the animal plunges under
GAVAL

water. There are five toes on the fore paws and four on the hind, the middle three of the former being united at their base by a very short web, and the external three of the latter by a thicker and more extensive membrane covered with small granular scales; the nails are feebly curved. The nuchal plates are two, of large size and ridged, and oval form, sometimes with a small plate on each side of them; the cervical plates, four pairs, extend from the middle third of the neck to the dorsal covering in a longitudinal band, and are ridged on their median line; the upper part of the trunk is protected by four longitudinal series of ridged quadrilateral scales, each containing about 18, and the sides of the neck and flanks by flat smooth scales of medium size; the tail has from 34 to 40 circles of scales, becoming crested about the sixth or seventh on each side, the double portion becoming single and the highest near middle of the length; the under surface of the body is covered by about 60 transverse rows of smooth, oblong, quadrilateral scales, each pierced on the posterior border by a small open-

fossil crocodiles which existed toward the end of the secondary epoch all had the elongated jaws of the gavial, the true crocodiles not appearing until the tertiary period at the same time with their mammalian prey. The crocodilus priscus of Sommering, the teleosaurus and the stenosaurus of Geoffroy, all had the cranial characters of the gavial. This reptile, though now confined to the warmest regions, in former geological ages lived in northern Europe.

GAY, Claude, a French traveller and naturalist, born at Draguignan, March 18, 1800. After having studied the natural sciences at Paris and travelled in Greece and the East, he went to Chili in 1828 and studied the botany, zoology, and meteorology of that country, and also of parts of Peru, Brazil, and Buenos Ayres. After his return to Paris in 1842 he published in Spanish, at the expense of the Chiliian government, his great work, the Historia física y político de Chile (Paris, 1843–81), in 24 vols., besides an atlas in 2 large 4to vols., composed of 815 plates.

GAY, Delphinus. See Girardin.

GAY, Ebenazer, an American clergyman, born in Dedham, Mass., Aug. 26, 1696, died March 18, 1787. He graduated at Harvard college in 1714, and was in 1718 settled over the church at Hingham, Mass., where he remained till his death. On his 85th birthday he preached a sermon from the text: “Lo, I am this day fourscore and five years old,” which, under the title of “The Old Man’s Calendar,” has been frequently republished in America, went through several editions in England, and was translated into one or two of the continental languages of Europe. In theology he was liberal. John Adams said, on the first distinctive announcement of Unitarianism in this country, that he had heard the doctrine from Dr. Gay long before. He published several volumes of sermons.

GAY, John, an English poet, born near Torrington, Devonshire, in 1686, died in London, Dec. 4, 1733. After receiving an elementary education at the grammar school of Barnstaple, he was apprenticed to a silk mercer in London, but soon abandoned this business for literary pursuits. In 1711 he produced his poem “Rural Sports,” which he dedicated to Pope, and a lifelong friendship sprung up between the two poets. In the following year he became secretary to the duchess of Monmouth. His next work, “The Shepherd’s Week,” was written to throw ridicule on the pastoral of Ambrose Philips, and met with great success. In 1713 he brought out a comedy called “The Wife of Bath,” which was acted only three nights. In 1714 he accompanied the British ambassador, Lord Clarendon, to Hanover as secretary. On the death of Queen Anne, however, he was dismissed from office, and driven once more to use his pen as a means of support. Soon after returning to England he produced a drama entitled “What d’ye Call It?” which was so well received that he made another attempt of a
similar nature, in which he is said to have been assisted by Pope and Arbuthnot. Owing to its personality and indelicacy, his "Three Hours after Marriage" proved a decided failure, and involved its author for a time in disgrace. In 1727 his celebrated "Beggars' Opera" was brought on the stage, and was represented for 63 successive nights, four of which were for his benefit, and yielded him nearly £700. This piece was followed by another opera entitled "Polly," but the lord chamberlain forbade its representation, and Gay was constrained to publish it by subscription, by which he realized £2,100 or £1,200. The most important of his other works are "Trivium, or the Art of Walking the Streets of London," and his "Fables," which are among the best of their kind in the language. Of his minor poems, the ballads of "Black-eyed Susan" and "Twas when the Sea was Roaring" are the most popular. Gay was at one time rich, but he lost nearly all his property by the bursting of the South sea bubble. His latter days were spent in the house of the duke of Queensberry. The prominent characteristics of his poetry are wit, simplicity, and sweetness. The best edition of his poetical works is that of W. Coxe (3 vols., London, 1797; 2 vols., 1806); the best edition of his "Fables," that of O. F. Owen (London, 1850).

GAY, Marie Françoise Sophie, a French novelist, born in Paris, July 1, 1776, died March 5, 1852. She was the daughter of a French financier named Nichault de la Valette, and was married in 1798 to M. Liottier, from whom she was divorced in 1799. She then became the wife of M. Gay, receiver general of finance in the department of Roer, under the empire, and accompanied him to Aix-la-Chapelle, its capital, where she resided ten years. She was remarkable for her wit, agreeable manners, and social disposition, and her house at Aix-la-Chapelle, at Paris after her return thither, and at Versailles, where she passed the last few years of her life, was the resort of literary and fashionable society. As early as 1802 she published anonymously in the Journal de Paris an article upon Mme. de Staël, and in the same year her first novel, Lauro d'Estell, which had a moderate success. In 1818 she published Léonce de Montmoreau, considered one of her best novels; in 1819, Anatole, which narrates the loves of a deaf mute; and in 1818, Les malheurs d'un amant heureux, a lively picture of manners during the empire. She continued to produce books until a few years before her death, among them Les souvenirs d'une vieille femme, a piquant abstract of her personal memoirs. She wrote unsuccessfully for the stage.

GAY, Sydney Howard and Winchworth Allan. See supplement.

GAYA, a town of Bengal, British India, in the district of Behar, 286 m. N. W. of Calcutta; pop. about 40,000. It consists of two parts, the old town, in which the Brahmas reside, and the new town, inhabited by the secular population and Europeans. The old town is well built, but the streets are narrow, filthy, and hardly passable. There are numerous shrines and places of pilgrimage, visited by devotees from all parts of India. The Phalgun, a tributary of the Ganges, flows through the town, and is deemed a sacred stream. The most revered structure here is the temple of Vishnu, erected by a Maharatta princess, 83 ft. in length, and crowned by an octagonal pyramid more than 100 ft. high. In the immediate vicinity are the ruins of Buddhagaya, supposed to have been the scene of the birth of Buddha, whence the sanctity of the existing town is derived. The new town has wide and straight streets, with a row of trees and foot walks on each side; but the houses for the most part are mere mud-built huts.

GAYANGOS, Pascual de, a Spanish orientalist, born June 21, 1809. He studied at Paris under Sylvester de Sacy, travelled through northern Africa in 1828, married an English lady at Algiers, and was from 1881 to 1886 interpreter to the ministry of foreign affairs in Paris. He afterward resided several years in England. He translated into English Al-Makkari's "History of the Mohammedan Dynasties of Spain" (2 vols., 4to, London, 1840-45). Prescott was indebted to Gayangos for materials for his historical works. In 1848 he was appointed professor of Arabic in the university of Madrid. He made with H. Vedea a Spanish translation of Ticknor's "History of Spanish Literature," to which he added copious notes (Madrid, 1861-65). Among his other publications are critical editions of the Gran conquista de ultramar, of the Libros de caballeria, and of the Escritos en prosa anteriores al siglo XV. His most recent works are Cartas del cardenal Cienfuegos (Madrid, 1887), and Cartas y relaciones de Hernan Cortes al emperador Carlos V. (Paris, 1879).

GAYARRÉ, Charles, an American historian, born in Louisiana, Jan. 9, 1868. He was educated at the college of New Orleans. In 1882, he drafted a criminal code having been placed before the state legislature by Edward Livingston, Gayarré published a pamphlet in which some of its provisions were ably canvassed. He studied law at Philadelphia, was admitted to the bar in 1892, and returned to New Orleans. An Essai historique sur la Louisiane (2 vols., 12mo), which he published at that time, attracted attention, and he was soon elected to the state legislature. The next year he was appointed deputy attorney general of the state, and in 1888 presiding judge of the city court of New Orleans. In 1896 he was elected to the United States senate, but impaired health prevented his taking his seat, and he went to Europe, where he remained for nearly eight years. In 1844 he again entered the state legislature, and was reelected in 1846. He was appointed secretary of state, and retired the office for seven years, after which he retired from public life. His histori-
eral of them are compounded is always an exact simple fraction, usually one half, one third, or one quarter of their joint bulk. Sir Humphry Davy having shown by means of the voltaic pile that potassium and sodium are not simple substances, as had previously been supposed, and having decomposed them by the same means, Gay-Lussac and Thénard obtained potassium and sodium in greater proportions even than they had been obtained by Davy himself. They also developed the compound character of boric and fluoric acids, introduced new methods of analyzing organic substances by their combination with chlorate of potash, and elucidated the composition of many of these compounds. The results of their investigation were given in *Recherches physico-chimiques sur la pâte, sur les alcools*, &c. (2 vols. 8vo, 1811). Gay-Lussac afterward made original researches of great value into the newly discovered elementary substances of iodine and cyanogen, into Prussian blue, chloric and hydrosulphuric acids, the theory of vapors, capillary attraction, and other subjects. Their results were published in the *Annales de chimie et de physique*, which he edited with Arago, and in other publications. In 1816 he invented the siphon barometer, since modified by Bunsen, by whose name it is best known. He also invented instruments for estimating the quantities of alcohol, chlorine, and alkali present in solutions, known severally as the alcoholometer, chlorometer, and alkaliometer. In 1882 he gave up the professorship at the Sorbonne, to which he had been appointed in 1809, and accepted that of general chemistry at the *jardin des plantes*. As an expounder of science he was distinguished for the clearness of his explanations. In 1831 he was chosen by the electors of his native town member of the chamber of deputies; and in 1839 he was made a peer of France.

GAZA (Arab. Ghaza or Ghusz), a town of Syria, built partly on a steep hill, partly on the plain below, on the road leading to Egypt, between the Mediterranean and the desert; pop. about 15,000. It is situated about 3 m. from the sea, in the neighborhood of rich gardens, is not fortified, and consists partly of mud cottages, partly of ruinous stone buildings, which are occupied by the government and chief citizens. It is an important entrepot for the caravan traffic between Egypt and Syria. It has few relics of antiquity, and its only interesting edifice is a mosque which was originally a Christian church, founded, according to tradition, by the empress Helena.—The ancient city of Gaza, which some suppose to have stood nearer the sea, is known in the Bible as the most southern of the five confederate cities of the Philistines, and is often mentioned, as in the history of Samson. Its Hebrew name (*Azaah*) signifies "strong." On the conquest and division of Palestine by the Israelites, it was allotted to the tribe of Judah, which conquered it, but lost it again. It
shared in the wars of the Philistines with the
Hebrews. Having become a possession of
Persia, it was taken after an obstinate siege by
Alexander the Great (332 B.C.); nearly all
its inhabitants perished during the assault, and
its commander Batis, at the conqueror’s order,
was dragged around the walls at the wheels of
a chariot. After Alexander’s death it was
taken by Antigonus, and witnessed the defeat of
Demetrius Poliorcetes by Ptolemy (812). After
the restoration of Jewish independence by the
Maccabees, it was several times assaulted, be-
sieged, and taken by the princes of that house.
The Romans ceded it to Herod the Great.
Under Nero it was taken by the revolted Jews.
Constantine restored its ancient splendor, made
it a bishopric, and gave it the name of
Constantia, with various privileges. These were
abolished by Julian the Apostate, and restored
by his Christian successors. The Arabs took
it in 684, two years after the death of Mo-
Peripatetic, and devoted himself to translating
from the works of Aristotle, Theophrastus, and
Hippocrates into Latin, and from those of Ci-
cero into Greek, and was also the author of a
treatise on the Attic months, of a book on the
origin of the Turks, and of a Greek grammar,
which was published at Venice and often re-
printed. After assisting at the council of Flo-
rence in 1439, he taught Greek at Ferrara by
the invitation of the duke, and founded there
an academy. In 1450 he was called by Pope
Nicholas V. to Rome. He afterward lived at
Naples under the patronage of Alfonso the
Magnanimous, and at Rome under that of Car-
dinal Bessarion.

GAZEL, or Gazzel, a kind of lyric poem, con-
isting of from 5 to 17 stanzas of two lines
each, all the second lines of which rhyme to-
gether. It is a favorite form in the poetry of
the Turks and the Persians, and may be called
the sonnet of the East. The last couplet al-
ways contains the real or assumed name of the
author. The subjects treated in the gazel are
either erotic and bache-
nalian, or allegor-
cal and mystical. Ha-
fiz excels in this form of
the lyric, and imi-
tations of it have been
made in German by
Platen, Rückert, and
others.

GAZELLE, the type of a group of the antelope
family (see Antelope),
of beautiful form, small
size, and graceful car-
rriage. Both sexes are
provided with horns, near-
ly over the orbits, an-
nulated and strata-
ted, nearly vertical, and
bending outward and
at the top inward in a
hook. The horns of the
ancient lyre is said to have originated from
using in its construction the horns and the
frontal bone of antelopes, the strings being
passed from a cross bar at their tips to a second
fastened across the orbits; the bony core of
the horn is solid. They have a small lachrymal
sinus, inguinal pores, generally tufted upon
the knees, a short dark-tuffed tail, and two or four
mammas; the darker color of the sides is sepa-
rated from the white of the abdomen by a very
dark band; the eyes are prominent, dark-colored,
with a soft and gentle expression; the
nose is ovine. They are gregarious, inhabiting
the open and barren plains of northern Africa
and western Asia, shy and difficult of approach,
and extremely swift. The common gazelle, or
Barbary antelope (gazella dorcas, H. Smith),
the gazal of the Arabs, is generally supposed to
be the éopard of Ælian and the beast of the

GAZA, Theodore, one of those learned Greeks
who contributed to the revival of letters in
Italy, born in Thessalonica about 1400, died in
Abruzzo in 1478. After the capture of his
native town by the Turks in 1480 he fled to
Italy, where he introduced a more exact
knowledge than had before existed of the two
principal philosophers of antiquity. He was a
lyrate form, and of a black color; the shape
of the
scriptures. It is a little less than the roebuck in size, with round, black, lyrated horns, about 13 in. long, with 12 or 13 bars, and sharp points turned forward; the general color is pale fulvous, extending down the front and outside of the limbs; the lips, nose, buttocks, appears to be one or the other of the preceding species. Other gazelles are the m’hor of Mr. Bennett, the nangrier of F. Cuvier, and the ariel or cora, which are also supposed by many to be varieties of the G. dorcas. Sömmering’s gazelle (G. Sommerringi, Rüpp.) is a very beautiful and delicate creature, about

common gazelle (Gazella dorcas).

under parts, and inside of legs white; a rufous tint on the forehead, blackish in the middle, and white and black streaks on the nose; eyes large, black, and lustrous. The horns in the female are more slender, and the points are turned inward; the mammae are two. This species seems to be confined to the N. side of the Atlas mountains, Egypt, Abyssinia, Syria, Arabia, and S. Persia. They feed generally at dawn and at evening, approaching water; it is said, only once in 24 hours; they are hunted in various ways, and their flesh is excellent; they furnish food to great numbers of carnivorous animals. The kevel (G. kevela, H. Smith) is by some considered a mere variety of the common gazelle; it is about the same size, but the head is longer, the horns are

Sömmering’s gazelle (Gazella Sommerringi).

2½ ft. high at the shoulder; the color above is a reddish-gray isabella color, the buttocks, lower parts, and inside of the limbs white, and the median line of the forehead to the nose brownish black; it inhabits N. E. Africa.

Geauga, a N. E. county of Ohio, drained by the sources of Cuyahoga, Grand, and Chagrin rivers; area, about 480 sq. m.; pop. in 1870, 14,150. It has an undulating surface, admirably adapted to pasturage. Sandstone and iron are abundant. The chief productions in 1870 were 64,815 bushels of wheat, 179,219 of Indian corn, 337,086 of oats, 185,731 of potatoes, 498,180 lbs. of flax, 877,941 of maple sugar, 105,811 of wool, 619,743 of butter, 458,834 of cheese, and 89,160 tons of hay. There were 4,632 horses, 18,674 milch cows, 7,267 other cattle, 19,816 sheep, and 3,844 swine; 6 manufactories of saddlery and harness, 12 of carriages and wagons, 8 of boxes, 27 of cheese, 4 flour mills, and 8 saw mills. Capital, Chardon.

Gébelin, Court de. See Court de Gébelin.

Gébee, Abu Musa Jafrar al-Gos, founder of the school of Arabian chemists about the close of the 5th century, born in Thys, Persia, or, according to Abulfeda, in Harran, Mesopotamia. He is reckoned by Cardan as one of the twelve sublimest geniuses of the world, and his authority was unrivalled among the alchemists of the middle ages. His works, only fragments of which remain, contain the germs of the belief in the transmutation of metals, and in the universal elixir, which he thought to be a solution of gold. They also contain curious and useful details concerning the nature, fusion, purification, and malleability of metals. They have all been translated into Latin (Dantzig, 1682), and into English by Russell (London, 1678).

Gebweiler (Fr. Guebwiller), a town of Germany, capital of a circle of Upper Alsace,
sitated on the Lanch in a valley of the Vosges mountains, 16 m. S. W. of Colmar; pop. in 1871, 11,888. It has three gates, a fine promenade, two handsome churches, and many Swiss chalets and pleasant cottages on the slopes of Mount Gebweiler, the culminating point of the Vosges (4,700 ft.). There are manufactories of cloth, cotton goods, ribbons, chemical products, machinery, and other articles. Previous to the Franco-German war it belonged to the French department of Haut-Rhin.

GECKO, a name applied to a family of nocturnal lizards (ascalesls of Dunéril and Bibron), numerous in species, living in warm climates, and presenting characters of form, structure, and habits which make the group as distinct as that of the crocodiles or chameleons. Their size is small; the head wide, flattened, covered with scales, with marginal scuta at each jaw; the neck short; the body depressed, stout, the tail in the middle, without crest on the back, generally covered with small imbricated scales and scattered tubercles, smallest on the back; the tail moderate; the feet five-toed, the thumb often very short, and the other fingers equal, flattened below and lobed at the end; the tongue is fleshy, short, slightly protractile, free and scarcely emarginate at the tip; the eyes very large, covered as in serpents by a transparent immovable lid, behind which these organs have free motion; the pupil vertical, and often linear as in nocturnal animals generally; the opening of the ear is distinct, and the tympanum depressed; there are no teeth on the palate, those of the jaws thin, entire, numerous, with cutting edges, and adhering to the internal margin; femoral pores occasionally present, but usually absent; besides the leaf-like expansion at the end of the toes, nails are generally present, capable of retraction, as in the cat, the latter favoring their progression in climbing on smooth surfaces. The tail is shorter than in ordinary lizards, and the flatness and width of the head give them somewhat the aspect of salamanders; the mouth is deeply cleft, and the widely expanded jaws may be kept open for a long time, the cavity of the mouth being shut off from the throat by the application of the base of the tongue to the posterior part of the palate; from the shortness of the robust legs, the abdomen touches the ground in walking. This reptile is mentioned by Aristotle, and the modern name gecko is derived from the sound made by some of the Indian species, resembling the click of the hostler urging on his horses, and was first given by Laurenti; this genus was the ascalabotes or Aristotele, the stella of Pliny, and the torrentola of the ancient Italians. Their colors are generally gray or yellowish, but some have brighter tints which can be varied like those of the chameleon, probably by the same changes in the reflecting surface of the integuments; the sides of the body, limbs, and tail are sometimes fringed with membranes. In many species there is a line of pores along and under the thighs, from which a fatty moisture distills; some species of a genus will have these, and others not, and sometimes one sex only will be destitute of them. The tail, as in salamanders, is ruptured with facility, and is reproduced readily, often in a deformed manner. Their food consists of larvae and insects, which they pursue into their leafy retreats; the imbricated plates on the bottom of their feet, like those of the tree frog and flies, enable them to climb smooth walls and similar surfaces, and to adhere to them with the back downward; by means of their sharp, curved, retractile claws, they can ascend trees and rough objects with ease and rapidity; from the quickness of their movements, their suddenly becoming motionless, and remaining so for a long time, and their resemblance to the colors of the substances on which they are placed, they are difficult to obtain, and not easy even to see; they hunt for food both by night and day, and are not particular as to which they choose for the pursuit of living prey enable them to escape their bird enemies. These reptiles are objects of horror and repugnance, from the erroneous idea that they exude a poison so powerful and subtle that their touch, a drop of their saliva, or a scratch with their nails, will produce leprosy and other contagious diseases, often ending fatally. They like to approach human habitations, as there they find in greatest abundance their insect food; their ill-shaped body, smooth or spiny, dull colors, large head, their enormous staring eyes, rapid and silent motions, and familiarity in houses, render them very disagreeable, but by no means dangerous insects. Found in all warm climates, they are very uncommon in Europe (two or three species), and most abundant in Asia, America, and Africa, and the Pacific islands are well supplied with them. They have been divided into genera according to the form and structure of their toes; but these generic characters in a family so nearly alike in its members are very unsatisfactory, and great and unnecessary multiplication of genera has been the result of the labors of various systematists. The arrangement of Dunéril and Bibron, which differs but little from that proposed by Ovlier in 1829, is as follows: 1. Platydactylus (Dum. and Bibr.), with toes enlarged for their whole length, with finely plicated striae beneath; of those species having the feet cloven, some have all the toes unarmed, others all ungulicate, others with the thumb only or with the second and third fingers unarmèd; of those with palmated feet the fingers are either all ungulicated, or the thumb alone is unarmed; there are about 20 species, of which the varieties have been made into genera by Fitzinger, Wiegmann, Kuhl, and others. 2. Hemidactylus (Cuv.), with the toes widened only at the base into an oval disk striated beneath; about 15 species. 3. Ptyodactylus (Cuv.), with the toes enlarged at the extremity into a cleft oval disk, striated below like a fan, and all armed with
claws; destitute of femoral pores; four described species. 4. Phylodactylus (Gray), with the terminal disk as in the last genus, except that two plates take the place of the fan-like stria; eight species. 5. Spheroiodactylus (Cuv.), small species, with the toes ending in a single, simple, smooth cushion; nails absent, as well as femoral pores; three species. 6. Gymnodaetys (Spix), with toes not widened, but striated beneath; 12 species. 7. Stenodactylus (Fitz.), with simple toes, granulated below, and all provided with nails; with a single species.—As specimens of this animal the following may be mentioned: The wall gecko (Pl. muralis, Dum. and Bibr.; Pl. facetans, Aldrov.) is 6 in. long, of a grayish color, the upper part of the body and head rough; this species occurs all around the Mediterranean, and conceals itself in walls and stone heaps, delighting to cover itself with dirt and filth; it likes the heat of the sun, and, though beneficial in houses by destroying insects and vermin, is generally feared and persecuted, like the toad and other useful creatures. The common gecko (Pl. guttata, Cuv.) of the continent of Asia and its archipelago is 11 in. long, of which the tail is about half; the general color is dark gray, with whitish spots. A common gecko in the walls of houses in the West Indies is the H. mabouia (Cuv.), about 5 in. long, of a grayish color marbled with brown, with the posterior half of the tail ringed with black. The house gecko (Pt. Hasselquiattii, Dum. and Bibr.), found in Egypt, Arabia, and countries bordering on the eastern part of the Mediterranean, is about 5 in. long, of a reddish gray color, spotted with white and pale brown, and whitish below; it is common in the damp and gloomy parts of houses, and is called at Cairo “father of leprosy,” from the belief that it communicates this disease to persons who partake of food over which this animal has walked, the poison being supposed to exude from the lobes of the toes. The truth is, that neither its bite nor any of its secretions are hurtful to man or beast; cats pursue it and eat it eagerly. The Egyptians are said to keep it from their kitchens by large quantities of garlic. The flat-tailed gecko (G. phylurus, Dum. and Bibr.) has the tail flattened like a leaf, and the upper part of the body rough with spines; it is a native of Australia, and is about 9 in. long, dark gray, marbled with blackish above, and whitish beneath.

GEDDES, William, a Scottish mechanic, the inventor of stereotyping, born in Edinburgh about 1890, died Oct. 19, 1749. He was originally a goldsmith in his native city, and is said to have first attempted stereotyping in 1725. In 1729 he entered into partnership with William Fenner, a London stationer, in order to carry his invention into regular practice, Fenner advancing the necessary capital on condition of receiving half the profits. Other partners subsequently joined the firm. In 1731 the company contracted with the university of Cambridge for the printing of Bibles and prayer books by stereotype, and invested a large sum of money in the enterprise; but when only two prayer books were finished the contract had to be surrendered, owing, as Ged alleged, to the malignant mismanagement of the presemens, who were hostile to the innovation, and the disreputable conduct of some of his associates. In 1735 he returned to Edinburgh, where in 1736 he completed an edition of Sallust, which was not published till 1744, and was inaccurately executed. Ged died in poverty.

GEDDES, Alexander, a Scottish Roman Catholic ecclesiastic, born in Arradow, Bannshire, Sept. 4, 1787, died in London, Feb. 20, 1809. He was educated at the Scotch college in Paris, where he distinguished himself as a theologian and linguist. In 1789 he was appointed pastor of a Catholic congregation at Auchinharig in his native county. In 1780 he removed to London with the intention of commencing a new translation of the Bible for the use of English Catholics; and under the patronage of Lord Petre, who allowed him £200 a year, and provided him with all the necessary authorities, he applied himself to his work. His original design was to make the Vulgate the basis of his translation, but he soon abandoned this idea, and substituted the Hebrew and Greek versions in its stead. The 1st and 2d volumes of this translation appeared in 1792 and 1798; the 3d, which was merely a commentary on the Pentateuch, in 1800; the rest of the work was never published. This translation is considered to have contributed in a considerable
degree to the advancement of Biblical criticism. The commentary was written in the spirit of the rationalistic school of Germany, and was favorably regarded by Paulus and Elsthorp, the principal writers of that school. Immediately after the publication of his commentary, the reading of his work was forbidden to the faithful, and the author was deposed from the priesthood. He was the author of several poems and translations, among which was an imitation of the satires of Horace, which had extraordinary success. A life of Geddes, with a catalogue of his works, was written by Dr. John Mason Good (1 vol. 8vo, London, 1808).

GEefs, Guillaume, a Belgian sculptor, born in Antwerp, Sept. 10, 1806, died May 10, 1860. After completing his studies he went to Paris, where he spent some time in the studio of M. Ramey. Soon after returning to Belgium he obtained a commission from the Belgian government to execute a monument to the memory of the victims of the revolution of 1830. He also produced "Genovière de Brabant," "Françoise de Rimini," "Fisherman's Daughter," "Infant St. John," etc., and executed a statue of Rubens, a colossal marble statue of King Leopold I. for the vestibule of the national palace, and a monumental statue of Charlemagne.—His brother Joseph, born in 1808, also a sculptor, distinguished by the same qualities, has executed among other works "Adonis departing for the Chase" and an equestrian statue of Leopold I. Their brother Azor, born about 1818, gave promise of great excellence as a sculptor, but died in 1841.

GEELONG, a city of Victoria, Australia, near the head of Corio bay or Geelong harbor, the W. arm of Port Phillip bay, 46 m. S. W. of Melbourne, with which it is connected by railway; pop. in 1871, 14,897. It is built on ground sloping to the bay; the streets are wide and well paved and drained, and the houses are mostly of brick and stone. The principal buildings are the hospital and benedictine asylum, the chamber of commerce, the mechanics' institute, the clock tower, the grammar school, the court house, the post office, several of the hotels, the churches, and the banks. There is an extensive botanical garden. The town is lighted with gas, and is supplied with water from the river Barwon. The surrounding country is beautiful, the soil fertile, and the climate healthy. There are four jetties in Corio bay, at which large ships can load and discharge, and the commerce in wool, tallow, gold dust, &c., is important. Three newspapers are published.—Geelong was first settled in 1837, and was incorporated in 1849. It first assumed importance after the discovery of gold at Ballarat, 48 m. N.W., in 1851, and for a time promised to become the principal seaport of southern Australia; but the discovery of gold at Bendigo in 1852 and of gold in southern Australia diverted the produce of the interior to Melbourne.

GEER, Karl de, a baron, a Swedish naturalist, born at Finspang, Feb. 10, 1720, died in Stockholm, March 8, 1778. He studied at Utrecht and Upsal, was a pupil of Linnaeus, and published Mémoires pour servir à l'histoire des insectes (8 vols. 4to, Stockholm, 1762-78), containing descriptions of more than 1,500 species, accompanied with excellent illustrations. To this the Genera et Species Insectorum of Retzius (Leipaic, 1788) may be regarded as a supplement. De Geer also published several other zoological works. He inherited from an uncle a very large fortune, which he employed in benevolent and useful enterprises.

GEETS, Charles Hare, a Belgian sculptor and wood carver, born in Antwerp in 1608, died in 1655. He was professor at the academy of Louvain. Among his principal works are "Christ sinking under the Weight of the Cross," in Leyden; a Madonna in the museum of Brussels; the "Mater Dolorosa" and "St. John" in Bristol. At the great exhibition of 1851 he gained a prize medal for his chief contribution, the "Coronation of the Virgin."

GEESTEMÜNDE, a seaport of Prussia, in the province of Hanover, at the confluence of the Geeste and Weser, separated by the Weser from Bremerhaven; pop. in 1871, 3,319. It was established by the government of Hanover as a rival of Bremerhaven, was made a free port in 1847, and in 1862 extensive harbor works were commenced. Since the annexation of Hanover to Prussia, Geestemünde has been made a station of a part of the German fleet. The place possesses some advantages, which will probably render it an important port.

GEEL. See ETHIOPIA, LANGUAGE AND LITERATURE OF.

GEFFRARD, Fabre, a mulatto soldier and president of Hayti, born at L'Anse-Vean, Sept. 19, 1806. His father, Nicholas Geffrard, was a general of the war of independence and one of the framers of the national constitution. Fabre entered the army in 1821. After the downfall of President Boyer in 1842 he rapidly rose in rank and consideration, and became general of division in 1845, to which rank Soulouque on becoming emperor in 1849 added a ducal title. Geffrard's popularity increased in proportion to the decline of that of his master, and at the end of 1858 he led the revolution against him, proclaiming his deposition at Saint-Marck. While the emperor was marching toward that place with a considerable force, Geffrard succeeded in outwitting him, and in entering Port-au-Prince Jan. 15, 1859. He banished Soulouque to Jamaica, and being at once chosen as president, he marked his succession by acts of clemency and by salutary reforms, declining to accept the absolute power offered him. Those who had benefited by previous abuses now conspired against him, together with the minister of the interior, Guerrier-Phillipe, and on Oct. 17, 1862, he was assassinated upon his life (Sept. 8), which resulted only in the assassination of his daughter, who had just been married. The minister and two accomplices were sentenced to death in their absence; 16
others were executed, and a few were pardoned or imprisoned. In 1861 his popularity was impaired by what was denounced as his subserviency toward Spain on its taking possession of the Dominican republic; and intestine commotions being set on foot on various pretexts, outbreaks became henceforward habitual occurrences, which were suppressed and many of their leaders executed. In 1864 Salzner headed an insurrection in the N. part of Hayti, which had belonged to Dominica. This movement being put down and Salzner outlawed, he enlisted soldiers in the adjoining republic and proclaimed a provisional government of the Cape district in May, 1865. In November this was overthrown with the aid of the English, with whose rights it had interfered, and Salzner took refuge on board an American man-of-war. In July, 1866, he led a new outbreak at Nordvijk, which was once more put down. To reconcile the people, who began to compare him with Soulouque, Geffrard abolished capital punishment for political offences; but the revolution continued and increased in strength till Salzner gained possession of the capital, March 18, 1867, and Geffrard was obliged to take refuge in Jamaica.

GEFFLE, a seaport town of Sweden, capital of the lands of Gefleborg, situated near the Gulf of Bothnia and the mouth of the river of its name, 92 m. N. N. W. of Stockholm. It formerly contained a population of about 13,000, and was one of the handsomest towns in Sweden, but in 1869 it was almost totally destroyed by fire. The chief manufactures are tobacco, linen, sail cloth, cards, and leather. There are two ship yards.

GEMEINA (Heb. Ge-Hinnom, the vale of Hinnom), a valley adjacent to Jerusalem, on the south and southwest, also called Tophet, and often mentioned in Scripture in connection with the idolatrous rites of Moloch, which were there celebrated. From the abhorrence with which the Jews after the captivity regarded this worship, the valley was made the common sewer of the city, and a receptacle for all its refuse, which was there consumed by fire. In the New Testament the name is transferred by an easy metaphor to hell.

GEIGEL, Emanuel, a German poet, born in Lubeck, Oct. 18, 1815. He became associated in 1836 at Berlin with Chamisso, Gaudy, and Kugler, and was professor of aesthetics in the university of Munich from 1852 to 1868. Of his Gedichte und Gedankenblätter, the 9th edition appeared in 1888; of his Neue Gedichte, the 12th; and of his Juniustiester, the 18th, in 1870; of his Gedichte, the 89th in 1871; and of his political poems, Heroldarufe, the 4th in 1871. His principal dramatic poems are Brunhild (1867) and Sophoinde (1868).

GEIGER, Abraham, a German rabbi, orientalist, and Biblical critic, born in Frankfurt, May 24, 1810, died Nov. 13, 1874. He studied at the universities of Heidelberg and Bonn, gaining in the latter the prize for a dissertation on the Hebrew sources of the Koran. In 1899 he became a rabbi at Wiesbaden, in 1898 at Breslau, in 1898 at Frankfurt, and in 1899 at Berlin, which position he held till his death. His efforts to effect reforms in Judaism rendered him one of the most conspicuous Jewish theologians in Europe. From 1895 to 1847 he edited the Zeitschrift für jüdische Theologie, and in 1863 he started the Jüdische Zeitschrift für Wissenschaft und Leben. The most important of his writings are: Lehr- und Lesebuch zur Sprache der Mischna (Breslan, 1848); Ur- schrift und Übersetzungen der Bibel (1857); and Das Judenthum und seine Geschichte (3 vols., 1865-71); English translation of part i., New York, 1886.)

GEIJER, Eric Gustaf, a Swedish historian and poet, born at Ransäter, Wermland, Jan. 13, 1788, died in Upsal, April 23, 1847. At the age of 18 he was sent to the university of Upsal. He neglected to take his degree at the proper time, and consequently in 1808 was refused a tutorship in a distinguished family. This aroused his pride, and to restore his reputation he at once determined to contend for the next prize of the Swedish academy for excellence in composition. With very meagre authorities, and with scarcely paper enough for his manuscript, he wrote a eulogy upon the Swedish administrator Sten Sture, which obtained the first prize. He graduated master of arts in 1806, and after a short visit to England was appointed in 1810 lecturer on history at Upsal, and was a second time crowned by the academy for an essay on the question: "What advantages may be derived from the imagination in the moral education of man?" In 1811 he was one of twelve young men who founded the Gothic society, the object of which was to nurture a national spirit and national manners, and to derive the materials of literature, not from classical and foreign sources, but from the ancient traditions of the North. The new school was quickly divided into two parties, the Gothic and more moderate party, of which Geijer and Tegnér were the chiefs, and whose organ was the Iduna, and the Phosphorist party, so called from its organ the Phosphores, of which Atterbom was the chief. In the Iduna, which appeared from 1811 to 1824, Geijer published his finest poems, as "The Viking," "The Last Scal'd," and "The Last Champion," which became immediately popular. His song of "The Charcoal Boy" is still a favorite throughout Sweden. In 1814-15 he united with A. Zelinus in preparing a collection of Swedish popular ballads, and in 1817 was appointed professor of history at Upsal. He composed melodies for many of his own songs, and in 1824 published, in connection with Lindblad, Musik för Sång och Pianoforte. Liberal in politics and religion, he was twice offered a bishopric, which he declined, and twice represented the university of Upsal in the diet. His chief distinction is as the historian of Sweden. He was appointed with Fant
and Schröder to edit the collection of *Scriptores Rerum Suecicarum Medii Ævi* (3 vols., Stockholm, 1818–25). His *Svea Rikes Häftcer* ("Annals of Sweden," Upsal, 1820; translated into German, 1826) is a collection of dissertations on the early history and antiquities of the kingdom. His principal work is the *Svenska Folkets Historia* ("History of the Swedish People," 8 vols., Orebro, 1832–6; translated into German by Leffler, Hamburg, 1832–6; into French by Lundblad, Paris, 1840; and into English by Turner, London, 1845), which extends only to the death of Queen Christina, but has been continued by Carlson. The work of Fryxell is also regarded as a supplement to it. At once a history of ideas, of manners, and of institutions, it is remarkable both for eloquence and learning, for its patriotic tone. Among his minor works are a "Sketch of the State of Sweden from Charles XII. to Gustavus III." (Upsal, 1839), and "Life of Charles XIV. John" (1844). A complete edition has been published (12 vols., Stockholm, 1849–55).

**GEIKIE, Archibald.** See supplement.

**GEIKIE, Cunliffe.** See supplement.

**Gela**, an ancient city of southern Sicily, on a river of the same name (now Fiume di Terranova), founded about 690 B. C. by a colony of Rhodians from Lindus and Crete. It soon became flourishing, and was the parent of Agrigentum (now Girgenti), which afterward surpassed the mother city. The constitution of Gela was originally oligarchical, but was overthrown in 505 B. C. by Cleander, who was the first of its tyrants. His brother Hippocrates succeeded him, and extended its influence and power over the greater part of Sicily. His successor Gelon's transfer of the seat of his power and of a part of the inhabitants of Gela to Syracuse (485), his brother Hiero being made governor of the former, caused his decay; and its desolation was completed about 280 by Phintias, tyrant of Agrigentum, who removed its inhabitants to a new town, to which he gave his name. In the time of Augustus it was already in ruins, which are still visible in the vicinity of Terranova.

**GELATINE**, an actized substance obtained from various parts of the animal body, such as the white fibrous tissue, the skin and serous membranes, and cartilage, by boiling in water. The substance as it exists in the body is probably not precisely the same as that obtained by boiling, although it cannot be said with certainty that the proportions of its chemical constituents have been changed. No precise formula of equivalents has been established, and it is therefore usual to write the composition of gelatine in percentage parts by weight. According to Mulder it consists, in 100 parts, of carbon 50·40, hydrogen 6·94, nitrogen 18·94, and oxygen and sulfur 24·62, of which about 0·7, according to Verdell, is sulphur; but the presence of sulphur is disputed, and gelatine, although an actized, is not a proteine substance. Frémy and Scherer make the percentage of nitrogen rather less than that here given. The gelatine of commerce is prepared as follows: The skins of calves' heads and other thick pieces which are unfit for the manufacture of leather are first freed from hair and thoroughly cleaned of flesh and fat, and well washed. They are then reduced by cutting machinery to small pieces or to a pulp, and cold water being allowed to run through the pieces during this operation in order to remove all impurities. The pieces of skin or pulp are differently treated by different manufacturers in order to obtain the solution most readily, some employing the mechanical force of rollers in conjunction with the application of a temperature varying from 250° to 300° F. When the solution is obtained it is clarified with some albuminous matter, as the white of eggs or ox blood, and after settling is drawn off upon shallow coolers, as plates of glass or plates. When partially dry, so that it can be cut into convenient shapes for handling, it is removed upon nets or placed in a vacuum drying apparatus to complete the process of desiccation. In the course of the preparation the substance is flavored with essences. Bones and ivory also are made to yield gelatine by subjecting them, when crushed, to water boiling at high temperatures in a digester, or to the action of steam gradually raised to the pressure of 32 pounds to the square inch, and thus kept for 24 hours. By this means their soluble portions are taken up, and the earthy matters, about 60 per cent. of the whole weight, are left behind, together with a soapy substance produced from the fat and lime of the bones. This residue is used for the manufacture of bone black, or the preparation of phosphorus, and is besides an excellent material for composts. The manufacture of gelatine has been largely carried on in France by first removing the earthy salts from bones by digesting them for many days in dilute hydrochloric acid, and afterwards in boiling water,—For a long time gelatine was largely employed in the hospitals and pauper establishments of Paris, as a cheap and, as it was believed, very nutritive material for soups. Its value for this purpose was at last questioned, and the commission appointed to investigate its qualities reported unfavorably. It is, however, generally regarded as possessing nutritive properties, though in a less degree than fibrine and albumen, and even if insufficient itself to support life, its almost universal use in some form of food attests its importance as an article of diet. It also finds numerous other uses, as for the clarifying of liquors, in the manufacture of cements, as a chemical test for tannin, and in pharmacy for coating pills and forming powders or capsules in which inseparable medicines may be concealed and afterwards removed. It is also applied in the dressing of silk and other stuffs. It is made by the French into thin transparent sheets called *papier glace*, which are used for copying drawings; and they also

GELLUS

prepare from it artificial flowers richly colored to imitate the natural specimens, or presenting the appearance, in their glittering and semi-transparent substance, of flowers wet with dew or drenched with rain. Another application of gelatine is in the making casts or forming moulds of objects presenting complicated forms, for retaining which plaster is not sufficiently adhesive. A series of casts in imitation of ivory were produced in this substance in 1844 by M. Franchi, for which the prize of the London society of arts was awarded in 1846. He afterward obtained gelatine casts from moulds of the same substance, the lines being perfectly retained in their original sharpness. He also took casts in gelatine from flat models, which he applied to cylindrical bodies, thus saving much expense in the carving or construction of intricate models. Pure gelatine is colorless, transparent, inodorous, and insipid. It should be tested for smell by putting it in boiling water, as when dry the odor of glue may not be perceived. It softens and swells in cold water, but does not dissolve till heat is applied, a property which distinguishes it from fibrine and albumen. According to Bos-tock, one part of gelatine dissolved in 100 of water gelatinizes on cooling, but in 150 parts it remains liquid. When the solution is repeatedly warmed and cooled, especially if boiled, it loses its tendency to gelatinize, and becomes more and more soluble in cold water. Gelatine is soluble in all the dilute acids except tannic, in which respect it differs much from albumen. It is precipitated from aqueous solutions by excess of alcohol. Tannic acid is a very delicate test; when added to a solution of one part of gelatine in 5,000 parts of water, it will render it cloudy; when added to a strong solution, a dense curdy precipitate falls, which is the same substance as the basis of leather. Gelatine is rendered insoluble when mixed with chromic acid and exposed to the action of light. The manufacture of imitations of ivory, and in the reproduction of photographic prints, according to the invention of Woodbury and Albert. Gelatine which is obtained from the sounds of fishes called isinglass, and an impure variety is known as glue. (See Glue, and Isinglass.)

GELDERLAND, or Guelderland, a province of Holland, bounded N. W. by the Zuyder Zee, S. E. by Prussia, and on the other sides by the provinces of Overyssel, Utrecht, South Holland, and North Brabant; area, 1,964 sq. m.; pop. in 1870, 482,689. Its surface is more hilly than that of most of the Netherlands; its climate is mild, but its soil, except in the river valleys, is poor. The principal streams are the Maas (separating it from North Brabant), Waal, Rhine, and Yssel, on the banks of which fruit, grain, hops, potatoes, and tobacco are cultivated with considerable advantage, while the more sterile districts have recently been planted with timber, or are used for cattle raising. Brewing, distilling, and the manufacture of paper, linen, tiles, and leather, are important branches of industry, and there is also an extensive transit trade. There are iron mines in the canton of Zutphen. The herring fishery is actively prosecuted on the Zuyder Zee. Arnhem, the capital, Nimbuacen, Zutphen, and Harderwyk are the chief towns. — Gelderland was made a county in 1079 by the emperor Henry IV., and a duchy in 1389 by Louis the Bavarian. It was governed by dukes of its own, who resided at its present capital, till 1528, when it passed into the hands of Charles V. It joined the union of Utrecht in 1579. In 1794 it was taken by the French, who held it till 1814, when it became a part of the Netherlands. A portion of upper Gelderland (area, about 450 sq. m.), including its capital Geldern, was added to Prussia by the peace of Utrecht (1718), and now forms part of the circle of Geldern in the district of Düsseldorf.

GELDERN, a town of Prussia, in the province of the Rhine, on the Niers, 28 m. N. W. of Düsseldorf; pop. in 1871, 6,096. It has a Catholic and a Protestant church, two convents, manufactures of cloth, stockings, hats, woollen, silk, and linen goods, and a considerable trade in grain. The town was built in 1097, and was till 1848 the residence of the counts and dukes of Geldern. (See Gelderland.) Its fortifications were razed by Frederick the Great in 1764.

GELL, Sir William, an English scholar, born at Hopton, Derbyshire, in 1777, died in Naples, Feb. 4, 1836. He graduated at Cambridge in 1798, and was sent on a secret mission to the Ionian Islands. In 1814 he accompanied the princess of Wales abroad as one of her chamberlains, and was one of the witnesses at her trial, after she had become queen. He subsequently returned to Italy, where he sojourned till his death. He was a voluminous writer on classical antiquities. His principal works are: "The Topography of Troy and its Vicinity" (fol., 1804); "Inscriptions and Specimens of Imitations of Imitations of Ivory, and in the Reproduction of Photographic Prints, According to the Invention of Woodbury and Albert." Gelatine which is obtained from the sounds of fishes called isinglass, and an impure variety is known as glue. (See Glue, and Isinglass.)

GELLEK, Christian Freidtgotth, a German poet and moralist, born in Hainichen, Saxony, July 4, 1715, died in Leipzig, Dec. 18, 1769. He was one of the early promoters of the great literary movement which produced Schiller and Goethe. The latter in his youth was one of his disciples, but judged his ethical system to be of an effeminate tendency. He published fables and poetical tales, which are still popular, letters, sacred hymns and odes, and a romance entitled "The Swedish Countess." He was professor of philosophy in the university of Leipzig.

GELLUS, Aulus, Roman orator, who flourished about the middle of the 3d century A. D., supposed to have been born in Rome. He studied rhetoric there, and philosophy at
Gelon. He was still a youth when he commenced, during the long winter evenings spent at a country house near Athens, a compilation of extracts from Greek and Roman authors, concerning languages, antiquity, philosophy, history, and literature, interspersed with original remarks. He continued it at Rome, where he held a judicial office. His work, named from its origin Noctes Atticae ("Attic Nights"), and divided into 20 books (of which the 8th is lost), though without any attempt at order or arrangement, contains a mass of materials, valuable mostly as remnants of lost ancient authors. The editio princeps was published at Rome (1469); the best of the older editions at Leyden (1706), by Gronovius, reprinted at Leipsic (1752). The best of all is that of Hertz (Leipsic, 1855). An English translation was published by Bedloe (London, 1795).

Gelon, a ruler of Syracuse, born in Gela in Sicily, died about 478 B.C. He served as commander of the cavalry under Hippocrates, tyrant of Gela; on whose death, the people revolting against his sons, Gelon supported the latter, but finally set them aside and assumed the chief power himself (491). Called to the assistance of the Camorians, the landed aristocracy of Syracuse, then expelled by the revolted slaves and the popular party, he contrived to become master of that city (about 485), appointed his brother Hiero governor of Gela, and by degrees extended his influence and power over all Sicily. He won the affections of the Syracusans by mildness, by the protection of arts and sciences, and by the aggrandizement of the city, for which purpose he even destroyed Camarina and other towns, and transplanted their inhabitants thither, as well as half the population of Gela. When Xerxes was threatening the invasion of Greece, the Ionians and Athenians invoked the assistance of Gelon. According to Herodotus, he offered to furnish 500 triremes, nearly 80,000 soldiers, and corn for the whole Grecian army so long as the war should last, provided he was made commander-in-chief. The condition being rejected, Gelon sent an ambassador to Delphi, with rich gifts, and orders to greet and acknowledge Xerxes if victorious. Herodotus, however, also mentions that the Syracusans give a different version of the affair, which vindicates the character of Gelon and the policy of the Syracusans in not assisting Greece. They were fully occupied at home, for the Carthaginians at this juncture invaded Sicily with a great army. Gelon completely defeated them at Himera (480), on the same day, according to Herodotus, on which the Greeks won the victory of Salamis, but according to Diodorus, on the second day of the battle of Thermopylae. He now proposed to resign his power and restore popular liberty, but the offer was rejected in the assembly, and his exhibition of magnanimity was rewarded by the title of king, which he accepted and bore till his death. The Syracusans erected, against his will, a splendid tomb to his memory, and honored him as a hero. When Timoleon, 180 years afterward, sought to destroy all vestiges of the tyrants, the statue of Gelon was excepted. His brother Hiero was his successor.

GEM (Lat. gemma, a bud), the designation of precious stones prized for their brilliant lustre and splendid colors or perfect limpidity. They possess also a hardness which renders them susceptible of the highest polish, and capable of retaining unimpaired the forms into which they are cut and the lines or figures that may be engraved upon them. These properties, in connection with their rarity, have given to them the highest value of all substances. The principal gems are diamonds, rubies, and emeralds; the finest specimens of these are noticed under their respective titles. Other beautiful species of gems are the agate, chrysoberyl, chrysolite, garnet, sapphire, topaz, tourmaline, &c. These stones are not usually presented by nature in their full beauty; but they are found in the form of worn pebbles among the sands derived from the disintegration of the rocks in which they were originally contained. Some, however, are obtained crystallized in the matrix of quartz, calcareous spar, or other gangue of veins in which they were produced, or in geodes, of the dark cavities of which they made with other crystals a lining or inerstination. The crystals may have the perfections of the stone fully developed, but art is not satisfied with the form, and this is almost always sacrificed to fit the stone to the shapes judged best suited to display its highest lustre. The rough pebble requires the work of the lapidary to develop its beauties. The processes to which the stones are subjected are described in the articles DIAMOND and LAPIDARY; the method of carving them to bring out from their differently colored layers figures in relief is described under CAMOS; and gem engraving will be treated in this article.—To distinguish gems from each other and from their artificial counterfeits, a practised eye was formerly sufficient; but modern imitations are so perfect, that the tests of comparative hardness and of specific gravity are often required. The chemical tests which are usually employed to distinguish minerals cannot be applied to these stones on account of the injury they would occasion. The finest collection of gems in the world is that of the emperor of Russia. Siberia has proved a rich field for their production, and all precious stones found there belong to the crown. They are taken to Yekaterinburg, and being cut and polished in the government works, the choicest are selected for the imperial treasury. Clarke in his account of his travels in Russia makes frequent reference to the abundance of gems, and we frequently meet with in the cabinets and jewellers’ shops, and states that in Moscow they were as costly as in Western Europe, that the most costly gems were sometimes purchased in London to be deposited in Russian collections. Different Asiatic coun-
tries, particularly Hindostan, Pegu, and Ceylon, have been famous from the remotest periods for their rich gems; and in modern times Brazil, Peru, and South Africa have rivalled them in these productions. —Gem Engraving, known also as the glyptic art (Gr. γλυττική, to engrave), was skilfully practised in very remote times. In Exodus xxviii. 17–20, the following stones are designated as those upon which were engraved the names of the twelve children of Israel: sardius, topaz, carbuncle, emerald, sapphire, diamond, Jigur, agate, amethyst, beryl, onyx, and jasper. At this early period, as we learn from verse 11 of the same chapter, engraving of signs, and upon the hardest stones, was practised. The Israelites, it is believed, acquired the art from the Egyptians, who are known to have made use of the lapidary's wheel and emery powder, and are supposed to have been acquainted with the diamond and the method of engraving other hard stones by means of it. The Assyrians and Babylonians were very skilful in engraving on gems, many of which have been found in the ruins of their cities. Many of their seals are most delicately and minutely ornamented with various sacred devices and with the forms of animals. The Greeks adopted the art, and practised it with the greatest zeal and success. Their works of the time of Alexander the Great are still the most perfect specimens. The most distinguished among their earlier artists was Pyrgoteles, who alone was permitted to engrave the head of Alexander, as Apelles only was allowed to paint his portrait, and Lysippus to cast his image in bronze. During the reign of Augustus in Rome, Dioscorides from Æolia in Asia Minor attained the highest eminence. His head of Io is regarded by some as the finest engraved gem in existence, and others almost equally beautiful are two busts of Augustus, a head of Demosthenes on an amethyst, and various mythological representations. Several of the most skilful artists of Greece established themselves at Rome under the emperors. With the empire the art declined, and though the mechanical execution was not lost, no productions of genius appeared till the 15th century. At this time it became fashionable to make collections of antique gems, and among others Lorenzo de' Medici was especially interested in this object and in encouraging artists to imitate the finest productions, in which they attained great success. The same taste soon spread to France, Germany, and England; and in all civilised countries the art has since been held in high estimation. As applied to the hardest gems, as the diamond, ruby, sapphire, and topaz, it is no doubt carried to a higher degree. For all practical purposes, for the gem engraver in modern times, for among the antique engraved gems preserved there are few if any of this class. Engraved gems are for the most part readily referred by connoisseurs to their true period, country, and sometimes to the artist himself. Each had his own cipher, which is commonly found upon the gem, though this is in modern times imitated, together with the peculiar style of the ancient artists and their complete work, in great perfection. Specimens of Egyptian art are recognized by the representations of the peculiar favourite animals and divinities of this people, accompanied with their hieroglyphics. Their gems were engraved almost exclusively in intaglio, and they were of the form designated as scarabaeus, from the upper surface of the stone, always of the oval form, being cut to represent the beetle. The Egyptians also adopted this form, but their devices more resemble those of the earliest Greek workmanship. Their specimens are distinguished by low relief, a granular border surrounding the engraving, stiffness in the figures, peculiar style of letters and writing, wings given to the deities which the Greeks represent without wings, and names generally attached to the figures. The Greeks also practised chiefly in intaglio, and some of their finest works are in chalcedony and carnelian. The highly famed Dionysiac bull of Hyllus, an artist supposed to have lived before the age of Augustus, is upon chalcedony; and a celebrated specimen in carnelian is the beautiful seal which once belonged to Michel Angelo, and was afterward preserved in the national library at Paris. The engraving represents a vintage, but the design has been referred in various learned dissertations to a number of different objects, some of mythological character. Many impressions and copies have been taken of this famous specimen. The engraved gems of the first 15 centuries A. D., excepting the imitations of antique works, generally have designs from Scriptural subjects —images of Christ and of the Virgin Mary, representations of the Good Shepherd, and often a fish, symbolical of the Saviour, from the letters in its Greek name, ιχθῦς, being the beginning letters in the appellation Ἰησοῦ Χριστοῦ Θεοῦ άνθρώπον Σωτῆρ. Some terms employed to designate certain styles of antique gems may be properly noticed here before speaking of the art in modern times. Stones convex on one side are said to be en cabochon; chimaerae are those with representations of imaginary beings made up of portions taken from different animals; grylli are those with hideous heads, said to be so called from an Athenian named Gryllus, who was extraordinarily ugly; conjugata, or joined, are those with heads represented together upon the same profile, called opposite when they face each other. Engraving was practised both in intaglio and in rilievo, and the two styles were sometimes combined in the same specimen. Stones having differently colored layers, like the onyx, were especially adapted for the rilievo style, for an antique gem often was even tinted. In modern times the finest gem engravers are found among the Italian artists of the 18th century, and chiefly those of Florence. Some of their works are hardly inferior to those of the most famous Grecian artists. Flaviano Sirletti of Florence, who died in 1737, was especially distinguished
for his copies of ancient gems and exact imitations of the ancient letters. The Costanzis and many others also attained great repute; and in the present century are some whose productions, as those particularly of Signor Rega of Naples, rank with the famous antique gems. Among the Germans, Daniel Engelhard of Nuremberg, a friend of Albert Dürer, was celebrated for his skill in engraving crests and arms. He died in 1553. The works of the Fichlers, father and son, who came from Tyrol, are of the highest merit, especially those of the father. The son was much in Italy, and is often spoken of as an Italian. The celebrated Poniatowski collection of antique gems has recently been credited to the elder Fichler. Natter of Swabia, who died in 1768, was not only a workman of the most delicate skill and refined taste, but a student and author also, and published in 1754 a treatise specially devoted to his art: *Traité de la méthode ancienne de graver en pierre dure, comparée avec la méthode modernes.* From this work it appears that the ancients employed the same sort of tools and the same methods as those in use at the present day. The modern practice is described by Holtzappfel in vol. iii. of his "Mechanical Manipulation."—The apparatus employed in engraving consists of a foot lathe attached to a small table, upon which is fixed a little pillar for holding the horizontal pulley, which is the receptacle for the cutting tool. This part of the apparatus is called the mill. The tools are soft iron wire spindles carefully annealed and nicely fitted to the hollow axis of the pulley. Only one is used at a time. When set in its place it projects through the bearings of the pulley, one end extending horizontally on the right-hand side of the operator, who sits at his work in front of the table. This extremity of each tool is fashioned for its special work. Most of them terminate in a small disk, the edge of which, as it rotates rapidly, cuts lines in the stone held up against it, the tool being fed with diamond dust and oil. The larger sized disks are only about a quarter of an inch in diameter, and from this they are made of decreasing sizes down to 1/16 of an inch, when the disk can scarcely be distinguished by the eye from the stem. They are also variously shaped for special kinds of cutting. The stone intended to be engraved is usually shaped by the lapidary, and is sometimes set by the jeweller before it is engraved. If not set, the engraver secures it to a wooden handle by the cement known as the lapidary's; or if set, he secures it in a notch in a piece of cork. The polish is removed by roughening the face with a suitable cutting powder, as the tools work better upon a rough surface, and the outline of the design, which is next marked with a brase point, is the more conspicuous. The area thus enclosed is then sunk by the tools to a suitable depth; and within this the details of the design are successively introduced and excavated. For the parallel lines, called color lines, a thicker disk with two cutting edges is employed, its form being that of a little pulley; the two edges are just as far apart as the lines they are intended to cut, and as one pair is cut the stone is moved so as to bring the outer edge of the disk into the groove marked by the other edge, and thus the work goes on step by step over the surface to be thus "colored." The plan must be perfectly understood by the artist at the commencement of his work, and as it goes on he watches the effect produced with the aid of a magnifying glass conveniently attached to a stand over the tool, and occasionally takes a proof of his work in wax. After the stone is engraved the polish is restored to the flat surface by a pewter polishing disk or lap fed with rotten stone and water. The engraved portions are polished with great care, first by using in the mill copper tools charged with diamond powder; this bursies itself more deeply in the copper than in the iron tools, and a smoother surface is thus obtained. Boxwood tools charged with still finer diamond powder are next used, and after these copper tools charged with rotten stone and water. The harder gems, excepting the diamond, which is engraved with the greatest difficulty, are better adapted for this process than those of softer quality. The latter are liable to hold the diamond powder and cause it to wear out the tools; they do not when finished present such smooth and highly polished surfaces as the harder stones. The amethyst is considered as soft a stone as can be cut very smoothly. Carnelian and bloodstone are of close texture, and admit of excellent work; the ruby cuts slowly, but small pieces are apt to flake off. The sapphire is firm and close; it cuts slowly, but presents beautifully smooth surfaces.—Artificial Gems. The great value attached to precious stones led at an early period to successful attempts to imitate them. The Egyptians possessed the art of coloring glass, and among their mixtures they produced excellent imitations of the most beautiful gems, so that, as Pliny states, it was difficult to distinguish the false from the real. Their artificial emeralds, sapphires, and hyacinths are spoken of by various ancient authors. Some of the first named were of such gigantic size that they were used in the construction of statues, as of that of Serapis in the Egyptian labyrinth, 154 ft. in height. Another presented by the king of Babylon to an Egyptian Pharaoh was 6 ft. long and 44 broad; and an obelisk in the temple of Jupiter 60 ft. high and 6 ft. broad was composed of four artificial emeralds. These were very extraordinary productions if made only of pieces of colored glass. Seneca also makes mention of one in his time who manufactured artificial emeralds. Beckmann states that in some ancient collections at Rome are pieces of colored glass, which were once used as jewels. In the Museum Victorium are seen a chrysolite and emerald of faultless execution. In the 17th century the discovery of the preparation of gold and binoxide of tin, called purple of Cassius, afforded
the means of giving a ruby-red color to glass, and artificial rubies were then first made, especially by one John Kunkel, afterward Lowenstein, inspector in 1879 of the glass houses in Potsdam. In modern times the art has been wonderfully perfected, both in Europe and America, through the genius of M. Donatien-Wieland.

A glass called strass, of great lustre and perfectly transparent, of which the ingredients are given in the article Glass, is prepared as the basis of the composition. It resembles the diamond in high refractive power as in its other qualities, except hardness. That it may be free from color its ingredients must be absolutely pure; and care must be exercised in selecting crucibles least likely to impart color to the fused mixture. Artificial diamonds are made from pure strass, which is cut directly into brilliants and roses, without the addition of other matter. Other gems are imitated by melting and mixing it with substances having a metallic base, generally oxides, which communicate the various colors. The researches and experiments of M. Ebelmen are of a higher order of art. He conceived the idea in 1847 of forming various mixtures with some ingredients volatile at very high heat. By the dispersion of these in the furnace the other ingredients should crystallize, as substances held in solution in liquids crystallize when these are evaporated. He thus proposed to produce the ruby, corundum or sapphire, and other precious stones. The volatile solvents or fluxes he employed were principally boracic acid and borax. The spinelle ruby, among the first minerals he imitated, was obtained by mixing together 80 parts of magnesia, 25 of alumina, 1 of chloride of potash, and 85 of boracic acid, and subjecting 500 grammes (7,716 grains) of the compound to high temperature in the muffle of a furnace for eight days. The crystals measured 0.197 inch on a side. Chrysoberyl was produced in crystals with faces of 1.44, perfect transparent, and scratching topaz from a mixture of alumina 19 grammes, glidine 8-5, carbonate of lime 10, and fused boracic acid 14 grammes. The object of the lime was to form a fusible borate for holding the other ingredients in a condition favorable for crystallization. Chrysolite in well defined crystals resulted from silica 4.5, magnesia 0-15, and boracic acid 6. Transparent crystals of pure alumina, which are sapphire or corundum, and which presented the same hardness and specific gravity with this mineral, were a product of alumina thus fused with 8 or 4 parts of borax, or of 10 parts of alumina with 4 of silica and 16 of borax. M. Ebelmen employed also as fluxes the salts of phosphorus and the carbonates of potash and of soda, all which are volatile at high temperatures, and by means of these solvents reproduced many other minor minerals in the laboratory in 1851. His death shortly after terminated his interesting researches; but they have been successfully continued by Deville, Elsner, Manross, and others, and numerous artificial minerals have been prepared.—The great establishment of M. Bourguignon in Paris was at one time the most famous manufactory of artificial gems in the world. About 100 workmen, besides many women and girls, were constantly employed in preparing and fusing the mixtures, cutting and polishing the stones, and lining the imitation pearls with fish scales and wax. The sand used to furnish the silica is from the forest of Fontainebleau; and its quality is so highly esteemed that much is exported for similar use elsewhere. The gems are such perfect imitations that they can be distinguished from genuine stones only by the closest scrutiny of those experienced in such matters. The great hardness of the natural stones it is found most difficult to imitate, and there is a want of permanency in the qualities of most of the imitations, which at last causes their true character to appear. See "A Popular Treatise on Gems," by Dr. L. Feuchtwanger (New York, 1859; revised ed., 1867); "The Natural History of Gems," by C. W. King (London, 1867); "Diamonds and Precious Stones," by Harry Emanuel (London, 1867); and "Diamonds and Precious Stones," translated from the French of Louis Dieulafait by F. Sanford (New York, 1874).

GEMINI (the twins), the third constellation in the zodiac, so named from its two brightest stars, to which the names Castor and Pollux are given, and which are about midway between Albæanar and Regulus.

GEMISTUS, George, surname PLETHO, a scholar and philosopher of the 15th century, born in Constantinople, and said to have lived to the age of 100. He held a high position at the court of the Palæologi, and at the council of Florence in 1439 opposed the union of the churches of the East and the West. Subsequently banished from his country, he found an asylum in Italy, and declared himself in favor of the Latin form of the philosophy of Aristotle was still reigning, he became an enthusiastic votary of the Platonic theories in metaphysics and natural theology, and being admitted to the circle of the Medici, prompted Cosmo to found his celebrated Platonian academy. His treatise in praise of Platonism inaugurated the long quarrel between the disciples of the two great masters of antiquity, which produced a profound study of their systems. Gemistus, however, mingled with the Platonic philosophy the notions of the later Alexandrian school and of the spurious writings attributed to Zoroaster and Hermes, and revived in the West that eclecticism, half Christian and half pagan, half oriental and half Greek, which flourished during the decline of the Greek philosophy at Alexandria.

GEMÜNDER, George, an American violin maker, born at Ingelheim, Württemberg, April 18, 1816. He was a pupil of Baptiste Vuillaume in Paris, and removed to the United States in 1847, establishing himself in Boston,
Mass. In 1851 his violins obtained the prize medal of the world's fair in London. In 1856 he removed to Berlin, where he has since lived. Vuillaume and other makers of violins in Europe adopted the practice of giving a pseudo-antiquity to their wood by a chemical process, in order to gain for their instruments a desirable quality of tone; but wood thus treated soon loses its resonance, and after a time the instruments become worthless. Gewunzter, rejecting this method, has succeeded with natural wood in producing violins which fulfill every requirement, and in respect of volume, power, equality, and quickness of tone, are fully equal to the work of the best old masters. In the model and finish of his instruments, and especially in the varnish, he is exceedingly successful. He reproduces faithfully the distinctive characteristics of the old Italian violins, so that his instruments are often taken for genuine productions of Cremona. One called the Kaiser violin, finished in 1879 and exhibited in the great exposition at Vienna, was pronounced an Italian violin of the classic period, because it was believed impossible to produce so fine a tone in a new instrument.

**GENDRIN, Auguste NICOLAS**, a French physician, born at Châteaudun, Dec. 6, 1796. He received a doctor’s diploma in 1821, and published on this occasion *Du traitement de la bilharziose*, relating to his new method of injecting opium. His *Recherches sur la nature et sur les causes prochaines des fièves* (2 vols., 1823), and his *Histoire anatomique des inflammations* (2 vols., 1826), which latter has been translated into German, won academic prizes, as did some of his subsequent writings, the most renowned being his *Traité philosophique de médecine pratique* (3 vols., 1838–41). After having been attached to various hospitals, he was from 1866 to 1868 the principal physician of La Pitié. During the June insurrection of 1832 he incurred odium for having, as alleged, reported to the authorities political offenders on whom he had happened to attend professionally; and his *Mémoire médico-légal*, showing that the prince of Condé did not die by his own hands in 1830, but by those of assassins, also gave rise to unfavorable comments, which he endeavored in vain to combat.

**GENDRON, Auguste**, a French painter, born in Paris in 1818. He studied under Delaroche and in Italy, and became famous (1844–8) by his picture representing *La willis*, or maidens reanimated from their graves according to a Bohemian legend, and dancing during a whole night. His ‘*Dante commented upon by Boccaccio*’ (1844), his ‘*Syphina*’ (1852), ‘*Titania*’ (1859), and many other works, have since been exhibited. He excels in historical, fantastic, and fairy delineations, and has also painted on porcelain for the manufactory at Sèvres, and remarkable decorations for the palais d’Orsay.

**GENELLI, Bonaventura**, a German painter, born in Berlin about 1798, died in Weimar, Nov. 18, 1866. He studied under his father, who was a landscape painter, and at the academy in Berlin, and during two years in Italy, chiefly in Rome. He was subsequently employed in classical decorations at Leipzig till 1866, when he removed to Munich. In 1859 he was invited to Weimar by the grand duke, and spent there the rest of his life. His most famous works are ‘*Lot’s Entry into Zoar,*’ and aquarelles illustrating *Æsop*, *Homer*, *Apollo*, *Sappho*, *Dante*, the life of a witch, and the life of a rake. His later works are chiefly oil paintings relating to mythological and classical subjects, upon which he brought to bear a glowing imagination and great ideality. The publication of some of his later paintings was begun in 1870 in a work entitled *Sature*—His brother HANS CHRISTIAN, born in Berlin, Dec. 8, 1823, has published several works relating to the fine arts, and excels as a draughtsman and architect. His son Oswald, who died in 1887, gave promise of being a good painter; and his daughter Gabrielle is a popular actress.

**GENESEE**, a river of western New York, rises in Potter co., Pa., within a few yards of the head waters of the Alleghany and the north branch of the Susquehanna, flows N. W. and N. E. through Alleghany, Wyoming, Livingston, and Monroe counties, N. Y., and falls into Lake Ontario 7 m. N. of Rochester. Its length is about 465 m. It is navigable from Lake Ontario to the N. line of Rochester. The mouth, protected by two fine piers, forms a good harbor, which gives rise to the village of Charlotte, on the W. side. The river abounds in beautiful scenery, especially in cataracts. In Livingston co., near Portage, are three falls within a distance of two miles, which are respectively 60, 90, and 110 ft. high; and for several miles below these the stream flows through perpendicular banks 400 ft. high. At the S. line of Rochester commences a series of rapids, which terminate in the centre of the city in a sheer fall of 96 ft., called Genesee falls. This was the scene of Sam Patch’s last leap. Six miles from the mouth of the river is a broken fall of 84 ft., by which the stream reaches the level of the lake. The Genesee is tapped above the rapids to feed the Erie canal, which at Rochester crosses it by a fine limestone aqueduct of nine arches, each of 50 ft. span. The Genesee Valley canal, commencing at Rochester, follows the course of the river for a considerable distance, locks into it at Mt. Morris, and crosses it at Portage by an aqueduct. The Buffalo branch of the Erie railway has a trestle bridge near the same place, 800 ft. long and 284 ft. high.

**GENESEE, N. A. W. county of New York, drained by Tonawanda creek; area, about 488 sq. m.; pop. in 1870, 21,563. The surface is almost level, and the soil, consisting chiefly of a very sandy loam, is well suited both to grain and pasture. Salt springs exist in several places, and iron, limestone, and water cement are obtained. The county is traversed by the
New York Central railroad, the Batavia and Attica branch, the Canandaigua, Batavia, and Tonawanda branch, and the Erie railroad. The chief productions in 1870 were 722,874 bushels of wheat, 928,710 of Indian corn, 508,690 of oats, 580,466 of barley, 21,447 of buckwheat, 275,717 of potatoes, 43,891 of peas and beans, 888,721 lbs. of butter, 481,537 of wool, 143,208 of hops, and 60,144 tons of hay. There were 10,411 horses, 10,462 milch cows, 7,796 other cattle, 78,884 sheep, and 8,496 swine; 5 manufactories of agricultural implements, 3 of brooms, 30 of carriages and wagons, 3 of cheese, 9 of clothing, 18 of barrels and casks, 1 of malt, 14 of saddlery and harness, 10 of tin, copper, and sheet-iron ware, 15 flour mills, 1 planing mill, 9 saw mills, 4 tanneries, and 9 currying establishments.

Capital. Batavia. II. A. S. E. county of the S. peninsula of Michigan, drained by Flint and Shiawassee rivers; area, 500 sq. m.; pop. in 1870, 38,900. It is intersected by the Flint and Pere Marquette, the Detroit and Milwaukee, and the Port Huron and Lake Michigan railroads. Its surface is undulating, covered with extensive oak openings in the S. part, and densely wooded with pine and other timber in the N. The chief productions in 1870 were 553,183 bushels of wheat, 826,687 of Indian corn, 410,561 of oats, 283,829 of potatoes, 910,876 lbs. of butter, 875,877 of wool, and 48,041 tons of hay. There were 7,486 horses, 8,560 milch cows, 11,980 other cattle, 79,806 sheep, and 9,818 swine; 12 manufactories of agricultural implements, 4 of boots and shoes, 8 of bricks, 31 of carriages, 9 of barrels and casks, 19 of furniture, 13 of iron castings, 18 of saddlery and harness, 8 of sashes, doors, and blinds, 11 of tin, copper, and sheet iron, 3 of woolen goods, 16 flour mills, 5 breweries, 5 planing mills, and 50 saw mills. Capital, Flint.

GENESIS, the name of the first book in the Bible, denoting in Greek "the generation," i.e., the account of the generation or production of all things. In Hebrew Bibles it is called Bereishith, signifying "in the beginning," because it commences with that word. By some Jewish writers it is also called Sepher Yetzirah, the book of creation. Its history goes back to the very earliest ages of the human race, and covers a period of upward of 2,500 years; giving an account of the creation, the fall of man, the religion, arts, settlements, genealogies, corruption, and destruction of the antediluvian world; of the repopulation and division of the earth, the dispersion of its inhabitants, the calling of Abraham, and the rise and progress of the Hebrew nation, to the death of Joseph.—For all questions relating to the authorship and authenticity of the book, see Pentateuch.

GENET (in this country commonly written Genet), Edmond Charles, a French diplomatist, born in Paris, February 25, 1763, died at Renselaer, N. Y., July 14, 1854. Although his father was attached to the court and his sister, Mme. Campan, was in the service of Marie Antoinette, he made himself known by his republican opinions. In April, 1789, he was appointed chargé d'affaires to the court of St. Petersburg, where his situation soon became uncomfortable; in 1791 he was informed by Count Ostermann, minister of Catharine II. that he would better not appear again at the court; and in July, 1792, he was formally dismissed. On his return to France he was appointed ambassador to Holland; but before going thither he received (December, 1792) his nomination as minister to the United States. He arrived in April, 1793, at Charleston, S. C., where he was cordially welcomed. On May 20 he had a triumphal reception in Philadelphia; the citizens presented him with an address congratulating France upon obtaining the freedom she had helped the United States to secure. Encouraged by these demonstrations of popular feeling, Genet thought he could easily persuade the American people to embark in the cause of France, notwithstanding the proclamation of neutrality recently issued by President Washington. He openly maintained that the United States were in duty bound to side with France against England, and bitterly denounced the American government for want of sympathy toward the French republic. He even fitted out privateers from Charleston, to cruise against the vessels of nations then at peace with the United States, and to project hostile expeditions against Florida and Louisiana, then colonies of Spain. In consequence of these imprudent measures Washington demanded and obtained his recall. Genet decided not to return to France, settled in the state of New York, was naturalized, and married a daughter of George Clinton.

GENET (genetta, Cuv.), a digitigrade carnivorous mammal of the family civitidae, inhabiting Africa, and occasionally found in southern Europe. The dentition and structural characters are the same as in the civet, the principal difference being that the anal pouch which contains the glands secreting the scent of the common civet is much less developed and prominent in the genet than in the civet.
Genet of Barbary (Genetta senegalensis, Cuv.) is a shy gray, with blackish spots; the tail is nearly as long as the body, with long hair and 10 or 11 dark and light rings; the length of the body is about a foot and the tail about the same, and the height 5 in. It is only semi-carnivorous, and will live in captivity wholly on vegetable food. The claws are sharp, semi-retractile, and well adapted for climbing; the anal secretion has a musky odor; as in other nocturnal animals, the pupil is vertical. The habits of the genet are like those of the weasel tribe; it is easily tamed, and is sometimes employed to catch rats and mice in houses; the period of gestation in captivity is about four months. The pale genet (G. Senegalensis, Fischer), or fossa, resembles the former species, and is reddish gray with pale spots above the eyes, brown bands and spots on the body and limbs, and an obscurely ringed tail. Both species prey upon small mammals, birds, and reptiles, and are not averse to fruits. Several other species are described.

Geneva, a S. E. county of Alabama, bordering on Florida and intersected by the Choctaw-hatchee and Pea rivers; area, about 550 sq. m.; pop. in 1870, 2,997, of whom 227 were colored. Pine forests abound; the soil is sandy and poor. The chief productions in 1870 were 53,642 bushels of Indian corn, 4,890 of oats, 22,059 of sweet potatoes, 4,749 of peas and beans, 420 bales of cotton, and 40,657 lbs. of rice. There were 2,148 milch cows, 5,125 other cattle, 4,222 sheep, 8,874 swine, and 408 horses. Capital, Geneva.

Geneva, a village of Ontario co., New York, beautifully situated at the N. W. extremity of Seneca lake, on the New York Central and the Geneva and Ithaca railroads, 100 m. E. of Buffalo; pop. in 1870, 5,521. The principal street runs parallel with the bank of the lake, at an elevation of 100 ft., and from many of the residences terraced gardens extend to the shore. It commands a fine view of the lake and of the surrounding country. Geneva is handsomely built, and contains many large stores. One of the Episcopal churches is a fine stone structure in Gothic style, and was built at an expense of $40,000. Steamers ply daily on the lake, which is open throughout the year, between Geneva and Watkins, at the opposite extremity, touching at intermediate places. There are six hotels, two national banks, gas works, marble works, two iron works, bending works, a flour mill, a malt house, &c. The nursery business is the chief branch of industry, employing 13 firms and many individuals. The nurseries cover over 8,000 acres, and furnish occupation to from 600 to 700 men and boys. The value of the stock is about $1,800,000, and the annual shipments of trees, &c., amount to over $500,000. Hobart Free college (called Geneva college till 1852) was established here in 1824, under the direction of Episcopalians, and in 1872 had 9 professors, 44 students, a library of 13,000 volumes, and a well appointed observatory. The union public school, a fine brick building costing $30,000, and its four branches, have about 1,200 pupils. A Roman Catholic school is in process of erection. There are two private schools for girls and one for boys, two weekly newspapers, and eight churches.

Geneva (Fr. Genève; Ger. Genf; Ital. Ginevra). I. A canton of Switzerland, bounded N. by Vaud and the lake of Geneva, and on all other sides by France; area, 109 sq. m.; pop. in 1870, 98,289, of whom 47,868 were Catholics, 48,639 Protestants, 771 Christians of other denominations, and 961 Jews and other non-Christians; 20,209 families were French, 978 German, 121 Italian, and 7 Roman. The peasantry speak a patois which resembles somewhat that spoken in the neighboring districts of France and Vaud. The canton is without mountains, and its highest hills rise only about 500 ft. above the lake. The soil is hilly and stony, and therefore not fertile; but in consequence of the excellent cultivation, the canton resembles a garden. The Rhône, which flows southwesterly from the lake of Geneva, receives the Arve, Nante de Verrier, Avril, London, and Laire. The canton is divided into three districts and contains 48 communes; in 31 of them the Catholics are a majority, and in 17 the Protestants. The canton has 5 gymnasia or secondary schools and about 75 primary schools with 5,600 pupils. The receipts and expenditures are about 3,000,000 francs annually, the public debt about 18,000,000 francs. The legislature, called the grand council, consists of one representative for every 600 inhabitants. Geneva was the first Swiss state to introduce trial by jury (1844), and exerted a liberal influence upon the national councils in the promulgation of the federal constitution in 1848. The canton sends four delegates to the lower house of the Swiss diet, and furnishes a contingent to the army of about 4,000 men. The Protestant churches are governed by a consistory, which is elected for four years, appoints an executive committee of 8, and is
composed of 25 lay members and 6 clergymen. The compagnie des pasteurs, which comprises all clergymen and professors of theology, presides over the religious instruction of the Protestant population, and controls ecclesiastical appointments. The Catholics of the canton, who are divided into 23 parishes, formerly belonged to the diocese of Lausanne. In 1872 the pope erected it into a diocese, a measure which the government of the canton denounced as contrary to the law, insisting that a new diocese could be erected only with the consent of the government. The free "Evangelical Church," which is unconnected with the state, has a theological school in the city of Geneva, and had in 1872 eight clergymen. The administration of education is in the hands of the government, but the parishes are called upon to contribute toward its support. II. A city, capital of the canton, at the W. extremity of the lake of Geneva, where the Rhône issues from it, and 3 m. above the confluence of the Arve; pop. in 1870, 46,774, of whom 25,897 were Protestants, 20,884 Catholics, 519 members of other Christian denominations, and 574 Jews and other non-Christians. Including the suburbs, the population in 1870 was 57,697. The old city, on the left bank of the Rhône, is hilly and narrow. It was enlarged in 1850 by the conversion of the fortifications into promenades and quayas. On the right bank is the more modern part, where the streets are mostly straight and wide. The two parts are connected by six bridges. The Mont Blanc bridge, near the lake, is magnificent. The cathedral, dedicated to St. Peter, erected in the beginning of the 12th century, in the Byzantine style, is believed to occupy the site of an ancient tem-

Geneva.

ple of Apollo. The hôtel de ville formerly had a number of inclined planes without steps, enabling the aged senators to ride up to the highest story in their litters or even on horseback. The public library contains about 60,000 volumes and 600 MSS. The Musée Rath is named after its founder and devoted to the fine arts. On a small island of the Rhône, below the Mont Blanc bridge, stands a monument to Rousseau, who was born in Geneva in 1712. Of the churches in Geneva, the Reformed have seven, the Catholics three; there are also one English and one Greek church, and a synagogue. In 1873 all the Catholic churches passed into the hands of the Old Catholics, as they alone took part in the election of pastors ordered by the new church law of the canton. Geneva has celebrated private schools, which attract many pupils from abroad, and commercial, industrial, artistic, and musical schools. The university of Geneva was founded in 1563, and was reorganized by Calvin and Beza. The college attached to it resembles the English Eton and Westminster schools, and is conducted by masters (regentes), under the direction of a rector, a principal, and the professors of the university. The studies at the university embrace belles-lettres, philosophy and science, divinity, and law. The environs of Geneva are dotted with villas. The suburb Plainpalais is regularly built, and has about 8,000 inhabitants. Les Eaux Vives, a suburb on the road to Chamouni, has a population of about 6,000. In the vicinity is a celebrated lunatic asylum in a magnificent edifice.—Geneva has long been celebrated for its manufacture of
watches, jewelry, and musical boxes, employing about 8,000 persons, who make more than 100,000 watches a year, and work up annually about 75,000 ounces of gold, 5,000 marks of silver, and $200,000 worth of precious stones. There are also manufactories of velvet, woollen goods, India stuffs, hats, leather, cutlery, firearms, chronometers, and mathematical, musical, and surgical instruments. Geneva became a free port in 1854. The transit trade is considerable, and the neighborhood of France and Italy gives rise to active smuggling. The forwarding, commission, and banking business, especially the latter, are of great magnitude. Geneva is also the principal telegraph station and the focus of the railways of Switzerland, and the central point of the federal postal and customs union.—Calvin lived in Geneva, and Servetus was burned at the stake in the champ du bourreau, the ancient place of execution, outside the walls. John Knox was made a citizen of Geneva in 1568. Among the distinguished persons born in the city are Jean Jacques Rousseau, Necker, the naturalists De Sars, de Manne, De Candolle; Dumont, the friend of Mirabeau and of Jeremy Bentham; Sismondi the historian; and Albert Gallatin, the American statesman. Sir Humphry Davy died and was buried in Geneva. Guizot the French statesman, whose mother found an asylum in Geneva, received his early education there.—Geneva is supposed to have formed part of the territory of Allobroges. It was subjected to the Romans about 129 B. C. The city was burned during the reign of Heliogabalus, and rebuilt by Aurelian, who gave it many privileges and called it Aurelianum Allobrogum. In the 6th century it was annexed to the possessions of the Burgundians, and in the 6th to the Frankish kingdom. The republic of Geneva originated in the municipal institutions of the town, to which Charlemagne granted certain privileges, subordinate to the bishop, who was called prince of Geneva, and was an immediate feudatory of the German empire. Dissensions occurred on many occasions between the citizens and the bishops on one side, and the counts of Genevois, who ruled the adjoining province of Savoy and claimed jurisdiction over Geneva, on the other. After the extinction of the line of the counts of Genevois, the dukes of Savoy were appointed their successors by the German emperor Sigismund (1429). Hence the claim of Savoy upon Geneva, from which the Genevans could only free themselves after several centuries by alliances with other Swiss states, and by the aid of the reformation. The bishop of Geneva was expelled in 1534. Through the zeal of William Farel, the new service of the reformed religion was established in August, 1536. But the old parties, the partisans of Savoy and the national party, reappeared under new forms and fomented discord. Farel prevailed upon Calvin, who came to Geneva in August, 1536, to remain there, and eventu-

curious phenomenon of a rise and fall of from 2 to 5 ft. in the course of 25 minutes. These changes of level, called seiches, have never been fully accounted for, but are supposed to be owing to the unequal pressure of the atmosphere upon different parts of the surface. They are independent of the wind, and most frequent when the clouds are low and heavy. The lake is never frozen over, though ice forms in winter near its lower extremity. Its waters are pure and bright blue, like those of the Mediterranean. The Rhône enters it at the E. end as a dark muddy stream, and leaves it near Geneva perfectly sluggish and of the finest azure hue. The débris brought down by this stream is deposited around the upper end, and have made considerable encroachments upon its basin. Port Valais, 14 m. inland, was formerly situated on the shore, and the waters are said to have extended as far as Bex, 12 m. up the Rhône. About 40 small streams discharge themselves into this lake. It has fewer fish than other Swiss lakes, but contains excellent trout, pike, carp, and perch, and a kind of salmon. Steamers ply daily between Geneva at the W. and Villeneuve at the E. end. The scenery is a unfailing theme of admiration to travellers. On the north are beautiful vine-covered hills dotted with villages; opposite, the abrupt cliffs of the Chaubais rise 8,000 ft. above the lake. The majestic Alps are seen beyond them through the openings. On the east, between the lofty summits of the Dent de Morcles and the Dent du Midi, about 9,000 ft. high, a narrow pass opens into Valais, while at the W. end the lake narrows almost to a point, and terminates among the pleasant slopes on which stand the city and suburbs of Geneva. The lake is famous in literary history as the scene of the Nouvelle Héloïse, and for the abode in its vicinity of many celebrated authors.

GENEVIEVE. L The patron saint of Paris, born in Nanteur about 422, died in Paris in 512. Almost every French town has its genevievian church, and her parents, Severus and Gerontia, were very poor, and Geneviève's early occupation was tending flocks. On the summit of Mont Valérien is a field which still bears her name, as well as a spring and grotto at its foot. In her 16th year she was dedicated to the divine service by St. Germanus of Auxerre. She predicted in 449 the invasion of the Huns under Attila, and when in 451 she threatened to attack Paris, her prayers were believed to have saved that city. Again, during the protracted siege of Paris by the Franks under Clotilde, she animated the courage of the citizens, and contrived to introduce into the city a supply of provisions. When Paris fell, Geneviève's intercession saved the vanquished from harsh measures. She was revered by Clotilde, and was buried near him in the church of Sts. Peter and Paul, which he had dedicated in her honour. Against the league of joining abbey bore her name. Her shrine, said to be the work of St. Eloi, was replaced in the 18th century by one much larger and richer, which was long considered the palladium of Paris. It was sent to the mint in 1791, and the relics it contained were burned. A monumental church, begun by the architect Soufflot in 1757, was named the Panthéon in 1791, and restored to public worship in 1852, under the title of St. Geneviève. The stone sarcophagus which formerly contained her remains has been transferred to the church St. Étienne-du-Mont. The life of St. Geneviève, written by her contemporary Gensius, was restored to its original simplicity by the Bollandists, and republished in 1645 in the Acta Sanctorum. Her feast is celebrated on Jan. 3. II. A daughter of the duke of Brabant, born about 860. Hagiographers and historians have spoken of Geneviève de Brabant sometimes as a canonized saint, sometimes as only beatified; the Bollandists say her feast was kept in April; but she was never acknowledged as a saint by Rome. Her history, the subject of so much romance and poetry, may thus be condensed from the best sources. She was married about 700 to Sigfrid, count palatine of Offenbach in the territory of Treves. He was summoned to attend Charles Martel on his expedition against the Saracens, leaving his wife and estates to the guardianship of one of his knights named Golo. The lady, whose pregnancy was not known to her husband, had now to resist the criminal solicitations of Golo, who after the birth of her boy accused her of adultery, and obtained from Sigfrid an order to put mother and child to death. Instead of executing this order, Golo abandoned them in a forest, where they subsisted for several years, until they were discovered by Sigfrid during a hunt, and carried back in triumph to his castle of Hohen-Simmern. Geneviève, in thanks- giving for her preservation, had a chapel built on the spot which had sheltered her babe and herself. The ruins of this chapel, called Frauenkirchen, are still visible, and contain, together with the despot of the Saracens, the body of one Sigfrid, an altar on which are rudely sculptured the main facts of their history.

GENGHIIS (or ZINGIS) KHAN, an Asiatic conqueror, born about 1160, died in August, 1227. His father was the chief of a horde, consisting of numerous families or clans, and tributary to the khan of eastern Tartary. When born, the child had his hand full of blood; and, pleased by the interpretation of this sign as a prediction of conquest and glory, the father procured for Genghis, or, as he was then called, Temudjin, an able teacher, who soon developed in him a talent for government and war. Temudjin was only in his 14th year when he succeeded his father, and after some reverses he made himself master of the neighboring tribes, 70 of whose chiefs are said to have been thrown into kettles of boiling water at his command. Against the two tribes he was also victorious, but was unable to subdue them, and compelled to invoke the protection of Vang or Ung, the great khan of
the Kerait Tartars. Temujin supported him in his turn in different wars, and received the daughter of the khan in marriage. But his bravery, liberality, and success soon made him an object of envy and fear; a war ensued, in which the khan lost his army on the battle field, and his life while in flight. Another enemy, Temujin, Tayan, khan of the Nat-
man Tartars, met with a similar fate in and after the battle of Altai, which gave Temujin a great part of Mongolia and the capital Karakorum. In the next spring he held a great as-
sembly of his nation at Blun-Yuldad, his capital, where the representatives of all the hordes appeared and proclaimed him their great khan. Then, obeying the words of a shaman (inspired man), who promised him the conquest of the earth, he adopted the title of Genghis (great-est), and gave to his people that of Mongols (the bold). He organized their civil and mili-
tary system, and laid down a code of laws which is still known in Asia under his name, and is based upon the belief in one God and the monarchy of one great khan, to be elected from the reigning family by the kurultai, or assembly of the nation. It grants great privi-
elges to the nobles, allowspolygamy, forbids to conclude peace except with the vanquished, and commands the delivery of arms into the hands of the government in times of peace, and when no national hunts are held. He granted equal rights to every religion, and admitted men of talents or merit to his court, whatever their creed. Appreciating the wisdom of other nations, he caused many celebrated books to be translated from foreign languages. Ambi-
tion soon prompted him to new expeditions. The annexation of the Uigur or central Tar-
tars served to complete the conquest of Tar-
tary; he now commenced that of China, passed the great wall, vanquished the opposing ar-
 mies, plundered and destroyed 96 cities, re-
duced to ashes smaller towns and villages, and carried away multitudes of children, who were destroyed in the homeward march, besides a vast spoil of cattle, gold, silver, and silk. In a second expedition he was equally successful. He devastated the country, and in 1215 took Yehkimg (now Peking) by assault. This great city was pillaged and burned. Giving the com-
mand in the east to his son Tutasoe, Genghis now turned his sword to the west, crushed some revolted tribes and their allies, and took a bloody revenge for the murder of his am-
bassadors on Mohammed, sultan of Kharasnia. A vast army, and the cities of Bokhara, Sa-
marcan, and others, opposed him in vain. The Mongols conquered and devastated the whole country; the cities were destroyed, and with them immense treasures of eastern science and art; and numberless inhabitants were slaughtered or carried away as slaves. An-
other Mongol army marched against Kaptchak, and took Derbend on the shore of the Caspian sea; another redoubled Iran and Astrahan; and, after a bloody battle on the Kalka, south-
ern Russia; another continued the conquest of China and subdued Corea. The countries N. W. of India were also conquered, and an expedition against that country was begun. In this he is said to have shared the fate of Alexander the Great in a similar undertaking; after some victories, the army refused to ad-
vance further, and he was compelled to return amidst terrible difficulties. He then turned his arms against the kingdom of Tangut, passed the desert of Gobi in winter, and defeated 800,000 men on a frozen lake; the Tangut dynasty was extinguished. He was meditating new conquests when death ended his career. He was buried in his native home, and his funeral was celebrated with songs, and some historians say with a hecatomb of beautiful young girls. His empire was divided among his four sons, Oglutzi, chosen great khan, Ja-
gatii, Tului, and Tutshee, whose armies soon completed the conquest of China, overthrew the caliph of Bagdad, made the sultan of Ico-
nium tributary, and penetrated as far as the Oder and the Danube.

GE NILIS. See Mythology.

GENILIS, Félicité Stéphanie Ducroz de Saint-Aubin, countess de, a French authoress, born near Antun, Jan. 25, 1744, died in Paris, Dec. 31, 1830. She had a taste for music, acquired great proficiency on the harp, and played seven other instruments; but her education was almost entirely neglected. When scarcely 15 years of age she was married to Count Brû-
lart de Genlis, a friend of her father who had fallen in love with her on seeing her portrait.

Full of ambition, she then devoted herself with great zeal to study. By the influence of her aunt, Mme. de Montessou, who was subsequently-
ly secretly married to the duke of Orleans, she was in 1770 appointed a lady in waiting in the household of his daughter-in-law the duchess de Chartres, became soon afterward governess of the daughter of that princess, and was formally nominated in 1782 by the duke de Chartres (afterward duke of Orleans) "gov-
ernor" of his three sons, the eldest of whom was afterward King Louis Philippe. Such a title given to a woman gave rise to no little scandal, and the influence she subsequently exercised upon the political course of her em-
ployer, the notorious Philippe Égalité, seemed to warrant the most injurious suspicions. Dur-
ing her governorship she published several works devoted to the moral education of her pupils—the Théâtre d'éducation, Annales de la
tervue, Adèle et Théodore, Les visites du châ-
teau—which were generally well received by the public, and were highly praised by Gail-
lard, La Harpe, and other eminent critics. During the first years of the revolution she proclaimed her liberal opinions, and is said to have been the principal adviser of Philippe Égalité. She published Conseils sur l'éduca-
tion du dauphin, and Leçons d'une gouvernante, written in the spirit of the new constitution. She was, however, obliged to emigrate, and in
GENNESARET

1798 retired for a while to Switzerland, and then to Altona. Amid all her troubles she neglected no opportunity of mingling in worldly pleasures. During this period she published several works, among which were her Mœurs villaines, Les petits émigrés, and Le petit La Bruyère. In 1800 she returned to France, and was well received by the first consul; she was allowed handsome apartments at the arsenal and a pension of 6,000 francs, to which the wife of Joseph on his accession to the throne of Naples added an annuity of 8,000. In return for this she had to write twice a month to Napoleon, and communicate to him her opinions and observations on politics and current events. It is not known what service she rendered to Joseph Bonaparte. This period of comparative repose and prosperity was also one of literary activity; she gave to the public, among other works, Mlle. de Clermont, the best of her performances, which ranks among standard novels in the French language, La duchesse de La Vallière, Mme. de Maintenon, and Le siège de La Rochelle. Her Histoire de Henri le Grand displeased Napoleon, and she lost her pension and residence. At the return of the Bourbons the Orleans family contented themselves with paying a small pension to their old "governor." Her temper meanwhile, which never had been very gentle, became sullen and unmanageable; her misanthropy increased with years. Her wrath was especially directed against the philosophers of the last century; she published amended editions, with critical notes, of several works of Rousseau and Voltaire, and even contemplated a similar "emendation" of the Encyclopédie, but, appalled at the magnitude of the undertaking, gave it up, and turned her pen against the most popular contemporary authors. Mme. de Staël, Byron, Sir Walter Scott, and Lamartine were among the objects of her attacks.

GENOA (Ital. Genova; Fr. Gênes; anc. Ge- nua). A N.W. province of the kingdom of Italy, bordering on the provinces of Porto Maurizio, Coni, Alessandria, Pavia, Piacenza, Parma, and Massa Carrara, and the gulf of Genoa; area, 1,589 sq. m.; pop. in 1872, 716,284. The province is divided into the districts of Albenga, Chiavari, Genoa, Levante, and Savona. It forms a narrow coast land, called Riviera di Levante and Riviera di Ponente, around the gulf of Genoa, and embraces the former duchy of Genoa. The rivers, mostly springing from the Apennines, have but a short
course through this province, either emptying into the gulf or passing over to the adjacent provinces. Agriculture is unimportant, for want of level land, but the hills are covered with vines and olives, and furnish delicate fruits which are largely exported; bee-keeping is a lucrative industry of the mountaineers. There are silver, copper, lead, manganese, and coal mines; and the slate quarried near Lavagna is celebrated for its deep, lustrous black color. The Ligurian Apennines touch the Ligurian Alps near the sources of the Bormida, where the road from Millesimo to Savona climbs three mountain ridges from 1,500 to 2,800 ft. high. From here the Ligurian Apennines extend along the coast of the gulf in three distinct chains, separated by deep depressions: the Monte S. Giorgio, N. W. of Savona; Ermetta and Reisa, N. W. of Voltri; Penello, Orditano, and Secco, N. W. of Genoa. North of this city are the Monte della Bochetta, 2,462 ft. high, and the Colli dei Giovi, 1,447 ft., with a double pass that permitted the construction of a turnpike and a railway to Alessandria. East of these the Apennines rise much higher. N. E. of Genoa is Monte Antola, 4,151 ft. high. N. E. of Chiavari, near the boundary, is Monte Penna, 5,360 ft. high. From Genoa to Antivari, and from Lavagna to Spezia and Porto Venere, close to the coast, are mountain chains 2,000 to 3,000 ft. high.

The mountainous peninsulas, Portofino and Castellana, form S. E. of Genoa the gulf of Rapallo and Spezia, of which the latter is important as a safe and commodious port for the Italian fleet. A railway skirts the entire coast of both Rivieras, and runs parallel with the magnificent highway called the Cornice road. The line penetrates numerous promontories by more than 80 cuttings and tunnels, many of them of considerable length, in a distance of 24 m., between Genoa and Chiavari. Another railway through the province, connecting Genoa with Alessandria, has nine tunnels between Argenta and the capital. The last tunnel before reaching Genoa, called the Galleria dei Giovì, is more than 2 m. long. II. A city, the capital of the province, on the N. extremity of the gulf of the same name; lat. 44° 24' N., lon. 8° 54' E.; pop. in 1872, 130,289. It is surrounded by a double wall, the smaller encircling the inner city, by ramparts and extensive outworks, detached forts, and redoubts, which make it one of the best fortified cities of Europe. Its large semicircular harbor is defended by two converging moles, the eastern or old, and the western or new. In the height of her power the city was called Genova la Superba (the proud); and the designation has also been used in the sense of "magnificent," on account of her beautiful situation and numerous marble palaces. On the N. E. side is the royal war harbor (darsena reale), with the marine arsenal. On the E. side is the free harbor (porto franco). This is a little walled town of itself, containing more than 300 large storehouses, and no priest, soldier, or woman is allowed to enter it except by special permission. A high wall with arcades separates the harbor from the houses, most of them six stories high, of the via Carlo Alberto and the piazza di Sciaccaimento. The quay is connected by rail with the railway station. Viewed from the harbor, the city, rising like an amphitheatre, with its churches, palaces, promenades, and gardens, with its encircling fortifications, and with the bare summits of the Apennines and the ice-covered peaks of the Alps behind, offers one of the grandest and most picturesque sights in the world. The
streets are mostly narrow, irregular, and steep, paved with smooth slabs of lava, with a path of bricks in the centre for carriages; but the vie Balbi, Nuova, and Nuovissima are broad and straight; and the more modern vie Carlo Felice, Carlo Alberto, Carrettierra, and Giulia compare favorably with the chief thoroughfares of other commercial cities. The splendid architecture of the palaces, the external frescoes of the houses, the imposing processions, and the varied attire of the passengers, the ancient attractions of the city, are all gradually disappearing. The pessotto, the long white wall with which the women formerly covered head and shoulders, is now rarely seen except on Sunday when they go to mass. The palaces were once renowned for their artistic riches, but the collections are constantly diminishing, and have become very small. The most striking of the palaces is the palazzo Doria, a conspicuous position overlooking the sea. It was constructed in 1539 by the renowned Doria, prince of Melfi; it is now almost abandoned, and retains but few traces of its former beauty. The ducal palace, restored in 1778 after designs by Simone Carbone, was formerly full of objects of art, which have been removed, some of them to the municipal palace, formerly the palazzo Doria Tursi. In the anteroom of the hall of the town council are a bust and autograph letters of Columbus. The Carlo Felice is one of the largest and finest theatres in the kingdom. That of Sant' Agostino is built entirely of wood, and can accommodate 2,000 spectators. A new café, with a garden and fountains, is one of the most splendid establishments of the kind in Europe. The dogana, or custom house, is the ancient edifice of the bank of St. George, and has in the hall two ranges of statues, larger than life, of the Doria, Piochi, Grimaldi, and other renowned personages of the old republic. Among the numerous churches, that of Santa Maria di Carignano is prominent for architectural beauty. The cathedral, dedicated to San Lorenzo, presents a strange mixture of styles. It was built in the 11th century, and has been restored many times. The richest part is the chapel of St. John the Baptist, into which no woman can enter except on one day in the year, in recollection of the daughter of Herodias. In it is preserved the sacro cotto, affirmed to be one of the gifts of the queen of Sheba to Solomon, and the vessel from which Christ ate the paschal lamb. It was a part of the spoil taken at Cesarina in 1101. It was long supposed to be cut from a single emerald, but is now known to be glass. In the piazza di Acqua, a public promenade, stands a statue of Columbus on a circular pedestal with protruding prows of galleys; at the feet of the statue kneels the figure of America. Genoa has a university with an observatory and a library of 50,000 volumes, a naval school, a lyceum, technical schools, seminaries, normal schools, and many societies for the promotion of arts and sciences. The foundling hospitals, orphan asylums, hospitals for the sick, crippled, insane, and deaf, and poorhouses, are in a praiseworthy condition. About two miles from the city is the campo santo (cemetery), with a magnificent circular chapel and many artistic monuments and vaults. The most delightful excursion in the environs is to the villa Pallavicini at Pegli, where the park extends to a considerable height on the slopes of the coast, affording charming views of Genoa, the sea, and the mountains. Luxuriant vegetation, kiosks in Pompeian, Turkish, and Chinese styles, a mausoleum, the remains of an ancient Roman burial place, and a stalactite grotto heighten the interest of the place.—The railway to Alessandria brings to Genoa a large trade with the provinces of northern Italy, Austria, Germany, and Switzerland. Cotton industry employs about 3,000 workmen, and about 5,000 are employed in the manufacture of silk goods. There are large establishments producing lace, embroideries, and filigree work. The hat factories export yearly about 100,000 hats to South America. Other considerable industries are the extraction of oil, the fabrication of soap, the preparation of chemicals, the making of artificial flowers, and the packing of candied fruit. The furniture factories employ several thousand workmen, and the construction of boats and ships is steadily increasing. In 1871 vessels of the aggregate tonnage of 50,000 were launched. Among them were two iron steamers, the first iron vessels built in Italy. Genoa is a free port. About 7,000 sailing vessels of 700,000 tons, and 8,000 steamers of 600,000 tons, enter every year. In 1871 the entries of vessels engaged in foreign trade were 8,009, with an aggregate tonnage of 284,263; the tonnage of coasting vessels entering in the same year was 406,065. The total imports amounted to $31,600,000; exports, $32,350,000. Numerous lines of steamers ply between Genoa and Leghorn, Civitá Vecchia, Spezia, Naples, Messina, Nice, Tunis, and other ports on the Mediterranean. The population of Genoa has increased but little during the past ten years, on account of the excessive Octroi duties levied on almost everything that passes the gates. To escape these, many people have settled in the neighboring communes, and Sampierdarena and other villages have grown largely in consequence.—The history of Genoa may be traced in legendary traditions to a time preceding the foundation of Rome. Livy mentions it first, at the beginning of the second Punic war, as a town in friendly relations with the Romans. It was subdued and partly destroyed during that war by a Carthaginian fleet, which sailed from the Balearic Isles under the command of Mago; the Romans rebuilt it, and it afterward became a Roman municipium. In the time of Strabo it was an emporium for the produce of the interior, exchanged by the Ligurians for the wine and oil of other parts of Italy. After the fall of the western empire it suffered greatly from the in-
vading Gothia, was taken by the Lombards in the 7th century, and conquered from them in the 8th by Charlemagne, who appointed a count for the government of the coast of Liguria. After the dismemberment of the Frankish empire, it became independent, and shared the fate of the Lombard cities, participating in their bloody struggles during the long contest for the iron crown of Lombardy between the emperors of Germany, the Berengarii, and others. After having been pillaged in 936 by the Saracens, Genoa strengthened its navy, entered into an alliance with Pisa, and expelled the Mohammedans from the islands of Corsica, Caprera, and Sardinia (1016–21), of the two former of which it kept possession. But the increasing maritime importance of the Genoese aroused the jealousy of their commercial neighbors, and they had to struggle for the maintenance of their power in the western part of the Mediterranean, against the rival republics of Pisa, and in its eastern part against Venice. The hostilities with the former commenced in the year 1070. The services of the Genoese in the first crusade were rewarded with a strip of the coast of Palestine. After the second war with Pisa (1118–32) they undertook an expedition against the Moors of Spain, with a large fleet carrying a land force of 13,000 men, conquered the island of Minorca (1146), Almeria (1147), where they found immense booty, and, in concert with the Catalans, Tortosa (1148). Their power was also rapidly extended over the coast of the Mediterranean; before the close of the 12th century they were masters of Monaco, Nice, Montferrat, Marseilles, and nearly the whole coast of Provence. The third struggle with Pisa commenced in 1169, and lasted for nearly a century. The early part of the fourth was marked by a great naval victory over Meloria (1284) of the Genoese over the Pisans, who lost 8,000 killed and 13,000 prisoners, most of whom were deserted by the cruelty of the victors to perish in chains; it was virtually ended by the conquest of Elba, and the destruction of the harbor of Pisa, under Corrado Doria (1290). Thus peace was conquered, and the power of the rival republic destroyed. No less severe had been the struggle with Venice since the conquest of Constantinople by the Franks (1204). Having assisted Michael Paleologus to reconquer the capital of the Byzantine empire (1261), the Genoese were rewarded with the suburbs of Pera and Galata, and the port of Smyrna, which made them masters of the Black sea. This brought them into collision with the Venetians, who disputed their supremacy in those seas; but after several naval battles a truce was concluded in 1271. On the termination of the wars with Pisa a powerful Genoese fleet crossed the Adriatic, and won a great victory near Curzola, where 84 Venetian galleys were taken or burned, and 7,000 captives made, among them the admiral Dandolo. This was followed by a treaty of peace (1299), which surrendered the commerce of the Black sea to the exclusive dominion of the Genoese, whose flourishing colonies and factories defended by forts soon lined all its coasts. Kaffa, or Feodosia, in the Crimea, became one of the finest commercial cities of Europe. Favored by the friendship and indulgence of the Byzantines, they carried on the commerce of the East, including India, through the Black and Caspian seas. A new war with Venice broke out in 1446, in which the Genoese were victorious in a sea fight in sight of Constantinople, but were beaten in another near the coast of Sardinia. To escape the consequence of this defeat and the perils of intestine commotions, they subjected themselves to the rule of Milan, Giovanni Visconti, whose yoke, however, they soon shook off. Having recommenced the war (1377), they took Chioggia, besieged Venice, and nearly reduced it, when two of its citizens, Vettor Pisani and Carlo Zeno, revived the spirit of the besieged, created a new fleet, blockaded Chioggia, and compelled the Genoese to surrender. The peace of Turin (1381) terminated the wars of the two greatest maritime republics of the middle ages; it was preserved with slight interruptions during the decline of both, caused particularly by the conquest of the Turks in the East and the maritime discoveries in the West. Giustiniani and his companions strove heroically, but in vain, to save the great bulwark of Christendom, Constantinople, and the interests of Genoa (1458); and Mohammed II. revenged himself by stripping the republic of all its possessions in the East; even the commercial access to the Euxine was soon closed by the Turks.——During all this growth and decline of the republic, its internal commotions, caused by the parties of the plebeians and patricians, and the subdivisions of the latter, had been a source of continual perils and distractions. Having been governed by consuls till 1190, then by podestas (annual magistrates, who were chosen from foreign cities) till 1270, it fell under the usurpation of Oberto Spinola and Oberto Doria, the "captains of liberty," who reconciled the lower classes and maintained their power till 1291. A new change was the institution of a council consisting of 12 members, subsequently of 24, 12 nobles and 12 plebeians. The feuds and even fights of the democratic and aristocratic parties, the Guelphs and Ghibellines, were meanwhile continuous. The latter faction, whose chiefs were the Doria and Spinolas, was at last overcome and exiled by their opponents, headed by the Fieschi and Grimelidis, but afterward found means of returning. These party struggles assumed the worst shape in the first half of the 14th century. To remedy these evils the dogate for life was instituted (1389), with the exclusion of the nobles of both parties. But neither this nor the addition of councils was sufficient to give peace to the distracted state; new contentions arose with new families; there were doges and anti-doges;
some were exiled, others forced upon the people. The Viscounts of Milan, and at a later period the kings of France, availed themselves of these dissensions to take possession of the republic. Francis I. held it during the first part of his wars with Charles V., but in 1528 the celebrated admiral Andrea Doria delivered the state from the French, and established a new constitution, which lasted to the end of the republic. The new form of government was strictly aristocratic; a roll of families, both plebeian and patrician, was formed, the nobility divided into the old and new; the former comprised the Grimaldis, Fieschi, Doriais, Spinolas, and 24 others distinguished by age, honors, or riches, and the latter 487 houses, to which new families could be added; the doge was elected for two years, and both branches of the nobility could aspire to this dignity. But the power of the republic had long since departed; its conquests, colonies, and maritime stations were lost one after another; the last of them, Corsica, revolted in 1730, and was ceded to France in 1768; the commerce of the seas and of the East passed successfully through the hands of the Portugese, Spaniards, Dutch, and English; the flag of Genoa was insulted with impunity by the Mohammedan pirates of northern Africa, and its naval force was a mere shadow of the ancient fleets which averted all the shores of the Mediterranean and Black seas. The single bank of St. George (commercia di San Giorgio), which had been founded in 1407, still maintained its importance as an institution for loans and deposits, to which even foreign states, and particularly Spain, were greatly indebted. When in 1796 the French had conquered the neighboring territories, Genoa strove in vain to sustain itself by neutrality. A rising of the democratic party was suppressed, after several days of bloodshed, by the nobles, who were assisted by the poorest of the population; but the French directory took the part of the democracy, and demanded a change in the constitution. This demand was supported by an army, and finally agreed to. The French garrison was taken into the city, and the state changed into the republic of Liguria, with a constitution like that of France, and some additional territory. In 1800 Genoa, under Massena, sustained a siege by the Austrians and English, and was compelled to capitulate to the former, who were obliged, however, to give it up after the battle of Marengo. Bonaparte, as first consul, gave it a new and less democratic constitution, which was soon abolished on the establishment of the French empire. After the coronation of Napoleon at Milan, the last of the doges, Durazzo, repaired to that city, and expressed the desire of the people for the change; and the decree of June 4, 1805, merged the republic in the empire, to form the three new departments of Genoa, Montenotte, and the Apennines. The bank of St. George, whose credit had suffered greatly by repeated loans to the state, was abolished, and the debts of the latter were transferred to the account of France. In 1814 Genoa was occupied by the English, with whose permission the ancient constitution was reestablished. But the congress of Vienna gave Genoa as a duchy to Sardinia. In 1821 it joined for a moment the revolutionary movements of Italy. At the end of March, 1849, after the defeat of Charles Albert at Novara, and the conclusion of a truce with the Austrians, a revolutionary outbreak took place, the national guards occupied the forts, and the garrison was compelled to withdraw. A provisional government, under Avezzana, Mochio, and Reta, was formed, and the independence of the republic was proclaimed. But a large body of Sardinian troops, under Gen. Lamarmora, soon appeared before Genoa; a bloody struggle ensued, and the forts and principal points of the city were taken by the royal soldiery. In the mean while a deputation was sent to Turin, which returned with the amnesty of the king, excluding, however, the chief leaders of the movement, who had withdrawn on board the United States steamer Princeton. On April 10 Genoa was disarmed, and the monarchical government restored. Garibaldi seized two steamships in the port of Genoa in May, 1860, and thence sailed for the liberation of Sicily. Early in 1861 the territory of Genoa was made a province of the kingdom of Italy.

**GENOVA**

**GENOUDE** (originally Genou, Antoine Eugène de, a French journalist and author, born in Montélimar in February, 1792, died in Hyères, April 19, 1849. He was the son of a cabaret keeper. He began his career as a political writer for the royalist journal Le Conservateur. In 1828 he founded the journal Le Défenseur, and in 1821 he bought the Étoile, which has since borne the name of La Gazette de France. He abandoned his intention of entering the priesthood when, in 1832, he was ennobled by Louis XVIII.; but in 1835, after the death of his wife, he took orders, and began to preach in Paris. The archbishop of Paris soon ordered him to quit either preaching or journalism, and he quit preaching. In 1846 he was elected by the city of Toulouse to the chamber of deputies, where he acted with the legitimist opposition. He differed, however, in many points from the legitimist party, defending universal suffrage, national representation, and legitimacy allied with popular sovereignty.
In February, 1849, at the outbreak of the revolution, he allied himself with the revolutionary party in order to attempt a restoration of the Bourbons by a general vote of the people. When he saw that his efforts were fruitless he retired from public life. The bold advocacy of his principles in the *Gazette de France* involved him in 68 lawsuits, which cost him more than 100,000 francs. He wrote *Lettres et modèles de littérature savante* (1887); *Histoire de France* (16 vols., 1844–7); a new French translation of the Bible, with the Latin version, a translation of the works of the fathers of the first three centuries, of those of St. Clement of Alexandria, etc.

**GENOVA.** Antonio, an Italian philosopher and political economist, born at Castiglione, near Salerno, Nov. 1, 1712, died in Naples, Sept. 22, 1789. He received priest's orders in Salerno in 1736, and held in succession the chair of rhetoric in the seminary of Salerno, and that of metaphysics in the university of Naples. He substituted the scientific doubt of Descartes and the Baconian laws of induction for the traditional belief in authority. He was threatened with persecution, but explained his views in a satisfactory manner, and was protected by Benedict XIV. In 1754 a chair of public economy was established in the university for Genovesi, by his friend Interi, a wealthy Florentine, who prescribed as one of the conditions of his endowment that no monk should ever be appointed professor. This chair was the first of the kind in Europe. On the expulsion of the Jesuits from Naples in 1767, he was requested by the government to propose a plan of university education. He advised the establishment of chairs of physical science and history, the substitution of mathematics for scholastic philosophy, and a chair for the interpretation of Cicero's *De Officiis*. His favorite masters in philosophy, after Bacon and Descartes, were Leibnitz, Locke, and Vico. As an economist Genovesi advocated the abolition of the monetary laws and of convents and monasteries, culminated the doctrines of free trade, and proclaimed before Adam Smith the supremacy of labor in the creation of the wealth of nations. As early as 1764 he predicted the emancipation of the American colonies, the foundation of the United States, and the total failure of the colonial system. He died as his friends were reading to him the *Phaedo* of Plato. His works include *Elementi Metaphysici*; *Lessoni di commercio o di economia civile*; *Diocesina*, relating to the rights and duties of man; *Logica dei giovane; Istituzioni delle scienze metafisiche; Meditazioni filosofiche; Elementi di fisica sperimentale; Lettere ad un amico provinciale*; and *Lettere academiche sulla questione se sieno più felici gli ignari che gli sciolti*. His life has been written in Latin by Galvani. It contains the names of his best pupils, published in 1771 *Elogio storico dell'abate Genovesi*; and Raccipoli's *Genovesi* appeared in 1871.

**GENSERIC** (from Gaizerich, prince of the spear), a Vandal conqueror, bastard brother and successor of Gonderic, died in 477. The Vandals had passed the Alps and the Pyrenees, and devastated and conquered a large part of Spain. In 429, when the weak and debauched Valentinian III. occupied the throne of the crumbling western empire, they were called to the province of Africa by Boniface, the governor, who had been induced by intrigues and the fear of a rival to betray his master. Eager for conquest, these northern barbarians prepared a fleet, and were ready to embark when the unexpected attack of Heremaric, king of the Suevi, and the ravages of this people on the possessions of the Vandals, delayed their departure. Having routed the Suevi in a bloody battle near Augusta Emerita (Merida), Genseric embarked with about 50,000 men, crossed the straits of Gibraltar, and conquered within two years all the cities in Mauritania. When Boniface, repenting of his crime, desired Genseric to return to Spain, he refused and could not be expelled; but he at last agreed in a treaty (425) to be satisfied with Mauritania and Numidia. But the native inhabitants of the Atlas mountains, so long oppressed by the Roman governors, and the Donatists, driven to despair by the persecutions of the orthodox church, joined the standard of Genseric, who soon took up arms again and subdued the whole province of Africa. In 439 he took Carthage and made it the capital of the Vandal empire, which now extended over the whole coast, and by piratical expeditions was established in parts of Italy, Sardinia, and Corsica. The attacks of the Huns in the north of the Roman empire made these aggressions on its southern provinces easier, and it was Genseric who invited Attila to his fatal march to Gaul (451). Rome escaped the hands of the Huns, but fell into those of the Vandals. Invited, as is said, by Eudoxia, widow of Valentinian III., who wanted to free her brother, the murder of her husband by Maximus, Genseric crossed the Mediterranean, sailed up the Tiber, took Rome, pillaged it for 14 days (June, 455), carried away Eudoxia and her daughters, one of whom he gave to his son Hunneric, and sent the Roman treasures and captives to Carthage. All the shores of the Mediterranean, from Asia Minor and Egypt to the straits of Gibraltar, were now ravaged by the Vandals. A fleet, sent by the emperor Majorian (457) to check these ravages, was destroyed in the bay of Cartagena; nor was another sent by the Byzantine emperor Leo (468) more successful; and Genseric reigned victoriously until his death. He was of middle stature, lame of one leg in consequence of a fall from a horse, slow and cautious in his speech, cunning, treacherous, cruel, an able general, and a skilful ruler. Professing the Arian creed, he compelled those who had the orthodox faith to leave his domains, and when they remained treated them as slaves. He was succeeded by Hunneric.
GENTIAN

GENTIAN, in medicine, the root of the plant *Gentiana lutea*, growing wild in the mountainous portions of Europe, and imported into the United States from Germany. Some other species are also used for medicinal purposes.

One of these, known as the blue gentian (*G. Catewba*), is found in the grassy swamps of the Carolinas, and so closely resembles in its properties the official gentian, that it is used at the south, and is introduced into the catalogue of the United States Pharmacopoeia. Its flowers are blue; those of the foreign gentian are yellow, which is also the color of the powdered root. Both have at first a sweetish taste, followed by intense bitterness; and both yield their medicinal qualities to water and alcohol. Its bitter principle, called gentiopircine, is soluble in water and alcohol, and is neither an acid nor an alkaloid, but ranks as a glucoside. The Swiss and Tyrolees macerate the plant in cold water, and the sugar it contains causing it to ferment on standing, they distil from it a spirituous liquor, bitter and unpleasant, but much used by them. As a tonic it has been used from remote times, and the name is said to have been given to it from Gentius, a king of Illyria. It is found as an ingredient in many of the ancient receipts transmitted from the Greeks and Romans. Its effects closely resemble those of the other pure bitters, such as quassia and colombo. In small doses and in suitable cases it increases the appetite, and invigorates digestion. In large doses, or in cases to which it is not adapted, it is liable to disagree with the stomach, exciting nausea and irritating the bowels, and cannot therefore be administered without due reference to the condition of these organs. It is given in powder, in extract, infusion, tincture, or syrup. The powder has been used as an external application to ulcers. In convalescence from fevers and acute diseases, when there is little appetite and a feeble digestion, gentian often increases the former and aids the latter. It is not well borne when there is any irritation or inflammation of the mucous membrane of the stomach. The tincture contains a large proportion of alcohol, and its physiological and therapeutical value is affected by this ingredient, whose presence should not be forgotten by those who take or administer it. A craving for ardent spirits may be engendered by the long continued use of tincture of gentian and similar tinctures.—Besides the native gentian mentioned above, there are several others found in the Atlantic states, among the most conspicuous of which is the closed gentian, *G. Andrewsii*; the inflated club-shaped blue corolla of this species never opens at the mouth. One of the most beautiful of all wild flowers is the fringed gentian, *G. crisata*, a much-branched annual or biennial species found in low grounds in autumn; the corolla is about two inches long, the tube and its elegantly fringed lobes of a deep sky-blue. The alpine gentians, *G. acutis*, *G. acaulis*, *G. pyrenaica*, and others, which are among the gems of European flower gardens, are rarely seen in this country, as our soils become too dry in summer to suit their alpine nature.

GENTILES (the equivalent of the Heb. goyim and Gr. ἐθνος), the name by which the Jews distinguished all other nations or gentes from themselves. In its religious bearing it nearly corresponded to our word heathen; for all who were not Jews, and circumcised, they regarded as excluded from all the religious privileges and relations by which they were so greatly exalted. In the writings of St. Paul the gentiles are generally denoted as Greeks. The court of the gentiles about the temple was the outer space, marked off by a wall or balustrade breast high, within which strangers were forbidden to enter, though they might come as far as the barrier to present their offerings. This explains the meaning of Paul,
when he speaks of "the middle wall of partition" between Jews and gentiles as being broken down by the gospel.

GENTILESCHI, Orazio, an Italian painter, whose family name was Lomi, born in Pisa in 1563, died in London, or according to some authorities in Rome, about 1646. At the invitation of Charles I, he took up his residence at the court of England, and decorated the palace at Greenwich and other buildings. Vandyke included him in his portraits of 100 illustrious men.

GENTRY, a N. W. county of Missouri, intersected by Grand river and drained by its E. and W. forks; area, about 500 sq. m.; pop. in 1870, 11,607, of whom 56 were colored. The chief productions in 1870 were 61,765 bushels of wheat, 640,951 of Indian corn, 155,555 of oats, 44,929 of potatoes, 177,884 lbs. of butter, 59,641 of wool, and 11,062 tons of hay. There were 8,516 horses, 4,014 milk cows, 7,555 other cattle, 18,758 sheep, and 20,585 swine; 3 flour mills, 14 saw mills, and a woolen factory. Capital, Albany.

GENTZ, Friedrich von, a German diplomatist and publicist, born in Breslau in 1764, died in Vienna, June 9, 1832. He was considered a duce until, in his 21st year, he attended Kant's lectures at Königsberg, when his mind was awakened, and he became familiar with the Greek and Roman classics, and mastered French and English. Returning to Berlin, where he had previously studied, he became a favorite in the highest circles, and commenced a career of gallantry, adventure, and authorship. In 1793 he published a translation into German of Burke's "Essay on the French Revolution," with copious notes. In 1794 he translated and annotated Mallet du Pan's book on the same subject, and in 1795 Mounier's. In 1799 he visited England, and for 20 years he was in correspondence with leading members of the British ministries, for whom he drew up many papers on taxation and finance. In 1808 he visited Vienna, and on Sept. 6 of that year was engaged by the emperor Francis as a councillor. He was sent to England to negotiate an alliance, and drew up the Austrian manifesto of 1805. Gentz was furiously assailed in Napoleon's bulletins, and as the court of Vienna was fearful of being compromised by his further presence, he was directed to leave the capital, and for a time he used his skilful pen in combating Napoleon in Prussia. He was recalled to Vienna by Metternich in 1809, wrote the Austrian manifesto of that year, and subsequently proved himself merely the tool of his employer. He took an active part in the congress of Vienna, assisted in framing the treaty of the holy alliance, and acted as secretary at the congresses of Aix-la-Chapelle, Troppau, Laybach, and Verona. He wasted his talents in sophistical pleas for reaction and political quietism, and his means in extravagance and luxury. He is the author of several works, the literary remains of Varnhagen von Ense and published in 1861 (complete ed., 2 vols., Leipzig, 1874). His Briefe an Pilat, a contribution to recent German history, was edited by Karl Mendelssohn-Bartholdy, with a biographical notice (3 vols., Leipzig, 1868).

GENUS, a closely allied group of animals or plants, characterized by ultimate structural peculiarities. Great confusion prevails among describers in the formation of genera, from their considering form and complication of structure as generic characters, whereas the former is characteristic of families, and the latter of orders; hence generic, family, and ordinal characters are mixed up in the determinations of almost all naturalists from Linnaeus to the present time, and genera have been unnecessarily and absurdly multiplied. Genera are subdivisions of families, and species are subdivisions of genera; the former, as has been stated, are limited by ultimate structural peculiarities, while the latter bear a closer relation to each other and to their special localities, their existence being also confined within a definite period. Generic peculiarities extend to the most minute details of structure of teeth, hair, scales, cerebral convolutions, distribution of vessels, arrangement of intestinal folds and appendages, and microscopic anatomy of the organs; so complete is this identity of structure that (in the words of Agassiz, "Essay on Classification," part i., chap. 1) if an animal were "submitted to the investigation of a skilful anatomist, after having been mutilated to such an extent that none of its specific characters could be recognized, yet not only its class, or its order, or its family, but even its genus, could be identified as precisely as if it were perfectly well preserved in all its parts." Every species of the genus vulpes (fox), for example, has the same dental formula, toes and claws, and other generic characters, whether arctic, tropic, or temperate, American, European, or Asiatic, in its habitat. Genera may or may not resemble each other in form; they usually have a wide geographical range, and are less modified in their characters by physical and external agencies. The generic distinctions of the testudinata or tortoises, both land and marine, founded principally on the characters of the skull, jaws, skin, and feet (see Agassiz, "Natural History of the United States," vol. i.), give an admirable idea of what constitutes a genus, as distinguished from families and orders.

GEODE, a hollow shell of stone, commonly of quartz, found in various rocks, and usually lined with crystals pointing toward the centre. These crystals are for the most part of quartz, often amethystine. Among the amygdaloids of the trap are found geodes of agate and chalcedony, the shell made up of concentric layers of these variously colored silicous matters. Besides quartz crystals, others of calcareous spar, analcime, &c., are found in the cavities of geodes. Some of the most remarkable specimens of this kind are to be seen in low stages of water loose in the rapids of the upper Mississippi river. Externally they are
of Merlin's "Prophecies," and was first printed at Paris in 1508. The best recent editions are those of J. A. Giles (1842) and Bohn (1848), both of which are reprints from a translation by Aaron Thompson published in 1718.

**GEOFFROY SAINT-HILAIRE**

Saint-Hilaire, L. Étienne, a French zoologist, born in Étampes, April 18, 1772, died in Paris, June 19, 1844. He was educated for an ecclesiastical life, but evinced a taste for natural philosophy, and had gained some proficiency as a mineralogist when the revolution broke out. Hasty having been incarcerated as a recusant priest, his pupil managed to procure his liberation, and at the peril of his life he rescued 12 other priests from prison, on the very eve of the massacre of September, 1792. A few months later he was appointed to a subordinate office in the _jardin des plantes_, and in 1793, on the reorganization of this establishment under the name of museum of natural history, he was made professor of zoology. Through his exertions, the old specimens were put in order, new ones were procured, and the zoological collections became the richest in the world. In 1795 he welcomed to Paris George Cuvier, then entirely unknown...
to fame. In concert they pursued researches in comparative anatomy, and at that time each of them had but a faint conception of the opposite systems upon which they were to separate 35 years later. In 1796 Geoffroy was one of the scientific commission that accompanied Bonaparte to Egypt; remaining there until the surrender of Alexandria in 1801, he was one of the founders and most active members of the Egyptian institute, thoroughly explored the country, gathered valuable collections of natural specimens, and carried them to France. The papers in which he described these specimens attracted general attention, and resulted in his election to the academy of sciences in 1807. In 1809 he was appointed professor of zoology in the faculty of science at Paris, which post he filled for years simultaneously with that at the museum. From 1812 to 1815 his scientific occupations were partly interrupted by sickness and political activity. He was a member of the chamber of deputies during the hundred days; but on the second restoration he returned to his wonted pursuits. He applied himself to demonstrating the principle of which Buffon and Goethe had had but a glimpse, the unity of organic composition among the various kinds of animals; and he founded what he called the "theory of analogues." The unity of composition, according to his idea, is the law of identity in the materials composing the organs of animals of different families, and which, although infinitely varying in shape, bulk, and use, are still the same in all, and discover a single plan; while the theory of analogues is the method through which the unity of composition is demonstrated. As to the unequal sizes among the various creatures, and monstrosities in individuals, they are explained by the principle of arrest of development. These principles, at once bold and original, were in direct contradiction to those which Cuvier had adopted as the basis of his comparative anatomy; and the opposition which had been silently going on for years, at last broke out openly, July, 1809, in the sittings of the academy of sciences. The contest between the two illustrious champions caused a deep sensation throughout the scientific world of Europe. Notwithstanding the superiority of Cuvier as an orator and scientific expounder, the victory was left undecided, and many among the learned sided with Geoffroy, whom Goethe hailed as an apostle of the true synthetic doctrine. Whatever may have been his faults, he is incontrovertibly, after Cuvier, one of the most important contributors to the advancement of the science and philosophy of natural history. His views contain much of the transcendental element of the German physio-philosophers, and, if carried to their legitimate conclusions, lead to doctrines directly opposed to the prevalent philosophy of final causes. (See Philosophical Anatomy.)

Among his numerous works and papers, which embrace nearly all branches of zoology, we refer specially to the following: Philosophie anatomique (3 vols. 8vo, 1818-22), which contains the exposition of his doctrine; Principes de la philosophie zoologique (8vo, 1880), which gives a synopsis of his discussions with Cuvier; Études progressives d'un naturaliste (4to, 1885); Notices synthétiques de philosophie naturelle (8vo, 1888); Fragments biographiques (8vo, 1888); Histoire naturelle des mammifères, in conjunction with Frédéric Cuvier (fol., 1820-42). He also contributed to several great publications, and especially to the description of Egypt by the scientific commission of which he was a member. It was not till 1840 that he gave up active life on account of blindness; a few months later he had a stroke of paralysis; but he withstood his last sufferings with admirable equanimity. His elegy was delivered by M. Flourens in 1859 at the academy of sciences. An excellent biography had been previously published by his son under the title Vie, travaux et doctrine scientifique d'Étienne Geoffroy Saint-Hilaire (Paris, 1847). H. Réaumur, a French zoologist, son of the preceding, born in Paris, Dec. 16, 1805, died there, Nov. 10, 1861. Under the direction of his father he devoted himself to natural philosophy, became assistant naturalist at the museum when only 19 years old, and in 1880 delivered zoological lectures in that institution as his father's substitute. Three years later he was elected to the academy of sciences. He was then publishing a great work in which he enlarged upon a branch of the natural system outlined by his father; this was his Histoire générale et particulière des anomalies de l'organisation chez l'homme et les animaux, ou traité de tératologie (3 vols. 8vo, with an atlas, 1832-6). On its completion he was appointed assistant lecturer to his father at the faculty of sciences, afterward filled some important offices in the university, and in 1850 resigned the post of general inspector to resume the chair of zoology. He devoted his life to the study of the Histoire naturelle des animaux utiles (1854), and advocated the use of horse flesh as food in his Lettres sur les substances alimentaires, et particulièrement sur la viande de cheval (1856). GEOGRAPHY (Gr. γεωγραφία, to write), the description of the earth. The science comprises three principal divisions: mathematical, physical, and political geography. Mathematical or astronomical geography treats of the figure, magnitude, and motion of the earth; of the construction of globes, and the solution of problems; of the mode of determining the position of places on the earth's surface, and of representing any portion of that surface on maps or charts. Most of these topics belong as much to astronomy as to geography. (See Astronomy, and Earth.) Physi-
Geography treats of the earth and its features of land, water, and air, its animal and vegetable inhabitants, and its political divisions. (See Physical Geography.) Political geography describes the countries and nations of the earth as they are politically divided, and deals with mankind in their social aspect and organization. The details of this branch of the science will be found under the names of the various countries, cities, and towns. The Phoenicians were the first who made any great progress in extending the bounds of geographical knowledge. They explored all the coasts of the Mediterranean, and at an early period passed the Strait of Gibraltar, and visited the Atlantic shores of Europe and Africa, extending their voyages northward and northeastward as far as Britain and the Baltic coasts, and southward to the tropic of Capricorn. Their neighbors, the Hebrews, probably acquired from them some knowledge of distant lands. In the Scriptures the remotest regions mentioned are to the north, Gomer (Gen. x.), which probably designated the Kimmeri of Herodotus, and Kir, the Caspian region of the Kur; to the east, India (Esther l. 1), and very probably China, called the distant "land of Sinim" (Isaiah xlix. 19); to the south, Cush (Ethiopia), Ludim or Lubim (Libya), Dedan (on the Persian gulf), Sheba (C. W. Arabia), and Ophir, concerning whose situation many conjectures have been made, the most probable of which seems to be that it was in southern Asia. To the west, the extreme land was Tarshish, which was probably Tartessus in Spain, though various other identifications have been attempted by critics. The first attempt to enlarge the bounds of geographical knowledge by an exploring expedition was made by Neecho, king of Egypt, shortly before 600 B. C. He sailed down the Red sea into the Indian ocean a fleet manned by Phoenicians, which in the third year, after circumnavigating Africa, reached the pillars of Hercules or strait of Gibraltar, and returned to Egypt by the Mediterranean. The Phoenicians asserted that during a part of the voyage the sun was in the north. This statement, which shows conclusively that they must have sailed to the south of the equator, Herodotus, naturally enough, wholly discredited. The geographical knowledge of the ancients was greatly enlarged by the Carthaginians, whose extended commerce led necessarily to long voyages, but the only authentic account of any of their maritime expeditions which has reached us is that of Hanno, the time of which is uncertain, but is plausibly conjectured to have been in the 6th century B. C. With 60 vessels he passed the Strait of Gibraltar, and sailed down the coast of Africa, as some writers suppose, to the gulf of Benin, while according to others he proceeded no further than the river Nun. About 820 B. C., Pytheas, a seaman of Massilia, the modern Marseilles, sailed out into the Atlantic, coasted the shores of Spain and Gaul, visited Britain, and passing onward discovered an island, which from the position and features among the ancients as Ultima Thule. Some modern geographers have conjectured that this was Iceland, others that it was Jutland, and others that it was Shetland; but nothing certain is known about it. In a second voyage he passed into the Baltic. The expedition of Alexander the Great, 330 B. C., greatly enlarged the knowledge of India. He penetrated to the Hyphasis, the modern Sulkej. The ambassadors of Seleucus, one of his successors, reached the Ganges and visited the city of Pampilothra, which was probably on or near the site of the modern Allahabad. Beyond this the Greeks seem to have known little or nothing of eastern Asia. The first systematic attempt at scientific geography was made by Eratosthenes, who flourished at Alexandria in the latter part of the 3d century B. C. The globular form of the earth was at this time known to the scientific schools of Alexandria, and the system of Eratosthenes was based upon its recognition, though he disregarded the great primal features of modern geographical science, the equator, the poles, and the tropics. The base line of his geography was a parallel drawn through all the places where it was supposed that the longest day was 14 hours. It stretched from Cape St. Vincent in Spain eastward through Rhodes, Asia Minor, Persia, and India, till it terminated at the city of Thamus, which was supposed to be on the shores of the eastern ocean, at the utmost extremity of the earth. The length of this line, according to Eratosthenes, was about 76,000 stadia, or a little more than 8,000 English miles. At right angles to this Eratosthenes traced a meridian which passed through Rhodes and Alexandria southward, through Syene and Memphis, till it reached what was supposed to be the uninhabitable region, the northern bounds of which were fixed at 12 degrees from the equator. Thule was regarded by Eratosthenes as the extreme northern end of the earth, and the distance from there to the habitable limit toward the equator was computed at 88,000 stadia, or nearly 4,400 miles. Beyond these limits it was commonly supposed that nothing existed but an impassable ocean, though Eratosthenes cautiously conjectures that continents and islands might be reached by sailing westward. Hipparchus, a Bithynian who lived at Rhodes and Alexandria about the middle of the 2d century B. C., carried still further the system adopted by Eratosthenes, and subjected the whole science of geography to astronomical principles. He made numerous observations of latitude in addition to the few previously existing, and pointed out the mode in which longitudes might be ascertained by observing the eclipses of the sun and moon. But his discoveries were neither appreciated nor applied to any practical use till long after his time. About a century and a half after
Hipparchus, Strabo, a Greek of Pontus and a great traveller, wrote a geography which embodies all that was known of the science at the beginning of the Christian era. The countries immediately around the Mediterranean were known with tolerable accuracy; but the Atlantic shores of Europe were very erroneously comprehended, while of the northern and eastern portions only the vaguest ideas were entertained. Nothing whatever was positively known of Scandinavia, Russia, or northern Germany. The extent of Europe to the east and northeast was greatly exaggerated, while that of Asia was proportionally underrated. Nothing was known of Siberia, Tartary, China, Japan, or the great Asiatic archipelago. The Ganges was thought to have throughout an easterly course, and to flow into the eastern ocean. The Caspian was supposed to be the limit of the earth to the north, and to be connected with the eastern ocean by a sea occupying the space now known to be covered by Siberia and Tartary. Of Africa only the northern part was known, south of which was thought to be an uninhabited and uninhabitable torrid zone. The belief in the probability of circumnavigating Africa, which had existed in previous ages, was rejected by Strabo, though he held to the theory of an encircling ocean. The earliest Roman geographer was Pomponius Mela, who wrote about the time of the emperor Claudius. In his treatise De Situ Orbis he explains the division of the world into two hemispheres: the northern that part of the earth which is known, the southern that which is unknown. The former is divided into three great divisions, Europe including all N. of the Mediterranean and W. of the Tanais, Africa all S. of the Mediterranean and W. of the Nile, and Asia all the remainder. A still more famous geographer was Ptolemy, who lived at Alexandria about the middle of the 2d century after Christ. At this period the Roman empire had reached its greatest extent, and all its provinces had been surveyed and were well known. Large advances had been made in the knowledge of the countries outside of the empire. The notion of a circumambient ocean had been given up, and an indefinite expanse of terra incognita substituted as the supposed boundary of the world. Africa was represented as stretching indefinitely south, and it was even carried round to join the east of Asia, so that the Indian ocean was enclosed like the Mediterranean. In Europe, Spain and Gaul were for the first time correctly delineated, together with the southern part of Britain. The outline of Scotland and the relative position of Ireland are very incorrectly given. Thule is laid down as an island upward of 100 m. long. From its position it is probable that some part of Norway was meant. Northern Germany and the southern line of the Baltic coast were tolerably well known, as was also some portion of Russia in the neighborhood of the Baltic and the southern part of Russia in Europe. In Asia, great regions had become known sufficiently to make it certain that they were inhabited by nomad tribes called Scythians, while from the far east some vague report of China and of the regions now known as Chin-India had reached the geographer. From the time of Ptolemy till the revival of letters in Europe little progress was made in geographical knowledge. In the 9th century, however, the Northmen discovered Greenland, and in the 10th, according to their sagas, visited the North American continent. In the 13th century missions were sent by the popes into remote parts of Asia. Father John de Plano Carpini, with some Franciscan monks, was sent in 1246 by Innocent IV. to Kayuk Khan, the Tartar emperor, and penetrated as far as Thibet. In 1258 Rubruquis, another Franciscan, was sent by Louis IX. of France in search of Prester John, and penetrated further into Asia than any European ever had before. But the greatest discoveries in this quarter were made by Marco Polo, a Venetian, who in 1271 set out with his father and uncle on a journey to the court of Kublai Khan, the Tartar conqueror of China. After travelling for more than three years they reached Yehking, near where Peking now stands. Marco Polo resided 24 years in the East, and on his return gave an account of his travels, which first made known to Europe the existence of Japan and many of the East Indian islands and countries. In the 15th century the spirit of enterprise and geographical exploration was strongly aroused in Europe. Portugal took the lead, and made great and systematic efforts to explore the unknown countries on the W. coast of Africa. In the year 1412 Cape Nun was doubled, and soon afterward the islands of Porto Santo and Madeira were discovered. In 1484 Benin and Congo were discovered, and the coast explored for 1,500 m. S. of the equator. In 1486 the cape of Good Hope was reached, and 11 years later doubled by Vasco da Gama. But the greatest of all geographical discoveries was that of the new world by Christopher Columbus in 1492. From this time forward the progress of geographical exploration was exceedingly rapid. Within 80 years from the date of the first voyage of Columbus the whole E. coast of America from Greenland to Cape Horn had been explored, and Spanish keels were floating on the Pacific ocean. In 1520 Magalhaens passed the strait which bears his name, crossed the Pacific, and although he was killed in the Philippine islands, his vessel, crossing the Indian ocean, returned to Europe by way of the cape of Good Hope, having been the first to circumnavigate the globe. The W. coast of America, with the exception of that portion N. of the bay of San Francisco, was explored before the middle of the 16th century, while considerable progress was made by the Spaniards in acquiring a knowledge of the interior of
South America. At the same time discovery in the East advanced with rapid strides. Within 50 years from the first of James Cook's voyages to the Pacific, the coast of E. Africa, Arabia, Persia, Hindostan, and further India had been explored, and many of the islands of the great archipelago discovered. In the 16th and 17th centuries the progress of astronomical science led to a general revision of Ptolemy's tables of latitude and longitude, which had for ages been received with implicit confidence, but which more accurate observations now proved to be generally erroneous. In the 18th century many learned and laborious writers, among whom D'Anville may be particularly mentioned, applied themselves to the rectification of the whole system of ancient geography, and to the identification of ancient with modern countries, cities, rivers, mountains, and other features. The desire to discover a shorter route to India than those by Cape Horn and the Cape of Good Hope led the English and the Dutch in the 16th century to make daring and persevering efforts to effect a N. E. and a N. W. passage. For a long time the opinion prevailed that the northern extremity of America terminated, like the southern, in a point or cape, by sailing around which the mariner could enter the Pacific ocean and make his way to India. The expeditions of Sir Hugh Willoughby and Richard Chancellor in 1583, of Frobisher in 1576–8, of Davis in 1585–7, of Barentz in 1594–6, in search of this northern route, greatly enlarged the knowledge of the arctic regions, and especially of the N. E. part of North America. So, too, in the succeeding century, a similar result followed from the voyages of Henry Hudson in 1607–11, and of William Baffin in 1612–16. It was not till the latter part of the 18th century, however, that the great land to the north of the upper part of North America became fully known from the investigations of Capt. Cook in his voyages to the Pacific. The determination of the distance from Behring strait to the E. coast of North America dispelled for a time all expectation of a N. W. passage; it was supposed that the continent stretched in one unbroken mass to the pole. The discoveries of Hearne in 1771 and of Mackenzie in 1789, by showing that an ocean bounded America on the north, dispelled these ideas, and in 1818 the attempt to effect the N. W. passage was revived by an expedition commanded by Capt. Ross. This was the beginning of a series of English and American expeditions to the arctic regions which have greatly advanced our knowledge of that part of the world, though without attaining the object for which they were commenced. (See Antarctic Discovery.) Early in the 17th century the Dutch, while seeking for a southern continent whose existence was supposed necessary to balance the northern, discovered Australia, which they called New Holland, and explored a considerable portion of its coasts. In 1642 Tasman discovered Van Diemen's Land, or Tasmania, as it is now called. Soon afterward he discovered New Zealand, belonging to the Polynesian groups. His explorations proved that New Holland was an island, and not a part of the southern continent. The famous Capt. Cook in his voyages, 1768–79, made strenuous efforts, without success, to discover the southern continent; but he added largely to geographical knowledge by his survey of the Pacific ocean and its innumerable islands. An expedition sent out by the United States in 1838, under command of Lieut. Wilkes, in 1842 discovered a continent within the antarctic circle, portions of which had been seen shortly before by the French and English navigators Dumont d'Urville and Sir James Ross. (See Antarctic Discovery.) Our acquaintance with the interior of Asia has been greatly advanced within the last two centuries by Russian, English, and French conquests, and by a multitude of travellers, prominent among whom have been the Jesuit missionaries, so that our general knowledge of that continent is tolerably complete. No great terra incognita remains, though fuller and more precise information about the vast regions known as Tartary is much to be desired. The travels of Humboldt, of Lewis and Clarke, and of Fremont have enlarged our acquaintance with the interior of the American continent; and during the last few years much light has been thrown upon it by the various exploring expeditions sent out by the government, and especially by companies of professors and students from our colleges. The interiors of Australia and of Africa are still only partially known. Much has been done for the exploration of the former by Stuart, Eyre, Leichhardt, Stuart, McKinlay, Landsborough, Burke, the brothers Gregory, and others; while in Africa a host of travellers have struggled for a century past to penetrate the mystery which envelops that great division of the globe. Foremost among the African explorers have been James Bruce, Mungo Park, Major Denham, Lieut. Clapperton, Richard Landor, Captains Burton and Speke, Dr. Livingstone, Dr. Barth, Henglin, and Sir Samuel Baker. Great additions to our knowledge of the countries on the upper Nile have been made by expeditions sent by the pasha of Egypt, which have penetrated far beyond the region so long assigned on our maps to the mountains of the Moon. These expeditions and the researches of Barth, Burton, Livingstone, Baker, and the missionaries Rebmann and Krapf, have left in obscurity only a portion of that part of Africa which lies between lat. 10° N. and 10° S., and lon. 18° and 27° E. Dr. Livingstone at the time of his death was endeavoring to penetrate this region.—The remarkable progress of geographical discovery during the present century may be thus briefly summed up: Northern Asia has been traversed by the expeditions sent out by the Russian government; the great fields
of central Asia have been crossed in various directions; our knowledge of China has been vastly increased; the newly awakened desire of the Japanese to participate in the advantages of European civilization has broken down much of their ancient prejudice against foreigners, and bids fair to introduce us to an intimate and exact knowledge of their country; Palestine has been explored with wonderful minuteness; the interior of Arabia has been penetrated; the sites of many of the most renowned cities of antiquity have been determined; the Niger and the Benoowe or Tchadda have been traced almost throughout their extent; the Nile has been traced to the great lakes in the equatorial regions of Africa; Madagascar and Australia have been crossed in various directions from sea to sea; the icy continent about the south pole has been discovered; the delineation of the North American continent has been completed; the principal features of the geography of that vast portion of our own territory lying between the Mississippi and the Pacific have been ascertained, and its sublime scenery has been described; and the river systems of South America have been explored. With the exception of the regions about the poles and in the centre of Africa, the general outlines of every part of the earth's surface are known to civilized man.

The literature of geography, to which the school of Carl Ritter has given its highest degree of scientific development, has within a few years undergone a marked change. Instead of the formal, regular descriptions of the earth and its inhabitants, which were once in vogue, gazetteers and geographical dictionaries are now popular. The progress of geography has been much aided during this century by the efforts of zealous geographical societies. Their transactions, issued periodically, contain a vast and constantly increasing mass of information. Among the best works on geography are: Geographie universelle, by Malte-Brun (6 vols. 8vo, Paris, 1810–29; revised by Th. Lavallée, 6 vols. 8vo, 1856–69), the English translation of which was revised by J. G. Percival, who added notes (4 vols. 4to, Boston, 1884); Die Geschichte der Erdkunde, by Londe (1840); Geschichte der Erdkunde und der Entdeckungen, by Carl Ritter (1861); Geschichte der Erdkunde bis auf Alexander von Humboldt und Carl Ritter, by O. Poschel (1865); and the works of De Rongemont, Von Roon, Berghaus, Voiger, Merieker, Meinike, Klieden (Handbuch der Erdkunde, 1858–62; 2d ed., 1865 et seq.), Wapiana (Handbuch der Geographie und Statistik, 4 vols., 1855–71), and Daniel (Handbuch der Erdkunde, 4 vols., 3d ed., 1869–72). For ancient geography, see Handbuch der alten Geographie, by Forbiger (3 vols., 1842); Smith's "Dictionary of Greek and Roman Geography" (2 vols. 8vo, London, 1864–7); Buchholz's Homerische Komyographie und Geographie (1871); and Deutsche Alterthumskunde: Stellung des Pytheas . . . in der Geschichte der Erdkunde, by K. Mollenhoff (1870). The principal geographical gazetteers and dictionaries are: "Encyclopedia of Geography," by Hugh Murray (London, 1844; Amer. ed. revised, 3 vols. 8vo, Philadelphia, 1845; new ed., 1857); "A Dictionary, Geographical, Statistical, Historical," &c., by J. R. McCulloch (4 vols. 8vo, London, 1841; new ed., 1868); Fullarton's "Gazetteer of the World" (7 vols. 8vo, Edinburgh, 1860–87); "The Imperial Gazetteer," by W. G. Blackie (2 vols., London, 1855; 3d ed., 1878); Ritter's Geographisch-statistisches Lexikon (Leipsic, 1855); Lippincott's "Gazetteer of the World" (Philadelphia, 1855; new ed., 1866); Keith Johnston's "Dictionary of Geography" (revised ed., London, 1867); Dictionnaire de géographie universelle, ancienne et moderne, by L. N. Boucharle (4 vols. 4to, Paris, 1866; new ed., 1868); and Dictionnaire universel d'histoire et de géographie, by M. N. Bouillet (1 vol., Paris, 1842; 2d ed., 1871). Most of the geographical societies publish periodicals, the principal of which are those of Paris (Bulletin, 1825 et seq.), London ("Journal," 1881 et seq.; "Proceedings," 1855 et seq.), Berlin (Zeitschrift, 1840 et seq.), St. Petersburg (1848 et seq.), Geneva (Journal, 1861 et seq.), and Florence (Bollettine, 1867 et seq.). Other valuable geographical periodicals are Petermann's Geographische Mittheilungen (Gotha, 1855 et seq.), and its Errungenschaften or supplements; Saint-Martin's L'Année géographique (Paris, 1865 et seq.), and its Ertrachtungen or supplements; St-Arnold's L'Année geographique (Paris, 1868 et seq.), and "Ocean Highways" (London, 1871; new series, 1878 et seq.).

GEOLoGY (Gr. γῆ, the earth, and ὁ λόγος, discourse), the science which treats of the structure of the earth, and of the methods by which its materials have been arranged. Under this term are confounded two distinct branches of study, the one being that of the chemical, physical, and biological laws which have preceded over the development of the globe, and the other the natural history of the earth as displayed in its physical structure, its stratigraphy, mineralogy, and paleontology. The name of geognosy, employed by some authors, may be very appropriately retained for the latter, while that of geology may be restricted to the first or theoretical division of geology. A knowledge of physical geography, of the distribution of land and water in past and present times, and of the laws of winds, currents, and climates, is one of the first requisites in the study of geology. Then comes the investigation of the various kinds of rocks, their arrangement and structure, their succession and relative antiquity, their chemical and mineralogical history. The investigation of the chemical agencies which have presided over the formation of the various kinds of rocks and minerals belongs to chemical geology, while the laws which have regulated their deposition, structure, and arrangement constitute dynamical geology. The student finds that organic life in past time played a part in the earth not.
less important than it does to-day, and the study of the organic remains found in the various rocky strata, and known as fossil plants and animals, is, with that of botany and zoology which are sometimes called palaeobotany and palaeozoology, but are more generally included under the common term of palaeontology. The changes that have taken place in the inorganic and organic world introduce in their study considerations of time and progress, and the science is found to be largely of a historical character; the geologist, as Cuvier remarked, being an antiquary of a new order. Its historical element is regarded by Lyell as so prominent that he defines geology simply as "the science which investigates the successive changes that have taken place in the organic and inorganic kingdoms of nature." In the present article little more will be attempted than to present a general sketch of the history and progress of geological science, a reference to some principal objects of its pursuit, and the system of classifying the groups of rocks generally adopted. The history of the science as developed in Europe is minutely traced in the familiar work of Lyell, "Principles of Geology," in which the whole subject may also be most advantageously studied.—From the earliest times the structure of the earth has been an object of interest to man, not merely on account of the useful materials he obtained from its rocky formations, but also for the curiosity awakened by the strange objects it presented to his notice. The south and west of Asia and much of the country bordering the Mediterranean were particularly favorable for directing attention to geological phenomena. Earthquakes were frequent, changing the relative positions of sea and land; volcanoes were seen in operation, adding layers of molten rock to those of sand and mud filled with the shells of the Mediterranean; the strata in the hills abounded in evidences of similar collections of vestiges of marine life far removed from access of the sea, and yet unchanged during the period of human observation and tradition; the Ganges and the Nile, pouring forth their vast sedimentary accumulations, were plainly building up the deltas at their mouths, and the broad valleys reaching far up their course were unmistakable productions of the same series of operations in remote periods. These phenomena could not escape the attention of the philosophers among the ancient Egyptians and Indian races; and their influence is perceived in the strange mixtures of correct observation and extravagant conceit which make up their cosmogonies or universal theories of the creation. In the first chapter of the ordinances of Manu alternating periods of creation and of deluging were distinctly recognized, extending in eternal succession throughout the whole assemblage of locomotive and immovable creatures, each period comprehending a duration of many thousand ages. The Greek schools of philosophy recog- nized these phenomena, which were clearly enunciated by Ovid in presenting the doctrines of Pythagoras. Remarkably free from extravagant statements, Aristotle's work proved a system of perpetual change slowly modifying the surface of the earth. Aristotle recognized the interchanges constantly taking place between land and sea by the action of running water and of earthquakes, and remarked how little man, in the short span of his life, can perceive of operations extending through the eternity of time. Strabo distinctly applied the raising up of land, not merely of small tracts, but of continents also, by earthquake convulsions, to account for the perplexing phenomenon of beds of marine shells contained in the interior of hills far distant from the sea. Arabian philosophers of the 10th century are also cited who entertained similar views of the changes going on and their causes.—The Italian philosophers in the early part of the 16th century were the first to engage in systematic investigations concerning the true nature of fossil shells. Their abundance in the strata of the sub-Apennine range could not fail to arrest attention and excite inquiries, which were the more perplexing from the limited time allowed in popular belief to the past duration of the earth, and from the general persuasion that no great catastrophe except the Noachian deluge could have occurred to modify its surface. Various fanciful explanations were therefore adopted in the spirit of the scholastic disputations, and for three centuries argumentations were sustained with much spirit on the questions: first, whether fossil remains had ever belonged to living creatures; and secondly, admitting this, whether all the phenomena could not be explained by the deluge of Noah. Among those distinguished for the soundness of their views in the commencement of this controversy are Leonardo da Vinci, the celebrated painter, who died in 1519, and Fraenstorfo, whose attention was engaged by the multitude of curious petrifactions which were brought to light in 1517 in the mountains of Verona, in quarrying materials for repairing the city. He exposed the absurdities of the theories which referred the petrifactions to a certain plastic force in nature that could fashion stones into organic forms, and showed the inadequacy of the traditional deluge to bring together the marine fossils that form solid strata of the earth. About this time collections of these curiosities were made for public museums and private cabinets; they were deposited in the museum of the Vatican at Rome, and that of Caneolarius at Verom became famous for them. Descriptive catalogues of these collections were published; and as early as 1556 appeared one of the collection tracts of J. Keutman in Gessner's work De Rerum Fossilium, Lapidud et Gemmarum Figuris. In 1580 Palissy was the first who dared assert in Paris that fossil remains of testacea and fishes had once belonged to marine animals. The truth made but slow progress in the face of
established prejudices. In 1669 Steno, professor of anatomy at Padua, published his work *De Solido intra Solidum naturaliter Contento*, in which he proved the identity of the fossil teeth found in Tuscany with those of living sharks, and the close similarity of the fossil testacea to living species; he traced their progressive change from unaltered shells to solid petrifications, and recognized the distinction between formations deposited by salt and by fresh water, and that some were of an earlier period than the introduction of plants and animals upon the earth. But neither he nor Scilla, the Sicilian painter, who in his Latin treatise on the fossils of Calabria, illustrated by good engravings (1670), ably maintained the organic nature of fossil shells, ventured to refer their occurrence in the strata to any other cause than the Mosaic deluge. Leibnitz, the great mathematician, in his *Prolegomena* (1680), first proposed the theory of the earth having originally been a burning luminous mass, which since its creation has been cooling down, and as it cooled received the condensed vapors which now compose its crust. In one stage of its formation he believed it was covered with a universal ocean. From these materials Leibnitz traced two classes of primitive formations, the one by refrigeration from igneous fusion, the other by concretion from aqueous solution. The first recognition of the arrangement of the earthy materials in strata, continuous over large areas, and resembling each other in different countries, appears to have been by Dr. Lister, who sent to the royal society of London in 1688 a proposal for maps of soils or minerals. He also believed that species had in past ages become extinct. Dr. Robert Hooke near the close of the 17th century prepared a "Discourse on Earthquakes," which contains the most philosophical views of the time respecting the nature of fossils and the effects of earthquakes in raising up the bed of the sea. William Woodward was a distinguished observer of the geological formations of Great Britain, and perceived that the lines of outcrop of the strata were parallel with the ranges of the mountains. About 1695 he formed a collection of specimens, which he systematically arranged and bequeathed to the university of Cambridge. For this he purchased the original specimens and drawings of fossil shells, teeth, and corals of Scilla. But his geological system was cramped by the attempt to make it conform to the received interpretation of the Scriptural account of the creation and deluge. The Italian geologists Vallisneri in 1721, Moro in 1740, and Generelli in 1748, advanced the most philosophical views yet presented respecting the fossiliferous strata, and sustained them by original observations made by the first two throughout Italy and among the Alps. Moro endeavored to make the production of strata correspond in time to the account of the creation of the world in six days, and hence was compelled to refer them to volcanic ejections, which by floods, he imagined, were distributed over the surface of the earth and piled up in strata with marvellous celerity. Buffon advanced views respecting the formation and modification of mountains and valleys by the action of water, in his "Natural History" (1749), a portion of which, contained in fourteen propositions, he was required by the faculty of theology in Paris to renounce. This he did in his next work, accompanying the formal abandonment of what he had written contrary to the narration of Moses with a declaration of belief of all contained in the Scripture about the creation, both as to order of time and matter of fact.—Geology did not begin to assume the rank of an important science until its application to the practical purposes of mining was first pointed out in the last quarter of the 18th century by Werner, professor of mineralogy in the school of mines at Freiberg in Saxony. This distinguished man attracted pupils from different countries, and sent them forth enthusiastic geologists and advocates of the views he had conceived from his imperfect observation of the geology of a small portion of Germany. He taught the systematic order of arrangement of the strata, adopting nearly the same divisions that had been proposed fifty years previously by Lehmann, a German miner. He explained their production as the result of precipitation from a common menstruum or "chaotic fluid," which he supposed had once covered the whole surface of the earth. As expounded by Jameson in 1808, the first precipitates from this ocean were chemical, and produced the crystalline rocks which lie at the base of all the others, and which he designated as the primitive class. They included the granitic rocks and those called crystalline schists, such as gneiss, mica slate, clay slate, serpentine, &c. The second class comprised the rocks he calls transition, certain limestones, flinty slate, gypsium, graywacke, and trap, most of which are probably now included in the palæozoic formations. They were supposed to have been formed during the transition of the earth from its chaotic to its habitable state, and to have been partly chemical and partly mechanical in their origin, and due to the action of the waves and currents. The third class contained the rocks denominated Flütz, because as observed in Germany they were disposed in horizontal or flat strata. In this were the coal formation, various sandstones, the chalk, rock salt, gypsium, various limestones, and certain traps. They were supposed to have been formed while animals and vegetables existed in numbers, and to have been partly chemical and partly mechanical in their origin. The fourth class contained the alluvial rocks, those produced on the land, as peat, sand and gravel, loam, bog iron ore, calc tuff, &c., being understood to comprise all above the chalk excepting the volcanic. The fifth class comprised the volcanic rocks, the pseudo-volcanic, and the true volcanic; the former being the supposed products of the combustion
of coal and sulphurous matters, the latter of real
volcanoes. These formations were supposed
to be systematically arranged; the later formed
either entirely covering the older, or, when
these form a central mountain mass, encircling
this, so that the “outgoings” of the strata
(meaning their upper edges or lines of outcrop)
form circles; those of the later formed groups
being successively larger. The basin and trough-
shaped deposits were also recognized, in which
the outgoings of the newer strata became suc-
cessively smaller. The strata, it was under-
stood, were subject to local disturbances from
portions sinking into subterranean cavities, and
members might be wanting in some localities,
but whenever present must be found in their
proper position in relation to the others.
Basalt, which in SAXONY and Hesse was seen capping
the hills of stratified rocks, he inferred must be of the same series of precipitated for-
formations, although many other geologists of
Werner’s time had fully established the anal-
ogy between this rock and modern lavas.
The observations of Desmarest, especially in
the district of extinct volcanoes in Auvergne,
made in 1788, are referred to by Lyell as
most clearly tracing the origin of the basalt
to the craters of the volcanoes. A new con-
troversy now arose, which for many years was
waged with animosity and bitterness unprece-
dented in disputes of this class. Geologists
throughout Europe were divided into the two
classes of Neptunists, who advocated the pro-
duction of the rocks by aqueous deposition
alone, and Vulcanists, who attributed the ori-
igin of many of them to the action of fire.
They were also called, from the names of their
respective leaders, Wernerians and Huttoni-
ans. Dr. Hutton of Edinburgh had studied
geology for himself in different parts of Scot-
land and England, and formed his own con-
clusions, which he ably sustained. He was
the first to announce that geology had no con-
cern with questions as to the origin of things,
but that the true field of its investigations was
limited to the observation of phenomena and
the application of natural agencies to explain
former changes. His friend Sir James Hall
showed by actual experiment that the prismatic
structure of basalt might result in cooling from
a state of igneous fusion; and Hutton himself
found in the Grampian hills the granite branch-
ing out in veins, which extended from the
main body through the contiguous micaceous
slates and limestone, thus indicating its having
been in a fused state at a time subsequent to
the production of Werner’s primitive rocks.
This discovery soon led to questioning the ex-
istence of any primitive class of rocks the
origin of which lay beyond the reach of the
present order of things; and the announcement
made by Hutton, “In the economy of the
world I can find no traces of a beginning, no
 prospect of an end,” may well have startled
men of science and shocked the religious public
in the sensitive condition to which it had been
brought by the infidel doctrines promulgated in
the latter part of the last century, especially by
men of letters in France. The Vulcanists came
to be classed with the enemies of Scripture, the
true object of investigation was lost sight of,
and the controversy was continued with such
animosity that the party names at last became
terms of reproach, and many geologists avoid-
ed being involved in it. Workers in the field,
however, were collecting new and valuable data
that were to give to the science a more exact
character. William Smith, a civil engineer,
personalized in 1793 a tabular view of the strata
near Bath, tracing out their continuity over
extensive areas, and recognizing them by the
fossils they contained. This method of identi-
fication and of arranging strata in their true
positions he taught himself, and was the first
to promulgate in England. With extraordinary
perseverance he continued to prosecute his
work alone, travelling on foot over all England,
freely communicating his observations, and in
1815 he completed a geological map of the
whole country. In France the importance of
fossils as characteristic of formations was also
beginning to be appreciated. Lamarck and
Defrance earnestly engaged in the study of fos-
sil shells, and the former in 1805 reconstructed
the system of conchology to introduce into it
the new species collected by the latter in the
strata underlying the city of Paris. Six years
previous to this Cuvier had established the
different specific character of fossil and living
animals, which opened to him, as he said,
views entirely new respecting the theory of the
earth, and determined him to devote himself
to the researches which occupied the remain-
der of his life. In 1807 the geological society
of London was established, with the professed
object of enunciating the collection of data,
multiplying and recording observations, with
no reference to any “theories of the earth.”
Its active members completed the classification
and description of the secondary formations of
Great Britain, so well commenced by William
Smith; while at the same time the tertiary
formations were thoroughly investigated by
Cuvier, Brongniart, and others in Paris. Thus
each country contributed to the advancement
of geological science in the department connect-
ed with its most prominent formations: Ger-
many in that of the lower stratified and crystal-
line rocks, and especially in the mineralogical
structure of these, while in Scotland the char-
acter of the granitic rocks had been more
particularly elucidated, in England that of the
secondary strata and their order of arrange-
ment, and in France the tertiary. The great
principles gradually developed by these obser-
vations were: that the materials of the stratified
rocks were sedimentary deposits that had slow-
ly accumulated in the beds of ancient seas and
lakes; that each stratum represented a certain
period during which its materials were gath-
ered, and that this period was characterized
by its peculiar group of organized beings, the
vestiges of which were buried and remained with their records of the condition of this portion of the earth during this time. The piles of strata of various kinds indicated changes in the character of the deposits introduced, sandstones formed from sand, alternating with shales formed from muddy and clayey deposits, and with calcareous strata, whose origin may have been in marl beds or the remains of calcareous organisms. The long succession of these strata, in connection with the evidences of their slow accumulation, observed in the undisturbed condition of the fossil remains which they contained, bore witness to long periods occupied in the production of a single group of strata constituting but a minor division of one of the formations. The lapse of long periods was also indicated by the fossils found in beds of older date becoming constantly more and more unlike existing species. The same localities, too, presented in their successive beds some that were filled with marine vestiges alone, corallines and sea shells, in layers of such thickness that ages must have passed while they were quietly accumulating; and above or below these were found other strata indicating that the surface at another period was covered with fresh water, the organic remains which they contained being only of the character of those belonging to ponds and rivers; and yet again these localities became dry land, and were covered with the forests of tropical climes, and peoples with numerous strange species of animals, whose nearest living analogues are met with only in hot countries. Such changes as these also plainly marked slowly progressing revolutions, the period of which no one could compute by years. It was apparent that the sediments had collected as beds of sand and clay now collect in seas and lakes, and especially about the mouths of large rivers; but it was only in such as were evidently the product of the streams of the present day that the organic vestiges were recognized as belonging entirely to familiar species. In these alone were discovered any relics of man or any indications of his existence; and here they were not wanting, for in the calcareous strata in process of formation and filled with recent species of shells human remains have been found. But with the first step backward the bones of extinct gigantic mammals introduce us to strange groups of animals, and no satisfactory evidence is afforded, either in the strata or in tradition, that man was their contemporary. Thus in the closest connection, geologically speaking, are we presented with the most striking examples of other great principles developed by geological research, viz., the extinction of old and the introduction of new species. In consequence of the system of observation and close investigation now established, geology lost its highly speculative character, and rapid progress continued to be made in acquiring correct information of the arrangement of the strata of different countries. While the defects of Werner's classification were exposed, the general plan of it was seen to be founded in nature, and attention was directed to collecting everywhere the materials for filling out the vertical column of the rocks, as well as mapping them throughout their horizontal range. In every country some formations could be recognized, from which as a base a local classification might proceed to contiguous groups, and thus at last the whole be included in one system of classification. So the work of descriptive geology has ever since been going on, new discoveries continually adding to its completeness and helping to the compilation of a perfect system, which in this case should present a full chart of the rocks from the lowest or oldest to the uppermost or newest. Strata lying in juxtaposition in one region, when identified in another, are found to be separated by the interpolation of a new series; and again, in tracing out over broad areas a group of sedimentary strata, they are found gradually to assume new features, and even to undergo an entire change of chemical composition. The deposits over different parts of the ocean's bed are found to be here sands and gravels brought by currents, and there soft calcareous muds, the remains of minute animal organisms accumulated in still waters. The organic remains as well as the mineral character of these contemporary deposits present wide differences. From the mode of their formation it is evident that all stratified formations must be of limited area, and must thin away at their edges, presenting the shape of lenticular sheets lapping upon each other. In 1819 the geological society of London, through the labors of Mr. Greenough and his friends, published a map of England which was a great improvement upon that of Smith. About the same time Leopold von Buch prepared a similar map of a large part of Germany. A geological survey of France was ordered in 1822 by the French government, by which a complete geological map of France was finally constructed in 1841. M. Bronchant de Villiers, professor in the school of mines, was appointed to take charge of the work, and with him were associated Élie de Beaumont and Dufrénoy. The attention of these geologists was first given to an examination of the strata above the coal formation of England, where they had been most carefully studied and particularly described by Conybeare and Phillips in their treatise on "The Geology of England and Wales" (1821). The secondary strata of Germany also were familiar to geologists; and both countries consequently furnished important points of reference for the arrangement of the groups of France. The chalk formation of Paris, the upper member of the secondary, served as the starting point, and proceeding from this they examined in detail the lower strata as they appeared successively emerging from beneath it, and identified them,
as they could, with the corresponding groups of other countries. Such is the method ever since pursued, by which our knowledge of the strata which make up the outer crust of the earth has been systematically extended. The importance of the organic remains found in the rocks has been more and more appreciated, and the shells constituting the chief portion of these have been most thoroughly studied; for while the different formations or groups of strata may contain numerous similar beds of limestone, sandstone, slates, and shales, not to be distinguished by their mineral characters, and which frequently cannot be traced to their meeting with other known formations by which their place or relative positions may be determined, the fossils show no such indiscriminate distribution. Each period was characterized by its peculiar group of animated beings, and if their arrangement is understood it follows that the position of any stratum in which the fossils are recognized must also be determined. A single species may in some cases be peculiar to one member of a geological formation, and serve wherever the fossil is found to identify the rock; but usually in different countries their identification by fossils is dependent upon characteristic genera and the order of succession of their principal groups. This branch of the subject will be more particularly treated in the article PALEONTOLOGY. — In the latter part of the last and early part of the present century papers upon geological subjects occasionally appeared in the transactions of the American philosophical society of Philadelphia, the transactions of the American academy, and in other scientific journals. The character of these papers is almost exclusively descriptive. There is, however, a theory of the earth proposed by Franklin in the "Philosophical Transactions" of 1798; and in vol. vi. appeared the memorable essay of William Maclure, read Jan. 20, 1809, entitled "Observations on the Geology of the United States, explanatory of a Geological Map." The author of this paper had undertaken a more arduous and gigantic work even than that which was occupying William Smith of England; it was no less than a geological survey of the United States alone and at his sole expense—a work which entitled him to the appellation he has received of the father of American geology. In this pursuit he crossed the Alleghanies fifty times, visited almost every state and territory in the Union, and for years continued his labors mostly among those who could have no appreciation of his objects. He had visited nearly all the mining districts of Europe, and thus was well qualified, for one of that period, to recognize the corresponding formations of the two continents. He traced out the great groups of strata then designated as the transition, secondary, and tertiary, and showed how large areas in the eastern parts of Europe, and the Gulf of Mexico. The tertiary, however, he did not recognize, owing to the absence of the chalk formation, the upper member of the secondary, which in Europe, being largely developed and most conspicuous, marks the strata of more recent origin lying above it as tertiary. He continued his explorations after this report, and in May, 1817, presented another to the philosophical society, accompanied by a colored map and sections. His observations were also extended in 1816 and 1817 to the Antilles, and a paper upon the geology of these islands was published in the first volume of the "Journal of the Academy of Natural Sciences." Prof. Silliman of New Haven, educated to the profession of the law, was induced by President Dwight of Yale college to qualify himself for the departments of natural science, particularly chemistry; and with this view he spent some time previous to 1806 in England and Scotland. In Edinburgh he became familiar with the discussions of the Wernerians and Huttonians in that transition period, as he styles it, between the epoch of geological hypothesis and dreams and the era of strict philosophical induction in which the geologists of the present day are trained. The interest excited by this controversy could not fail to direct his tastes toward the new science, and he returned to become its zealous promoter, for half a century or more aiding to elucidate the geology of his country, inspiring the enthusiasm of others, and furnishing in the "American Journal of Science" an organ for the diffusion of scientific knowledge. At that period (1804—5), he says, geology was less known in the United States than mineralogy. Most of the rocks were without a name, except so far as they were quarried for economical purposes, and classification of the strata was quite unknown. Dr. Archibald Bruce of New York commenced in 1810 the publication of a journal devoted principally to mineralogy and geology, the earliest purely scientific journal supported by original American communications. It was well received at home and abroad, but appeared only once in two years, and with the fourth number. The mineralogical collections at the principal colleges, and others belonging to scientific men mostly in New York, promoted inquiry and observation concerning the geological relations of the minerals and their distribution. The admirable treatise on mineralogy by Prof. Parker Cleaveland, published in 1816, fostered while it gratified this spirit of inquiry. In 1816 the brothers Prof. J. F. Dana and Dr. Samuel L. Dana published a detailed report on the mineralogy and geology of the vicinity of Boston. In the same year was first published the "American Journal of Science," which has continued ever since to be the chief periodical American recorder of the progress of the sciences. The next year the American geological society held its first meeting at New Haven, where it continued to meet annually for twenty years. The importance of geological explorations, with the view of thereby ascertaining the agricultural and mineral capacities of large districts, was be-
beginning to be appreciated by communities and public bodies. In 1829 a geological survey of the county of Albany, N. Y., was made under the direction of the agricultural society of the county by Prof. Amos Eaton and Dr. T. R. Beck. Two years afterward Troost, Reynolds and Saratoga counties were also thus explored. Prof. Eaton was also engaged by Gen. Stephen Van Rensselaer to make at his expense a geological survey of the country adjacent to the Erie canal. The result of this was published in 1834 in a report of 160 pp. 8vo, with a profile section of the rock formations from the Atlantic ocean through Massachusetts and New York to Lake Erie, the Rev. Edward Hitchcock furnishing many of the details through Massachu-
estta. The first geological survey made by state authority was that of North Carolina in 1824 and 1825, by Denison Olmsted. Since that time there have been various surveys by the different states and by the federal government, of which we shall notice the most important historically. Beginning at the northeast, early surveys were made of Maine, New Hampshire, and Rhode Island, by Dr. G. T. Jackson, in 1856- '41; of Massachusetts, by Edward Hitchcock, in 1830- '40; of Connecticut, by J. G. Percival and C. U. Shepard, in 1836, and of Vermont in 1845- '6, a work which was continued by Edward Hitchcock and his son, C. H. Hitchcock, in 1858- '60, the latter of whom is now (1874) engaged in a resurvey of New Hampshire. In 1836 was commenced the survey by H. D. Rogers and his assistants of the state of Pennsylvania, which was not completed till 1855. The survey of New York in 1836- '42, by Vanuxem, Emmons, Mather, and Hall, may be said to have opened a new era in American geology by giving a complete and systematic classification of the palaeozoic rocks within its borders, which has served as a basis for all subsequent work to the east of the Rocky mountains. The description of the or-
ganized geology of the state recorded by Prof. James Hall is still incomplete, but five large quarto volumes have been published. The surveys of Michigan in 1887- '48 by Houghton, and of the Lake Superior region in 1847- '9 by Jackson, and subsequently by J. D. Whitney and J. W. Foster, served to extend our knowledge of the palaeozoic rocks to the westward. From that time to the present systematic surveys of the various states of the great Mississippi valley have been or still are in progress, and have already given us a pretty accurate knowledge of the geology of the whole of this vast region. The history of this work is too long for the present occasion, and it may seem invidious to mention names among workers in this great field; but a prominent place should be given, in addition to those just mentioned, to D. D. Owen, B. F. Shumard, Swallow, T. B. Hodge, W. F. Stetson, S. W. Stetson, E. W. Bigelow, B. C. Horsfall, Cox, and Tuomey. Nor should the important labors of Oscar Lieber in South Carolina and of Emmons in North Carolina be forgotten, nor the elaborate survey of Virginia by Wil-
liam B. Rogers, of which only partial reports have been published. The geology of the western portion of our continent presents charac-
ters widely different from that already noticed, and is now attracting great attention. Much important information was gathered by the lab-
ors of W. P. Blake and J. S. Newberry in the course of the great railroad surveys undertaken by the national government; and the geological work has been continued in the important survey of the 40th parallel under Clarence King, and that of the Rocky mountain region by J. V. Hayden. These labors are still in progress, as is also a geological survey of California under J. D. Whitney, and the great geo-
logical features of this region are being rapidly made known. Much progress has also been made in the study of the geology of British North America. A geological survey of Can-
ada, embracing the present provinces of Onta-
rio and Quebec, was begun in 1842 under Sir W. E. Logan, with whom were associated for many years Mr. Alexander Murray and Dr. T. Serry Hunt. In 1870 Mr. A. R. C. Selwyn succeeded Logan in the present Dominion of Canada, including the British territory west to the Pacific, the field of the survey being thus greatly extended. The provinces of Nova Scotia and New Brunswick were early exam-
nined by Gesner, since which time Matthew Bailey, Hartt, Hind, Hunt, and Dawson have done much to develop their geology. The last named has especially studied the carboniferous rocks of that region. A survey of Newfoundland is in progress under Alexander Murray. The labors of the late Sir John Richardson, Hector, Hind, and others, have done much to elucidate the structure of the great region north of Canada, until lately known as the Hudson Bay territory. With this brief sketch of the progress of geological research in North America, we may now proceed to discuss the more general principles of geological classification, and to illustrate them by especial reference to American geology. The great groups intro-
duced by Werner remain essentially unchanged, but many alterations in nomenclature and vari-
ous subdivisions and reclassifications have since been adopted, some of which require no-
tice. Besides the great distinction between crystalline and uncrystalline rocks is that of stratified and unstratified rocks, having refer-
ence not to their intimate structure, but to their geognostical relations. The stratified rocks include all those which appear to be ar-
 ranged in beds or strata, whether crystalline or not; and the unstratified, those which, like granites, traps, basalts, and volcanic lavas, oc-
cur in masses which are destitute of such ar-
angements, and appear to have been forced into their present position under circumstances less softened or molten condition. These are often spoken of as eruptive, intrusive, or intrusive rocks. They are with a few exceptions crystalline, and in certain cases are not readily
distinguished from those crystalline stratified rocks in which the bedding is ill defined, either from having been obscure from the first or else obliterated by subsequent crystallization. There are strong reasons for believing that the stratified crystalline rocks, by a process of softening and subsequent displacement or eruption, gave rise to the unstratified rocks with which they are often mineralogically identical; and hence the names of indigenous and exotic crystallines have been proposed by Dr. Hunt to designate respectively the stratified and the eruptive rocks. A third class of crystalline rocks is also to be distinguished, viz.: those which occur as veinstones in the fissures of other rocks, and have probably been deposited from watery solutions. Such are the quartz and spar veins which form the gangue of many metallic ores, and a large part of the so-called granite veins. The rocks of this third class, from their mode of formation, are designated by Dr. Hunt as endogenous crystallines. It is in some cases impossible to determine from its mineralogical characters to which of these three classes a given crystalline rock belongs. The unstratified crystalline or eruptive rocks include the modern volcanic lavas, which are evidently the products of igneous fusion, and the whole class is therefore sometimes designated as igneous rocks. It is supposed however that many of these rocks, as for example the exotic granites, have never been in a state of igneous fusion, but have assumed a plastic condition by the intervention of water under great pressure and at a temperature far below that of fused lavas. They have hence been called by some geologists plutonic and by others hypogene rocks, the latter name signifying rocks generated beneath, in allusion to their obvious subterranean source. The distinctly stratified and sedimentary character of the great formations of crystalline rocks, and the obvious analogies they present in this respect to the uncrystalline formations, early attracted the attention of geologists. In both occur intercalated layers of limestone, argillites, and conglomerates; and the question naturally arose as to the origin of the gneisses, micas schists, diorites, serpentines, chlorite schists, and talc schists, which are the characteristic rocks of these crystalline stratified formations. That the elements of these had in some way been deposited from water, like the beds of sand, mud, and carbonate of lime of uncrystalline strata, seemed obvious; and hence the conclusion that they were once, like the latter, uncrystalline strata, which had subsequently changed their form. In accordance with this notion, they were designated metamorphic strata, and this term is by many geologists used as synonymous with stratified crystalline rocks. It was noticed that in some instances uncrystalline sediments had assumed a crystalline character in the immediate vicinity of certain erupted rocks; the effect of heat, or more probably of the heated solutions impregnating the last, having generated in the midst of the contiguous sediments crystalline mineral species. It was then possible that a formation uncrystalline in one part of its distribution should elsewhere become crystalline, or in other words metamorphic; and it was conjectured that great areas of such rocks might be the stratigraphical equivalents of formations which are elsewhere uncrystalline sediments. In the Alps, for example, it was supposed that the gneisses and other crystalline schists were of mesozoic and even of cenozoic age, and similar rocks in other regions were declared to be palæozoic; till at length it seemed, such was the extension of the doctrine of rock metamorphism, that the sediments of any age might assume the characters of the primitive crystalline schists. In fact, the crystalline schists of the Alps, the British islands, and the Appalachians have all in turn been claimed as altered strata of palæozoic or more recent times. But these views have been controverted, and it has been shown that the crystalline strata which are now found in the Alps, superposed upon the uncrystalline fossiliferous sediments, are really ancient strata which were crystalline before the deposition of the latter, and in their normal position underlie them, but by great foldings and inversions have been brought to overlie them. In some instances in this region beds of apparently crystalline rocks are met with in which occur fossils like those of the uncrystalline sediments. These were regarded as further evidences of the metamorphic process which had proceeded so far as to develop a crystalline structure in the newer beds, without however obliterating their organic remains. But it has been shown that these pseudo-crystalline rocks are really sediments of the newer periods, made up of the ruins of the older and truly crystalline rocks. In many other cases, as in Wales and in eastern North America, it is found that the broken-up materials of the crystalline schists enter into the composition of the oldest palæozoic schists, which are themselves uncrystalline. While, therefore, it is clear that the crystalline schists were deposited from water, and, as will subsequently be seen, under conditions which, although chemically somewhat different from those of later times, did not prevent the development of organic life, it is now affirmed by one school of geologists that the great bodies of crystalline schists do not result from the alteration of any known series of uncrystalline strata; so that the division between the two established by Werner may still be retained as a fundamental one. This view is now sustained by Favre of Geneva, Sterry Hunt, Gümfel, Credner, and others; but the opposite view, which maintains a wide-spread metamorphism of palæozoic and more recent rocks, has been taught by very eminent names, and is still maintained in the principal geological text books and treatises. The partisans of the latter view, while asserting the comparatively recent origin of many crystalline schists, have always
admitted the existence of an underlying or basal system of stratified crystalline rocks, which were supposed to be anterior in their formation to the appearance of life upon the earth, and from the apparent absence of fossils were called azoic rocks (signifying without life). In accordance with this nomenclature, the formations containing the fossil remains of plants and animals have been divided into paleozoic, mesozoic, and cenozoic rocks (signifying ancient, middle, and recent life); while subsequent discoveries, indicating that life had already made its appearance in the so-called azoic period, have led to the substitution of the name azoic (signifying the dawn of life). These four great divisions are made the basis of the accompanying tabular view of geological formations. The subordinate divisions of Cambrian, Silurian, Devonian, &c., are of local origin, which, as will be seen, is also true of the names of most of the formations into which these in their turn are divided. In regard to the paleozoic rocks, which have been most minutely studied in Great Britain and America, the names of the subdivisions recognized in these countries are given side by side. For the details of the mesozoic and cenozoic rocks, which have been made the subject of not less careful analysis and subdivision in Europe, the reader is referred elsewhere. A complete table of them is given on page 109 of Lyell's "Student's Elements of Geology" (1871).

</table>

It should, however, be borne in mind that all such divisions of the rocks are arbitrary and artificial. From the mode in which sediments have been deposited, and from the alternations...
of sea and land, it follows that there are breaks in the succession of the rocks, which are often marked by a want of conformity in the arrangement of the successive formations. The sea retires from an uplifted continent, the strata become more or less disturbed, and perhaps in the course of ages partially broken down and swept away. When a new movement of the earth's crust brings this region once more beneath the sea, a new series of beds resting horizontally upon the older formation is deposited, and we have evidence, both from the relations of the strata and from the changes in the organic remains, of a break in the succession. Yet it is clear that elsewhere in the region occupied by the sea during this interval would be deposited sediments which fill up the interval. The process of deposition of sediments in the sea has never been interrupted, though the area of deposition has changed, and all breaks in the succession are local and accidental interruptions. Our divisions into systems and groups have been based in great part upon these interruptions, corresponding to omitted leaves in the succession, which the progress of investigation is now gradually supplying, so that the record when completed will show no breaks and no interruption either in the deposition of strata or in the succession of the forms of life. The disturbances or cataclysms which in the theories of the older school of geologists were looked upon as universal are really local, and are dependent upon the disturbances due to slow movements and the transfer of the process of sedimentation to other regions. But it is precisely where these breaks have been noticed that geologists have established horizons or lines of demarcation upon which the systems of classification have been built. From time to time we find out the formations which in other regions correspond to these interruptions, and serve to show the transition from one of the periods to another. These limits between hitherto separated formations are designated beds of passage. It is proposed to give a brief sketch of the successive geological groups enumerated in the preceding table, commencing with the lowest or eozooic period, and to notice the principal facts in their history, more especially as seen in North America.—The rocks which we have called eozooic include the crystalline strata, which are regarded in the present state of our knowledge as forming four great groups marked by lithological differences. At the base we have placed the Laurentian, which consists in great part of granitoid gneiss, in which, but for the interposed strata of quartzite, crystalline limestone, &c., there would in many parts be found small evidence of its stratified origin. This ancient group is what is called in Scandinavia the primitive gneiss, and corresponds to the fundamental gneiss of which it is often spoken as underlying all other rocks. It is the oldest series of rocks known, and in North America forms a large part of the Lau-

rentides, the Adirondacks, the Highlands of the Hudson, and their continuation southward. The thickness of this great series is unknown, but Sir William Logan has estimated that at least 20,000 ft. of strata belonging to it are exposed on the Ottawa river. It there includes three great limestone formations, which are associated with iron ore, plumbago, and phosphate of lime, and contain the remains of a foraminiferous organism to which Dawson has given the name of *eosun Canadenes.* To the Laurentian succeeds what has been named the Huronian, a group of crystalline rocks much more schistose than the Laurentian, and consisting of imperfect gneisses, with micaceous, chloritic, and talcose schists, and beds of hornblende and serpentine rocks, associated with argillites and magnesian limestones. This series is widely spread along both the N. and S. shores of Lake Superior, and the N. shore of Lake Huron, and constitutes the Green mountain range of eastern Canada and New England, stretching thence northeastward into Newfoundland and southwestward along the Appalachians. Rocks apparently belonging to this series fringe portions of the E. coast of New England, and are seen in a wider development in the coast range of southern New Brunswick. In some parts of the Lake Superior region the Huronian rocks are found to rest unconformably upon the Laurentian, and to be made up in part of its ruins, thus indicating a break between the two series. The third great group noticed in our table is that of the White mountains, or, as it may be called, the Montabal series. It consists in great part of gneisses, which, however, are lithologically dissimilar from those of the Laurentian, and are associated with large bodies of highly micaceous schists, abounding in kyanite, staurolite, andalusite, and garnet. This series of rocks is traced from the White mountains northeastward across the state of Maine and southwestward throughout the Appalachians. The facts, so far as known, seem to show that it is newer than the Huronian, resting unconformably upon it, and in some places probably upon the Laurentian in the absence of the former. The fourth group is what has been called the Norian or Labradorian, which consists in great part of granitoid or gneissoid varieties of the rock called norite, consisting chiefly of Labrador feldspar. With this are associated gneisses, quartzites, and crystalline limestones not unlike those of the Laurentian. This series in various parts of Canada and in northern New York appears to rest unconformably on the Laurentian, and was hence called by Sir William Logan the upper Laurentian; but according to recent observations by Hitchcock, it occurs in New Hampshire, apparently overlying the White mountain series. Dr. Steery Hurl can, the author of this attempt to group and classify the economic rocks, remarks: "The distribution of the crystalline rocks of the Norian, Huronian, and
Montalban series suggests that they are remaining fragments of great formations once widely spread over an ancient floor of granite (Laurentian) gneiss; but that these four series mentioned include the whole of the stratified crystalline rocks of North America is by no means certain. How many more formations may have been laid down over this region and subsequently swept away, leaving only isolated fragments, we may never know; but it is probable that a careful study may establish the existence of many besides the four series above enumerated." Notwithstanding the distinction which has been drawn between crystalline and uncrystalline rocks, there is probably to be found somewhere a series of beds marking the passage from these crystalline schists to the uncrystalline sediments of the paleozoic, although, so far as yet studied, the oldest known strata hitherto referred to the latter are completely uncrystalline, and rest unconformably upon crystalline eozoic rocks. There appears to be a close similarity between the latter in widely separated countries, the great series already indicated being recognized with their typical characters in remote parts of the globe.—The paleozoic rocks have been divided into five great groups, sometimes called systems; but these divisions, as already remarked, are local, and the breaks in stratification and in the succession of organic remains are in some parts filled by beds of passage. As will be seen in the table, there is some difference in the nomenclature of the lower paleozoic rocks, a portion of the Cambrian of Sedgwick being included by Murchison in the Silurian. In the present account we shall use these terms in the sense in which they were applied by the former. The lower portions of the paleozoic show no evidence of terrestrial forms of life, their vegetable remains consisting of algae, and their animals of mollusks, corals, and crustaceans. At the summit of the Silurian, however, fishes and amphibians appear, while an abundant land vegetation of acrogens and gymnoperms begins to make its appearance. The paleozoic rocks are of especial interest to the student of American geology, as they form the surface of the greater portion of the United States east of the Rocky mountains. The succession of the members of the paleozoic series in this country was first clearly defined by the geological survey of New York, which in its reports in 1842 included under the name of the New York system the whole of the known paleozoic rocks to the base of the coal formation. The subdivisions then established have since been generally adopted in the United States, and their relations to those recognized in Great Britain will be seen in the table. The names Cambrian, Silurian, and Devonian found their way into American nomenclature some years later. For an account of the progress of discovery in these rocks, the reader is referred to the third part of a paper on "The History of Cambrian and Silurian," by Dr. Hunt, in the "Canadian Nat-
constituting the Erie division of the New York series, the equivalent of the English Devonian or old red sandstone, and characterized by an abundant terrestrial fauna, the precursor of that of the carboniferous series, into which it passes by such transitions that it is a matter of discussion whether to draw the line. The carboniferous series is so named because it is the earliest and most important coal-bearing series of strata, and includes great beds of fossil fuel, interstratified with sandstones and shales.

At the base of the carboniferous in Michigan, Pennsylvania, and western Virginia, and also in Nova Scotia and New Brunswick, deposits of gypsum and salt are met with. In the western part of its distribution, toward the Mississippi, the carboniferous formation includes great thicknesses of marine limestone, which are wanting in the east. Overlying the carboniferous in Kansas and Iowa are beds which are the equivalent of the magnesian limestones of the north of England, and of the rocks called Permian in Russia. They are regarded as the summit of the paleozoic series. - The paleozoic rocks correspond to the transition rocks of Werner, to the lower part of which the name of the graywackes series was very generally given until the labors of Sedgwick and Murchison classified them and established the great divisions of Cambrian, Silurian, and Devonian. The thickness of these groups varies greatly in different parts of their distribution. Thus, while the entire paleozoic series in Pennsylvania is estimated at 40,000 ft., it is reduced to 4,000 in the valley of the Mississippi. This is due to the fact that the great sandstones, apparently derived from the erosion of rocks to the eastward, thin out in the opposite direction. In a similar manner the Cambrian and Silurian rocks, which attain in Great Britain a thickness of 80,000 ft., are represented by less than 2,000 ft. in Scandinavia. - Under the name of mesozoic or secondary rocks are included the triassic, Jurassic, and cretaceous series. The formation has received its name from the threefold division of it in Europe into sandstones, overlaid by fossiliferous limestones, which are succeeded by sandstones and shales. At the base of the trias in the Tyrol, at St. Cassian and Haltstadt, occurs a series of fossiliferous beds in which the characteristic animal remains of the trias are found mingled with those of the paleozoic, thus showing a passage between the paleozoic and the mesozoic rocks. The trias, both in England and on the continent of Europe, is characterized by beds of rock salt and gypsum, like the Silurian and the lower carboniferous in North America. The sandstones of the trias in England are often red, and constitute what is there named the new red sandstone. The same name is applied to sandstones of similar age which are found in Prince Edward island and Nova Scotia, in the valley of the Potomac, and abound in the upper New Jersey, Pennsylvania, Virginia, and North Carolina. To this series belong the coal fields of Rich-
tilian forms of immense dimensions, and having curious resemblances to birds, are met with; while the birds themselves, which then first appeared, had remarkable reptilian affinities. The earliest evidences of mammals appear in the Trias; throughout the Mesozoic they were insignificant in size, and chiefly marsupial. In the eocene and miocene divisions of the tertiary we find the greatest development of mammalian forms. The deposits of these strata to the west of the Mississippi have within the last few years afforded a great number of remarkable species of mammals, which have been described by Leidy, Marsh, and Cope. The flora of the tertiary period is not less remarkable than its fauna. The geographical and climatic conditions of the northern hemisphere were then widely different from those of the present day. Not only over Europe, but in North America, and northward as far as Greenland and Spitzbergen, a mild and equable climate prevailed, and the abundant plant remains preserved in the tertiary beds of these arc time regions show a luxuriant vegetation like that of the warmer parts of the temperate zone of to-day. This condition of things had been of long continuance; for in western America great beds of coal or lignite are found both in the cretaceous and the eocene strata. It was continued far into the pleisocene; but as this went on, a cold climate like that which now characterizes the northern hemisphere prevailed, and gave rise to the glacial phenomena which have been described under the head of Diluvium. This change of climate is one of the most perplexing problems of geology. That a different distribution of land and water and of the oceanic currents may have contributed in some degree to this former climatic condition of the arc time regions is probable. Astronomical conditions connected with changes in the eccentricity of the earth's orbit have also been suggested as a cause; and actually it has been noted perhaps that at a somewhat different chemical composition of the earth's atmosphere prevailing up to that time may have cooperated with geographical conditions to maintain the peculiarly mild climate which, so far as we can judge, prevailed throughout the arc time regions in palaeozoic times, and perhaps without interruption nearly to the close of the tertiary.—The distribution of metallic ores and other economic materials in the various geological series is a point of much interest, and demands a brief notice in this place, although the subject is discussed more in detail under MINERAL VEINS, and in the articles on the different metals. Metallic ores are met with both in beds interstratified with the rocky layers and in veins cutting these. The eozoic rocks are remarkable for their great deposits of crystalline iron ores, of which those of the Chamois series, in the Alps, and those of the Huronian on Lake Superior are remarkable examples, as are also those of Missouri. Similar deposits occur in the eozoic rocks of Scandinavia and Russia. It is in these rocks also that titanic and chromic iron and emery occur; and to them belong graphite and beds of iron pyrites and copper pyrites, often associated with gold and with silver. Oxides of iron also appear to be characteristic of these crystalline rocks. These various ores are found not only in contemporaneous layers, but also in veins and beds cutting the crystalline strata. But the metallic ores are not confined to these more ancient rocks, for beds of oxide and carbonate of iron are met with at various horizons from the Cambrian up to recent times, while under the heads of Copper and Gold the distribution of those metals and their ores is described. Besides these contemporaneous deposits, veins or lodes carrying the ores of various metals are found cutting rocks of all ages, and are probably even now in process of formation.—The question of eruptive or exotic rocks has already been briefly alluded to, but from its intimate connection with volcanic phenomena, from which it cannot well be separated, it is proposed to consider the whole subject in the article Volcanic, in which connection the various theories with regard to the nature of the earth's interior, the sources of subterranean heat and of ancient and modern eruptive rocks, as well as of the gaseous products of volcanic eruptions, will be discussed. (See also Granite.) Under the head of Mountain will be considered some of the most important questions of geological dynamics, namely, those relating to the elevation of continents, the phenomena of denudation, and the origin of mountains. The chemical history of the globe, or what may be called chemical geology, will be discussed under the titles Rocks and Water.

GEOMETRY (Gr. γεωμετρία, from γῆ, the earth, and μέτρον, to measure), the science of relations in space. As its name indicates, it originally denoted the measurement of land, and was equated with that art, which is the most ancient as well as the most exact and useful. As surveying. As at present understood, surveying is but a subordinate application of the science, and although geometry retains its ancient name, it has by the labors of many successive generations grown to be a vast and comprehensive system, forming the basis of many of the most important arts and sciences. It has been defined as "the science which treats of forms in space," and if we give a sufficiently extended meaning to the word "form," the definition is perhaps as good as any other. It regards material objects only in so far as they occupy space. With their other physical qualities, their color, weight, hardness, &c., geometry has nothing to do. Assuming that a billiard ball and the sun are each a perfect sphere, then the only geometrical difference between them is the difference of size. Neither has geometry anything to do with the nature of space abstractly considered. It assumes the notion of space as it is assumed by all men in practical life, and leaves to philosophy
the discussion of its nature. It assumes that space is infinite in extent; that is, it assumes as undeniable, and therefore as requiring no proof, that we can neither in fact nor in thought set any boundary to space and rightfully say there is no space beyond. It assumes that space is infinitely divisible; that is, that no portion of space is so small that we cannot conceive it as being divided. Finally, it assumes that space is continuous; that is, that which separates any two definite portions of space is itself space. Any definite portion of space, whether occupied by a body or not, is in geometry called a solid or volume, and the property of a body by virtue of which it occupies space is called extension. Extension is said to have three dimensions, length, breadth, and thickness. The limits of a solid are called surfaces, and are said to have length and breadth without thickness. The limits of a surface are called lines, and are said to have length without breadth or thickness. The limits of a line are called points, and are said to have neither length, breadth, nor thickness, but position only. A point may be considered independently of any line, a line independently of any surface, and a surface independently of any solid. The definitions of these fundamental notions of geometry have always been matters of controversy among geometers and philosophers, but practically all men are agreed as to its nature. The idea of space involves three notions which are indissolubly connected, viz.: position, direction, and magnitude. Starting from any given point, we can suppose lines to be drawn in an infinity of different directions. The difference in the direction of any two of these lines is called an angle. A line whose direction is everywhere the same is called a straight or right line; a line which changes its direction at every point is called a curved line. When the word line is used alone, and there is nothing to indicate the contrary, a straight line is always meant, and a curved line is usually called simply a curve. In treating of forms in space, straight lines, angles, and curves, and their mutual relations, are the principal things which the geometer has to consider. The object of geometry is the indirect measure of magnitude. To measure a magnitude is to find how many times it contains a known magnitude of like nature with itself, which is assumed as a unit. Thus, to measure a line is to find how many times it contains a line of known length, as an inch, a foot, a yard, a metre; to measure a surface is to find how many times it contains a known surface, as a square inch, a square foot, a square yard, a square metre, an acre, a square mile; to measure a solid is to find how many times it contains a known solid or volume, as a cubic inch, a cubic foot, a cubic yard, a cubic metre, a cubic mile. To measure a straight line, the most obvious method is to apply to it the assumed unit, for example, a foot, and count the number of times the line to be measured contains it. This method of measurement is purely mechanical, and geometry has nothing to do with it; it is a question, not of geometry, but of physics and arithmetic. In many cases, as in measuring the height of a mountain, this method is impracticable; in many others, as the distance of the moon from the earth, it is impossible. And when we pass from the measurement of straight lines to the measurement of curves, surfaces, and solids, we find that in almost all cases the mechanical method is either impracticable or impossible. Thus the every-day problem, to find how many acres there are in a farm, would, in the absence of all geometrical knowledge, remain for ever insoluble. It is evidently necessary to find some method of measuring indirectly that which we cannot measure directly. Thus in the case of a farm we can measure by mechanical means the length and directions of its boundary lines, and then geometry teaches us how, knowing these, we can find the number of acres it contains. Let us take as another example a problem of a higher kind. From the observation of certain physical facts men long ago concluded that the earth was a spherical body. A great number of interesting questions immediately presented themselves. What was its diameter? How many square miles did its surface contain? Were all its diameters equal? To answer these questions by direct measurement was impossible; all that could be done was to measure here and there a line upon its surface. Yet with the aid of a few direct measurements and of the principles of geometry all these questions have been answered. It is evident that the attainment of these results would be hopeless, and that geometry would be impossible, unless the different magnitudes of space and the elements of which each magnitude is composed were related to each other according to certain fixed and definite laws. The number of different forms in space is infinite, and unless their relations to each other were fixed and definite, and they were susceptible of classification and comparison, there could be no science of geometry. The same would be the case if the different magnitudes which are the elements of every form were not connected by definite relations. Geometry shows that they are so related, and explains the nature of those relations. — According to the different points of view from which it is regarded, geometry is variously divided. Its primary division is into elementary and higher geometry. Elementary geometry treats of angles, straight lines, planes bounded by straight lines, solids bounded by planes, circles, cylinders, cones, and spheres. The treatment of all curves except the circle, and of all surfaces and solids which involve the consideration of any curve other than the circle, belongs to higher geometry. The only instruments necessary for the construction of the figures employed in treating of elementary geometry are the rule and
true nature consists in its generality. The ancient geometry was essentially special. Thus the study of one curve was of little or no advantage in the study of another, except in so far as it had trained and strengthened the mental powers. The problem to draw a tangent to any point of a curve affords striking example of the difference between the two methods. When the ancient geometer had discovered a method of drawing a tangent to any point of the circle or the ellipse, this did not aid him in drawing a tangent to the curves called the conchoid and the cissoid. Whenever a new curve was discovered, the problem of drawing a tangent to it had to be solved anew, and independently of its solution in the case of any other curve. Modern geometry substitutes, in place of the consideration of the geometrical magnitudes themselves, the consideration of equations representing them according to a general system; and after the discovery of the differential calculus the problem above mentioned was solved with the greatest ease and simplicity by a formula applicable to every known curve and to every curve that may hereafter be discovered or invented. (See Analytical Geometry.) Considered as a method of arriving at results, the modern is infinitely superior to the ancient; considered as a means of mental discipline, its superiority is disputable.—The history of geometry may be conveniently divided into five periods. The first extends from the origin of the science to about A. D. 550, followed by a period of about 1,000 years during which it made no advance, and in Europe was enshrouded in the darkness of the Middle Ages; the second began about 1650, with the revival of the ancient geometry; the third in the first half of the 17th century, with the invention by Descartes of analytical or modern geometry; the fourth in 1684, with the invention of the differential calculus; the fifth with the invention of descriptive geometry by Monge in 1795. The quaternions of Sir William Rowan Hamilton, the Ausdehnungslehre of Dr. Hermann Grassmann, and various other publications, indicate the dawn of a new period. Whether they are destined to remain merely monuments of the ingenuity and acuteness of their authors, or are to become mighty instruments in the investigation of old and the discovery of new truths, it is perhaps impossible to predict. According to a tradition handed down by the Greek historians of geometry, the science took its rise among the Egyptians. The inundations of the Nile annually obliterated their landmarks, and efforts to restore them gave rise to geometry. From them, about 600 B. C., Thales of Miletus, one of the "seven wise men" of Greece, is said to have derived a knowledge of the elements of geometry, and to have introduced it into Greece. Pythagoras is also said to have derived his first notions of geometry from the same source, and to him is ascribed the dis-
GEOMETRY

obcovery of the proposition, which still bears his name, that the square described on the hypothenuse of a right-angled triangle is equal to the sum of the squares described on the other two sides. His disciples are said to have demonstrated the incommensurability of the diagonal and side of a square, and to have investigated the five regular solids. They were also possibly acquainted with the transcendental definition of the circle, viz., that it is the figure which within a given perimeter contains the greatest area; and with the analogous proposition in regard to the sphere, that it is the body which within a given surface contains the greatest volume. About a century after Pythagoras, Plato and his disciples commenced a course of rapid and astonishing discoveries, through the study of the analytic method, conic sections, and geometric loci. The ancient analytic mode consisted in assuming the truth of the theorem to be proved, and then showing that this implied the truth only of those propositions which were already known to be true. In modern days the algebraic method, since it allows the introduction of unknown quantities as data for reasoning, has usurped the name of analytic. Conic sections embrace the study of the curves generated by intersecting a cone by a plane surface. Within 150 years after Plato's time this study had been pushed by Apollonius and others to a degree which has scarcely been surpassed by any subsequent geometer, and his works, embracing his predecessors' discoveries as well as his own, proved 19 centuries afterward the foundation of a new system of astronomy and mathematics. Geometrical loci are lines or surfaces defined by the fact that every point in the line or the surface fulfills one and the same condition of position. The investigation of such loci has been from Plato's day to the present one of the most fruitful of all sources of geometrical knowledge. Just before the time of Apollonius, Euclid introduced into geometry a device of reasoning which was exceedingly useful in cases where neither synthesis (i.e., direct proof) nor the analytic mode is readily applicable; it consists in assuming the contrary of your proposition to be true, and then showing that this implies the truth of what is known to be false. Contemporary with Apollonius was Archimedes (died in 212 B.C.), who introduced into geometry the fruitful idea of exhaustion. By calculating circumscribed and inscribed polygons about a curve, and increasing the number of sides until the difference between the external and internal polygons becomes exceedingly small, it is evident that the difference between the curve and either polygon will be less than that between the polygons themselves; and the process may be continued by increasing the number of sides, until the difference between the curve and the polygon is as small as we please. This method is generally regarded as the germ of the differential calculus. Hiparchus in the 2nd century before Christ, and Ptolemy in the 2nd century after Christ, applied mathematics to astronomy; at the date of the latter writer the doctrine of both plane and spherical triangles had been well discussed by Theodosius and Menelaus. Vieta (1540-1603), to whom we principally owe the perfecting of algebra, enlarged Plato's analytic method by applying algebra to geometry. Kepler (1571-1630) introduced into geometry the idea of the infinitesimal, thus perfecting the Archimedean exhaustion; he also first made the important remark which leads to the solution of questions of maxima, that when a quantity is at its highest point its rise becomes zero. To Kepler we owe also one of the first examples of a problem of descriptive geometry, in the graphic solution of an eclipse of the sun. Soon after Kepler, Cavalieri published (1635) his Geometria Indivisibilibus, a further step in the road from Archimedes' exhaustions to Newton's fluxions. Roberval gave a method of drawing tangents identical in its philosophy with fluxions. Fermat (who shares with Pascal the credit of inventing the calculus of probabilities) introduced the infinitesimal into algebraical calculation, and applied it with great success to geometrical questions. Pascal anticipated some of the latest inventions by his famous theorem concerning the relation of six points arbitrarily chosen in a conic section. But most wonderful of all the great geometrical inventions of the 17th century was that of Descartes, published in 1637; it consisted simply in considering every line as the locus of a point whose position is determined by a relation between its distances from two fixed lines at right angles to each other. The relation between these distances, being expressed in algebraical language, constitutes the equation of the curve. By later geometers this method has been generalized so that the distances may be measured from any fixed point or line, and measured in a straight line or in a given curved line; or instead of some of the distances, directions or angles may be introduced. For a majority of the most important cases, however, Descartes' coordinates are still the best. Huygens, whose treatise on the pendulum is ranked by Chasles with Newton's Principia, making a combination of Descartes' methods with those of his predecessors, added to geometry the beautiful theory of evolutes, which are the curves formed by the intersection of straight lines at right angles to a given curve; and he applied it not only to the pendulum, but to the theory of optics. Soon after (1686) Tschirnhausen published a wider conception of the generation of curves by straight lines. His famous cas- tics were made by the intersection of reflected or refracted rays of light; and he proposed other curves made by a pencil point stretching a thread whose ends were fastened, and which also wrapped and unwrapped from given curves. About the same time also De la Hire and Le Pouvre invented, independently of each other,
modes of transforming one plane curve into another, by making the given curve a peculiar basis for the locus of a new curve. They thus transformed the circle into all the conic sections, without any reference to a cone. The great Newton also invented a means to the same end, so that the consideration of the ellipse and parabola became independent of that of any solid. Thus these methods, especially that of Le Poivre, anticipated descriptive geometry, and perhaps prepared the way for it. In 1700 Parent generalized the method of Descartes from representing a line to representing a curve surface by an equation between the distances of a point in the surface from three given planes, at right angles to each other; but this was not methodically arranged, and it was left for Clairaut, in 1751, to finish this great step. Meanwhile Newton's fluxions and Leibniz's differential calculus had come into use, and Newton, Maclaurin, and Cotes had made the most exhaustive investigation into curves of the third degree, and many fine discoveries in regard to curves in general. The enthusiasm which Newton's example aroused in England and Scotland for pure geometry was followed by a lull of about a century, when Monge by his "Descriptive Geometry" gave the whole study a new life. The essence of descriptive geometry lies in the transmutation of figures, the reduction of geometry of three dimensions to geometry in a plane. One beautiful example of this branch of science may be found in linear perspective, which simply projects the points of a solid upon a plane, by straight lines of light from the eye. Carnot, at the beginning of this century, in his "Geometrie de Position" and "Theory of Transversals," also introduced valuable methods; in the first showing how to indicate the direction of lines more exactly by the use of positive and negative signs, and how to use the idea of motion more effectively than before in geometry; in the second introducing that general form of the theory of transversals, i.e., of the intersections of a system of lines by one not belonging to the system, which Chasles employs so happily in his "Geometrie superieure" (1822). This writer develops two principles in the correspondence of figures: one, the principle of duality, by which for a given figure a second is found such that points, planes, and straight lines in one correspond to planes, points, and lines in the other; the second, the principle of homography, by which for any figure a second is drawn such that points, planes, and lines in one correspond to points, planes, and lines in the other; the utility of each being to transfer the demonstrations of truth in one figure to the problems of another figure. We have alluded to the difficulty of appreciating the value of some of the new methods of treating geometry which have been discovered or invented in recent times, more especially the "quaternions" of Sir W. R. Hamilton and the "doctrine of extension" of Dr. H. Grassmann. From a somewhat protracted study of both systems, the present writer is satisfied that any attempt to give a condensed account of them would only serve to perplex the reader. Especially is it difficult to comprehend either system without a more than ordinary acquaintance with the history of mathematical science during the present century, and particularly with the efforts to give a geometrical interpretation of what are called in algebra imaginary quantities. The beginner in geometry will find many text books, of which none is more popular than the "Elements of Geometry and Trigonometry," by Prof. Charles Davies, from the works of A. M. Legendre (New York, 1858). Much more condensed and suggestive is an "Elementary Treatise on Plane and Spherical Geometry," by Prof. Benjamin Peirce (Boston, 1859). An easier treatise than either of these, by Prof. G. R. Perkins, has been published in New York. The true style of Greek geometry may be found in Playfair's "Euclid." For advanced studies the following list of works is recommended: "Modern Geometry," by Mulechay (London, 1859), giving some idea of the new methods, but not employing analytical geometry; "Elementary Treatise on Plane and Spherical Trigonometry," and "Elementary Treatise on Curves, Functions, and Forces," by Benjamin Peirce (Boston, 1859), giving in its most condensed form the necessary introductory knowledge of the notation of trigonometry, analytical geometry, and the calculus; "Analytical Geometry," by Charles Davies (New York, 1865), giving a more popular expression of the same knowledge; a "Treatise on Conic Sections, containing an Account of some of the most important Modern Algebraic and Geometric Methods," by G. Salmon (London, 1865); a "Treatise on the Higher Plane Curves," by the same author; Sir Isaac Newton's "Enumeratio Linearum Tertii Ordinis; Sir W. R. Hamilton's "Lectures on Quaternions" (Dublin, 1863) and "Elements of Quaternions" (London, 1866); "An Elementary Treatise on Quaternions," by P. G. Tait (Oxford, 1867); Chasles's "Traité de géométrie supérieure" (Paris, 1823), "Mémoire de géométrie sur les propriétés géométriques des coniques sphériques" (Brussels, 1881; soon after translated into English), and "Aperçu historique sur l'origine et le développement des méthodes en géométrie" (Brussels, 1887; translated into German, Halle, 1889; a work which will richly repay a close study); Carnot's "Géométrie de position" (Paris, 1808), "De la corrélation des figures de géométrie" (1801), and "Mémoire sur la relation qui existe entre les distances respectives de cinq points quelconques pris dans l'espace, suivi d'un essai sur la théorie des transversales" (1806, and 4to, 1815); Monge's "Géométrie descriptive" (Paris, 7th ed., 1846, including "Application de l'algèbre à la géométrie"); Systematische Entwickelung der Abhängigkeit geomeitarer Gestalten von einander, mit Be- rücksichtigung der Arbeiten alter und neuer
of schemes to place upon the throne the son of James II., the accession of George I. was without disturbance. He arrived with his eldest son at Greenwich in September, and was crowned the next month. The ministers of Queen Anne, Bolingbroke, Oxford, and their associates, were impeached, and a whig ministry came into power, Viscount Townshend and Sir Robert Walpole being its most influential members. The opposition broke out into rebellion in Scotland and the north of England, but was overcome in the battle of Preston, Nov. 12-13, 1715; and although the pretender landed in Scotland in December, 1715, his presence did not strengthen his cause, and he soon fled. The leading rebels were captured, and some of them punished with severity. The dangers of this rebellion led to the repeal of the triennial act, and an act was passed allowing parliament to sit for several years unless dissolved by the crown. On Jan. 4, 1717, a triple alliance was formed with France and Holland against Sweden and Russia. The Swedish ambassador was arrested, and among his papers were found evidences of a plot for an insurrection in England, and an invasion of Scotland by the king of Sweden. In the preparations for defence, jealousy of Sunderland led to a schism in the ministry, and Walpole and others resigned. Stanhope now took the lead of the ministry. In 1718 a quadruple alliance was formed with Holland, France, and the emperor. In the short war that followed Admiral Byng annihilated the Spanish fleet at Cape Passaro, Aug. 11. There had long been hostility between the king and the prince of Wales, on account of the prince’s mother, the unhappy Sophia of Celle. This lady had been suspected of an intrigue with Count Königsmark, who suddenly disappeared and was supposed to have been assassinated, while the princess was divorced in 1694 and imprisoned from that time till her death in 1736. The prince of Wales was attached to his mother, and the enmity with his father broke out into open hostility at the end of 1717. The prince left St. James’s palace, and his residence, Leicester house, became a rival court. An important event of 1718 was the passing of a bill for the relief of Protestant dissenters. At this time arose the financial enterprises which culminated in the South sea company, of which the king was elected governor. Among the companies of the time were many of real value, but the principle of financial combination was extravagantly overrated; and when in 1720 the great South sea bubble burst, the general panic was overwhelming. The ministry was held responsible, and it was even expected that the king would abdicate. Lord Stanhope, in replying to an attack in the house of lords, was seized with a fit and died; on the following day (Feb. 5, 1721) Craggs, secretary of state, died of the smallpox, and Sunderland left the treasury. Walpole came to the front again,
supported by a house of commons strongly whig. In 1722 a new Jacobite plot was formed, but was detected, and Bishop Atterbury was punished for complicity in it. A patent was granted to William Wood, a proprietor and renter of copper mines in England, enabling him to coin farthings and halfpence for Ireland. This lucrative privilege was secured through the duchess of Kendal, the king’s mistress; Walpole guarded against fraud, and Sir Isaac Newton, as master of the mint, approved the contract; but the issue caused immense disturbance in Ireland. Dean Swift wrote a pamphlet which raised a furious popular clamor, and the patent had to be withdrawn. In 1738 the regium donum, the grant to Presbyterians and other dissenters, was increased, and in 1724 the king founded professorships of modern history at Oxford and Cambridge. In 1725 the lord chancellor Macleisfield was impeached for malversation. There were many schemes for the overthrow of Walpole; but this sagacious statesman showed as much ability in disconcerting his private enemies as in his management of the national affairs. He kept the nation at peace, and secured a season of prosperity and progress.

War was rekindled in 1725 by the alliance between the king of Spain and the emperor, and the treaty of Hanover between England, France, and Prussia, and subsequently Sweden. The siege of Gibraltar was begun by Spain in January, 1727; and a British fleet was sent to the West Indies, but accomplished nothing. Preliminary articles of peace were signed at Paris, May 81, 1727. In 1726 the king’s unhappy wife died at her place of imprisonment. He is said to have been warned that he would survive her only a year. On June 8, 1727, immediately upon the agreement for peace, he set out for his beloved Hanover, accompanied by the duchess of Kendal and Lord Townsend. On the 10th he was taken with a fit in his carriage, and died before he could reach Osnabrück. He was buried in Hanover. He was a man of moderate faculties, a cruel husband and a bad father, with gross vices, yet by no means a bad sovereign. He did not attempt to interfere with the liberties of England; the ministry of Walpole was singularly able; and the policy of union with France, upheld by the same party which had been the war party of the preceding reign, was wise and statesmanlike beyond the time, it being for the interest of the nation as well as of the house of Hanover that the union between France and the house of Stuart should be broken up. By his queen Sophia of Celle George I. left a son, George Augustus, who succeeded him, and a daughter, Sophia Dorothea, who was married in 1706 to Frederick William I. of Prussia.

GEORGE (Augustus) II., son of the preceding and of Sophia Dorothea, born in Hanover, Oct. 30, 1683, died in Kensington palace, Oct. 26, 1760. Little is known of his early history, except that he was neglected by his father, and was brought up by his grandmother, the electress Sophia. He visited Holland in 1699, and in 1705 married Wilhelmina Dorothea Caroline, daughter of the margrave of Brandenburg-Annspach, a woman of marked character and superior talent. The next year he was made a peer of England, his chief title being duke of Cambridge, with precedence over the peerage. He made the campaign of 1708 under the duke of Marlborough, and conducted himself with great bravery at the battle of Oudenarde, having his horse shot under him. In the opposite ranks, and showing equal valor, was the pretender, son of James II. He accompanied his father to England in 1714, and was proclaimed prince of Wales on Sept. 22. The quarrel between father and son broke out soon, and they hated each other cordially. The prince had been preferred by the electress Sophia to her own son, and was attached to his mother, two causes that sufficed to increase his father’s original dislike of him. He was, moreover, employed upon as instrument of political intrigue against his father. The king also hated the princess of Wales, and was jealous of her popularity. So vindictive was his feeling that he entertained a proposition, made by the earl of Berkeley, to carry off the prince to America, there to be so disposed of as never to trouble his father again. When the prince left St. James’s palace, at the close of 1717, the king sought to deprive him of all control of his children; and the matter being referred to the judges, 10 of the 12 decided in his favor. A sort of reconciliation was effected in 1720, through Walpole’s influence. When he ascended the throne, George II. endeavored to transfer power to the hands of Sir Spencer Compton, but his incapacity was so evident that Walpole retained his place, the more easily as he was supported by Queen Caroline. The coronation took place Oct. 11, 1727. The history of the first 14 years of the reign of George II. is that of the struggle of Walpole and the opposition, the fierce civil political contest, unstained by blood, that England has ever known. The hopes that had been entertained of Walpole’s overthrow as a consequence of the death of George I. had been disappointed, and that great minister’s power was now fixed on a firm basis. The new parliament contained an overwhelming ministerial majority, and the king soon became strongly attached to the minister both on personal and political grounds. The royal avarice was gratified and the royal ease consulted by the minister, and hence the king supported the latter with all his influence; but the support he received from the queen, who governed her husband without his knowing it, was of greater importance. George II. was as fond of Hanover as his father had been, and visited it often, to the disgust of his English subjects. He hated his son Frederick, prince of Wales, as bitterly as he had himself been hated by his father, and the queen shared his
feelings in that respect. Frederick was not allowed to visit England till 1728. The prince long bore the king’s parsimony and harsh treatment without complaint, and perhaps would have done so to the last if it had not been for the interest of the opposition to make him acquiesce with his political importance, and to stir him to resentment, because the king supported Walpole personally. The first great act of this reign was the treaty of Seville, concluded in 1729, between England, France, Spain, and Holland, which was very advantageous to England, and by which Spain silently acquiesced in the English possession of Gibraltar. Walpole quarrelled with his colleague Townshend in 1730, and the latter resigned office and retired altogether from public life. Walpole was supreme in the cabinet, and appears to have been disposed to make some improvements in the laws and to correct abuses; but the virulence with which all his measures were opposed in parliament compelled him to be cautious. In 1729 and 1730 a committee of parliament investigated the condition of prisons, and secured some important reforms. In 1731 the use of Latin in the courts of justice was discontinued, and English substituted. The sinking fund, which Walpole himself had aided to establish, was so encroached upon that it soon ceased to be of any value. The great contest on the excise question was the most remarkable incident of the first half of the reign. The mere report of the intention to introduce a scheme of general excise caused alarm, and the opposition, which had been reduced very low, immediately became vigorous. The battle was fought with ability and courage on both sides, and though in some of its stages the ministerial majorities were 60, they finally fell to 16, in a house of commons which had given Walpole almost 200 majority on other questions. The bill was then withdrawn, greatly to the satisfaction of the people. The king was as much beaten as the minister, and they revenged themselves by dismissing from office, or from sinecure places, a number of distinguished noblemen who had been prominent in opposing the measure, the chief of whom was Lord Chesterfield. A new quarrel broke out in Europe in 1733 in regard to the Polish succession. Walpole maintained the neutrality of England even in spite of the king’s preference for war, and finally won the king to his policy; and under the mediation of England peace was concluded in 1735. The election of 1734 resulted in the return of a strong Walolian majority. The opposition sought the repeal of the test act, and were beaten by 128 majority. The gin act, which sought to do something to lessen drunkenness, was passed in 1736. The prince of Wales was married in 1738, and the question of his income afforded the opposition means to annoy the minister. He trimmed by making more sacrifices than his father and son to become bitterer than ever. At the birth of his first child the prince left Hampton court and took up his residence at Norfolk house. The queen died in 1737, recommending her husband to Walpole with her last breath. In 1738 a son (afterward George III.) was born to the prince of Wales; and about this time the king gave notice that no visitor of the prince should be admitted to the court of St. James’s. The opposition gathered more and more about the prince, and William Pitt became one of the gentlemen of his bedchamber. The opposition endeavored to have the army reduced in 1738, but failed. They then assailed the ministry because of its indifference to the outrages perpetrated by the Spaniards in America on Englishmen there trading. An arrangement made with Spain was unpopular. Pitt’s fame may be dated from his speech against it. The ministerial majority was greatly reduced, but the minister was saved by the folly of his enemies, a number of whom succeeded. The troubles with Spain went on, and war was declared against that country, Oct. 19, 1739. The ministerial strength now diminished, and the hopes of the Jacobites revived. The war was by no means brilliantly conducted. Anson’s cruise in the Pacific and Indian seas revived the recollections of the Elizabethan age, and Vernon took Portobello; but the English failed at Cartagena, and also at Santiago de Cuba. The war of the Austrian succession began soon after, and England was drawn into it. Parliament was dissolved, and the new elections took place under circumstances unfavorable to Walpole. When parliament assembled, the opposition found themselves in a majority, and after a hard battle Walpole gave way, much to the grief of the king, who continued to take his advice to the last days of his life. Sir Robert was created earl of Orford, and the attempts made to prosecute him fell through. Lord Wilmington became premier, and Carteret secretary of state. Success was ruinous to the opposition, which showed it could not administer affairs, though so eloquent in fault-finding. The public was greatly disappointed, and the useful object of the bill to repeal the septennial act, which had been the object of their especial indignation when out of office, caused much disgust. England had now become actively engaged in the Austrian war, supporting the settlement called the pragmatic sanction, by which the Austrian succession devolved upon the late emperor’s eldest daughter, Maria Theresa of Hungary, while France and Spain maintained the claims of Charles Albert, elector of Bavaria. A large force was sent to Flanders, which did nothing. Some success was achieved by the navy, and a British squadron compelled Naples to observe neutrality. The king, brave and fond of military life, was desirous of placing himself at the head of an army, and a large German force was taken into English pay. This added to the hatred of Hanover already felt in England. The king joined the elections, and the opposition seized the opportunity. A few days later was fought the battle of Dettingen, in which the French were beaten, the monarch showing much courage. The death of
Lord Wilmington led to Henry Pelham's elevation to the premiership, the king acting under the advice of Walpole. Carteret continued to manage foreign affairs, and was much liked by the king. The Hanoverian policy was still vigorously opposed, but the resolve conduct of France, the fear of invasion, and the revival of the Jacobite party, caused some remission of party feeling, and the adoption of strong measures by government, the whigs of all views uniting in their support. The French government called Charles Edward Stuart to France, and extensive preparations were made to invade England, which failed through the occurrence of a storm, the fleet being destroyed or dispersed, February, 1744. War was declared against France a few weeks later, but little success attended it, and Carteret, now Earl Granville, was compelled to leave the ministry. Pelham forced the king to admit Chesterfield and some others of the old opposition to office, and Pitt gave his support to the government. The Hanoverian policy was kept up despite these changes, and England entered on an extensive system of German subsidies. Great preparations for the campaign of 1745 were made, but with no gain to England. The allies, commanded by the earl of Cumberland, were beaten by the French at Fontenoy. Charles Edward landed in Scotland, was joined by many highlanders and others, and, after occupying much of the ancient kingdom of his race, marched into England as far as Derby, when his leading supporters compelled him to retract his steps. He was proclaimed at Perth and at Edinburgh. He won the battle of Gladsmuir or Preston Pans, and if he had pressed forward to London the capital would probably have fallen into his hands. George II., though very brave, and prepared to place himself at the head of his guards for a last fight, made preparations to fly. The rebels defeated the royal troops at Falkirk, but three months later their army was annihilated at Culloden (April 16, 1746). From that time dates the extinction of the Stuart party. The rest of the war was inglorious, and it was terminated by the treaty of Aix-la-Chapelle in 1748. For some years there was but little political discussion, and the opposition dwindled into a small faction, headed by the prince of Wales, which became extinct soon after his death in 1751. Private bills excited more interest in parliament than public ones. An increase in the stringency of the mutiny bill, and the passage of a regency bill, caused some discussion. The reformation of the calendar was effected by statute in 1751, providing that the year should commence on January 1 instead of March 25, and 11 days be dropped out of the month of September, 1752, thus bringing the year in accordance with the Gregorian calendar. The bill for the naturalization of the Jews, passed in 1753, though one of the most creditable acts of English legislation, caused so much popular excitement that it was immediately repealed. In the same year was passed the marriage act, requiring the publication of the banns and a proper license, which was exceedingly unpopular, but is thought to have been a great blessing to the nation. The premier died March 6, 1754, and was succeeded by his brother, the duke of Newcastle, who found himself compelled to share power with others. His first ally was Henry Fox, afterward Lord Holland, and at a later day William Pitt. In 1754 the French aggressions in America became troublesome, and in July, 1755, occurred Braddock's defeat at Fort Duquesne. The seven years' war began in 1756, and England was involved in a contest of the severest character with France, while at the same time she was the ally of Prussia, which was at war with the empire, France, Russia, and lesser powers. The contest extended over the world, and was marked by great actions in Europe, in North America, and in the East Indies. The early part of the war was inglorious to England. In June Calcutta was taken by Suraj Dowlah, and his prisoners were confined in the Black Hole. But shortly after the formation of the Pitt and Newcastle ministry in 1757, the genius of Pitt changed the fortune of the contest, and the English were triumphant in every quarter. Ample subsidies were furnished to Frederick of Prussia, so that he was enabled to make head against the coalition formed for his overthrow. An army of English and Germans defeated the French in Germany, at Crefeld, Minden, and elsewhere. North America was the scene of great operations, which ended in the expulsion of the French. An expedition to France, twice renewed, inflicted considerable damage on that country, destroying, among other things, the works at Cherbourg. The success of Clive laid the foundation of the British Indian empire; Bengal and Goree were conquered; and the victory of Admiral Hawke over Confins, in the naval battle of Quiberon, established English supremacy on the ocean. Never had England stood so high as she stood in 1760. In the midst of these successes, forming so striking a contrast to most of his reign, George II. suddenly died at the age of 77. He was a man of ordinary character, and never had been popular with his English subjects; but he had governed constitutionally, and in his reign the liberal polity was established, and the industrial system of England began to display itself. GEORGE (William Frederick) III., grandson of the preceding, and son of Frederick, prince of Wales, and of Augusta of Saxe-Gotha, born June 4, 1738, died in Windsor castle, Jan. 29, 1820. He was not likely to be well educated in the court of his father, nor did the death of that parent improve his prospects in that way. His mother confined his early associations to a small circle, wishing to preserve him from the profligacy of the day, in which she was successful; but he was brought up more as a Stuart prince might have been than as the heir.
apparent to the throne of a constitutionally governed state. His disposition was arbitrary and crafty, and the noblest of his leniency, until he lost his intellect, was passed in a continual combat against liberal ideas and institutions. At first he was popular. Young, a native of the country, and but little known to the people, his accession (Oct. 25, 1760) was hailed with loud rejoicings. His first speech in parliament contained a sentence, originated by himself, expressing pride in his English birth and confidence in the people, which excited great enthusiasm. He married, Sept. 8, 1761, the sister of the duke of Mecklenburg-Strelitz, Charlotte Sophia, who shared his throne for 57 years, and bore him 15 children, all but two of whom grew up. The fact that he had offered himself in 1761 to Lady Sarah Lennox seems to be proved by the statement of her brother-in-law, the first Lord Holland, and her son, Capt. Henry Napier, contained in "Holland House," by Princess Maria Liechtenstein (London, 1878). The new king was resolved upon being a king in fact as well as in name. To afford an opportunity to attempt the inauguration of the new system, it was necessary that peace should be restored, though the war was very popular, and Pitt, the war minister, was at the height of his power. The earl of Bute, long connected with the king's father and mother, was introduced into the cabinet, and ultimately became premier, and put an end to the war, though not until a new war had been made in consequence of Spain having joined France. When the family compact was made between France and Spain, Pitt was for anticipating the latter and commencing the war, but was overruled in the cabinet, where almost every man hated him because of his inordinate egotism and arrogance. He resigned his office Oct. 5, 1761; but the event showed the wisdom of his advice, for the conduct of Spain was such that England was compelled to declare war against her, Jan. 4, 1763. This war was a series of successes on the part of England. Havana was captured with a large part of the island of Cuba, the Philippines were reduced, treasure ships of immense value were taken from the Spaniards, and the naval and colonial supremacy of England was established. The effect was to make the premier more determined than ever upon peace, which was finally brought about at Paris in 1763, on terms that were honorable to England, though party spirit caused them to be denounced as treacherous, insecure, and disgraceful. The king became unpopular, and the minister was the object of violence. Lord Bute resigned in April, and was succeeded by George Grenville, whose administration commenced with the famous contest with Wilkes and the "North Briton." The restoration of peace enabled the king to seek the development of his political plans, and for many years he was engaged in a warfare against those principles to uphold which his house had been called to the British throne. While George Grenville was minister, in 1765, the stamp act was passed, which threw the North American colonies into a blaze, and was the first in that series of acts which in their entirety make up the American revolution. The same year the first indications appeared of that mental malady which clouded the king's latter days. In July the Grenville ministry was dismissed, and the new ministry of Rockingham repealed the stamp act. In 1766 Pitt was made earl of Chatham, and formed a new ministry; and during this administration the taxation was renewed which ultimately led to American independence, although Chatham had little or nothing to do with this measure. He resigned in October, 1768. In 1769 appeared the famous letters of Junius attacking the policy of the ministry, and especially the duke of Grafton, who resigned in January, 1770, and Lord North, who had been chancellor of the exchequer, became premier, and held the place for 12 years. The modern party dates from that time as a powerful and efficient organization. The king ruled as well as reigned, and the attacks on American liberty were his acts, the guilt of the minister consisting in his being the tool, against his own convictions, of a master who was not always in possession of his reason. The year 1771 is memorable for the successful assertion by the newspaper press of the right of reporting the debates of parliament. The printer of the debates was arrested on the king's proclamation, but released by the London magistrates. In 1772 the king's message, provoked by the marriage of his brother in a manner he did not approve, secured the passage of the act, still in force, making the sovereign's consent necessary to marriages in the royal family. The American war began in the spring of 1776, and for seven years the most desperate efforts were made to conquer the colonies, which in 1776 declared themselves independent. Besides large bodies of English troops, and Tories and Indians recruited in America, thousands of German mercenaries were employed in the war, which was marked by just enough of success to encourage the king to persevere. Gradually other countries were drawn into the contest, until it had assumed a European character. War between France and England began in 1778, and Spain and Holland were soon ranked among England's active enemies. The northern powers formed the armed neutrality. The combined fleets of France and Spain obtained command even of the English channel. Gibraltar was beleaguered by an immense fleet. Lord Chatham urged a conciliatory policy with the Americans in 1777. The same year Burgoyne's army surrendered, and four years later Cornwallis capitulated. The fortunes of England were never before so low; and though the successful defence of Gibraltar, and the naval victory won by Rodney over De Grasse, closed the war with some flashes of glory, the contrast between the state of things then and
20 years before was most humiliating to all reflecting Englishmen. The king was compelled to submit to a whig ministry, headed by the marquis of Rockingham and Charles James Fox (March, 1782). Lord Rockingham's death (July 1) caused the new ministry to fall to pieces, and power passed into the hands of the earl of Shelburne and the younger William Pitt. American independence was acknowledged, and peace restored, though the king was even then resolved to continue the contest, and talked of retiring to Hanover because of the coercion to which he was subjected. The Shelburne ministry was driven from power by the famous coalition of the Foxite whigs with the Tories who followed Lord North (April, 1783). The king hated this ministry intensely, and talked of going to Hanover more than ever, and probably refrained from going because of the hint that while it would be easy to reach that country, it would not be so easy to get back to England. His submission was short-lived. The coalition broke down in an attempt to put a stop to the misgovernment of India. Its India bill passed the commons, but was thrown out by the lords in consequence of royal influence having been brought to bear on the minds of some of the peers. The king then dismissed the ministry, and placed Pitt at the head of his councils (December). After the new ministry had carried on a conflict with the coalition party in the commons until the latter had lost its majority, parliament was dissolved, and in the elections that followed the coalition was annihilated. The king, with the Pitt ministry, was now as popular as formerly he had been odious, and the tory party commenced a reign of nearly half a century. The prince of Wales was now of age. His loose life was all the more distasteful to the king because his associates were mostly whigs. As George I. had hated his eldest son, and George II. followed his father's example, so did George III. hate the heir apparent. Public affairs, however, went on smoothly, save that the impeachment of Hastings, who was patronized by the king, was brought about by the aid of Pitt. In August, 1786, an attempt upon the king's life was made by an insane woman named Margaret Nicholson. The labors of John Howard had led to legislation for prison reform. Various expedients were tried, and in 1787 the first convicts were transported to New South Wales. In 1788 the king was severely assailed by that illness which finally rendered him incapable of attending to business. A fierce struggle was commenced between parties, the object of the whigs being to have the prince of Wales made king under the title of regent should the royal illness continue, while the Tories were determined to abridge materially the powers of the regent. The recovery of the king put an end to the contest, and was the subject of great national rejoicing. Immediately afterward occurred the commencement of the French revolution, which arrested his attention; and that great movement found in him the most determined of its enemies. Before the breaking out of the war with France, a dispute took place with Russia, the object being to prevent the conquest of Turkey by Catherine II. The opposition rallied and gained strength, but Turkey was saved. Another dispute occurred with Spain, but did not lead to war. The war with revolutionary France began in 1793; and though the English maintained their naval character, defeating the French off Brest on June 1, 1794, at the Nile on Aug. 1, 1798, and elsewhere, the Spaniards at Cape St. Vincent, Feb. 14, 1797, and the Dutch at Camperduin, Oct. 11, their military character was not raised by its events. The most arbitrary rule was maintained at home, and nothing but the firmness of English jurors prevented the establishment of as complete a reign of terror in Great Britain as existed in France. Ireland was goaded into rebellion, which was suppressed by measures as cruel and bloody as any perpetrated by the French republicans in La Vendée and Brittany. The union between Great Britain and Ireland was effected in 1800, the parliament of the latter ceasing to exist, while she was allowed to send 100 members of the house of commons and 80 representative peers to the imperial parliament. Peace was made with France in 1802, though against the king's wishes, his opinion being always in favor of bloodshed, unless his enemy should unconditionally submit. The French had been driven out of Egypt, and Malta captured from them. The peace was but a hollow truce, and the refusal of the English to give up Malta led to the renewal of the war in 1803. The Pitt ministry had broken down in 1801, really on the question of peace with France, but ostensibly because of the king's bigotry, he refusing relief to the Catholics, though it had been understood that it was to be granted as one of the conditions of the Irish union. Henry Ad- dington became premier, and kept his post until after the renewal of the war, when Pitt returned to office. The threats of Napoleon to invade England, and the vast preparations he made for that purpose, caused the people to rally around the throne, and an immense force was on foot, of regulars, militia, and volunteers, while the navy was much increased. Spain was drawn into the war on the side of France, and their united fleets were destroyed in Nelson's victory at Trafalgar (1805), which made England irresistible on the ocean, and settled the invasion question for that generation. For some time the war on the part of England was chiefly confined to the ocean, though she assisted the enemies of France with money. Such military expeditions as she fitted out were on a small scale, and mostly failed. In South America, in Egypt, in the north of Europe, her armies either were beaten or accomplished nothing; and it was not until the breaking out of the Peninsula war in 1808 that, under the command of Moore and
Wellesley, they performed anything worthy of the high name of their country. Pitt died in 1806, and the government was then in the hands of a coalition ministry, of which Lord Grenville and Mr. Fox were the chiefs. The object of the latter was the restoration of peace with France, but he died before anything could be done. The coalition endeavored to grant some relief to the Catholics, but the king got rid of them, and a ministry of Tories was formed, headed by the duke of Portland (end of March, 1807). This ministry was probably the worst England ever had, and though it succeeded in the attack on Denmark, taking possession of the Danish fleet, the immorality of that attack more than balanced its success. Operations in Spain and Portugal were badly conducted; and the Walcheren expedition in 1809, which might have struck a deadly blow at Napoleon's power while he was combating Austria on the Danube, was probably the worst managed under taking even in English history. This failure led to the breaking up of the Portland ministry, for which the Perceval ministry was substituted, an improvement on its predecessor, inasmuch as Marquis Wellesley took the foreign office. The commencement of the 50th year of the king's reign, October, 1809, was observed as a jubilee. There was little occasion for rejoicing. The war had failed utterly on land; France ruled almost the whole of continental Europe; the disputes with the United States threatened to add a new enemy to those England already had; while the conduct of some of the king's sons was flagrantly profligate. His second son, the duke of York, was compelled to resign the post of commander-in-chief, in consequence of the exposures made by Mrs. Clarke. In 1810 died the princess Amelia, the king's youngest and favorite daughter, and the news and the demand for so much from anxiety during her illness that he lost his reason for ever. More than once he had been raving mad. The first indication of his disease appeared on the very day of the completion of the 50th year of his reign, Oct. 25, 1810. His reign ceased in fact from that date, although in law it lasted more than nine years longer. The prince of Wales became prince regent by act of parliament on Feb. 5, 1811. The national events of the regency will be found under the title GEORGE IV. The care of the king's person was given first to the queen, and in 1819 to the duke of York. To his early education George III. owed a want of frankness and a moodiness when angry which did him much harm. But though he began his reign ignorant and ill educated, he learned much, and his last years of rule were as popular as the first had been unpopular. His original purpose to make himself an arbitrary monarch yielded to the rebuffs of his many defeats, and his personal morality and manly integrity and piety caused him to be respected and even beloved. A weak man naturally, and perhaps never strictly sane, he reigned 50 years, and left a memory in refreshing contrast with that of his immoral and un-English predecessors.

GEORGE (Augustus Frederick) IV., son of the preceding and of Queen Charlotte, born Aug. 12, 1762, died June 26, 1800. He was educated with great care, and closely restrained until 18 years of age, when he commenced a career of extravagance and profligacy that contrasted painfully with the upright life of his father. He early formed a connection with Mrs. Mary Robinson, an actress, and the wife of an attorney, who afterward became well known from her novels, verses, and autobiography. He became intimate with Fox, Sheridan, and other whig leaders, who were his companions in dissipation, and whose politics he adopted, in open opposition to his father. In 1788 his friends came into power as the famous coalition ministry, and on Nov. 11 he took his seat in the house of lords as duke of Cornwall, and as a supporter of the new administration, while they immediately demanded for him an augmented establishment and allowance, and Carlton house was assigned to him as a residence. When his friends fell from office he stood by them, and tried to restore them. In 1786 the debts of the prince were brought before parliament by Sheridan, but the king would not sanction a bill of relief. In the preceding year the prince had privately married Mrs. Fitzherbert. There is no doubt about the marriage, but it was illegal as being without the consent of the king; and Mrs. Fitzherbert being a Roman Catholic, the marriage, if valid, would have excluded the prince from the succession. When it was referred to in the debate on the prince's debts, Fox denied it, as he said, by the highest authority. In 1791 a difference arose between the prince and his sporting companions; and he so disliked his house that he shut up Carlton house, and devoted himself to the payment of his creditors, and in a speech in the house of lords separated himself from his old political friends. In 1795 he espoused his cousin, Caroline of Brunswick, in order to get his debts paid. After they had lived together for a year, during which their only child, the princess Charlotte, was born, they separated by common consent. Anxious for a complete divorce, the prince endeavored to prove his wife unfaithful. At this time he had returned to associations with Fox and his old friends, and was made a rallying centre by the whigs, while the Tories naturally clung to the princess, who had the sympathy of the king. Under these circumstances took place the first investigation by parliament into her conduct. The main decisions of the investigation, which alone were made public, acquit the princess fully, although the matter was made a subject of political dispute. It seems that at most she was guilty while in England only of imprudent acts, and her father-in-law always protected her, not only because he had caused the marriage, but because he hated her hus-
band. It was not until he became regent in 1811 that the prince of Wales assumed political importance, and he then gave himself up to the Tories. The years 1810 to 1811 were the period of Napoleon's greatest power. By conquest or by alliance continental Europe was under his control, although Sicily and Portugal were under the protection of England. In 1811 coolness arose between Napoleon and the czar Alexander. Early in 1812 Sweden became allied with Russia in resistance. The memorable Russian campaign followed. Wellington had taken Badajoz and Ciudad Rodrigo, and won the battle of Salamanca, and England rejected Napoleon's overtures for peace. War broke out this year with the United States, and success at first attended the English arms on the borders of Canada, while the frigate Constitution captured the British frigate Guerriere. In 1813 the war continued with varying fortune in America, and Wellington entered France in October. Napoleon was driven by the discontent at home to the campaign of 1814, beginning in January; but while by a bold movement he placed himself in the rear of his allied enemies, the latter marched upon Paris, which they entered March 31, and Napoleon abdicated and was taken to Elba. In America the city of Washington was taken, Aug. 24, but peace was signed with the United States at Ghent, Dec. 24. On March 1, 1815, Napoleon landed at Cannes, and an army was at once formed to oppose him in the Netherlands, of which Wellington took command on April 5. The victory of Waterloo, June 18, made England the most important power of Europe. The only wars of England now were in India, while the attention of the country was mainly given to the development of home industry and the agitation for parliamentary reform. An attempt was made in 1817 to assassinate the prince, and there was much discontent at his extravagance and vice. His daughter, the princess Charlotte, died in 1817. He became king, Jan. 29, 1820. The Cato street conspiracy for the assassination of the ministry absorbed attention at the beginning of his reign. The king soon commenced an open persecution of his wife which agitated the whole country. A bill of pains and penalties was introduced into the house of lords, charging the queen with adultery. The trial lasted for many weeks, and the bill passed to a third reading Nov. 10; but the majority for it was so small and public opinion so decidedly pronounced against the prosecution, that the government withdrew it. Nominally victorious, the queen was really beaten, and died of chagrin in less than a year. The king visited Ireland, Scotland, and Hanover, and apparently was popular. He was, however, greatly perplexed by politics. The progress of liberal opinions was making itself felt in England, and the ministry had to go with the world. Castle-reaigh's suicide and Canning's promotion were sources of much trouble to him. The foreign policy of Canning, decidedly opposed to the policy of the holy alliance, was eminently distasteful to him. When a French army, at the bidding of the holy alliance, entered Spain to restore absolutism (1823), England was greatly moved, and probably nothing but financial considerations prevented war with France. When Portugal appealed for English aid against Spain, that aid was promptly given. The independence of the Spanish American countries was effectually promoted. The Greek revolution added to the interest which the English felt in foreign affairs, from classical associations. Internal policy was liberalized. Peel led the way, through a Tory minister, in mitigating the criminal law; Huskisson's commercial ideas began to make head; Brougham labored in the cause of education; and the work of Catholic emancipation went vigorously forward. The year 1824 was a period of great material prosperity, and was followed by a crash in 1825. The Burmese war, begun in 1824, ended in 1826 with a considerable accession to the British territory on the eastern coast of the bay of Bengal. Early in 1827 the duke of York, heir presumptive to the crown, died, and the title was transferred to the duke of Clarence, while his office of commander-in-chief was given to the duke of Wellington. Lord Liverpool, who had been prime minister since 1812, was incapacitated from further attention to business by illness. The contest that followed for the premiership ended in the triumph of Canning, whereupon seven of his associates resigned, and he was compelled to reconstruct the cabinet, which he did on a liberal basis. He died, however, before he could accomplish anything. His successor was Lord Goderich, whose ministry lasted but a few months, during which the Turkish fleet at Navarino was destroyed by the combined squadrons of England, France, and Russia; an event which the king called "untoward" in his speech at the opening of parliament. The ministry of Goderich was followed by that of Wellington, January, 1828, with the duke as first lord of the treasury and Peel as home secretary. The return of the Tories to power was the signal for the revival of the emancipation agitation, and the Catholics proved successful in 1829. The ministry had to choose between civil war and giving up their principles, and they made the sacrifice required of them. The king, whose bigotry and dread of popular ideas increased with his years, stood out to the last against the current of opinion, but was forced to give way. The dissenters had previously been freed from disabilities. These acts, noble though they were, proved the ruin of the Tory party, and so demoralized it that it could not stand before the feeling that was soon after roused over Europe by the French revolution of 1830. The king was taken seriously ill early in that year, and died in midsummer. The duke of Wellington, who
was no flatterer, said of him after his death: "He was the most extraordinary compound of talent, wit, buffoonery, obstinacy, and good feeling—in short, a medley of the most opposite qualities, with a great preponderance of good—that I ever saw in any character in my life." His short reign had been remarkable for the advance made in liberal sentiments, and for the many practical reforms which it had witnessed; changes with which the sovereign had little to do. The Empress of Vienna, where he kept up an incessant agitation against Prussia; and as even when he had agreed, in February, 1868, to accept 16,000,000 thalers as an indemnity for his lost kingdom, he persisted in his spiteful attitude, the Prussian government ordered (March 2) the provisional suspension of the payment of that amount.

GEORGE II, prince of Denmark, born April 21, 1658, died Oct. 28, 1708. He was the second son of Frederick III. and Sophia of Lüneburg. On the death of his father in 1670 war was renewed with Sweden, and the prince took part in the campaign of his brother Christian V. against Charles XI., when the rival kings commanded and fought in person. On July 28, 1688, he married the princess Anne of England, second daughter of the duke of York, afterward James II. She bore him 17 children, all of whom died before their mother's accession to the throne. The prince was wholly devoid of talent, as of ambition. "I have tried him drunk," said Charles II., "and I have tried him sober; and drunk or sober, there is nothing in him." But he was brave, good-natured, and humane; taking no part in politics, and deserting his unhappy father-in-law in the hour of need, chiefly by the desire and after the example of his wife. He had been brought into the conspiracy through her subservience to Churchill, the future duke of Marlborough, but his extreme insignificance rather excited the raillery of the king, even on this sad occasion. "After all," said James, hearing of his defection, "a good soldier would have been a greater loss." After the triumph of the prince and princess of Orange, Prince George was naturalized by act of parliament and created by the new king duke of Cumberland, in acknowledgment of his cooperation in the great measure which he had achieved. He accompanied the king to Ireland, and was present at the battle of the Boyne. On the accession of his wife to the throne, in 1702, he was made lord high admiral of England. He had previously been invested with the title of generalissimo of all the queen's forces. As admiral he was assisted by a council consisting of four members. The legality of this board was much doubted, but parliament was so obsequious to the queen, that it was suffered to act without question.

GEORGE V., ex-king of Hanover, born in Berlin, May 27, 1819, died June 12, 1878. He was a son of King Ernest Augustus and of a sister of Queen Louisa of Prussia, and married in 1838 the Countess of Sussex-Altenburg. Although he became totally blind in his youth, he succeeded to the throne on the death of his father, Nov. 18, 1851, and soon created dissatisfaction by his affiliations with eccentric and unpopular courtiers, and by his ultra-conservative principles. Although he was a Protestant and a grand master of freemasons, his Roman Catholic minister Windthorst persuaded him to favor ultramontanes, while he engaged a tutor of the same faith for his elder son, and the ex-queen was reported in 1871 to have joined the church of Rome. His unstable policy resulted in a perpetual change of ministers, and in 1865 he restored a reactionary cabinet under Baeheimer. Despite his relationship with the Prussian dynasty, and the reminiscences of his most influential prime minister, the secretary general, Herrman, he showed no sympathy for Prussia; and as he ostentatiously sided with Austria at the outbreak of the war of 1866, his territory was invaded by the Prussians in June, and annexed by King William Sept. 20. He fled to

GEORGE I. (Greece)

SAINT GEORGE 711
talled on the offender the most cruel punishment. Reverence for the sufferer soon extended through Phoenicia, Palestine, and the whole East. A Greek inscription dated 846, on a very ancient church at Ezra, in Syria, mentions George as a holy martyr. Constantine the Great built a church over the tomb of the saint between Lydda and Ramleh; and the latter place, which claimed also to be his birthplace, was then called Georgia. In Constantinople a temple of Juno was converted by the same emperor into a church of St. George, to which his remains were translated. About the same time the name of "St. George's arm" was bestowed upon the Hellespont. In Rome, Palermo, and Naples churches also bore his name from a very early date. Queen Clotilde in 509 founded in his honor a convent at Chelles, and Clovis II. a convent at Baralle in Normandy. St. George was honored in England during the Anglo-Saxon period. Under Canute a monastery of St. George was founded at Thetford; St. George's, Southwark, was built a little later; and in the reign of the Conqueror there was a collegiate church of St. George in Oxford. England, Aragon, Portugal, and Genoa chose him as their patron. In 1222 a council held at Oxford ordained that St. George's day should be a national holiday. In 1470 Frederick of Austria instituted an order of knighthood called after him. About 1550 Edward III. made him the patron of the order of the garter. St. George is also the patron saint of Russia. St. George slaying the dragon was the cognizance of the grand dukes until the marriage of Ivan III. with the Greek princess Sophia, when the two-headed eagle, the Byzantine emblem, was adopted. It is still the emblem of Moscow. The Russian order of St. George was founded by Catharine II. in 1769. Besides the universal veneration in which he is held by Christians in the East, especially in Georgia, the Mohammedans revere him under the appellations of Ghergis and El-Khouder. The historian John Cantacuzenus enumerates several shrines erected by them in his honor; and Dean Stanley found a chapel on the seashore near Sarafend (ancient Sarepta) dedicated to El-Khouder. The George whose relics are shown in St. Germain-des-Prés, is a Syrian deacon martyred in Spain in 852; but his name is not in the Roman martyrology. The honor paid to St. George the martyr was sanctioned by Pope Gelasius I. in 494, in a council at Rome; but the "acts" were rejected as unworthy of credit. The crusaders found him honored by the Greeks with the surname of Tropaeophoros or Victioria. He is generally represented, according to a comparatively modern legend, as slaying a dragon sent by a magician Athisanios to devour a princess Alexandria. This came from his being confounded with George of Cappadocia. II. Called the Fuller, the Arian, and George of Cappadocia, born in Epiphania, Cilicia, about 800, died in Alexandria toward the close of 861. From the fuller's shop kept by his father, he is said by Ammiannus to have raised himself to opulence by unworthy means. He collected a valuable library, became the leader of the Arians in Asia Minor, and through the influence of Constantius was chosen in 856 bishop of Alexandria, while Athisanios was still living. He and his military supporters persecuted their religious opponents, pillaged the pagan temples, ruined commerce by monopolizing all trade, and proposed the impost of a heavy tax on households. Driven from the city by the revolted inhabitants, he was restored by military force; but on the accession of Julian he and his two principal followers were imprisoned by the pagans, and after 24 days were taken out and butchered. Gibbon and other writers confound George of Cappadocia with St. George the martyr; but Heylin and Milner, with whom Milman agrees, have shown them to be distinct personages. GEORGE, Essex, a bishop of the Methodist Episcopal church in the United States, born in Lancaster co., Va., in 1767 or 1768, died at Staunton, Va., Aug. 28, 1828. After preaching one year at the head waters of the Catawba and Broad rivers, in North Carolina, he was received into the conference on trial in 1790, and sent to Pamlico circuit. For four years he travelled over extensive circuits in the states of Virginia, North Carolina, South Carolina, and Georgia, when he was obliged to retire from active ministerial labor on account of physical debility. In 1799 he resumed the itinerant work in Rockingham circuit, Virginia. In 1800 he had charge of an immense district extending from Chesapeake bay to the Alleghenies, but again his health failed, and for two years he taught a school in Winchester, Va. In 1808 he resumed his ministerial labors, acting as pastor of churches in Frederick, Alexandria, Montgomery, and Baltimore, and as presiding elder of the Baltimore, Alexandria, and Georgetown districts till 1816, when he was elected to the episcopacy. He continued to labor effectively in this office to the date of his death. He was remarkable for a peculiar and powerful style of preaching, and for great humility. GEORGE, Lake, a picturesque sheet of water in Warren and Washington cos., New York, 86 m. long from N. E. to S. W., from ½ m. to 4 m. wide, and in some places 400 ft. deep, discharging into Lake Champlain on the north. It is remarkable for the transparency of its water, its multitude of little islands, popularly supposed to correspond in number with the days of the year, and the beautiful scenery of its banks. Black mountain, on the E. shore, has an elevation of 2,900 ft. above the surface of the lake; and 12 m. distant from it is a very steep rock rising 200 ft. from the water, down which it is said Major Rogers, when pursued by Indians during the French war, slid and landed safely on the ice. Not
far from this spot is the place where the English under Lord Howe landed previous to their attack on Fort Ticonderoga. The ruins of this fort can be seen at the E. end of the narrow channel through which the waters of Lake George are conveyed to Lake Champlain. Steamers ply upon the lake in summer, between Caldwell and Fort Ticonderoga, conveying large numbers of tourists attracted by its beautiful scenery. Caldwell, Bolton, and other places on its banks, are favorite summer resorts.—Lake George was discovered by the French from Canada early in the 17th century. Champlain knew of its existence in 1609, and saw it some time between that year and 1618. It was named by Father Jogues Lake St. Sacrement, from the festival of Corpus Christi on which he reached it, May 27, 1644. The English subsequently named it after King George II. By the Indians it was called Andianateota, or "the place where the lake closes." Cooper in his "Last of the Mohicans" called it Horicon, the name Horiconi being given on some old maps as that of an Indian tribe in the vicinity, probably by a misprint for Horiconi, that is, Irroquois. It bears a conspicuous place in American history. For more than a century it was a channel of communication between Canada and the settlements on the Hudson. In the French and Indian war it was repeatedly occupied by large armies and was the scene of several battles. On Sept. 7, 1755, occurred engagements between the French and English, near the S. end of the lake, in which Col. Williams of Massachusetts, the founder of Williams college, was killed, Baron Dieskau, the French commander, severely wounded, and the French totally defeated. In 1757 Fort William Henry, at the same end of the lake, was besieged by the French general Montcalm, at the head of 10,000 men. The French, strongly entrenched and defended, capitulated, and were barbarously massacred by the Indian allies of the French. In July, 1758, the army of Gen. Abercrombie, about 15,000 strong, passed up the lake in 1,000 boats, and attacked Ticonderoga without success. In July, 1759, Gen. Amherst with an almost equal force also traversed the lake and took Ticonderoga and Crown Point. The head of Lake George was the depot for the stores of the army of Gen. Burgoyne before he began his march to Saratoga.

GEORGE OF TREBIZOND, a Greek scholar, born in the island of Crete in 1396, died in Rome in 1486. He arrived in Italy in 1430 at the invitation of Francesco Barbaro, a noble Venetian, and became professor of Greek literature and philosophy at Venice. Pope Eugenius IV. invited him to Rome in the same capacity, and made him his secretary; and he was continued in these functions by Nicholas V. Though he was famous throughout Italy, some of his hasty translations of the Greek authors into Latin drew upon him attacks from Lorenzo Valla and Theodore Gaza, and his eulogies of Aristotle and attacks upon Plato provoked the enmity of the Florentine admirers of Plato, and particularly of Cardinal Bessarion. His subsequent life was a series of disputes, and his writings are remarkable for violent personalities.

GEORGES, Margarette Josephine, mademoiselle, a French actress, born at Bayeux, Feb. 28, 1787, died at Passy, Jan. 12, 1867. She was a daughter of an actress and of a military tailor, Wemmer (long erroneously called Weymer). Some juvenile performances of hers at Amiens attracted the notice of the actress Rancourt, by whose influence she was brought to Paris and educated. Her imposing beauty and powerful acting produced a great sensation at her first appearance in 1802 as Clytemnestra; but as she desired to shine also in less austere characters, in which Mlle. Duchesnois excelled, a contest arose which subsequently resulted in her clandestine departure for Vienna, and soon afterward for Russia. The emperor Alexander I. became so infatuated with her that he would not consent to her returning to France, and in 1808 she played before him and Napoleon in Dresden and at Erfurt. Napoleon, one of her warmest admirers, and Hortense, one of her earliest patronesses, procured her readmission at the Théâtre Français in 1813, and the payment of her salary from the time of her entrance in 1808. Here Talma imparted great finish to her style; but in 1816 she again broke her engagement. Excepting occasional performances in England and Germany and the French provinces, she was subsequently connected with the Odéon and the Porte St. Martin theatres from 1821 to 1847, sustaining her reputation as a most impassioned and majestic tragedian. She gave farewell performances in 1849, and despite increasing stoniness she appeared once more in 1856. She was most admired at Praga, Meroper, Dido, Agrippina, Lucrezia Borgia, Mary Tudor, and Catharine de’Medici. She received costly presents from emperors and princes, and from a host of other admirers and lovers; yet on retiring from the stage her poverty impelled her to become a teacher at the conservatory.

GEORGETOWN, an E. county of South Carolina, bordering on the Atlantic, bounded S. W. by Santee river and intersected by the Great Peeee, Black, and Waccamaw, which unite just above the seat of justice and enter the ocean through the estuary called Winyaw bay; area, 818 sq. m.; pop. in 1870, 16,161, of whom 13,888 were colored. The surface is level and partly occupied by marshes and pine forests. The soil is generally fertile. The chief productions in 1870 were 14,094 bushels of Indian corn, 7,644 of sweet potatoes, 5,924,770 lbs. of rice, and 61 bales of cotton. There were 4 manufactories of barrels and casks, 5 of tar and turpentine, 1 saw mill, and 1 planing mill. Capital, Georgetown.

GEORGETOWN. I. A port of entry of the District of Columbia, situated at the head of navigation on the left bank of the Potomac,
125 m. from its mouth, and 24 m. N. W. of the capital, Washington, from which it is separated by Rock creek, which is spanned by four handsome iron bridges; pop. in 1850, 8,866; in 1860, 8,783; in 1870, 11,384, of whom 8,217 were colored and 1,020 foreigners. On the north and west it is overlooked by heights, commanding a magnificent view of Washington and the Potomac, and a vast expanse of country, and crowned by villas and country seats. It is a quiet but thriving place, noted for its refined society and educational advantages. The custom house and post office building is near the centre. On the N. W. slope of the heights is Oak Hill cemetery, encompassed by an iron fence, and beautified by original forest trees; it was laid out in 1849. Extensive street improvements are in progress. The Chesapeake and Ohio canal has its terminus at Georgetown, where a branch is carried across the Potomac by an aqueduct 1,446 ft. long, and 86 ft. above the ordinary tide, over which is an elevated roadway. Georgetown is the only port of the District, and is connected by steamship lines with New York, Philadelphia, Boston, Baltimore, and Norfolk, and carries on a considerable coasting trade. The value of foreign commerce for the year ending June 30, 1878, was $29,656. The canal furnishes excellent water power, which is utilized by a number of extensive flour mills, and brings down large quantities of bituminous coal from the Cumberland mines. The principal literary institution is Georgetown college, under the direction of the Jesuits, which was founded as a college in 1789 and chartered as a university in 1815. It consists of a classical, a medical, and a law department. The classical department has a senior division (corresponding to the ordinary college course), divided into four classes; a junior division, divided into two classes, and a preparatory department, with two classes; the whole covering seven years. There is also a post-graduate course of two years. Besides more than 3,000 volumes in the students' libraries, the college possesses a library of some 80,000 volumes, among which are many rare and curious works. There are 100 volumes printed between the years 1460 and 1520; three manuscripts anterior to the year 1400, and one of the year 1280. The faculty consists of the president and 20 professors and instructors. The number of students in 1872–3 was 187, viz.: senior division, 53; junior division, 68; preparatory, 69. The number of graduates was 11. The medical department was organized in 1851, and a school of pharmacy has recently been established in connection with it, in which diplomas are given for proficiency. In 1872–3 there were 10 professors and 56 students, of whom 24 graduated in medicine and one in pharmacy. The law department was established in 1870, and in 1872–3 had 4 professors and 56 students, of whom 28 graduated. These two departments are in Washington. The college buildings, which are spacious, are at the W. end of Georgetown, and are surrounded by handsome grounds. Near the college is a convent of Visitation nuns, founded in 1799, and attached to the latter a female academy, with a library of 2,500 volumes. Georgetown institute is an English and classical school for boys. The whole number of private schools in 1872 was 21 (including 6 for secondary instruction), with 869 pupils. There were 4 public school houses and 17 separate schools, including 7 for colored children, having 19 teachers and an average attendance of 705 children. The principal charitable institutions are the aged women's home and the industrial home school for juvenile vagrants. There are a national bank, an insurance company, a weekly newspaper, a monthly periodical (published by the college students), and 15 churches. Georgetown was laid out in pursuance of an act of the colonial government of Maryland dated June 8, 1751, and was incorporated as a city Dec. 25, 1789. The charter was abolished upon the organization of the territory of the District of Columbia in 1871, but the locality is still known as the "city of Georgetown." (See District of Columbia.) II. A town, port of entry, and the capital of Georgetown co., South Carolina, situated on the W. shore of Winyaw bay, near the confluence of the Black and Great Pee Dee rivers, 15 m. from the sea and 110 m. E. S. E. of Columbia; pop. in 1870, 2,080, of whom 1,879 were colored. The entrance to the harbor is obstructed by a bar. The neighboring country produces large quantities of rice. The value of foreign commerce, consisting wholly of exports, for the year ending June 30, 1878, was $64,637; entered, 6 vessels of 907 tons; cleared, 21 vessels of 3,818 tons. In the coastwise trade 89 vessels of 19,387 tons entered, and 14 vessels of 2,250 tons cleared. There were 7 sailing vessels of 767 tons, and 9 steamers of 775 tons, belonging to the port. III. A town and the capital of Scott co., Kentucky, built on high ground in the midst of the fertile section known as the "blue grass region," on the North Elkhorn river, 17 m. E. of Frankfort; pop. in 1870, 1,570, of whom 728 were colored. It contains two factories, two banks, and a weekly newspaper. It is the seat of Georgetown college (Baptist), founded in 1829, occupying three large buildings, and having in 1872 8 professors, 133 students (41 preparatory), and a library of 7,000 volumes. The western Baptist theological institute, founded at Covington in 1840, was removed to Georgetown in 1854, and is conducted in connection with Georgetown college. In 1872 it had 2 professors and 24 students. Georgetown female seminary (Baptist) in 1873 had 7 instructors and 110 students. Warrendale female college (Reformed) had 4 instructors and 70 students.
GEORGIA 715

river, at its mouth, here about 1 m. wide; lat. 6° 49' 24" N., lon. 58° 11' 30" W.; pop. about 27,000, of whom one quarter are whites. It is regularly built, with broad, clean streets, intersecting at right angles, and neat wooden houses having open verandas in front, thickly shaded and surrounded by gardens. Canals communicating with each other and with the river run through the middle of most of the streets, and are crossed by numerous bridges. The great business thoroughfare is Water street, facing the river, and inhabited exclusively by Europeans. The principal edifice is the town hall, a large stone building, with marble-paved galleries supported by iron columns. The Episcopal cathedral is a handsome stone building, besides which there are one Episcopal and ten other churches, a college, many schools, two hospitals, a lunatic asylum, two banks, two theatres, a handsome promenade, several artesian wells, and a market place surrounded by well supplied shops. Below the town is Fort Frederick William, and near it, at the mouth of the river, a lighthouse. Georgetown is unhealthy, owing to its low, marshy situation. By way of security against dampness the houses are raised on piles three or four feet above the ground. Diarrhea, dysentery, dropsy, and yellow and intermittent fevers are prevalent diseases. There is a bar at the mouth of the river, on which is 15 feet of water. The principal exports are coffee, sugar, and rum. The value of imports for the year ending Dec. 31, 1871, was $6,804,949 68; amount of duties collected, $909,719 43; value of exports, $13,080,943 12. Entered, 72 steamers of 9,216 tons, and 854 sailing vessels of 216,165 tons; cleared, 72 steamers of 9,216 tons, and 906 sailing vessels of 192,758 tons.

GEORGIA, one of the thirteen original states of the American Union, situated between lat. 30° 21' and 85° N., and lon. 80° 48' and 85° 40' W., having an extreme length N. and S. of 320 m., and an extreme breadth E. and W. of 254 m.; area, 58,000 sq. m. It is bounded N. by Tennessee and North Carolina, N. E. by South Carolina, from which it is separated by the Savannah river, E. by the Atlantic ocean, S. by Florida, and W. by Alabama, from which it is partly separated by the Chattahoochee river. It is divided into 158 counties, viz.: Appling, Baker, Baldwin, Banks, Bartow, Berrien, Bibb, Brooks, Bryan, Bullock, Burke, Butts, Calhoun, Camden, Campbell, Carroll, Catoosa, Charlton, Chatham, Chattahoochee, Chattooga, Cherokee, Clarke, Clay, Clayton, Clinch, Cobb, Coffee, Colquitt, Columbia, Coweta, Crawford, Dade, Dawson, Decatur, De Kalb, Dodge, Dooly, Dougherty, Douglas, Early, Echols, Effingham, Elbert, Emanuel, Fannin, Fayette, Floyd, Forsyth, Franklin, Fulton, Gilmer, Glascock, Glynn, Gordon, Greene, Gwinnett, Habersham, Hall, Hancock, Haralson, Harris, Hart, Heard, Henry, Houston, Irwin, Jackson, Jasper, Jefferson, Johnson, Jones, Laurens, Lee, Liberty, Lincoln, Lowndes, Lumpkin, Macon, Madison, Marion, McDuffie, McIntosh, Meriwether, Miller, Milton, Mitchell, Monroe, Montgomery, Morgan, Murray, Muscogee, Newton, Oglethorpe, Paulding, Pickens, Pierce, Pike, Polk, Pulaski, Putnam, Quitman, Rabun, Randolph, Richmond, Rockdale, Schley, Screven, Spalding, Stewart, Sumter, Talbot, Taliaferro, Tattnall, Taylor, Telfair, Terrell, Thomas, Towns, Troup, Twiggs, Union, Upson, Walker, Walton, Ware, Warren, Washington, Wayne, Webster, White, Whitfield, Wilcox, Wilkes, Wilkinson, and Worth. The counties are subdivided into 1,186 militia districts, and contain 184 incorporated towns. There are eight cities, viz.: Savannah (pop. in 1870, 28,235), the chief port, on the river of

Obverse.

the same name, 18 m. from the sea; Atlanta (pop. 21,789), the capital, in the N. W. part of the state; Augusta (pop. 15,899), on the Savannah, 248 m. from its mouth; Macon (pop. 10,810); Columbus (7,401); Athens (4,261); Milledgeville (2,700), the former capital; and

Included in the last total are 1 Chinaman and 40 Indians. Georgia ranked 12th among the states in 1870 in total population, a gain since 1860 of 12 per cent.; 16th in the number of white inhabitants, gain 5·01 per cent.; and 1st in colored population, gain 17·96 per cent.

There were 1,172,988 whites and 11,127 foreigners, 578,955 males and 605,154 females. Of the natives, 938,962 were born in the state, 54,987 in South Carolina, 26,858 in North Carolina, 19,084 in Virginia and West Virginia, 12,230 in Alabama, 9,894 in Tennessee, and 4,781 in Florida. There were 374,142 persons born in the state living in other states and territories. Of the foreigners, 5,086 were natives of Ireland, 2,761 of Germany, and 1,088 of England. Of the colored, 501,814 were blacks, and 48,328 mulattoes.

The number of male citizens of the United States 21 years old and over was 234,919. There were 237,250 families, having an average of 4·98 persons to a family, and 286,486 dwellings, averaging 5·01 to a dwelling. There were 418,553 persons 10 years old and over unable to read, and 468,598 unable to write, of whom 945,397 were colored and 1,070 foreigners, 230,820 males and 248,628 females; 101,114 were between 10 and 15 years of age, 92,120 from 15 to 21, and 275,842 21 and over. Of the last number, 21,899 were white males and 108,551 colored males. The number of blind persons was 740; deaf and dumb, 326; insane, 894; idiots, 871; paupers, 1,516, of whom 507 were colored and 99 foreigners; persons convicted of crimes during the year, 1,776. There were 444,673 persons 10 years old and over engaged in occupations, viz.: 336,145 in agriculture, 64,089 in professional and personal services, 14,410 in trade and transportation, and 27,040 in manufactures and mining. Included in these numbers were 264,655 agricultural laborers, 70,488 farmers and planters, 953 clergyman, 57,027 domestic servants, 14,976 laborers, 855 lawyers, 1,587 physicians and surgeons, 2,225 teachers, 6,429 traders and dealers, 5,545 clerks, salesmen, &c., 5,105 officials and employees of railroad companies, 1,279 carmen, draymen, &c., 2,262 blacksmiths, 1,875 boot and shoe makers, 1,005 masons and stone cutters, 4,723 carpenters and joiners, 3,519 cotton and woollen mill operatives, 1,206 millers, 1,315 saw-mill operatives, and 2,604 tailors, seamstresses, &c.—Georgia presents a great variety of surface. Along the coast and the Florida line it is low and swampy, while a little further back occur parallel ranges of sand hills, 40 or 50 ft. high. Near the S. E. corner is the Okefinokee swamp, or rather series of swamps, about 180 m. in circuit, filled with pools and islands, covered with vines, bay trees, and underwood, and teeming with alligators, lizards, and other reptiles. The elevation for 20 m. inland rarely exceeds 40 ft., and averages 10 to 12 ft. above the sea. Then the land suddenly rises by a terrace 70 ft. higher, and this table land continues nearly level about 20 m. further inland, when another rise of 70 ft. leads to a third tract, which continues to ascend toward the north, till at Millicenteville, about 150 m. from the sea, the elevation is about 575 ft. From the central portion of the state the surface becomes more elevated, the hills increasing in size toward the north. The southern spurs of the Appalachians, which cross the N. portion of the state from N. E. to S. W., are reached in the Etowah hills of Bartow and Cherokee counties, and the Amicolola hills of Gilmer and Lumpkin; and the Blue Ridge, ranging with these between Lumpkin, White, and Hadcreshaam counties on the south, and Union and Towns on the north, constitutes the great watershed. These mountains attain an elevation of from 1,300 to 4,000 ft. The coast of Georguia extends S. S. W. from Tybee sound to Cumberland sound, a distance of about 100 m., with a shore line estimated at 480 m. Though generally uniform as to course, it is very irregularly indented, and is skirted by numerous low islands which extend parallel to the shores. The principal of these from N. to S. are Cabbage, Ossabaw, St. Catherine’s, Sapelo, St. Simon’s, Jekyll, and Cumberland. The inlets and sounds which divide the islands from one another and from the mainland are generally navigable, but too shoal to admit vessels of more than 100 tons. Vessels of larger dimensions can enter only four harbors: Savannah, Darien, Brunswick, and St. Mary’s. The bar of the Tybee entrance of the Savannah has 19 ft. of water; that of the Sapelo entrance of the Altamaha, 14 ft.; that of St. Simon’s sound (entrance of Brunswick harbor), 17 ft.; and that of St. Mary’s river, 14 ft. These figures represent the least water in the channel ways at low water of mean tides; the mean rise of tides on this part of the coast varies from 7 ft. in the Savannah to 5·9 ft. in the St. Mary’s. The Savannah, the largest river of Georgia, and the boundary toward South Carolina, rises by two head streams, the Tugalo and Keowee, in the Appalachian chain, and near the sources of the Tennessee and Hiwas-
see on the one side and of the Chattahoochee on the other. From the junction of these currents (lat. 34° 28') the river has a S. E. course of 450 m. to the sea, which it meets near lat. 32° and lon. 81°. It is navigable for large ships to Savannah, 18 m., and for steamboats of 150 tons to Augusta, 280 m. further; and by means of a canal round the falls navigation for small steamboats is prolonged for 150 m. above. The Chattahoochee rises near the W. constituent of the Savannah, pursues at first a S. W. course, but at West Point (lat. 33° 62') on the Alabama line turns S. and enters Florida (lat. 30° 41') under the name of the Apalachicola. Its whole length to the gulf is about 550 m., and steamboats ascend it 300 m. to the falls at Columbus. Flint river rises in the hilly country S. of the Chattahoochee, and joins that river in the S. W. corner of the state after a course of 500 m.; it is navigable for steamboats to Albany. The Ocklockonee, Withlacoochee, and Alapaha drain the S. section of the state, and pass through Florida to the gulf of Mexico. The Withlacoochee and Alapaha by their junction in Florida form the Suwanee. Next to the Savannah, the Altamaha is the largest river falling into the Atlantic. It is formed by the junction of the Oconee and Ocmulgee, which rise in the hilly region S. of the Chattahoochee and flow for about 200 m. nearly parallel to each other, when the latter bends to the east and unites its waters with those of the former. The main river is navigable for sea-going vessels to Darien, and steamboats ascend the Ocmulgee to Macon and the Oconee to Milledgeville. The Ogeechee drains the country between the Savannah and Altamaha, and has a S. E. course of 200 m., with 80 or 40 m. of slope navigation; its southern branch, the Cannonee, is navigable for 50 m. The Santilla and St. Mary's drain the S. E. section of the state; both are navigable for sloops about 40 m., and for boats much further; the St. Mary's forms the boundary toward Florida. The N. and N. W. sections of the state are drained by the Taccoah, the Notley, and other tributaries of the Huwassee; and by the Oostenaull and Etowah, which, uniting at Rome, form the Coosa, one of the tributaries of the Alabama. The Tallapoosa, also a tributary of the Alabama, has its sources in this state between the Coosa and Chattahoochee.—Georgia is naturally divided into two regions distinguished by their geological structure, as well as by their topography, climate, and vegetable productions. The line of the first falls which are met with in ascending the streams marks here, as well as further N., the ascent upon the platform of granitic and paleozoic rocks, which stretches on to the Appalachian mountains. This line crosses the central portion of the state from Augusta on the Savannah, by Macon on the Ocmulgee, to Columbus on the Chattahoochee. It is nearly parallel with the range of the Alleghany, which crosses in a N. E. and S. W. direction the northern portion of the state; but it is so distant from these mountains that the intervening hilly region of the metamorphic and lower Silurian rocks is here much broader than elsewhere along the eastern slopes of the Alleghany. The width of the belt is not far from 150 m. On the south it is succeeded immediately by the lowest tertiary, the eocene, whose sands, clays, and calcareous and silicious strata are seen reposing upon the ancient metamorphic slates and gneiss along the line of contact with these. The cretaceous formation only intervenes from a point almost in the centre of the state, near Macon, gradually widening in its outspread toward the west and pushing the outcrop of the overlying eocene further to the south. The cretaceous group is also seen at a few isolated points rising through the tertiary near the Ogeechee river. S. of the line designated above, the whole country toward the gulf of Mexico and the Atlantic ocean is occupied by the eocene and the modern tertiaries of the coast; a belt wider even than that of the ancient formations of the N. half of the state. In the alluvium, which attains an elevation of only a few feet above the water, skeletons of the mastodon, mylodon, megatherium, an extinct species of elephant, and of the ox, have been found; and beneath the muddy peaty soil in which they lie the sands and clays are of the post-tertiary formation, containing fossil shells, all of the same species that now live in the neighboring salt water. In Bartow co. the limestones of the lower Silurian are met with just N. of the Etowah river, and the formation extends toward Tennessee, till in the N. E. corner of the state it is overlaid by later members of the paleozoic rocks, which finally are capped by the coal formation. Near the junction of the limestone with the metamorphic rocks immemorial deposits of iron ore are found, in the latter ranging N. E. from the S. E. corner of Bartow through Cherokee co. Gold was discovered in 1829 in Habersham co. It occurs in veins and alluvial deposits in almost every county N. of the central line of the state, the W. limit being the W. base of the mountains. The chief deposits are in a belt, 15 to 20 m. wide, extending across the state on the E. slope. The production from 1829 to 1888 is estimated at 800,000 ounces; from 1888 to 1849, at 200,000 ounces; and it has gradually diminished until in 1870 only five mines were in operation, the product being valued at $29,780. The amount of gold deposited at the United States mint and branches, from Georgia, to June 30, 1873, was $7,267,794 76. The copper veins worked in Polk co., Tenn., are traced across the line into Gilmer co. The other mineral productions of the state, except the limestones, and in the eocene region the marls and burrstone of this formation, are of little importance.—Among objects of interest are the falls of Tallulah, in a branch of the Tugaloo, in Habersham co.; Toccoa falls in the same
stream, 185 ft. high; Amicolah falls in Lumpkin co., with a descent of 400 ft. in as many yards; Tawaligo falls in Monroe co.; the falls in Rabun co., and a series of falls in the Hiwassee. Stone mountain in De Kalb co., 7 m. in circuit, and 2,520 ft. high, abounds in fine scenery, and Track rock and Pilot mountain (1,200 ft. high) in Union co. are worthy of mention. Nicooja cave extends into the Racoon mountains, near the N. W. extremity of the state, for several miles, with a portal 160 ft. wide and 60 ft. high, through which flows a stream, up which boats can pass for 3 m. to a cataract. In Hancock and Bartow co., and near Macon are artificial mounds, containing ruins of fortifications, articles of pottery, and human remains.—In the low lands and swamps along the coast the climate is hot and unhealthy, malignant fevers being prevalent, while in the pine lands further back the air is salubrious. In the N. portion of the state the climate is cooler and healthful. The following table embodies the results of meteorological observations made at Augusta and Savannah, under the direction of the chief signal officer of the United States, for the year ending Sept. 30, 1872:

The number of deaths in 1870 was 18,606, including 8,928 from general diseases, 1,519 from diseases of the nervous system, 446 of the circulatory, 2,247 of the respiratory, 2,289 of the digestive, and 241 of the integumentary system; 741 deaths were caused by enteric, 405 by intermittent, and 300 by remittent fever, 875 by consumption, 248 by dropsy, 270 by measles, 145 by cerebro-spinal fever, 277 by encephalitis, 379 by meningitis, 116 by apoplexy, 165 by paralysis, 214 by convulsions, 856 by croup, 1,383 by pneumonia, 236 by hydrothorax, 259 by enteritis, 927 by dysentery, 446 by diarrhea, 844 by cholera infantum, and 100 by ascites. The soil of the coastal islands is light and sandy, but productive of long-staple or "sea island" cotton. The mainland possesses a rich alluvial soil, producing corn and cotton, while the tide swamps of the rivers are fertile in rice. Back from the coast is a stretch of sandy land, chiefly valuable for its timber and naval stores, but capable of being made productive. The S. W. portion of the state is light and sandy, but yields good crops of cotton, and the middle region, possessing a red loamy soil, produces cotton, corn, tobacco, &c. These two portions of the state have been much exhausted by unscientific cultivation. The N. region contains much fertile land, particularly in the valleys, yielding grain, fruits, potatoes, and other vegetables, but is not so well suited to cotton. Near the coast, the growth along the banks of the streams is of cane, cypress, magnolia glauca and grandiflora, gun of different species, including the liquidambar tree, oaks, tulip, ash, sweet bay, and many other genera; while back upon the sandy lands pines and scrub oaks are almost the only trees. Several species of palmetto give a tropical aspect to the sea islands, and the magnificent live oaks largely obtained in the vicinity of Brunswick furnish the most valuable ship timber grown in the United States. In 1870 Georgia produced more cotton than any other state except Mississippi; more rice than any other except South Carolina; and more sweet potatoes than any except North Carolina. The number of acres of improved farm land was 6,881,856; value of farms, $94,559,468; of farming implements and machinery, $4,614,701; wages paid during the year, including the value of board, $10,787,056; estimated value of all farm productions, including betterments and additions to stock, $80,380,228; value of orchard products, $352,926; of produce of market gardens, $198,286; of forest products, $1,281,028; of home manufactures, $1,113,080; of animals slaughtered, or sold for slaughter, $5,564,382; of live stock, $30,156,317. The productions were 306,890 bushels of spring and 1,915,127 of winter wheat, 92,549 of rye, 17,646,459 of Indian corn, 1,904,601 of oats, 5,640 of barley, 402 of buckwheat, 410,020 of peas and beans, 197,101 of Irish potatoes, 2,631,562 of sweet potatoes, 143 of clover and 540 of grass seed, 48 of flaxseed, 22,277,380 lbs. of rice, 288,596 of tobacco, 846,947 of wool, 4,499,572 of butter, 2,492 of cheese, 2 of hops, 988 of flax, 14 of silk cocoons, 31,233 of wax, 610,977 of honey, 470,504 bales of cotton, 21,927 gallons of wine, 109,139 of milk sold, 558,192 of cane and 374,027 of sorghum molasses, 644 hogheads of sugar, and 10,518 tons of hay. The live stock consisted of 81,777 horses, 87,426 mules and asses, 231,310 milch cows, 54,382 working oxen, 412,261 other cattle, 419,465 sheep, and 988,568 swine. There were in addition 28,460 horses and 111,704 cattle not on farms. The number of manufacturing establishments was 3,886, having 405 steam engines of 10,826 horse power and 1,279 water wheels of 27,417 horse power, employing 17,871 hands, of whom 15,078 were males above 16, 1,498 females above 15, and 1,295 youth; capital invested, $13,930,185; wages paid, $4,844,508; value of materials, $18,588,781; of products, $51,198,115. The principal branches are shown in the following table:
There are three ports of entry, Savannah, Brunswick, and St. Mary's. The imports from and exports to foreign countries, with the shipping belonging to the several ports, for the year ending June 30, 1873, are shown in the following table:

<table>
<thead>

The exports consist almost wholly of cotton and lumber, the cotton being shipped from Savannah. The quantity of the former was 975,481 bales, valued at $82,189,060; of the latter, 46,425,000 feet of boards, clapboards, deal, &c., and 3,176,457 cubic feet of timber, together valued at $1,609,140. Of the vessels, 27 of 9,009 tons were steamers. The entrances and clearances were as follows:

The mileage of railroads in the state at different periods has been as follows: in 1841, 271; in 1851, 795; in 1861, 1,420; in 1871, 2,108. The Central railroad of Georgia, which extends from Savannah to Macon, leases and operates the Augusta and Savannah railroad, from Millen to Augusta; the Milledgeville and Easton ton, from Gordon to Easton ton; the Southwestern, which extends from Macon to Enfants, Ala., 144 m., with branches from Fort Valley to Columbus (72 m.), Smithville to Albany (234 m.), Cuthbert to Fort Gaines (20 m.), Fort Valley to Perry (18 m.), and Albany to Arlington (36 m.); the Macon and Western, from Macon to Atlanta; and the Upson County railroad, from Barnesville to Thomaston. The Georgia railroad, from Augusta to Atlanta, with branches from Camak to Warrenton (4 m.), Union Point to Athens (40 m.), and Barnet to Washington (18 m.), operates the Macon and Augusta line, which connects Warrenton and Macon. The Western and Atlantic railroad, from Atlanta to Chattanooga, Tenn., 188 m., was built by the state. The other lines are the Alabama and Chattanooga, from Chattanooga, Tenn., to Meridian, Miss., 396 m.; the Atlanta and West Point, between those places; the Atlantic and Gulf, from Savannah to Bainbridge, with branches from Thomasville to Albany (584 m.), and from Lawton to Live Oak, Fla., 484 m.; the Brunswick and Albany, between those points; the Cherokee, from Cartersville on the Western and Atlantic to Rockmart, to be extended to Pryor, Ala., 23 m. further; the Macon and Brunswick, between those places, with a branch from Cochran to Hawthorne (10 m.); the North and South (in progress), from Columbus to Rome, 135 m.; the Rome, from that point to Kingston; the Savannah and Charleston, between those cities, 104 m.; the Savannah, Griffin, and North Alabama (operated by the Macon and Western), from Griffin to Newnan, to be extended to Guntersville, Ala., 116 m. further; the Selma, Rome, and Dalton, from Selma, Ala., to Dalton, 286 m.; the Atlantic and Richmond Air Line, from Atlanta to Charlotte, N.C., 286 m.; and a branch of the East Tennessee, Virginia, and Georgia railroad, from Cleveland, Tenn., to Dalton, 27 m. The mileage of these roads and branches in operation in Georgia in 1873, with the capital stock and cost as far as reported of those lying wholly or chiefly in the state, is shown in the following table:

VOL. VII—46
The canals of this state have been constructed for local convenience: that around the falls of the Savannah, at Augusta, is 9 m. long; another (16 m.) connects the Savannah and Ogeechee rivers, and another (12 m.) connects Brunswick and the Altamaha, making a total length of 37 m. All the chief towns are connected by telegraph. The number of national banks in 1878 was 12, having an aggregate capital of $2,725,000; of state banks (including 3 savings banks and 2 trust companies), 16, with $4,082,000 capital. There were 7 insurance companies in 1872, of which 2 were life companies, having a capital of $1,765,415.

Ten banks are chartered; the capital stock is $1,640,000; the amount of deposits is $800,000.

The government is administered under the constitution of 1868, which ordains that there shall be neither slavery nor involuntary servitude except as a punishment for crime, that the social status of the citizen shall never be the subject of legislation, that there shall be no imprisonment for debt, and declares that every citizen owes paramount allegiance to the constitution and government of the United States, and that the state shall ever remain a member of the American Union. All elections are by ballot, and the right of suffrage is conferred upon every male person 21 years old and upward who is a citizen of the United States, or has legally declared his intention to become such (except idiots, insane persons, and those who have been convicted of heinous crimes), who shall have resided in the state six months before the election, and 30 days in the county in which he offers to vote, "and shall have paid all taxes which may have been required of him, and which he may have had an opportunity of paying, agreeably to law, for the year next preceding the election." No one convicted of felonv or larceny, unless pardoned, nor any defaulter in public funds, is eligible to office; nor can any resident of the state who sends or accepts a challenge, or engages in or aids or abets a duel, vote or hold office. General elections commence on the Tuesday after the first Monday in November, unless otherwise provided by law. The legislative power is vested in a general assembly, consisting of a senate and house of representatives. For senatorial purposes the state is divided into 44 districts, each returning one senator. The senators are elected for four years, one half retiring biennially, and must be citizens of the United States, 21 years of age, and have resided two years in the state and one year in the district from which they are elected. The house of representatives consists of 175 members apportioned among the counties, who are elected for two years, and must be citizens of the United States, 21 years of age, and have resided one year in the state and six months in the county from which they are elected. The legislature meets annually on the second Wednesday in January; no session can continue more than 40 days, unless prolonged by a vote of two thirds of each house. Appropriations to "sectarian corporations or associations" are prohibited. No town or city can be granted permission to become a stockholder in or to contribute to any railroad or work of public improvement, unless a majority of the voters desire it; and restrictions are placed upon the power of the state to become a stockholder in or to pledge its credit to any company. The executive power is vested in a governor, elected by a majority vote of the people, who holds office for four years or until his successor is qualified. If no candidate receives a majority, the general assembly chooses one of the two who have the highest number of votes. The governor must be 30 years of age, for 15 years a citizen of the United States, and for six years of the state. He is the commander-in-chief of the army and navy of the state and of the militia, may grant reprieves and pardons except in cases of impeachment, and has a veto upon acts of the legislature which can only be overcome by a two-thirds vote of each house. In case of the death, resignation, or inability of the governor, the president of the senate, and in case of the latter's inability, the speaker of the house of representatives, acts as governor until the disability is removed or a successor is elected. There are also a secretary of state, comptroller general, treasurer, and surveyor general, elected by the general assembly, an attorney general, and a state school commissioner, appointed by the governor with the consent of the senate, each holding office for four years. The power of impeachment is vested in the house of representatives. The senate, presided over by one of the judges of the supreme court, constitutes the court for the trial of impeachments, but no person can be convicted without the concurrence of two thirds of the members present. The supreme court consists of three judges, who hold office for 12 years, one rei-
woman at the time of marriage, and all that may be given to and inherited or acquired by her, is her separate property, and not liable for the debts of her husband. A married woman may sue and be sued in matters pertaining to her separate estate as though single, and with the consent of her husband may trade as a jure sola. No total divorce can be granted except on the concurrent verdict of two juries. The grounds of total divorce are intermarriage within the prohibited degrees, mental or physical incapacity at the time of marriage, adultery, wilful and continued desertion for three years, conviction of crime and sentence to the penitentiary for two years or more, force, menace, duress, or fraud in procuring the marriage, and pregnancy at the time of marriage unknown to the husband. For cruel treatment or habitual drunkenness the jury may grant either a partial or a total divorce. Treason in the first degree, murder, arson of an occupied dwelling or of a house in a city, town, or village, castration, and rape may be punished with death. Other punishments are fines, imprisonment, and whipping, not more than 50 lashes.—According to the federal censuses, the valuation of property has been as follows:

<table>

</tbody>
</table>

The diminution in the value of personal property is chiefly owing to the emancipation of the slaves. In 1870 the taxation not national amounted to $2,827,029, of which $945,394 was state tax, $906,270 county tax, and $775,385 town, city, &c., tax. The public debt was $21,758,712, of which $6,544,500 (funded, but not including bonds issued subsequently to 1898) was state debt; $361,728, of which $380,336 was funded, county debt; and $14,647,477 town, city, &c., debt, of which all but $364,162 was funded. The total receipts into the state treasury during the fiscal year amounted to $1,164,304, of which $739,998 was from general taxes, $35,924 from liquor tax, $5,775 from licenses, $1,446 from corporations, $45,000 from state railroad, $10,292 from interest, $81,000 from loans, and $2,966 from miscellaneous sources. The disbursements amounted to $1,144,817, of which $17,085 was for the executive department, $526,891 for legislative expenses, $95,280 for the judiciary, $2,547 for penitentiary expenses, $114,647 for institutions for deaf and dumb, blind, and insane, $230,000 for educational purposes, $57,221 for printing, $495,606 for payments and interest on public debt, and $170,485 for miscellaneous expenses. The treasurer in his report for the year ending Dec. 31, 1878, gives the outstanding debt of the state, Jan. 1, 1874, as follows:
The disbursements were $1,885,207.14, viz: $992,892 paid on public debt, $255,227.70 on special appropriation, $172,251.93 on legislative pay rolls, $98,408.49 on civil establishment, $89,628.73 on contingent fund, $26,977.25 on printing fund, $3,561.30 on educational fund, and $3,564.75 on overpayment of taxes; cash on hand Jan. 1, 1873, $776,183.70, of which $100,000 was set apart to pay coupons maturing on that day, and $106,708.20 belonged to the special and $164,277.45 to the general school fund. The total receipts in 1873 were $2,406,655.94; total disbursements, $2,250,282.49. The state owns the Western and Atlantic railroad, valued at $7,000,000; 10,000 shares of stock in the Atlantic and Gulf railroad company (par value $1,000,000), worth $200,000; and 186 shares in the Georgia railroad and banking company, $18,600; total, $7,218,600. It also owns 1,833 shares in the bank of the State of Georgia and 590 shares in the bank of Augusta, which they have no market value. The Western and Atlantic railroad was leased to a company for 20 years in December, 1870, at the monthly rent of $25,000. The assessed value of property in 1872 was $425,620,468, of which $226,638,263 was taxable. The taxable property in 1873 amounted to $425,487,882. The rate of taxation was 50 cents per $100; 40 cents for general purposes, and 10 cents for school purposes. The institution for the deaf and dumb, at Cave Spring, Floyd co., in 1873 had 5 instructors and 63 pupils, of whom 29 were males and 34 females. The academy for the blind, at Macon, had 4 instructors (3 blind) and 47 pupils. The state lunatic asylum, near Milledgeville, has 10 officers (2 non-residents); number of patients, Dec. 1, 1873, 576. The penitentiary is at Milledgeville. The convicts, 864 in number (39 white and 771 colored), are all leased to a corporation, and employed on public works in different parts of the state. The state has only one officer, the principal keeper, under pay, and derives a revenue from the lease.—Before the civil war no common school system existed in the state, although certain funds had been set apart, and were distributed to the various counties, for the education of indigent children. The constitution of 1869 required the legislature to establish a system of common schools, and to carry this provision into effect an act was passed in 1870, which has been superseded by the general school law of Aug. 29, 1872. This law constitutes the governor, attorney general, secretary of state, comptroller general, and state school commissioner, the state board of education, which is an advisory body to the commissioner, and hears as a court of last resort appeals from his decisions touching the administration or construction of the school laws. The state commissioner is charged with the administration of the school laws, and is general superintendent of the public schools; he apportions the school revenue to the several counties in

The issue of 1870 is gold bonds; the rest, currency. The total annual interest is $566,460. During the administration of Gov. Bulloch, 1868-71, bonds to the amount of $8,980,000 were issued, and these inased bonds of various railroad companies to the amount of $7,923,000. It has been charged that the greater part had been illegally and fraudulently issued or indorsed, a committee was appointed by an act of Dec. 9, 1871, to investigate the subject, which sat at Atlanta during March and April, 1872. Of the state bonds $2,280,000 were returned and cancelled, $3,482,000 were declared null and void by the legislature in accordance with the report of the committee, and $3,598,000 were recognized as valid, $2,098,000 of this amount being included in the preceding table. Of the indorsed bonds $240,000 were returned and cancelled, with respect to $4,475,000 all obligation is disclaimed, while $194,000 of the Alabama and Chattanooga railroad, $446,000 of the South Georgia and Florida railroad, and $2,050,000 of the Macon and Brunswick railroad, in all $2,305,000, are admitted to being bound upon the state. This amount being added to the aggregate of the table, the total recognized debt at the beginning of 1874 becomes $11,550,500. The receipts during 1872, with the balance on hand at the beginning of the year, are shown in the following table:

proportion to the number of youth from 6 to 18 years of age and of confederate soldiers under 30 years of age resident in each, and is required to make an annual report to the legislature. Each county constitutes a school district, under the control of a county board of education consisting of five freeholders, who are elected for four years by the grand jury. The board chooses a secretary for the same term, who is ex officio the county school commissioner, divides the county into subdistricts, and in each is required to establish one or more primary schools, and, where the public wants demand them, graded schools from the primary to the high school grade. The county boards have a general supervision of the schools and school houses of their counties, employing the teachers, and prescribing the text books, but no sectarian nor sectional books are to be used, nor can the Bible be excluded from the public schools. These boards constitute a tribunal for the determination of any local controversy respecting the construction and administration of the school laws, an appeal lying from their decisions to the state school commissioner, and are required to provide separate schools, with equal facilities, for white and colored children. The county school commissioner is the medium of communication between the state commissioner and the subordinate school officers; he is required to visit each school in his county at least twice a year, to make an annual census of the children of school age, to apportion the school fund of the county to the subdistricts in proportion to the number of such children in each, and to make such reports to the state commissioner as may be required. He examines teachers, who are licensed by the county board, and are divided into three grades, with licenses continuing one, two, and three years respectively. No county is entitled to its share of the state school fund unless the county board has provided by tax assessment or otherwise for the salary of all those who in operation for three months in the year, or two months in the case of ambulatory schools, which may be established in counties in which from sparseness of population it is impracticable to maintain schools for three months. The schools are free to the children of the respective school districts. The county boards may establish evening schools for youths over 12 years of age who cannot attend during the day, and under the direction of the state board they may organize self-sustaining manual labor schools. Public school buildings and furniture and the site (not more than four acres) of a public school house are exempt from taxation and from sale on execution. The school system of two cities and of four counties is organized under special laws. The school fund consists of the proceeds of the poll tax and of the taxes on liquor and malt liquors, one half of the monthly payments made by the lessees of the Western and Atlantic railroad, the dividends on 186 shares of the Georgia railroad and banking company, set apart as a permanent educational fund by the act of Jan. 22, 1853, and the interest (6 per cent.) on $300,000 in bonds issued under the act of Dec. 11, 1866, as a permanent school fund. By an act of 1818 certain lands or the proceeds thereof were set apart for the education of poor children, but it is believed that but a small portion is now available. By the act of Feb. 19, 1878, it is provided that when legal bonds of the state are purchased and cancelled, or paid off, the same amount of bonds having 100 years to run shall be issued by the governor payable to the school fund, and that the interest on these at the rate of 7 per cent. per annum shall be paid semi-annually for the support of the public schools. From the adoption of the constitution of 1868 to Dec. 1, 1878, $759,729 42 belonging to the school fund had been collected, of which $354,418 89 had been diverted to other uses, but measures had recently been taken to restore it to the proper channel. The present school revenue is about $250,000 a year. The state school commissioner in 1878 reported (two months wanting) 849,164 children of school age, of whom 198,816 were white and 150,848 colored. Public schools were in operation in 120 counties; 89 reported 1,379 white and 856 colored schools; number of pupils enrolled, 76,157, of whom 58,499 were white and 17,658 colored; average attendance, 32,224. According to the United States census of 1870, the state contained 1,860 schools, having 2,492 teachers (1,517 male and 915 female), 66,150 pupils (32,775 male and 33,375 female), and an annual income of $1,250,599, of which $466,560 was derived from endowments, $114,626 from taxation and public funds, and $1,072,118 from other sources, including tuition fees. Of this number 246 were public schools, viz.: 4 normal, 9 high, 25 grammar, 18 graded common, and 168 ungraded common, having 827 teachers, 11,150 pupils, and an income of $175,844, which 461,599 was derived from taxation. Of the schools not public, 151 were classical (36 colleges and 115 academies), 3 professional (1 law and 2 medical), and 9 technical (9 commercial, 1 for the blind, 1 for the deaf and dumb, and 4 of art and music). Of the residue, 1,455 were day and boarding schools and 19 parochial and charity schools. The colleges had 77 male and 56 female teachers, 978 male and 1,620 female pupils, and an income from endowments of $36,860, and from other sources of $112,516. The university of Georgia, at Athens, was chartered in 1785 and organized in 1801. It has a permanent endowment of $100,000, derived from the sale of lands set apart in 1784 by the revolutionary statesmen and soldiers of Georgia, to found a university. The interest on this sum, which has been invested by the legislature, is paid by the state. The university consists of a university department, an academic department, embracing the ordinary branches of collegiate study, and a law department. The state college of
agriculture and the mechanic arts, endowed with the congressional land grant of 270,000 acres, which has been sold for $249,000, was organized as a fourth department in 1872; it embraces instruction in agriculture, engineering, and chemistry. Students intending to enter the Christian ministry are relieved from payment of tuition when in need of aid, and other poor students, residents of the state, to the number of 50 annually, have their tuition remitted, in return for which they are expected to teach in some school in Georgia as many years as they have resided at the university. The number of professors and instructors in 1872 was 15, including 2 in the law and 3 in the preparatory department; number of students, 817, viz.: 7 resident graduates, 255 undergraduates (including 15 law students), and 55 in the preparatory department; number of volumes in the college and society libraries, 20,000. The North Georgia agricultural college, at Dahlonega, became toward the close of that year a branch of the state college and a department of the university. Atlanta university, in the city of that name, was established in 1887 by the freedmen's bureau and the American missionary association. It is not restricted as to color or sex, but is designed especially for the higher education of colored youth. Preparatory, normal, collegiate, agricultural, and theological departments have been organized, and in 1872 there were 7 instructors and 178 students. Oglethorpe university (Presbyterian), also at Atlanta, had 5 professors, 48 collegiate and 62 preparatory students; but it has since been suspended for want of funds. Mercer university (Baptist), at Macon, in 1871 had 5 professors and instructors, 82 students, and a library of 5,000 volumes. It has a theological department. Emory college (Methodist Episcopal church south), at Oxford, in 1872 had 13 professors and 199 students, 90 preparatory and 189 collegiate students, and a library of 3,000 volumes. Bowdoin college, at Bowdoin, Carroll co., had 4 professors and instructors and 22 students. The other institutions classed as colleges are chiefly for the superior instruction of females. The principal are Furrow Masonic female college at Americus, Griffin female college at Griffin, Hamilton female college at Hamilton, the Southern female college at La Grange, the Wesleyan female college at Macon, the Georgia female college at Madison, Marietta female college at Marietta, La Vert female college at Talbotton, West Point female college at West Point, and Monroe female college at Forsyth. The Atlanta medical college in 1872 had 14 professors and instructors and 52 students. The medical college of Georgia, at Athens, had 31 professors and instructors, 108 students, and a library of 5,000 volumes. The Savannah medical college in 1872 had 14 professors and instructors, 36 students, and a library of 3,000 volumes. The census of 1870 returns 1,736 libraries, containing 467,282 volumes, of which 545, having 163,851 volumes, were not private, classified as follows: state, 1, with 18,000 volumes; town, city, &c., 4, with 8,780; court and law, 83, with 8,610; school, college, &c., 18, with 41,100; Sabbath school, 369, with 84,114; church, 82, with 16,002; historical, literary, and scientific societies, 2, with 2,000; benevolent and secret associations, 1, with 400; circulating, 8, with 11,895. Besides the college libraries, the principal are those of the young men's library association at Atlanta (3,000 volumes), of the mechanics' and scientific association at Columbus (8,000), and of the Georgia historical society at Savannah (7,000). There were 110 newspapers and periodicals, issuing 15,589,724 copies annually, and having an average circulation of 150,987, viz.: 15 daily, circulation 80,800; 5 tri-weekly, 8,600; 9 semi-weekly, 8,100; 78 weekly, 88,887; 2 semi-monthly, 700; and 6 monthly, 21,950. They were classified as follows: agricultural and horticultural, 6; illustrated, literary, and miscellaneous, 5; political, 93; religious, 4; technical and professional, 2. The number of church organizations was 2,878. The number of edifices and settings, and the value of church property, are shown in the following table:

—Of the thirteen provinces which declared themselves independent in 1776, Georgia was the latest settled. The country lying within its present boundaries was a wilderness previous to 1733, and, though comprehended within the charter of Carolina, had been claimed by Spain as well as England. By patent dated June 9, 1733, George II., in honor of whom it received its name, granted the territory to a corporation entitled the "Trustees for settling the Colony of Georgia." The double purpose proposed in the settlement of this region was, on the one hand, to afford a retreat for the destitute at home, and on the other, to secure the frontiers of the Carolinas from the incursions of the Indians and the Spaniards of Florida. In November of the same year 116 persons were embarked at Gravesend under the direction of James Oglethorpe, and arrived at Charleston in January, 1733. From this place Oglethorpe explored the country, and soon after purchased a large tract of land from the Creeks. On a high bluff overlooking a river the foundation of a town was laid,
which received the name of Savannah. Here
the settlement was commenced in the spring
of 1733. The condition upon which the lands
were parceled out was military duty, and so
grievous were the restrictions to which the
colonists had to submit that many returned
into Carolinas, where the lands were held in
fee simple. The number of inhabitants in the
colony nevertheless continued to increase, con-
siderable accessions to its population being
received from Germany and Scotland. In
1739 war broke out between Spain and Eng-
lund, and Gen. Oglethorpe was appointed to
the command of the South Carolina and
Georgia troops. Having mustered 1,000 men
and a number of Indian allies, he invaded
Florida, but, failing in an expedition against
St. Augustine, returned unsuccessful. In 1742
this invasion was retaliated, and a Spanish
fleet of 86 ships and 5,000 men appeared in
the Altamaha river, took Fort St. Simon, and
were proceeding against Fort Frederica, on
St. Simon's island, when from a stratagem
conceived by Oglethorpe they became alarmed,
retired to their ships, and sailed for Florida.
Peace was soon restored; but restrictions of
various kinds, and especially the prohibition of
slavery, rendered the people discontented, and
many abandoned their settlements, while those
who remained with difficulty obtained a scant-
y subsistence. The restrictions upon slavery
were removed about 1750, and in 1760, the
trustees having surrendered their charter to
the crown, Georgia became a royal govern-
ment, with privileges and regulations similar
to those of the other colonies. The first good
effect of the change of government was felt in
the establishment of a general assembly in 1755.
The limits of the colony to this time were the
Savannah on the north and the Altamaha on
the south, extending westward to the Pacific.
In 1763 all the lands between the Altamaha
and St. Mary's were annexed to Georgia by
a royal proclamation. From this period the
colony made rapid progress; the rich swamps
and lowlands on the rivers were brought into
cultivation, and production rapidly increased.
At the commencement of the revolution the
colonists did not hesitate to make the grievan-
ces of their northern brethren their own, and
take part in the coming struggle. In July,
1775, a convention gave the sanction of the
colony to the measures of congress, and appo-
sited delegates to that body. During the
war that ensued Georgia was overrun by Brit-
ish troops, and the principal inhabitants were
compelled to abandon their homes and fly into
the neighboring states. In 1778 Savannah was
captured, and in 1779 Augusta and Sunbury.
In the latter year an unsuccessful attempt was
made by the Americans and French to recaptu-
re Savannah. Georgia framed its first con-
stitution in 1777, a second in 1782, and a third
in 1798, which was several times amended.
The constitution of the United States was
ratified by Georgia on Jan. 2, 1788. After
the revolutionary war Georgia suffered on her
frontiers from the incursions of the Creeks and
Cherokees. In 1790 and 1791 treaties were
concluded with the chiefs of these nations.
By the treaty of Fort Wilkinson in 1802 the
Creeks ceded to the United States a large
tract which has since been assigned to Georgia,
and now forms the S. W. counties of the state.
In the same year Georgia ceded to the United
States all its claims to the lands westward of
its present limits. Subsequently serious diffi-
culty arose between the state and national gov-
ernments respecting the Cherokees, which was
terminated by the removal of that tribe in 1838
to the Indian territory, when Georgia came
into possession of their lands. In the presi-
dential election of 1860 the vote of Georgia
was 51,889 for Breckenridge, 42,886 for Bell,
and 11,590 for Douglas. Immediately after
the result became known the legislature (Nov.
18) ordered an election to be held on Jan.
4, 1861, for the choice of delegates to a con-
tinent to consider the question of withdraw-
ing from the Union. This convention, consisting
of 801 delegates, assembled at Milledgeville
on Jan. 16, and on the 19th passed an ordi-
nance of secession by a vote of 208 to 89. A
proposition to call a congress of the disaffected
states, with a view to cooperation, was defeated
by a vote of 164 to 188. All the delegates
subsequently signed the ordinance except six,
who caused an entry to be made in the journal
that they acquiesced in the will of the majority.
On the 24th 10 delegates were appointed to
the congress of the seceded states, to be held
at Montgomery, Ala., Feb. 4, and on March
16 the constitution of the Confederate States
was unanimously ratified. Ordinances were
also passed resuming jurisdiction over places
ceded to the United States, and transferring
all forts, arsenals, and munitions of war to the
confederate government. On Jan. 3, 1861,
Fort Pulaski, on Cockspur island at the mouth
of the Savannah river, mounting 60 guns, was
seized by order of Gov. Brown, and at the same
time Fort Jackson, 4 m. below Savannah, was
occupied. On the 24th the arsenal at Augusta,
containing two 12-pound howitzers, two cannon,
about 20,000 small arms, and large stores of
ammunition, was taken possession of by 700
state troops under Gov. Brown. Georgia, ex-
cept on the coast, was not the theatre of active
hostilities until 1864. On Nov. 25, 1861, Com-
mander Du Pont, who had just taken Fort Royal, S.
C., occupied Big Tybee island at the mouth of
the Savannah, and soon after other points com-
ceding Fort Pulaski were taken possession of,
and that fort was reduced, April 11, 1863, by
a bombardment from batteries erected on Tybee island. Early in March Com. Du Pont,
with a fleet from Fort Royal, took possession
of St. Mary's, Brunswick, Darien, and St. Si-
mon's island, and left a small force at each. On
Feb. 28, 1863, the Nashville, a confederate
ironclad, was destroyed in the Ogeechee river
by Commander Worden; and on March 8 an
inefficient attack was made on Fort McAllister on the same river, a few miles S. W. of Savannah, by a federal fleet. On June 11 Dainger was burnt, and on June 17 Capt. John Rodgers in the Weehawken disabled and captured in Warsaw sound the confederate ironclad Atlanta, which had just come down from Savannah. A portion of the operations around Chattanooga in the autumn of 1863 took place in N. W. Georgia. On May 6, 1864, commenced the decisive campaign from Chattanooga under Gen. Sherman, which resulted, after a persistent resistance and much severe fighting, in the evacuation of Atlanta by the confederates on Sept. 1. Sherman started, Nov. 15, on his memorable march to the sea. Passing through the heart of Georgia, he entered Milledgeville on the 28th, and reached the vicinity of Savannah on Dec. 10. On the 15th Fort McAllister was taken by storm, and on the 21st Savannah was occupied, having been evacuated the night before by the confederates under Gen. Hardee, who had destroyed the navy yard, two ironclads, several smaller vessels, and much ammunition and stores. A cavalry force under Gen. Wilson in April, 1865, entered Georgia from Alabama, took Columbus and West Point, arrived at Macon on the 21st, and captured Jefferson Davis, the fugitive president of the confederacy, at Irwinton, May 10. Andersonville in this state was the seat of the most noted of the confederate military prisons, and there was another at Millen, which was removed upon the approach of Gen. Sherman. After the surrender of the confederate armies, the state was under the control of the military until June 17, 1865, when President Johnson appointed James Johnson, a citizen of the state, provisional governor, with power to call a convention of delegates chosen by the citizens loyal to the United States, who were qualified as voters by the laws in force immediately before the passage of the ordinance of secession, and who should take the oath prescribed in the amnesty proclamation of May 29. The election of delegates took place Oct. 4, and the convention, assembling at Milledgeville on the 25th, remained in session 18 days, during which time it repealed the ordinance of secession and acts in pursuance thereof, declared the war debt void, amended the constitution by abolishing slavery and in other respects, and ordered an election to be held on Nov. 15 for governor, members of the legislature, and congressmen. The legislature convened Dec. 4, and soon afterward ratified the amendment to the constitution of the United States abolishing slavery, by a unanimous vote. On the 14th Charles J. Jenkins, who had been elected governor, was inaugurated, and on the 19th the provisional governor was instructed to turn over to him the government of the state. These measures not meeting with the approval of congress, the senators and representatives were not admitted to seats; and under the reconstruction acts of 1867 Georgia, with Alabama and Florida, was constituted the third military division, and placed in command of Major Gen. Pope. A registration of those entitled to vote under these acts was subsequently made, when 192,285 voters were registered, viz.: 96,262 white and 96,023 colored. An election was held during the five days commencing Oct. 29, which resulted in a large majority for a constitutional convention (the whites generally returning from voting), and in the choice of 166 delegates, of whom 83 were colored. The convention met at Atlanta Dec. 9, and adjourned finally March 11, 1868, after framing a constitution, and providing for an election for its ratification or rejection and for the choice of state officers and congressmen, to be held April 20 and the three following days. The result was a majority of 17,699 for ratification, and the election of Rufus B. Bullock, republican, by 7,047 majority over John B. Gordon, democrat. The legislature consisted of 22 republicans and 22 democrats in the senate, and 73 republicans and 105 democrats in the house; 3 senators and 25 representatives were colored. On June 25 an act of congress was passed providing for the readmission of Georgia, with other states, upon the ratification by the legislature of the 14th amendment to the constitution of the United States, and the abrogation of certain provisions of the state constitution prohibiting suits on debts contracted prior to June 1, 1865. The legislature organized on July 4, and on the 21st complied with the prescribed conditions by a vote of 24 to 14 in the senate and 89 to 70 in the house, and on the following day Gov. Bullock was inaugurated. On the 29th United States senators were elected, and on the 80th the government of the state was turned over to the civil authorities. The congressional representatives had been admitted to seats on the 25th, but the senators were still excluded. In September the colored members of the legislature were expelled, and the candidates having the next highest number of votes in the respective districts seated in their places, on the ground that by the code and the laws existing at the adoption of the constitution, which were continued in force by one of its provisions, negroes were ineligible to office. This action was regarded by the majority at Washington as a violation of the reconstruction acts and of the conditions upon which the state had been admitted; and on the organization of the 41st congress, March 4, 1869, the representatives from Georgia were not permitted to take their seats. Subsequently the supreme court of the state decided that negroes were entitled to hold office, and on Dec. 22 congress passed an act directing the governor by proclamation to convene at Atlanta all persons declared by the order of Gen. Meade (who had succeeded Gen. Pope in December, 1867) of June 25, 1868, to be elected to the legislature, who were required to take the test oath prescribed by the act as a condition precedent to organization, and to ratify the 15th amend-
The Georgians properly occupy the country comprised within the more limited of the boundaries above given, and embracing Kartlia on the Kur, Kakhetia, N. E. of Kartlia, and other districts. West of them are the Mingrelians, who occupy Mingrelia, and Guria, on the Black sea. The Suanethians inhabit the southern slope of the Caucasian N. E. of the Mingrelians. These three divisions belong to the Russian empire. The Lazians in the sanjakate of Lazistan, pasalik of Trebizond, are subjects of Turkey. While the Armenians, who control most of the traffic of the country, are timid and intent on gain, the Georgians are bold, reckless, turbulent, and extravagant. They are also indolent, apathetic, and ignorant, seldom giving any signs of animation except when on a drinking bout. The lower classes are chiefly cultivators of the soil, which they work in the same way that their ancestors did centuries ago. The Georgian men are noted for their athletic forms and the women for their beauty, although the features of the latter are regular and handsome rather than beautiful, and are wanting in expression. The general characteristics of the race are finely chiselled brows, large, black, liquid eyes, prominent semi-aquiline nose, and voluptuous mouth. Before marriage the women endeavor to keep their waists as small as possible by means of a girdle, which they wear almost continuously; this results in a large development of the bosom, which is much admired. It is said that in former times the belt was never removed until the nuptial day, when it was cut out by a dagger of the bridegroom. Many such ancient customs, now obsolete in the neighborhood of Tiflis, are still preserved in the mountains and isolated districts. Before the Russian domination a large
trade in slaves was carried on with Turkey, the Georgian nobles deriving their chief revenue from the sale of their serfs, the men for the Turkish armies, the women for the harems; but the traffic is now interdicted, and the relations between the upper and lower classes are much modified. The Persians and Mussulmans from the north of India also purchased many women from this region for their harems, paying sometimes as high as 20,000 piastres for a remarkably beautiful one. The Georgian stock consequently is largely disseminated throughout Mohammedan countries. The Georgians are nominally members of the Greek church, and have had the Bible in their language since the beginning of the 10th century; but the priests are generally as ignorant as the people.—Nothing certain is known of early Georgian history. The statements of the Greek and Latin writers are confused and lead to various conclusions. George Rawlin-son thinks that the territory was anciently "in the possession of a people called by Herodotus Sueptreis or Sapeptreis, whom we may identify with the Iberians of later writers." The Colchians and Albanians were probably their neighbors. Their legends trace their origin to Targamos, a descendant of Japhet, and claim Mtzkhutes as the founder of the ancient capital Mtzkhita, which stood about 15 m. N. W. of Tiflis. The first Georgian empire seems to have been ended by the Scythians, who invaded it in the 7th century B. C. It is probable that it afterward formed a part of the Persian empire, was conquered by Alexander the Great, and regained its independence at his death. Pharnavas was the first or one of the first kings of the second Georgian empire. Mirvan, in the latter part of the 2d century B.C., and his son Phraoj, sovereign of Persian descent, introduced Parseeism, which led to a revolt. The king of Armenia came to the aid of the Georgians, and put his son Arshag on the throne, thus founding the dynasty of the Arsacides. In 65 B. C. the Georgians or Iberians came into contact with the Romans, and were compelled by Pompey to sue for peace. In the beginning of the 3d century A. D. the kingdom became highly prosperous, but in the following period the Persians made destructive invasions. Early in the 4th century the Georgians were converted to Christianity by St. Nina, a captive woman. At the death of Stephanos I. in 574, Guram, a Jew who had been his general-in-chief, ascended the throne. In 635 the Arabs overran the country, but did not succeed in subverting Christianity. Subsequent kings suffered much from their aggressions, and the Armenian dynasty of the Bagratides, who succeeded the Guramides, eventually became vassals of the caliphs. Bagrat III. liberated his country from foreign domination, and David III. (1089–1126) extended his dominions over a part of Armenia and as far as Trebizond. Queen Tamar III. (1184–1206) reduced several of the tribes north of the Caucasus, and her son George IV. vanquished the Persians, converted many of them to Christianity, and rendered valuable aid to the crusaders. In the 18th century the Mongolians subdued the country, but in the middle of the 14th George VI. threw off their yoke and extended his sway over the neighboring provinces. Tamerlane reduced the country to subjection, but it was again liberated by George VII. In 1424 King Alexander divided his kingdom among his three sons, and the history of the next two centuries is one of conflicts between the three governments, and of quarrels with Persia and Turkey, in which Russia interfered. The country was reunited under Vakhtang IV. or V., whom the Persians call Shah Naos. He died in 1676, and for a century after Georgia was the scene of intestine fends and divisions, in which the Turks and Persians took part. In 1788 Iraki (Heraclius) II. of Kakhetia, who had united under his sway a large part of the ancient kingdom, being pressed by the Persians, announced himself a vassal of Russia. His successors having new difficulties with the Persians and Lesghians, Georgia was made in 1801 a province of Russia, and in 1810 Imerethis was added to it.—The Georgian language is written in an alphabet of 40 letters, somewhat varying in different manuscripts. The following are used in Brosset's dictionary:
The characters used in the ecclesiastical style of writing differ from the common ones. The languages of the four tribes, the Georgians, the Mingrelians, the Svanethians, and the Lazians, are related to each other, and show a common development from one primitive form, either primitive Aryan or Dravidian; but there is no foundation for connecting them with the languages spoken by tribes north of the Caucasus. The Georgian is written from left to right. It makes no distinction of gender. To distinguish sex, the words male and female are introduced, except for the words king, queen, young man, young woman, him, and her. No article is used. There are two numbers, singular and plural, and six cases, nominative, genitive, dative, vocative, instrumental, and instrumental modal. There are special forms for the comparative and superlative of adjectives. Nouns are inflected by means of suffixes, and verbs by means of suffixes, prefix, and changes in the radical letters. The verbs are either active, passive, reciprocal, or neuter, and are modified according to one of the 20 classes of conjugation into which they are divided. Prepositions govern either the genitive, dative, or instrumental.—Among the literary remains of ancient Georgia, some of the manuscripts written in the ecclesiastical style of alphabet are probably of high antiquity; but most of them date subsequently to the introduction of Christianity, and consist of homilies and translations of portions of Scriptures, and of Plato, Aristotle, and other Greek authors. Some manuscripts contain novels and romances; one gives in verse the history of Shah Naco, and several, dating principally from the 17th century, are poetical works of some merit. The most important of Georgian manuscripts are: a volume of 63 treatises, historical and biographical, which has thrown much light on the history of the Khazars during the 8th century; a translation of the Gospels by Drouchild, dating from the 10th century; and a romance entitled "Tariel, the Man with the Tiger Skin," a general of Queen Tamar, by Eskotia. The following is a facsimile of the last verse of Rustavel's romance:

The literal translation is as follows: "Moses of Khorì has glorified Amiran, the son of Darzjan; the poem of Abdul Messeia, written by Khvcel, and the history of Dilar by the indefatigable writer Ghot Sargis of Tmogvi, were worthy of praise; but Rustavel has left without ceasing over his Tariel." Among similar compositions, an epic on Queen Tamar, by Tchakadze, ranks equally high. During the 18th century, in spite of the incessant wars that harassed the country, there was a rich supply of meritorious literature, and the language attained that definiteness, richness, and energy which are now its most prominent features. Prince Sulikhan-Saba-Orbelian published in that century a dictionary of the language, containing at least 25,000 words, and King Vakhtang VI. caused an extensive history of the country to be written. The Russian language has now generally superseded the Georgian in the schools, and books in the Georgian language are printed in Russian characters. The language and literature of the Georgians have been specially studied by Adeleung, Brosset, Dorn, Josselein, Klapproth, Saint-Martin, and Tchubinoff. Brosset is considered the highest authority on the subject. Ethnological studies of the Georgian race are contained in the books of travel of Cunyghame, Dorn, Dubois de Montpéreux, W. J. Hamilton, Hartmann, Monseey, Poullett-Cameron, and Wagner.—See Histoire de la Géorgie depuis l'antiquité jusqu'au XIXe siècle, traduite du géorgien, by Brosset (3 vols. 4to, St. Petersb., 1849-57); "Historie de Grusia," by Baratoff (St. Petersburg, 1866 et seq.); and La Géorgie, by De Villeneuve (Paris, 1871).—GEORGIA BARK, the common name of Pinake-nya pubens, one of the handsomest of our native shrubs. It grows in bogs and along the banks of streams from South Carolina to Florida, and sometimes attains the height of 20 ft.,

See HURON, LAKE.

GERMAN, a Germanic people, akin to the Goths, who first appear in history in the 8th century A. D. as living on the Baltic near the Vistula. They subsequently moved further S. and settled N. of Fannonia, between the Ostrogoths on the east and the Visigoths on the west. They were at first compelled to follow Attila, but regaining their independence at his death, under their king Arderic, they drove back the Huns and occupied their territory on the lower banks of the Theiss, Danube, Drave, and Save. Theodoric, king of the Ostrogoths, defeated them in 498 near Sirmium (now Serem in Slavonia), and Albino, king of the Lombards, assisted by the Avars, destroyed their power in 566. The remnants of the people became gradually amalgamated with the conquerors.

GERA, a town in the German principality of Reuss-Schleiz, in a beautiful valley on the right bank of the White Elster, 35 m. S. W. of Leipzig; pop. in 1871, 17,959. It consists of the town proper and two suburbs, and is regularly built, having been restored in modern style after a great conflagration in 1780. It has manufactories of woolens, cotton, linen, camlet, porcelain, stoneware, tobacco, leather, soap, chocolate, glue, artificial flowers, musical instruments, and fire engines, iron foundries, large breweries and dyeing establishments, and carries on a considerable trade. Its old castle dates from 1086, when the place first became a town, and was bestowed on the baron of Reuss in the 12th century. Three railways connect the town with Zeitz, Gossnitz, and Ezekicht.

GERARD, a town in Belgium, near the Meuse.

GERARD, Joseph Marie de, baron, a French philosopher and statesman, born in Lyons, Feb. 29, 1772, died in Paris, Nov. 11, 1842. He was educated in the college of the Oratory at Lyons, and was preparing for the priesthood against the wishes of his family when the revolutionary persecutions of ecclesiastics led him to change his purpose. When in 1793 his native town was besieged by the troops of the convention, he took arms for its defense, was made prisoner, and narrowly escaped death. He entered the army, but his regiment having been sent to Lyons, he was there recognized, denounced, and obliged to seek safety in flight. He went to Switzerland and thence to Italy, and was employed two years in a commercial house in Naples. In 1797 he returned to France, afterward joined a regiment of cavalry, and was in garrison at Colmar when the institute proposed the question: "What is the essence of signs on the formation of ideas?" De Gérando sent in a dissertation on it, and learned that he had received the prize soon after the battle of Zürich, in which he had taken part. Invited to Paris, he entered the ministry of the interior under Lucien Bonaparte in 1799, became secretary general of that department under Champagny in 1804, accompanied him to Italy in 1805, was appointed master of requests in 1808, was afterward engaged in the organization of Tuscany and of the Papal States when they were united to France, received the title of councillor of state in 1811, and was appointed governor of Catalonia in 1812. On the fall of the empire he retained his dignities; but for having been sent to organize the defense of the Moselle during the hundred days he was under a French Trappist, born in Lyons, April 17, 1772, died in Rome, March 15, 1848. He was educated in Vienna, and served against the French in the Austrian, Spanish, and English armies. He was a violent temper, and fought several duels. In 1812 he was in London, and his creditors sought to have him arrested, but he barricaded his dwelling, hung out a flag inscribed "My house is my castle," and resisted for a fortnight the sheriff and his deputies. He was afterward sent to the continent, where he fell into the hands of Napoleon, by whose orders he was imprisoned in Vincennes and afterward in La Force. In the latter prison he met the bishop of Troyes, and thenceforward he consecrated his life to religion, joining the Trappist order some time after his release (1815). He took the vows in 1817 at the monastery of Port du Salut near Laval, and distinguished himself so greatly by his piety that he was appointed procurator general of the order. In 1881 he made a pilgrimage to the Holy Land, and in 1887 went to Rome. His Pèlerinage à Jérusalem et au mont Sinaï en 1881–83 (4 vols., Paris, 1886) has been translated into foreign languages, and passed, like his Voyage de la Trappe à Rome (1889), and other works, through many editions.

GERANDO, Joseph Marie de, baron, a French philosopher and statesman, born in Lyons, Feb. 29, 1772, died in Paris, Nov. 11, 1842. He was educated in the college of the Oratory at Lyons, and was preparing for the priesthood against the wishes of his family when the revolutionary persecutions of ecclesiastics led him to change his purpose. When in 1793 his native town was besieged by the troops of the convention, he took arms for its defense, was made prisoner, and narrowly escaped death. He entered the army, but his regiment having been sent to Lyons, he was there recognized, denounced, and obliged to seek safety in flight. He went to Switzerland and thence to Italy, and was employed two years in a commercial house in Naples. In 1797 he returned to France, afterward joined a regiment of cavalry, and was in garrison at Colmar when the institute proposed the question: "What is the essence of signs on the formation of ideas?" De Gérando sent in a dissertation on it, and learned that he had received the prize soon after the battle of Zürich, in which he had taken part. Invited to Paris, he entered the ministry of the interior under Lucien Bonaparte in 1799, became secretary general of that department under Champagny in 1804, accompanied him to Italy in 1805, was appointed master of requests in 1808, was afterward engaged in the organization of Tuscany and of the Papal States when they were united to France, received the title of councillor of state in 1811, and was appointed governor of Catalonia in 1812. On the fall of the empire he retained his dignities; but for having been sent to organize the defense of the Moselle during the hundred days he was under a French Trappist, born in Lyons, April 17, 1772, died in Rome, March 15, 1848. He was educated in Vienna, and served against the French in the Austrian, Spanish, and English armies. He was a violent temper, and fought several duels. In 1812

though, as it throws up many stems from the same root, it retains a shrub-like form. It has the general botanical characters of the rubiaceae, to which family it belongs. The leaves are large, oval, acute, and downy on the under surface, as are the flower clusters which are borne at the ends of the branches; these consist of several five-flowered fascicules of purplish-spotted flowers, with a tube nearly an inch long and a reflexed limb; the calyx is short and five-lobed, one of the lobes being expanded into a large, ovate, rose-colored leaf, which is more showy than the flower itself. The plant is closely related to cinchona, and is one of the many that have been proposed as substitutes for Peruvian bark. From the reports of physicians living in the states where it grows, it appears to have decided anti-periodic properties, though slower in its action than quinina. As an ornamental plant it is deserving of the attention of those who live in a climate where the winters are mild; in England it is sufficiently valued to be cultivated as a wall plant. The honors was named by Michaux in honor of Gen. Charles C. Pinckney.

GEORGIAN BAY. See HURON, LAKE.
suspended in 1822 and resumed in 1828. In 1837 he was raised to the peerage. His principal philosophical works are: *Des signes et de l'art du peser considérés dans leurs rapports mutuels* (4 vols. 8vo, Paris, 1800); *De la génération des connaissances humaines* (Berlin, 1802); and *Histoire comparée des systèmes de philosophie* (8 vols. 8vo, Paris, 1803), of which a posthumous volume appeared in the third edition (1847–8). In 1825 he received the prize of the academy for his treatise *Du perfectionnement moral et de l'éducation de soi-même* (translated into English, Boston, 1880), the fundamental idea of which is that life is a discipline whose object is perfection. The five leading motives which solicit the will are sensations, affections, thought, duty, and religion; and the two conditions of harmonious development are a love of the good (l'amour du bien) and a habit of self-control. His *Visteur du pauvre* also received the prize of the academy (1821). In 1827 he published *De l'éducation des sourds-muets de naissance*; and in 1829 appeared his *Instituts du droit administratif français*, which was finished by Boulatignier and Alfred Blanche (3d ed., 5 vols., 1842–5). Shortly before his death he made a tour through Germany and Switzerland, in order to study the system of hospitals and other charitable institutions.

**GERANiUM** (Gr. *γερανός, a crane*), the botanical name of one genus and the popular name of another genus of plants belonging to the family geraniaceae. Plants of the genus *geranium* are herbs with perennial, biennial, or annual roots; stems swollen at the joints; leaves usually rounded and palmately lobed or dissected; flower stalks terminal or lateral, one to three-flowered; flowers symmetrical, parts in fives, petals equal; stamens ten, in two series, the five outer ones opposite the petals and sterile; alternating with the petals are five small glands upon the receptacle; the pistil consists of five two-ovuled carpels united to a prolongation of the axis. As the pistil matures this axis and the attached styles elongate and form a pointed fruit about an inch and a half long; the beak-like character of the fruit suggested the popular name of cranesbill, and probably the botanical name for the genus also. When quite ripe the carpels break away from the central axis, the small one-seeded pods remaining attached to the styles, the separation taking place from below upward. Six species of *geranium* or cranesbill are found east of the Mississippi, and a few others are peculiar to the western side of our territory. The only perennial among the eastern species, and at the same time the largest and best known, is *G. maculatum*, the spotted cranesbill; its stem is about two feet high, each of its numerous branches bearing two light purple flowers about an inch across; the leaves are about five-parted, with the divisions cut at the ends; when old they sometimes have whitish blotches, on account of which not very conspicuous character the specific name was given. The root stock of this plant is very astringent, and is not only a popular domestic remedy in diseases of the bowels and other cases where astringents are required, but is officinal in the United States pharmacopoeia. On account of its astringency it is in some places called alum-root, a name which properly belongs to *Heuera*, and should be restricted to it. Of the annual kinds we have *G. Robertianum*, or herb Robert, a beautiful plant common in our woods, especially among rocks and in the rich black mould of their crevices, where it is partially shaded. Its flowers, though small, are numerous and prettily striped and rosy, and its foliage is so delicately cut and borne upon long slender petioles, that it is well adapted for the garden, especially in the rockwork. A heavy disagreeable odor is however emitted from its leaves, if handled. Frequently in the autumn...
the leaves are curiously dotted with minute black specks, the perithecia of a parasitic fungus (dothidea Robertianum). G. Carolinianum, similar, with paler flowers and scentless foliage, erroneously supposed to be G. dissectum, occurs in waste places on barren soils, and is widely diffused. G. pumilum (small-flowered cranesbill), with slender stems, rounded, five-parted, kidney-formed leaves, and small bluish-purple petals, has been found in waste places in New York and Massachusetts. The last three are natives of Europe, naturalized in this country. Some exotic perennial species are cultivated in our gardens; the commonest of these is G. sanguineum, a native of England, with deep crimson-purple flowers which bloom nearly all summer; a variety of this is known as G. Lancastriense. G. Ibericum, G. pratense, and a few others are also grown. The anemone-leaved geranium, G. anemonefolium, is a greenhouse species, with beautifully divided leaves, from the Cape of Good Hope.—Geranium is the name popularly given to the species and varieties of pelargonium, so generally cultivated. The genus pelargonium differs from geranium in several characters, the most obvious of which are the half-shrubby character of the stems and the somewhat irregular flowers. One of the sepals or divisions of the calyx has its base prolonged, which runs down on one side of the pedicle or flower stalk as an adherent spur, as may be seen in a cross section of the pedicle; the two petals nearest this sepal are often different from the others in size and shape; stamens that bear anthers usually seven, always less than ten; pistil as in geranium. The name, as with geranium, is suggested by the fancied resemblance of the fruit to the bill of a bird, but in this case it is the stork in place of the crane (Gr. &omicron;v&omicron;i&upsilon;&omicron;v, a stork). There are no more popular tender plants than the various pelargoniuns, whether for window culture, summer bedding plants, or choice ornaments to the conservatory and greenhouse. Though the name geranium applied to them is incorrect, it has become so firmly attached by long usage that no change is probable. As with many other plants that have been long in cultivation, the pelargoniuns have become so mixed by hybridizing, crossing, and sporting, that it is generally difficult to determine the species from which they originated. The Cape of Good Hope has furnished a large majority of the species, a few only having come from Australia and elsewhere. A scientific classification being impracticable, it will serve our purpose to group them after the manner of the florist. The scented pelargoniums include a number that have fragrant foliage and generally inconspicuous flowers. The best known is the rose geranium, P. capitatum, which is probably the oldest species in cultivation, it having been carried to England in 1690; its lobed, downy, pleasantly scented leaves are well known; there is a variety with the leaves edged with white. The peppermint geranium is P. tomentosum; the nutmeg-scented, P. odoratissimum; and the pennyroyal-scented, P. ezeitipulatum. The ivy-leaved pelargoniums form a very distinct group, distinguished by their smooth, fleshy leaves, lobed like those of the ivy, and their weak and trailing stems; they are mainly derived from P. peltatum and P. lateripes. Within a few years great improvement has been made in this class, and they now present a great variety in foliage and flowers; their prostrate habit especially adapts them to cultivation in vases and hanging baskets. Florist's pelargoniums, or show pelargoniums as they are often called, have rounded leaves and flowers, often somewhat irregular, of the greatest beauty of color and markings; they have resulted from long continued crossings, and their origin is so obscure that recent French writers name them all P. hortulanum, the pelargonium of the gardeners. This class is only seen in perfection in greenhouses, and it requires great care and skill to make a fine show of them. We then have a large class that flower indoors in winter, and are turned out into the borders in summer, where they are used in masses to produce fine effects by their flowers or foliage; the foliage of these has an unpleasant odor, and some of them are popularly known as fish geraniums. The old scarlet geranium, P. inquinans, and the horseshoe geranium, P. sonale, are the principal species from which this class originated; the flowers range from white to the most dazzling scarlet and dark crimson; of late a number with double flowers have been introduced; their foliage is often highly ornamental, it being variegated with white, yellow, pink, and other shades upon the green. The florists do not agree in their classification of these varieties; their principal divisions are into nosegay, zonale, bronze-zoned, gold and silver.
tricolors, and gold and silver margined. Some of the tricolors, of which “Mrs. Pollock” may be taken as the type, have leaves beautifully colored; but these do not flourish well in our hot summers, and are only seen in perfection when grown under glass. Pelargoniums grow readily from seed, and if started early in a hotbed the plants may be had in bloom the same season; the plants have such a mixed and varied ancestry that seeds from almost any of our cultivated kinds are likely to produce plants different from the immediate parent.

Those who engage in the production of new varieties practise careful crossing, using the pollen of one variety upon the pistil of another in the usual way. The varieties are perpetuated by propagating from cuttings, which readily take root; the commercial florists propagate them all winter for the spring sales; the amateur can readily multiply them in the open ground after the hot weather of summer is over. Cuttings two to six inches long, planted in a shady place, will soon take root and make good plants for winter blooming; if the stems from which the cuttings are to be taken are very succulent, they should be cut half or two thirds through, and when the wounded surface has dried the cutting can be entirely removed. Erodium (Gr. epidēs, a heron) is a genus closely related to geranium, from which it principally differs in having the leaves pinnately instead of palmately divided, and in the twisting of the styles when in fruit they break away from the beak-like receptacle. The plants are mostly natives of Europe and the East, and there is one species indigenous to Texas, E. Texanum. The only erodium of special interest is E. octocarpum, which is sparingly naturalized in some parts of the eastern states, and abundantly so on the Pacific coast, where it is of great service as a forage plant, its young growth furnishing a bite to the cattle when there is but little else for them to eat. It is known as pin grass, and also by the Mexican name of aflarís.

GERARD, the Blessed, a saint of the Roman Catholic church, and founder of the order of knights hospitaliers of Saint John of Jerusalem. (See ST. JOHN OF JERUSALEM.)

GERARD, Cécile Jules Badie, a French officer, born at Pignans, Var, June 14, 1817, drowned in Africa in September, 1864. Enlisting in the spahis, he landed in Africa in 1842, and two years later killed his first lion. In all he killed 28. On his return to France he gave the results of his experience in La chasse au lion (1856) and Gérard le tueur de lions (1856). The latter work has been translated into English under the title of “Gérard the Lion Killer.” He afterward proposed to explore the Kong range in western Guinea, which had not yet been visited by any European. Starting from England in the latter part of 1863, he attempted to penetrate into the interior of Africa through Dahomey. Failing in this, he proceeded to Sierra Leone, whence an English man-of-war took him to the river Gallinas. He started again for the interior, but having been plundered of his baggage he resolved to return to Sierra Leone. While crossing the river Jong he was drowned.

GERARD, Etienne Maurice, count, a French marshal, born at Damvillers, April 4, 1773, died in Paris, April 17, 1855. He enlisted in 1791 as a private, served under Dumouriez and Jourdan, and obtained a colonelcy in 1800. He distinguished himself at Austerlitz, Halle, Jena, and Wagram, receiving as reward for his services the rank of general of brigade and a barony. After service in Portugal and Spain, he joined the Russian expedition, and as general of division evinced unflagging energy during the retreat from Moscow. He was severely wounded in the campaign of 1813, and in 1814 fought successfully against the invading troops.
During the campaign of 1815 he was placed under the command of Grouchy, who had orders to prevent the Prussians from joining the English army under Wellington. On the morning of June 18, bearing the report of cannon, he strongly urged a march toward Waterloo, but was overruled. On the fall of Napoleon, Gérard left France, and did not return till 1817. In 1822 he was elected deputy, took his seat among the opposition members, and was re-elected in 1823 and 1827. He contributed to the success of the revolution of 1830, and after being minister of war for three months, reentered the chamber of deputies. Having been promoted to the rank of marshal, he was in 1831 intrusted with the command of the French army sent to protect Belgium against Holland. In 1832 he commanded at the siege of Antwerp, which he forced to capitulate, Dec. 23. In 1834 he again held for three months the office of minister of war. He was made count in 1818, peer in 1833, grand chancellor of the legion of honor in 1835, commander general of the national guards of the Seine in 1838, and senator in 1869.

GÉRARD, François Pascal Simon, baron, a French painter, born in Rome in 1770, died in Paris, Jan. 11, 1837. He entered the studio of David in 1796; in 1792 he visited Italy, but soon returned, and exhibited in 1795 his first great picture, "Belisarius," "The Three Ages," "Cupid and Psyche," "Ossian," and the "Battle of Austerlitz," which appeared in succession from 1806 to 1810, established his fame. The last was applauded for its accuracy and beauty by Napoleon, who, as nearly all the members of his family, had their portraits painted by Gérard. At the command of Louis XVIII. he executed in 1817 his "Entry of Henry IV. into Paris." His "Louis XIV. declaring his grandson Philip of Anjou King of Spain" appeared in the public exhibition of 1828; and his "Coronation of Charles X." in that of 1829. Under Louis Philippe he executed various important works in the halls of the historical museum at Versailles and in the cupola of the Pantheon. The latter, completed in 1836, were the last of his performances. During his career, besides 80 historical pictures, some of which are of very large dimensions, he painted nearly 800 portraits.

GÉRARD DE NERVAL (GERARD LABRUNIE), a French author, born in Paris, May 21, 1808, died there, Jan. 24, 1855. He published when 18 years old a series of poems entitled Études nationales, and in 1828 a new translation of Faust. He wrote dramas either by himself or in conjunction with Alexandre Dumas, one of which, Léo Burckart, was published in 1839 with notes. In 1850, in conjunction with Méry, he produced Le chariot d’enfant, a metrical translation of an Indian drama, and a series of philosophical and biographical essays upon eccentric characters, entitled Les illuminés, ou les précurseurs du socialisme (1852). On the morning following the anniversary of the death of Jenny Colon, an actress whom he loved devotedly, he was found hanging and dead in the street.

GERARDMER, Gérome, or Giro mushrooms, a town of France, in the department of Vosges, on the margin of Lake Géralm, near the German frontier, 22 m. S. E. of Épinal; pop. in 1886, 6,225. It covers a considerable extent of ground, the houses mostly standing in gardens. It has a large trade in cheese, known as Géromé cheese. Lake Géralm is the most beautiful of the inland waters of France; it is oval in shape, about 1/4 m. long, and traversed by the river Vologne.

GERASA, or Galasa (now Jerash), a ruined city of Palestine, E. of the Jordan, in the ancient Decapolis, 55 m. N. E. of Jerusalem, on the opposite slopes of two hills, between which flows the river Keruan. The most interesting of its remains extend along the right bank of the stream, and comprise a Corinthian temple and triumphal arch, five or six other temples, and two theatres, all of marble; a naumachia, or artificial basin for the representation of sea fights; and a small temple, with a semicircular Ionic colonnade from which a street, lined with rows of columns, traverses the city. At right angles with this are three other streets, all full of relics of ancient greatness. There are raised walks for foot passengers on either side, while
the centre course still shows marks of chariot wheels. The walls, which are pierced by three ornamented gateways, and flanked by occasional towers, are in tolerable preservation. Outside is an extensive necropolis; 200 yards N. E. is a large reservoir, and near it can be traced an aqueduct. The river and valley are crossed by two bridges. There are two grand baths, and inscriptions, chiefly of the time of Antoninus Pius, but in general much defaced, are met with in all directions. Mention of Gerasa is first made by Josephus, who states that King Alexander Jannaeus, after subduing Pella, attacked and captured it, about 85 B. C. It is referred to by Greek and Roman writers, but no details of its history are given. After the Roman conquests in the East the district around Gerasa became one of their favorite colonies. It was burned by the Jews at the commencement of their war with the Romans, and taken again by Annius, one of Vespasian's generals. Half a century later it attained its greatest prosperity. On the rise of Christianity it became the seat of a bishop. In 1192 Baldwin II. captured it and destroyed the castle.

GERBOA. See JERBOA.

GERDIL, Hyacinthe Séguier, a Savoyard philosopher, born at Samoens, June 23, 1718, died in Rome, Aug. 12, 1802. He became a Barnabite, studied theology in Bologna, won the friendship of Cardinal Lambertini, afterward Pope Benedict XIV., and became professor of philosophy at Macerata, at Casale, and finally at Turin. Refusing the dignity of general of his order, he became tutor to the prince of Piedmont, afterward Charles Emanuel IV. of Sardinia, the rich abbey of Chinese being given him, whose revenues he devoted to charity. His first works were Éclairissements sur la notion et la divisibilité de l'âme géométrique (Turin, 1741), and Immortalité de l'âme démontrée contre Locke (1747). To these works succeeded almost every year until his death others in Latin, French, or Italian, on questions of theology, philosophy, physical or mathematical science, and sociology. He was created a cardinal in petto by Clement XIV., and officially proclaimed as such in 1777 by Pius VI. Appointed prefect of the Propaganda, protector of the Maronites, and rector of oriental publications, he led in Rome a life of the most laborious poverty. He sold his library in 1798 in order to support himself, followed Pius VI. to Siena, and would have been unanimously chosen by the conclave as his successor, if the fact of his being a native of Savoy, then a part of France, had not caused Austria to oppose him. His complete works were published in Rome (20 vols. 8vo, 1806–91). An edition of his select works in 12 vols. was given in Paris in 1836, but only 4 vols. have appeared. In 1863 Migne published a selection of his theological works in 1 vol. large 8vo.

GERDY, Pierre Nicolas, a French physiologist, born at Loches, Aube, May 1, 1797, died in Paris, March 18, 1856. In 1884 he became professor in the Paris faculty of medicine, and in 1887 was elected a member of the academy of medicine. His treatment of physiology was systematic rather than experimental, and he carried to an extreme degree the doctrine of the so-called vital properties residing in as many different organs and tissues of the body, and accounted directly for the phenomena of life, without any reference to the action of physical or chemical forces. His publications were numerous and varied in character, most of them appearing in the medical journals or in the bulletins of the academy of medicine. He also wrote: Anatomie des formes extérieures, appliquée à la peinture, à la sculpture et à la chirurgie (1829); Traité des bandages et des pansements (1837–9); Physiologie philosophique des sensations et de l'intelligence (1846); and Chirurgie pratique, uncompleted (1851–5).

GERFALCON, or Jerfalcon. See FALCON.

GERHARD, Eduard, a German archaeologist, born in Posen, Nov. 26, 1796, died May 15, 1867. Resigning a professorship at Breslau on account of weak eyes, he travelled in Italy, and resided 15 years in Rome. He was engaged on Platen's Beschreibung der Stadt Rom, planned by Niebuhr, and then directed by Bunsen, for which he undertook to furnish a complete account of the sources of knowledge concerning ancient Roman topography, under the title of Scriptores de Regionibus Urbis. When in 1829 the crown prince of Prussia visited Italy, Gerhard accompanied him to Naples, and obtained his protection for the Instituto di corrispondenza archeologica, founded at Rome, of which Gerhard was director until his return to Prussia in 1837. He was afterward appointed archæologist of the royal museum at Berlin, professor in the university of that city, and member of the academy of sciences. Among his numerous writings are: Antike Blücherne (Stuttgart, 1827–44, with 140 copperplate illustrations); Ausserlieue Griechische Vasenbilder (4 vols., Berlin, 1889–98, with 380 plates); Griechische und Etruske Trinkschalen (1840); Etruske und Campanische Vasenbilder (1849); Trinkschalen und Gefäße (2 parts, 1848–50); and Ueber die Hermbilder auf Griechischen Vasen (1868).

GERHARDT, Charles Frédéric, a French chemist, born in Strasburg, Aug. 31, 1816, died there, Aug. 19, 1856. The son of a manufacturer of chemical products, he studied in 1835 in Liebig's laboratory at Gießen, and in 1844 was appointed professor at Montpellier, where he remained four years. He returned to Paris and established a private laboratory, in which he continued his researches till 1855, publishing papers upon homologous series, the theory of types, the amhydride, and the azonium. In 1855 he accepted the chair of chemistry and pharmacy at Strasbourg. Among his most important publications is the Traité de chimie organique (4 vols. 8vo, 1858–60), upon which he was occupied a large portion of his life, and in
which he presents a complete account of the actual progress of organic chemistry. The work was intended as an appendix to Berzelius’s Chemie minerale.

GERHARDT, Paul, a German poet and theologian, born at Gräfenhainichen, near Wittenberg, March 12, 1607, died at Lübben, June 7, 1676. Little is known of his life till in 1651 he became pastor at Mittenwalde, a position which he exchanged in 1667 for that of deacon in the church of St. Nicholas in Berlin. He was there at the head of the strict Lutherans against the syncretism of Calixtus and his followers, and was deprived of his diaconate because he refused to obey the edict of 1664 forbidding either party to defame the other in the pulpit or tax it with heresy. In January, 1667, he was reinstated in his office, but resigned the following month, and in 1668 became arch-deacon in Lübben. He is esteemed the author of the best German hymns after those of Luther; several of them were translated by John Wesley, and are found, in part at least, in the Methodist hymn book. In Germany they were first collected under the title of Geistliche Andachten in 120 Liedern (Berlin, 1666), and many of them are contained in most of the Protestant hymn books in Germany. Of their numerous editions, the best is that of Philipp Wackernagel (Stuttgart, 1848).

GÉRICAULT, Jean Louis Théodore André, a French painter, born in Bosen in 1790, died in Paris, Jan. 18, 1824. He was a pupil of Carle Vernet and of Gérin, and his first pictures, the “Guide of the Imperial Guard in 1812” and the “Wounded Cuissard,” were well received. In 1816 he went to Italy, and in 1819, on his return to France, he exhibited the “Raft of the Medusa,” a very dramatic scene, executed in the most powerful style, which is considered one of the masterpieces of the French school.

GERLACH, Otto von, a German theologian, born in Berlin in 1801, died there, Oct. 24, 1849. He held various ecclesiastical offices, and not long before his death became professor at Berlin. He published several works, prominent among which are a commentary on the Scriptures, known as the Gerlachsche Bibel, which was continued after his death by Schmieder. He also edited Auswahl von Luther's Schriften (24 vols., Berlin, 1840-48).—His elder brother, Enser Ludwie, born in Berlin, March 7, 1795, is prominent as an ultra-conservative journalist and politician, and as the parliamentary leader of the high-church party in Prussia.

GERMAN CATHOLICS (Deutschkatholiken), a religious denomination, formed in 1844 by secession from the Roman Catholic church of Germany. It owed its origin mainly to a letter written Oct. 1, 1844, by Johannes Ronge, an excommunicated priest of Silesia, to Bishop Arnoldi of Treves, in which the exhibition of the holy coat of Treves was called an idolatrous festival, and the bishop was called upon to suppress it. In the Prussian province of Posen another Catholic priest, Johann Czerski, had already declared on Aug. 22 his secession from the Roman Catholic church, and had attempted the foundation of a Christian apostolic Catholic congregation. After the publication of the letter of Ronge these two united, and a number of congregations, who called themselves German Catholics, sprang up within a short time. The “Confession of Schneidemühl,” drawn up by Czerski, rejected the reception by the priests alone of the Lord's supper in both kinds, the canonization and invocation of saints, indulgences and purgatory, fasting, the use of the Latin language in divine service, the celibacy of priests, the prohibition of mixed marriages, the supremacy of the pope, and other points. They retained the seven sacraments and the mass, which they celebrated in the vernacular language. The “Confession of Breslau,” which set forth the views of Ronge, also claimed free investigation of the Bible and freedom of belief for every individual member. A council which met at Leipsic, March 22, 1845, adopted a new creed mostly based on the “Confession of Breslau.” From this time the principles of German Catholicism spread very rapidly. The attitude of the governments with regard to it was very diverse. In Austria and Bavaria it was even forbidden to use the name. A serious obstacle to the growth of the new religious denomination was found in their internal dissensions. There had been from the beginning a radical disagreement between Ronge and Czerski. The latter agreed in general with the doctrines of orthodox Protestantism, while the former adopted almost all the views of the Protestant rationalists. Czerski issued a circular (“New Confession of Schneidemühl”) against those who denied the divinity of Jesus Christ. An attempt to unite the two parties on a common platform was made in an assembly at Rawicz, February, 1846, but it had not the desired effect. The revolutions of 1848 seemed to be very favorable, and some additions were made to their congregations in Austria and Bavaria; but after their suppression German Catholicism was again prohibited in those countries. The second council of Leipsic, which met in May, 1850, had to be transferred to Köthen on account of the interference of the police; it proposed an alliance with the Free congregations, which had formed themselves by secession from the Protestant churches, and the election of a joint executive committee from both denominations, which was to act as a presiding board until the meeting of a triennial diet, which was appointed for 1852, but it did not meet. In June, 1859, the representatives of the German Catholics and Free congregations met at Gotha, where a union between the two parties was effected under the name of Bund freireligiöser Gemeinden. In 1862, however, they were again divided, and the majority of the German Catholics joined the national Protestant church. The fullest
history of German Catholicism is given by Kamps, Geschichte der religiösen Bevölkerungen der neueren Zeit (4 vols., Leipzig, 1882–86). GERMANIC RACES AND LANGUAGES. Before the political history of Germany began, or a distinct German nation appeared, Germanic races moulded the political organizations of the north and west of Europe, and Germanic languages either superseded or modified the speech of the previous inhabitants. Ethnologists sometimes classify the Germanic races under the generic name of Tountons, as a main division of the Slavo-Germanic branch of the Aryan or Indo-European family of nations. The term Tountons, in this wider sense, is chiefly used by English writers, as the equivalent of the German Germantisch (Fr. germanique), in contradistinction to Deutsch (Fr. allemand), in the narrower sense, and is thus often used in this work. Three groups are distinguished: Scandinavians, Goths, and Germans. The Scandinavians occupy Norway and Swedon (excepting the territory of the Lapps), the Danish islands, and the peninsula of Jutland. The Goths, now extinct, were subdivided into Ostrogoths and Visigoths, or Eastern and Western Goths. The Germans are subdivided into two groups, the northern and southern, or Low and High Germans, and are found principally in Germany, the Netherlands, England, the United States, and the British colonies. There are many hypotheses in regard to the meaning of the word German. Some authorities derive it from the old High German ger, spear or javelin, and consider the Germani of the ancients as the equivalent of Germanen or men armed with such weapons. Others derive it from the Celtic gastern or garm, noise, and understand it to refer to the ancient German practice of shouting in battle. The modern German word Deutch is held by some to be a modification of the name Teut, Talus, or Tuisto, a mythical ancestor of the Germans; others trace it to diat, old High German diat, pertaining to the people, or national; and others again to the verb diutan, to explain. The cradle of the Indo-Europeans is generally placed in Asia, whence the Germans have been supposed to have entered Europe across the Ural and Caucasus. Some recent authorities, however, remove the primitive habitat of the Aryans from the sources of the Oxus and Jaxartes to the Russo-Lithuanian plateaus, contiguons to the first historical habitat of the Germans, north of central Europe, and within the boundaries of the Rhine, the Danube, and the Vistula. There are no positive data about the Germanic races prior to the 3rd century B.C. No mention is made of them when the Hellenes came in contact with the Scythisans, and the Gauls carried terror to Rome and Delphi. Pytheas of Massalia met with Goths and Teutons on the Baltic, and it is probable that the Goths inhabited Scandinavia before the 4th century. Arrian says that Alexander the Great had dealings with peoples living on the lower Ister (Danube), whom he calls Celts; but he mentions the Germanic Quadi and Marcomanni as tribes of them. It is evident that the Greek writers often speak of Germans as Celts or Galatians. Strabo designates the Germans as Celta-Scythians, meaning a people neither Celtic nor Scythic. The uncertainty of the Greek and early Roman writers concerning them renders it presumable that the Germans lived before the time of the Cimbri migrations isolated from their neighbors to the south and west, while the correlation of the two linguistic groups seems to indicate that they lived in constant intercourse with the Slavs. In the 2nd century B.C. the Germanic races became the dominant element in western and central Europe. The first historical migration started from the Cimbri peninsula, whence the tribes composing it were indiscriminately called Cimbri. Other migrations of the same period took their rise in the region of the Baltic, and the name of Teutons was given to the tribes figuring in these. The Celta previously moved to the west and south, but many of them had retraced their steps, and migrated with Germanic races from west to east. This mixed people appeared under Cambaules and Cerethrius in Thrace, and after the dissolution of the Macedonian empire under Brennus in Macedonia and Greece, and under Leonnarius in Asia Minor. The torrent of Cimbri and Teutons which rushed over the Alps at the close of the 2nd century B.C. failed to weaken the Romans in the mountainous districts of northern Italy and Illyria. Germanic tribes were for centuries put to their utmost to prevent the further advance to the north of their southern enemies. Caesar and Tacitus are the most valuable authorities upon the condition of the western districts of Germany in their time. Caesar states that the Rhine was the eastern boundary of Gaul, and affirms that in Switzerland, southern Alsace, near the upper Moselle, and on the shores of the strait of Dover, there were only four Celtic tribes, the Helvetii, Sequani, Mediomatrici, and Morini. He called the country of the Mass, north of Sedan, Germania Inferior, and the left bank of the Rhine, between Bresach and Linz (near Coblentz), Germania Superior. Tacitus divides the Germans into three classes, which he says were the descendants of the three sons of Mannus, the son of Tuisto, a god whom all Germans adored. He names Ingevones as living close to the sea; Hermiones inhabiting the centre; and all others were Isteriones. He mentions also as original divisions, according to some, the Marsi, Gambrivii, Suevi, and Vandals. Pliny the Elder knew five principal divisions of Germans: Vindill, Ingevones, Isteriones, Hermiones, and Pauclini. The Germanic races formed confederations at a very early period. The most ancient known were the confederation of Suevi, described by Caesar; another of Cherusci, founded by Arminius; and a third of Marcomanni, with Marboiunus as chief. The Batavi settled on the banks of the
Rhine, around the lowest portion of its course, the Ubii near Cologne, the Treviri near Treves, the Nervii in Hainaut, the Vangiones near Worms, the Nemetes near Spire, and the Triboci in Alsace. Between the Rhine and the Elbe lived the Catti (Hessians), with the Usipii N. of the Lippe, the Sigambri and Teneteri between the Ruhr and Sieg, the Cherusci around the Hartz, the Bructeri in Westphalia, and further north the Chamarvi and Angirbari. Between the Weser and the Emms lived probably the Donjubini and Chasauri mentioned by Tacitus. On the shores of the North sea were the Frisii and Chanci, and on those of the Baltic the Heruli and Rugii. On the lower Elbe lived the Saxons, with the Angles S. E. of them; higher up on the west bank of the river, the Longobards. On the Danube, and subsequently in Bohemia, were the Marcomanni, and E. of them the Quadi. In Silesia dwelt the Semnones, Lygii, and Burgundians, and between the Vistula and the Pregel, the Goths. The name of Suevi was given to a confederation of tribes scattered over the territory between the Elbe, the Vistula, and the Baltic. This confederation reached subsequently to the southern portions of Germany, where its name Swabians (Schedewam) is still current. It is impossible to state the precise limits of the different tribes. There was a constant shifting of settlements, and the subsequent migrations have rendered the boundaries of Tacitus totally indistinguishable.

The southward pressure of the Germans, Slavs, Finns, Huns, and Avars commenced in the 3d century A. D. The result was the withdrawal of the Romans from the southern portion of Germany, and the loss of the eastern portion to Slavic and Finnic tribes. The Longobards settled for a while in the north of Hungary, the Gepidae in the east of it, the Goths in Moesia and Illyria, the Marcomanni in Vindelicia and Noricum, the Alemani and Burgundians in Helvetia. The whole original territory from the mouth of the Danube to the delta of the Rhine was thus occupied again by Germanic races. But the pressure of the eastern races continued, and impelled by it about one half of the German warriors attacked the Roman empire, and divided southern Europe among them. The whole Gothic family of Vandals, Heruli, Rugi, Gepidae, Alani, Suevi, Longobards, Burgundians, and Franks left Germany almost entirely, and the Slavs and Finnic races took possession of the thinly populated districts, and extirpated in several places the German inhabitants. The Gothic empire on the Danube, founded there after the exodus of the Goths from the Baltic territory, was conquered by the Huns. After Attila's death the Goths separated again into the old divisions of Eastern and Western Goths. The Visigoths were led by Alaric to Italy (about 400), and by his successor Ataulf to Spain, and became Romanized. Theodoric led the Ostrogoths to Italy (489), where he founded a mighty empire, which after his death was absorbed by the Byzantines.
1066. The Danes moved south on the peninsula of Jutland as far as the Schel, but their invasions of England, prior to the Norman conquest, proved fruitless in the end. The Swedes were similarly unsuccessful in Estonia and Livonia, but their conquest of Finland led to a lasting establishment of their nationality on the European mainland, which the Russian occupation of the country since the beginning of the 19th century has not been able to efface. The history of the German empire after Otho I. is a series of contests between the emperors and the dukes of the principal races composing it. The Saxons, the Franconians, and the Swabians were in turn at the head of the empire in the persons of their own leaders. The political significance of special races ceased in the 18th century, but in language and manners there are still five which may be clearly distinguished. The Saxon race is dominant in the northwestern lowlands of Germany, especially in the northern districts of the Elbe, across the Hartz to Cassel, and across the Weser to the mouth of the Rhine. The Frankish race extends from the Fichtelgebirge to Treves, and from Hesse to the Ruhne Alp. The Thuringians inhabit the section between the Thuringian forest and the Hartz, and from the Werra far into Brandenburg. The Swabians live between the central Neckar and the Alps, and from the upper Rhine to Augsburg. The Bavarians reach from Augsburg to Vienna, and from the Fichtelgebirge to the Tyrol.—The boundaries of the modern German language are not coincident with the limits of the present German empire. In the northwest, German is spoken in some portions of the French department of Le Nord, the south and east of Belgium, and the eastern portion of the Netherlands. In the southwest, German is heard as far as the Doubs, the eastern Jura, the lake of Neufchâtel, and Monte Rossa in Italy. In the south, the language reaches from Monte Rossa to Mount St. Gothard, and thence almost directly east as far as the Mur in Styria. In the east, the line may be drawn from Radkersburg on the Mur, through Presburg in Hungary, to Pöhlitz on the Iglau in Moravia, thence to Krünzmau on the Moldau in Bohemia, and thence again to Taus. Further N. E. the territory of the German language reaches to Leitmeritz on the Elbe, and to the sources of the Oder in Austrian Silesia, whence the boundary runs directly N. to Krotoschin in Posen, and thence indefinitely to Interburg in East Prussia and N. W. to the Kurische Haff. The N. boundary follows the Baltic from Polangen to Flensburg in Schleswig, and the North sea from Tondern to Gravelines. It is possible to distinguish about 20 different dialects within this territory. They may be divided into Low German and High German dialects, of which the latter may be subdivided into South German and Middle German. Since the time of Luther these historical peculiarities of speech have however in a great measure disappeared, and are heard only among the lower classes.—Languages. Of all the numerous Teutonic tongues of ancient times, only five languages, German, Dutch, English, Danish, and Swedish, are now in a flourishing condition. Linguists consider the Scandinavian, Gothic, and German forms of speech as descended, in common with the modern idioms of India, Persian, Greek, Latin, Celtic, Slavio, and Lithuanian, from a single parent tongue, Sanskrit. It was, however, deemed necessary to go further, and to derive the whole group of Indo-European tongues from a primitive language, which was also the mother of Sanskrit. This language, of which no monuments exist, has been constructed by the science of comparative grammar, not as the primitive tongue from which all forms of speech are derived, but as one of many primitive languages, and as the parent of Sanskrit, Greek, Latin, Gothic, etc., as Latin is the mother of French, Italian, and Spanish. The following table exhibits the probable course of development of the Teutonic tongues:

| High German | Old High German | Middle High German | German |

Among the Indo-European languages, Gothic diverges widely from the primitive tongue, and must be considered as a younger sister of Sanskrit. Gothic was not the oldest of the Germanic tongues, though its literary documents date back further than any other. Old High German, old Norse, Anglo-Saxon, and Gothic were probably sister dialects; at least no one of them appears to be derived from any of the others. Old High German comprises a number of dialects which were spoken chiefly in South Germany, as the Thuringian, Frankish, Swabian, Alsatian, Swiss, and Bavarian. They are found in literary records dating
from the 9th to the middle of the 11th century. A gradual change took place subsequently in the language, and it became the mother of a new dialect, which is called the middle High German, and which survived it in the same districts of upper Germany. The literature of middle High German reaches from the 12th to the end of the 15th century, and it is so clear, grand, refined, and melodious, that it has been called the first classical period of German literature. A new modification of the old High German, and a daughter of the middle High German, made its appearance for the first time in a literary production of note in Luther's translation of the Bible, and in its rapid development seems to have reached its culminating point in the literature of the present century. Under the term Low German are comprised all the dialects spoken in the lowlands of Germany. The old Saxon, which belongs to this group, was spoken between the Rhine and the Elbe, in the districts which lie at the foot of the central plateau of Germany. Its literary documents date from between the 9th and 11th centuries, and had their origin in the districts of Minden, Essen, and Cleves. The old Saxon is the mother of the middle Low German, which is to be distinguished from the middle German and middle Netherlandish or middle Dutch, and also from the modern derivative of it called modern Low German, or Platt-Deutsch. While old Saxon most closely approaches old High German, the dialect spoken in the districts of Thuringia and the region between upper and lower Germany formed a kind of transition between High and Low German. On the N. coast of Germany, between the Rhine and the Elbe, and beyond the latter river as far as Jutland, extended the old Frisian dialect. Its literary records are of comparatively late date, but it displays a very antique cast, resembling most closely the old High German. The Dutch language has no literature earlier than the 16th century, but it is still a literary and national language; while Flemish, which was also used during this period in the courts of Flanders and Brabant, had to give way to the official languages of Holland and Belgium, and its use is almost completely confined to the Flemish peasantry. Anglo-Saxon is also a Low German dialect. The four Germanic tribes that invaded Britain have left no record in the dialects peculiar to each, and there are no facts from which to determine the precise nature of their speech. The Jutes who settled in Kent, Hampshire, and the Isle of Wight probably did not speak an old Norse dialect, as no traces of it are found in those districts. The Angles, coming from a settlement adjacent to the Saxons, may also have spoken a Saxon dialect. The Saxons of England called themselves simply Saxons, in distinction from the old Saxons, or those who had remained on the continent; but it is still doubtful whether they belonged exactly to one and the same tribe. The term Anglo-Saxon
is however applied to all Germanic dialects spoken in England after the 8th century. The language of the period extending to the end of the 10th century is distinguished as old Anglo-Saxon, with two principal dialects, the Saxon and Anglo, or southern and northern, of which the Anglian or northern was the most affected by Norse influences. The language of the subsequent period was a strange mixture of Anglo-Saxon with the Norse of the Danes and Norwegians, and the Norse-French of the Norman conquerors; and the literary documents are characterized by a considerable loss of the inflectional forms. Modern Anglo-Saxon or English is divided into three periods: old English, middle English, and modern English. Old English continued to disregard the old inflectional forms, especially in the declension of substantives. Middle English is characterized by an almost total absence of declensions of nouns and adjectives, and a great diminution of strong verbs. Modern English continued the same decline, and has now been stripped of all inflectional forms with the exception of the s and st of the present and the ad and en of the preterite of verbs, the ing of the present participle, the s of the genitive and plural, the degrees of comparison of adjectives and adverbs, and a few pronominal cases. Old Norse is the dialect which from an unknown period to the 11th century was spoken in Sweden, Norway, Denmark, and the adjacent islands. It is believed that it was split at a very early date into two sister dialects, one the mother of old Norse or Icelandic, the other the parent of Swedish and Danish. The first germs of Swedish and Danish are considered to have existed long before the 11th century in the dialects of the Scandinavian tribes. Swedish scholars distinguish between the East and West Scandinavian, which division they consider as having taken place before the Northmen settled in Norway and Sweden. The stationary existence of the Norse language in Iceland, in which it has been preserved almost intact to the present day, is explained by the secluded position of the island, and the zeal with which the old songs and sagas, as collected and fixed in the two Eddas, have been cultivated by the inhabitants.—In regard to the degree of relationship in which these languages stand to each other, and in which they stand collectively to cognate languages, the six old Teutonic tongues may be classified in three groups: 1, the Low German, with the Gothic and its nearest relatives Anglo-Saxon, Old Saxon, and Old Frisian; 2, the old High German; 3, the old Norse. The affinities between these languages and the modern tongues derived from them are illustrated in the following table. The first ten cardinal numbers have been chosen for this purpose, as numerals are preferable for comparative purposes to any other class of words on account of the invariance of their meaning. The Latin, Greek, and Sanskrit forms have been added to show the degree of relationship of the Germanic to the cognate groups of the Aryan or Indo-European family of languages. The primitive tongue is understood to be the mother of all, and gives the forms from which linguistic scholars derive those of the most ancient as well as of the modern Aryan dialects. The changes which the words have undergone in these languages have been discovered to appear in each according to fixed principles, which in linguistic science are known as Grimm’s law.

The law is stated by Max Müller as follows: "If the same roots or the same words exist in Sanskrit, Greek, Latin, Celtic, Slavonic, Lithuanian, Gothic, and High German, then wherever the Hindoes and the Greeks pronounce an aspirate, the Goths and the Low Germans generally, the Saxons, Anglo-Saxons, Frisians, &c., pronounce the corresponding hard check .... Secondly, if in Greek, Latin, Sanskrit, Lithuanian, Slavonic, and Celtic we find a soft check, then we find a corresponding hard check in Gothic, a corresponding breath in old High German .... Thirdly, when the six first and good language show a hard consonant, then Gothic shows the corresponding breath, old High German the corresponding soft check." In illustration of the different formulas we add examples for each class and division. 1. Sansk. kauṇa, Gr. καύνα, Lat. anser (=hâner), Goth. guna, O. H. Ger. kana, Ger. Guna, Eng. goose; Sansk. kau, Gr. καύς, Lat. hera, Goth. giafra, O. H. Ger. käster, Ger. gästern, Eng. yesterday. 2. Sansk. bhrī, Gr. βρέ, Goth. ga-daurrem, O. H. Ger. tarran, Eng. to dare. 3. Sansk. bhri, Gr. βρε, Lat. fero, Goth. baira, O. H. Ger. pieru, Eng. to bear. 4. Sansk. jād, Gr. γαυμα, Lat. guna, Eng. goose; Sansk. jau, O. H. Ger. chen, Ger. kennen, Eng. to know. 5. Sansk. pad-ā, Gr. ποδ-ε, Lat. ped-ās (pes), Ger. Fuß, Eng. foot. 6. Gothic. helpi, O. H. Ger. hilf, Ger. helfen, Eng. help. 7. Sansk.

GERMANICUS CÆSAR, a Roman general, born in Rome, 16 B.C.; died near Antioch in A.D. 19. He was the son of Claudius Nero Drusus and Antonia, the daughter of the triumvir Antony, and was adopted by his uncle Tiberius in accordance with the will of Augustus. His original names are unknown. In 7 he accompanied Tiberius against the rebels of Dalmatia, served with distinction during three campaigns, and on his return to Rome received a triumph and the hand of Agrippina, granddaughter of Augustus. At the close of another campaign, in 11, he was made consul, and in the following year was placed in command of the eight legions on the Rhine. He was absent in Gaul when upon the death of Augustus (14) a universal sedition broke out in the army. He was a favorite with the soldiers, and they had already determined to raise him to the head of the empire, when he suddenly returned to the camp, and at the peril of his life succeeded in repressing two successive revolts, and in establishing Tiberius upon the throne. He immediately marched the pacified legions against the enemy across the Rhine, and routed the Marsi, whom he fell upon by night as they were celebrating a festival. Being soon after appointed commander-in-chief of all the legions of Germany, he began that series of exploits which gained him his title of Germanicus. He marched against the native hero Arminius, the conqueror of Varus, defeated him, and made his wife Thustenilda prisoner; then penetrated to the Teutoburg forest, near the sources of the Lippe, the scene of Varus's disaster, and buried the bones of the legionaries who had fallen there. Yet Arminius hovered about the Roman army in impracticable places, attacked it in a narrow pass, and drove it into a marsh with so great loss that Germanicus decided to retreat to the Rhine. In the year 16 he returned against the Germans with a fleet of 1,000 vessels, landed at the mouth of the Ems, crossed the Ems and the Weser, and defeated Arminius first on the plains of Idistavus and then in the vicinity of Minden. He determined thereupon to return, but he lost a part of his fleet in a storm, and his own vessel stranded on the shores of the Chancel. Fear that his losses might embolden the Germans, he sent Silius against the Catti, while he himself attacked the Marci. He purposed to pursue his advantages in the following year, when Tiberius, jealous of his fame, recalled him, and in the triumph which was granted him Thustenilda figured among the captives. To rid himself of Germanicus, the emperor sent him to the East to fight the Parthians and to pacify Armenia. He at the same time gave the government of Syria to Cæcina Piso, with secret instructions to thwart and annoy Germanicus. The latter hastened to Armenia, and placed the crown upon Zenon. He subsequently reduced Cappadocia to a province, and gave the command of Comagene to Servæus. At the request of Artabanus, king of the Parthians, he removed Volumes, the deposed monarch, to Pompeiopolis. In the year 19 he visited Egypt without the special permission of the emperor, as required at the time. On his return to Syria he suddenly fell ill and died. Agrippina brought his ashes to Italy amid universal mourning; honors almost unexampled in Roman history were paid to his memory; and Piso, accused by the senate of having poisoned him, anticipated his condemnation by a voluntary death. "Germanicus is the hero of the "Annals" of Tacitus, and is one of the noblest characters in the history of the Roman empire. He had reputation also as an orator and poet, but of several works which he composed there remains only a Latin translation of the Phenomena of Aratus, which is superior to Cicero's translation of the same work. He was the father of the emperor Caligula. GERMAN IVY (senecio scandens), a house plant cultivated for its quick-growing, ivy-like foliage, but which is not properly an ivy. It is one of the composite family, and a native of the Cape of Good Hope. Its twining stems grow to the height of 8 or 10 ft., and are well clothed with round heart-shaped leaves, which have several pointed lobes, of a rather thin texture and a light green color. The plant is rarely seen in bloom, but it sometimes produces umbel-like clusters of small bright yellow flowers.
It grows readily from cuttings, flourishes well in the dry atmosphere of dwelling rooms, and is admirably adapted to window culture; in the open ground it is a useful climber where it is desired to cover a surface quickly, but it is killed by the first frost.

GERMAN OCEAN. See North Sea.

GERMAN SILVER, or Argentine, an alloy resembling silver, made of variable proportions of its ingredients according to the uses for which it is designed. A composition of 8 parts of copper to 3 each of nickel and zinc is recommended as making a close imitation of silver of 100%. The two latter metals are also used in the proportions of 4 each to 8 of copper. By using a larger proportion of copper the alloy is more easily rolled into plates, but the copper sooner becomes apparent in use. Iron used in the proportion of 2 to 24 per cent. renders the composition whiter but more brittle. The genuine German silver, made from the original ore of Hildburghausen in Hesse-nburg, analyzed by Kefferstein, was found to consist of copper 40-4 per cent., nickel 31-6, zinc 20-4, iron 2-0.

GERMANTOWN, formerly a post borough of Philadelphia co., Pennsylvania, 6 m. N. W. of the state house, Philadelphia, and included since 1854 in the 23d ward of that city; pop. of the ward in 1870, 22,805. It has one main street, about 4 m. long, extending S. S. E. and N. N. W., which is intersected at right angles by several others. It is lighted with gas, is well supplied with water, and is connected with Philadelphia by both a steam and a horse railway. Many retired merchants and wealthy citizens of Philadelphia have here their residences, some of which are of great elegance. Among the public buildings are 21 churches, an academy and other schools, and a bank. There are also a number of extensive manufactories.—Germantown was laid out in 1684 under a grant from William Penn, and settled by Germans, whence its name. It is memorable as the scene of the defeat of the American army under Washington by the British on Oct. 4, 1777. Washington, having learned that Gen. Howe had detached a portion of the main division of his army, then at Germantown, determined to take advantage of it to attack his camp. After marching all night, he entered the town about sunrise. The enemy, who were encamped across the main street at right angles, were taken by surprise, but the morning being dark and foggy, the Americans were thrown into confusion by the many small enclosures of the village, and the British rallied and attacked in turn. Some of the Americans were seized with a panic, and what had promised to be a victory was changed into a defeat. Washington withdrew in good order, with all his artillery. The British loss was upward of 600; the American about 1,000.

GERMANUS (Fr. St. GERMAIN L'AUXERROIS), a saint of the Roman Catholic church, born in Auxerre, central Gaul, about 380, died in Ravenna, July 31, 449 or 449. He was of a senatorial family, studied literature and jurisprudence, and distinguished himself for eloquence. He was made by the emperor Honorius military governor of his native district, and in 418 was elected bishop of Auxerre, although a married man. He separated from his wife, gave his property to the poor, and built a monastery on the river Yonne. He twice visited England at the request of Celestine I., and by his authority the doctrines of Pelagius were condemned and suppressed there, and schools for the education of the clergy were opened. He once led the Britons against a party of Picts and Saxons who were plundering the coast, and terrified them into retreat by a general shout of "Hallelujah," an action known under the name of the Hallelujah victory. He encouraged St. Patrick to undertake the conversion of the Irish, and in 447 went to Ravenna to mediate between the revolted Bretons and Valentinian III. His feast is celebrated on July 31. A manuscript preserved in the abbey of St. Gall, entitled Liber Sancti Ambrosii in Lendem Sanctorum compositus, is said by the Benedictine editors of St. Ambrose to have been probably written by St. Germanus. His life, written 30 years after his death by the priest Constantius, and put in verse by the monk Erich, is to be found in Labbe's Nova Bibliotheca Manucriptorum. A new life of St. Germanus was given in vols. ix. and xi. of Newman's "Lives of the English Saints" (London, 1844).

GERMANY (Ger. Deutschland; Fr. Allemagne), formerly a large empire of central Europe, with an area at the time of the first French revolution of 267,714 sq. m., and 26,885,000 inhabitants. From 1806 to 1815 it was dismembered and disorganized. In 1815 the German confederation (Deutscher Bund) was established in the place of the old German empire, embracing part of Austria (the present...
Cisleithania, with the exception of Galicia and Bukowina; see Austria), the bulk of Prussia (with the exception of Prussia proper and Posen), the kingdoms of Bavaria, Würtemberg, Saxony, and Hanover, the electorate of Hesse-Cassel, and a number of grand duchies, duchies, principalities, and free cities; in all 29 states, which in 1866 had been reduced to 23. The area of this confederation was 248,829 sq. m.; the population in 1865, 46,412,526. In 1866 it was dissolved. Austria was excluded from Germany, and Hanover, Hesse-Cassel, Nassau, and Schleswig-Holstein, with Lauenburg and Frankfort, were annexed to Prussia; the states north of the Main were formed into the North German Confederation under the headship of Prussia. The four South German states, Bavaria, Württemberg, Baden, and Hesse-Darmstadt, were made independent states, but were closely united with the North German confederation by means of the Zollverein and defensive and offensive alliances. Luxemburg and Liechtenstein were dismissed from all connection with the other German states. Thus the term Germany, from 1866 to 1871, designated the North German confederation and the four South German states, with an aggregate area of 204,719 sq. m., and a population in 1867 of 38,581,592. In January, 1871, the North German confederation and the four South German states united to reestablish the German empire, to which, by cession from France, the Reichsland of Alsace-Lorraine was added. This empire is bounded N. by the North sea, Denmark, and the Baltic sea, E. by Russia and Austria, S. by Austria and Switzerland, and W. by France, Belgium, and Holland (including Luxemburg). Its extreme northern point is on the frontier of the province of East Prussia, in lat. 55° 55' N.; its extreme southern point is in the Bavarian district of Swabia and Neuburg, lat. 47° 17'. From E. to W. it extends from lon. 29° 83', on the boundary of East Prussia and Russian Poland, to lon. 13° 45', on the line dividing German and French Lorraine. The area is 308,788 sq. m.; pop. in 1871, 41,058,189, or 197 to the square mile.—Stretching from the lofty summit of the Alps to the low beaches of the Baltic, from the picturesque and diversified countries of western Europe to the monotonous plains of the east, Germany encloses a rich variety of mountainous regions, terraced country, table lands, and fertile plains. Though mainly an inland country, it has good outlets to its numerous navigable rivers. Two great river systems, tributary to the North sea and the Black sea, meet in Germany, rendering it the centre of the interior commerce of the European continent. Its climate unites the characteristics of the surrounding countries, holding a mean between the extreme heat of the south and the extreme cold of northern Europe, between the excessive moisture of the western coast countries and the dryness of the eastern plains. Until recently its boundaries were but poorly protected; but the recovery of Alsace and part of Lorraine, in consequence of the war of 1870-71, restored to Germany a very strong position for defence, as now the Voges mountains form the western frontier, and to the former bulwarks against an invasion from France, Mentz, Coblenz, Saarlouis, Landau, and Germersheim, a number of equally strong fortresses have been added: Metz, Strauburg, Diedenhofen (Thionville), Bitsch, and Neu Breisach. On the south and southeast Germany is protected by the Alpine system and the maze of its projecting spurs, and the mountains separating it from Bohemia. The weakest point of Germany is the E. and N. E. frontier toward Russia. There the Russian territory enters like a wedge into the side of Germany, and the defence of its easternmost provinces depends on its military organization rather than on the three fortresses of Posen, Thorn, and Königsberg.—The vertical configuration of Germany presents three principal groups: the Alpine region south of the Danube, the elevated and terraced central portion, and the level northern country. 1. By the exclusion of Austria from Germany, the Alps have become the southern frontier, and only two comparatively small branches (the Algan Alps between the Rhine and the Lech, and the Bavarian Alps between the Lech and the Salzach) belong to the German empire. 2. The terraced country of central Germany has its nucleus near the junction of the boundaries of Saxony, Bohemia, and Bavaria, about lat. 50°, in the Fichtelgebirge, the watershed of the tributaries of the Rhine, Danube, and Elbe. Thence a number of mountain chains of the secondary order radiate in all directions. To the southeast the Bohemian Forest, the frontier between Bavaria and Bohemia, runs nearly 150 m. in parallel rugged chains toward the Danube. Its highest elevation is the Arber, about 4,800 ft. To the northeast the Erzgebirge, the loftiest peaks of which rise to an elevation of 4,000 ft., forms the frontier between Bohemia and Saxony. On the right bank of the Elbe the mountains cluster in a group of sandstone formation (Saxon Switzerland and Lusatia); after which, assuming the name of Sudetic mountains (Riesengebirge, Glatzengebirge), they turn S. E., dividing Bohemia from Silesia, and extending to the head waters of the Oder, where they meet the Carpathians. They culminate in the Schneekoppe, upward of 5,000 ft. high. S. W. of the Fichtelgebirge the Franconian Jura sweeps to the Danube and along its northern bank in a westerly direction into Württemberg, where its long-stretched, sharply defined ridges and table lands are known by the names of Ranne Alp, Swabian Alp, Albuch, &c. In S. W. Germany (grand duchy of Baden), near the head waters of the Danube, the mountain ridge of the Black Forest sets off at an acute angle from the Alp in a northerly direction nearly parallel to the Rhine, and skirting the fertile bottom land
of its E. bank. The spurs of this ridge, extending as far N. as the Neckar river, there meet with the Odenwald (grand duchy of Hesse), which, by the Oberwalt and Rhön (N. W. frontier of Bavaria), and again by the Thuringian and Franconian forests, is connected with the Fichtelgebirge. The territory enclosed by these different ridges, being those sections of Bavaria and Wurttemberg N. of the Danube, nearly the whole of Baden, part of the grand duchy of Hesse, and a few of the petty Saxon duchies, is intersected by a number of lesser hill chains. Between this Franconian and Swabian mountain system and the Rhetician Alps of Austria extends a vast level plain (southern Bavaria), bounded N. by the Danube, W. by the Iller, E. by the Inn and Salzach. The N. W. section of central Germany (always taking the Fichtelgebirge as the centre) appears like a labyrinth of hill chains, few of which attain a considerable elevation. The more important of them are: the Werra mountains, the Habichtswald, the Westerwald, the Taunus (Prussian province of Hesse-Nassau), the Eder hills, Egge hills, Rothhaar hills, and the Haarstrang (Prussian Westphalia). These are all between the Rhine on the west, the Main and Kinzig rivers on the south, the Werra on the east, and the Lippe on the north. The highest summit is the Astenberg in Westphalia, nearly 2,860 ft. high. N. of the Lippe only one other hill chain stretches in a N. W. direction nearly parallel to the Ems, viz., the Teutoburg forest, renowned in German history as the theatre of the conflict by which the rule of the Romans east of the Rhine was broken. E. of the Weser, the Weser hills run parallel to that river, while S. E. of them and N. of the Thuringian system the Hartz appears as an isolated mass of mountains, the highest summit of which (Brocken) reaches the height of 3,737 ft. On the left or western bank of the Rhine the Vosges, extending along the western frontier of Alsace, rise near Colmar to an altitude of about 4,700 ft., and their northern spurs in Renish Bavaria and Renish Prussia, called the Haardt, the Hunrück, and the Hochwald, to about 2,700 ft. in the latter range. Further N. the Ardennes send into Rhinish Prussia the ridge of the Eifel (2,500 ft.) and the Hohe Venn. Northeastern offshoots of the Jura cross the southern frontier of Alsace. 3. The great plain of northern Germany extends over the entire breadth of the country N. of a line drawn from the Holland frontier to Osnabriick and Minden, thence E. S. E. to Leipsic, thence S. by E. to a point where the head waters of the Oder and Vistula approach one another. This vast plain, which at some former geological period has undoubtedly formed the bottom of the sea, is traversed only by two ridges of hills, none of which rise above 400 ft. One of these ridges extends from the lower Vistula W. to the Oder above Stettin; the other from Tarnowitz in S. E. Silesia along the Oder to lat. 52° N., then a little to the north of that parallel through the Prussian provinces of Brandenburg and Saxony into Hanover.—Each of the seas by which Germany is bounded on the north has a peculiar coast configuration. While the coast of the North sea or German ocean is largely indented by deep bays (Dollart and Jade bays) or wide embouchures (Weser and Elbe), and its "marshes" are the richest and most fertile soil in all Germany, the shores of the Baltic form many extensive lagoons (Haffs), and are generally uninviting and sterile. The advantages which the formation of the shores of the North sea would seem to offer for the development of the maritime interests of Germany, are to a great extent neutralized by the fact that a series of sand banks, called Watten, stretch nearly all along the coast. Besides this, the island which commands the entrance of all German ports on the North sea (Helgoland) has been ceded to Great Britain.—Germany is intersected by many rivers. The principal river systems are those of the Danube, Rhine, Weser, Elbe, and Oder. The Danube, flowing from W. to E., has within the empire a length of 400 m. Its principal tributaries in Germany are: on the left or N. bank, the Altmühl, Nab, and Regen; on the right bank, the Iller, Lech, Isar, and Inn. The North sea receives the river systems of the Rhine (469 m. within Germany), the Ems (about 200 m. long), the Weser (400 m. inclusive of the Werra), and the Elbe (500 m. within the empire). The principal tributaries of the Rhine are the Ill, Nahe, and Moselle, on the left bank; the Kinzig, Murg, Neckar, Main, Tauber, Lahn, Sieg, Wipper, Ruhr, and Lippe, on the right. The Weser is formed by the confluence of the Werra and Fulda, and receives only a few tributaries (Werra, Ane, and Hunte on the left, Aller and Leine, Ocker, Wanne, and Geest on the right). The Elbe has next to the Danube, the largest river system. Its affluents in the empire are the Mulde, Saale, Jetze, Ilmenau, Schöne, and Oste, on the left bank; the Black Elster, Havel and Spree, Stecknitz, Elbe, and Stör on the right bank. Two thirds of the territory drained by rivers which flow into the Baltic sea belongs to the system of the Oder (about 500 m. within the empire), and its numerous tributaries, the Neisse, Weistritz, Katzbach, Bober, Ucker, and Peene on the left, the Klodnitz, Malapan, Weide, Bartsch, Warthe, Plöne, and Ihna on the right. Of the small river systems the following may be mentioned: the Eider (boundary between Schleswig and Holstein), about 105 m. long; the Pomeranian rivers Rega, Persante, Wipper, Stolpe, Lupow, and Leda; and the Vistula, which in Germany has a length of about 150 m. A number of canals connect several of the large river systems, but only a few of them can compare with the American canals. The most important is the Ludwig's canal, connecting the Danube with the Main (and through this with the Rhine), thus furnishing uninterrupted naviga-
tion from the North to the Black sea. The Rhône and Rhine canal connects the system of the two rivers by January the Doubs and the Ill. The Brenemudse canal connects the Oste and Schwinge, tributaries of the Elbe; the Kieler canal connects the North and Baltic seas by the Eider, and the Strecknitz canal furnishes an outlet from the Elbe into the Baltic by the Trave; by the Finow and Müllrose canal the systems of the Elbe and Oder are connected.—The number of lakes in Germany is large, but most of them are insignificant. The following deserve to be mentioned: the lake of Constance (Bodensee), the banks of which belong to five different states, Baden, Württemberg, Bavaria, Austria, and Switzerland; Ammer, Würm, Chiem, and Königs lakes, in Bavaria; Feder lake, Württemberg; lake of Steinhude (Steinhuder Meer), in Hanover and Lippe; Zwischenahner Meer, in Oldenburg; lake of Plön, in Holstein; lake of Ratzeburg, in Lauenburg and Mecklenburg; the lakes of Schwerin and Müritz, in Mecklenburg; Schwieloch and Scharmütz lakes, in Brandenburg; Damm and Plön, in Pomerania; Zarnowitz lake, in Pomerania and western Prussia; the Salt lake near Eiseleben, in the Prussian province of Saxony; and the lake of Lasch, in Rhenish Prussia.—The climate of Germany is temperate, and, considering the extent of the country, remarkably uniform, the greater heat of the lower latitudes being tempered by the greater elevation of the country and its Alpine character. On the great plain of northern Germany the districts exposed to the moist west and southwest winds have a more inclement climate than central Germany; while the southernmost districts, though drier, have less heat than more northern latitudes. The average decrease of the mean temperature, going from S. to N., is 1° F. in 58 m., and going from W. to E. 1° in 73 m.; measured by the vertical elevation, it is 1° in 256 ft. The mean annual temperature of Strausund (lat. 54° 18' N., lon. 18° 5' 28'' E.) is 46° 4'; the mean temperature in summer 68°, in winter 29° 8'. The mean annual temperature of the valley of the Rhine is 52°, of Thuringia 47° 6', of Silesia 47°, of all Germany 46° 8°. The extremes of temperature in the country N. of the Alps are 95° above and 81° below zero. In an average of 10 years the Rhine had been frozen over 26 days during each winter, the Weser 80 days, the Elbe 62 days, the Oder 70 days. The atmosphere is pure and wholesome, and unfavorable to the development of endemic or hereditary diseases, except in the high Alpine valleys, where scrofula prevails. Epidemics are generally less destructive in Germany than in the neighboring countries.—Of wild animals, the deer, hare, rabbit, fox, hamster (a kind of marmot peculiar to Germany), marten, badger, wessel, otter (rare), &c., are found nearly everywhere, stringent game laws preventing their destruction. A good breed of horses is raised in Mecklenburg, Holstein, and Hanover; cattle raising is a most important branch of husbandry in the N. W. part of Hanover, Frisia, and the Altenburg. Sheep are raised extensively in Saxony, Silesia, and Brandenburg; Saxony furnishes the finest quality of wool; goats, mules, and asses are reared principally in the mountainous districts of the south; hogs in all states, but chiefly in the west. Large birds of prey (the eagle and vulture) are rarely found beyond the Alpine districts; fowl of all kinds, wild and domestic, are plentiful in all parts of the country. Germany has only a few species of amphibias; there are only two venomous kinds of snakes, vipera berus and v. cerastes. Carp and pike are numerous in nearly all rivers and ponds, the salmon only in the larger rivers; sturgeon, cod, and sheatfish in the Elbe, trout in all mountain streams; herring and sardines in the Baltic and North sea. Oysters of good quality are obtained near the shores of Schleswig-Holstein, and pearl mussels in some rivers of the interior. The silkworm is not raised extensively.—Germany is rich in mineral products, and mining has employed there a great number of persons from the remotest times. Gold is found only in a few places in limited quantities (in the Hartz mountains and in the kingdom of Saxony); silver abounds in the Hartz and in southern Westphalia; iron is found in large quantities in nearly all the mountain ranges, the best qualities being those worked in Westphalia, Alsace-Lorraine, and Rhenish Prussia; excellent tin abounds in the Erzgebirge; lead in Saxony and upper Silesia; calsomine and zinc in Silesia; cobalt in Saxony. Salt is obtained in quantities more than sufficient for domestic consumption in all the states except Saxony and Anhalt. The production of coal has been enormously increased within the last 40 years. The most extensive coal beds occur in Rhenish Prussia, Westphalia, upper Silesia, Saxony, and Anhalt. The N. W. districts have instead an abundant supply of peat. Sulphur, salt petre, alum, vitriol, gypsum, chalk, ocher, emery, porcelain clay, graphite, marble, alabaster, and amber (on the shores of the Baltic) are found in different districts. Precious stones are comparatively scarce. Of mineral springs Germany has a great number, and several of them (Fyrmont, Ens, Wiesenbaden, Selten, Homburg, Baden-Baden, Kissingen, Schwabach, Salzbrunn, Warmbrunn, &c.) enjoy a world-wide reputation.—The soil on the whole is only of moderate fertility. Many tracts are exuberantly productive, but many others are almost as barren and sterile as the Russian steppes. The most fertile tracts of land in Germany and in Europe are the marshes on the shore of the North sea. Scientific agriculture has improved the natural condition of the soil in a high degree. All kinds of grain and fruit belonging to the temperate zone are raised: rye, barley, oats, potatoes, peas, and beans, everywhere;
MAIZE PRINCIPALLY IN THE SOUTH; WHEAT IN THE SOUTH AND WEST; BUCKWHEAT IN THE NORTH; MILLET IN THE SOUTHEAST; RAPSSEED, POPPY, AUNICE, AND CUMIN IN THE CENTRAL AND NORTHWEST DISTRICTS. THE LARGEST GRAIN FIELDS ARE IN WURTENBERG, THE SMALLEST IN MECKLENBURG. BAVARIA, WURTENBERG, Saxe-Altenburg, MECKLENBURG, HOLSTEIN, ETC., PRODUCE A LARGE QUANTITY OF BREADSTUFFS THAN IS REQUIRED FOR HOME CONSUMPTION, WHILE SAXONY AND SILESIA OF THE SAXON DUCHIES IMPORT BREADSTUFFS. FLAX AND HEMP, MADDER, WOOD, AND SAFFRON ARE CULTIVATED MORE IN THE SOUTH AND CENTRAL REGION THAN IN THE NORTH. TOBACCO IS EXTENSIVELY RAISED (EVEN FOR EXPORTATION TO OTHER TOBACCO-GROWING COUNTRIES) ON THE UPPER RHINE, THE WERRA AND ODER, AND IN BRANDENBURG. EXCELLENT HOPS ARE FURNISHED BY BAVARIA AND BRUNSWICK. BEETS ARE RAISED IN ENORMOUS QUANTITIES FOR THE MANUFACTURE OF SUGAR, AND THEIR CULTIVATION HAS ALMOST ENTIRELY SUPERSeded THE GRAIN CULTURE IN THE PRUSSIAN PROVINCE OF SAXONY, ANHALT, HESSE-DARMSTADT, AND S. BAVARIA. CHICORY, AS A SUBSTITUTE FOR COFFEE, IS RAISED IN THE COUNTRY BETWEEN THE ELBE AND WESER RIVERS. IN GARDEN CULTURE WURTENBERG, BAVARIA, HESSE, AND THE SAXON DUCHIES HOLD THE HIGHER RANK. THE FRUIT RAISED ON THE BANKS OF THE RHINE AND NECKAR, IN SAXONY AND N. W. BAVARIA, IS OF THE VERY BEST QUALITY TO BE FOUND ANYWHERE. PEACHES AND FIGS ARE RAISED IN LOCALITIES PROTECTED FROM THE COLD. THE APPLES OF SAXONY ARE THE CHOICEST KIND, AND ARE EXPORTED TO RUSSIA IN LARGE QUANTITIES. MARRON CHESTNUTS, ALMONDS, ETC., ARE RAISED IN THE S. W. STATES. GREAT ATTENTION IS PAID TO THE IMPROVEMENT OF FRUIT. IN ALL THE STATES THERE ARE POMOLOGICAL SOCIETIES, WHICH FROM TIME TO TIME HOLD NATIONAL CONVENTIONS. THE CULTURE OF THE VINE EXTENDS TO LAT. 51° 30'. (SEE GERMANY, WINE OF.)

—The three free cities excepted, the greatest density of population prevails in the principalities of RESSN. ELDER LINE (473 TO THE SQUARE MILE), THE KINGDOM OF SAXONY (443), THE GRAND DUCHY OF HESSE (288), AND THE DUCHY OF Saxe-Altenburg (286). IN THE FOLLOWING STATES IT EXCEEDS THE AVERAGE: WURTENBERG, BADEN, BRUNSWICK, Saxe-Oberburg-Gotha, SCHWARZBURG, RESSN. YOUNGER LINE, LIPPE, ANHALT, AND Saxe-Weimar. IN PRUSSIA IT IS 184, IN BAVARIA 186. THE NUMBER OF LARGE CITIES, PROPORTIONATELY TO THE POPULATION, IS GREATER IN GERMANY THAN IN ANY OTHER COUNTRY EXCEPT GREAT BRITAIN, BELGIUM, AND HOLLAND. THERE IS ONE CITY WITH MORE THAN 800,000 INHABITANTS (BERLIN), TWO WITH MORE THAN 200,000 (HAMBURG AND BREISLAN), SEVEN WITH MORE THAN 100,000 (DRESDEN, MUNCHEN, COLOGNE, MAGDEBURG, KÖNIGSBURG, LEIPSIC, AND HANOVER), 22 WITH MORE THAN 30,000, 50 WITH FROM 20,000 TO 30,000, AND 50 WITH FROM 10,000 TO 20,000. MORE THAN NINE TENTHS (92 PER CENT.) OF THE POPULATION OF GERMANY BELONG TO THE GERMAN RACE; THE REMAINDER, BELONGING PRINCIPALLY TO THE SLAVIC RACE, IS MAINLY CONFINED TO THE EASTERN PRUSSIAN PROVINCES. THE ENTIRE NUMBER OF SLAVS IN GERMANY IS ABOUT 2,640,000 (2,480,000 POLES, 140,000 WENDS, 50,000 CZECHS), OR 6% PER CENT., OF WHICH NUMBER ONLY ABOUT 50,000 ARE OUTSIDE OF PRUSSIA. IN THE LATTER COUNTRY THERE ARE ALSO ABOUT 160,000 LITHUANIANS AND LETTS. THE DANES, IN SCHLESWIG, NUMBER ABOUT 160,000, AND THE FRENCH, CHIEFLY IN LORRAINE, 280,000. EXCEPT IRELAND, NO COUNTRY OF EUROPE HAS LOST SO LARGE A NUMBER OF INHABITANTS BY EMIGRATION AS GERMANY. FROM 1819 TO 1855 THE AGGREGATE NUMBER OF GERMAN EMIGRANTS WAS ESTIMATED AT 1,800,000. THE NUMBER OF GERMAN IMMIGRANTS INTO THE UNITED STATES FROM 1820 TO 1872 AMOUNTED TO 2,580,000. THE GERMANS ARE USUALLY CLASSIFIED INTO LOW GERMANS AND HIGH GERMANS, OR NORTH-ERNERS AND SOUTHERNERS. THE DIVIDING LINE MAY BE DRIVEN FROM LAT. 50° 30' IN WESTERN GERMANY TO LAT. 52° 30' ON THE EASTERN FRONTIER, OR ALONG THE COURSE OF THE SIEG (A TRIBUTARY OF THE RHINE) TO THE SOUTHERN SLOPE OF THE HERTZ MOUNTAINS, CROSSING THE ELBE NEAR ITS CONFLUENCE WITH THE SAALE, THEN TO THE NORTHWARD ALONG THE SOUTHERN BANKS OF THE HAVEL AND OF THE WARTHE. IN PHYSICAL DEVELOPMENT THE GERMANS ARE SUPERIOR TO EITHER THE LATIN OR THE SLAVIC RACE. THEIR FRAME AND THEIR MUSCULAR DEVELOPMENT ARE STRONG, ALMOST HEAVY. AMONG THE LOWER CLASSES OF THE RURAL AND LABORING POPULATION STOUTNESS AND STRENGTH OFEN APPROACH TO CLUMSINESS. GENERALLY THE NORTH-ERNERS ARE TALLER AND HAVE BETTER-SHAPED FEATURES AND LIMBS THAN THE SOUTHERNERS. THE BLONDE COMPLEXION PREVAILS ONLY IN THE NORTH; IN CENTRAL AND SOUTHERN GERMANY LIGHT OR DARK BROWN IS MORE FREQUENTLY FOUND. IN POWER OF ENDURANCE THE GERMANS ARE SURPASSED BY THE SLAVIC RACE, IN AGILITY BY THE LATIN. THE EMINENT FEATURES OF THE GERMAN NATIONAL CHARACTER ARE HONESTY, FAITHFULNESS, VALOR, THOUGHTFULNESS, PERSERVANCE, AND INDUSTRY. THE GERMANS HAVE LARGELY PROMOTED THE PROGRESS OF HUMAN KNOWLEDGE. THERE IS SCARCELY A SINGLE BRANCH OF SCIENCE IN WHICH THEY HAVE NOT EXCELLED. IN MUSIC, PAINTING, AND SCULPTURE THEY OCCUPY A HIGH RANK AMONG NATIONS. THE GERMAN ARTISAN IS VALUED FOR HIS DETERMINATION AND STEADINESS. THE SECTIONAL AND LOCAL VARIETIES OF CHARACTER ARE VERY GREAT IN GERMANY. WHILE THE PROTESTANT NORTH-ERNERS HAVE MANY CHARACTERISTICS IN COMMON WITH THE ANGLO-SAXON, THE CATHOLIC SOUTHERNERS APPROACH IN SOME IMPORTANT RESPECTS THE LATIN RACE, PARTICULARLY IN A CERTAIN PREPONDERANCE OF IMAGINATION OVER REASON. THE LOW GERMAN ASIMILATES FAR MORE READILY TO THE ENGLISH OR AMERICAN THAN TO THE AUSTRIAN OR SWABIAN. THE CULTURE OF THE SOIL IN GERMANY IS HIGHLY DEVELOPED, AND INFERIOR ONLY TO THAT OF ENGLAND. THE PRODUCTS OF AGRICULTURE HAVE BEEN NEARLY DOUBLED BY THE INTRODUCTION OF MORE RATIONAL METHODS OF CULTIVATION SINCE 1816. ALL GERMAN STATES HAVE AGRICULTURAL COLLEGES, SOME OF WHICH ENJOY A WORLD-WIDE REPUTATION. THE METHODS OF CULTIVATION ARE DIFFERENT IN DIFFERENT PORTIONS OF THE COUNTRY. THE TRIENNIAL AND QUADRUENNIAL ROTATIONS OF CROPS ARE MOST IN USE. ACCORDING TO THE FIRST METHOD,
winter grain is raised in the first year, spring grain in the second, and potatoes, pulse, or fodder in the third year; according to the second method, recommended by Thaer, a grain crop is always followed by a crop of fodder or pulse. In some of the northern states crops of grain are raised on a certain portion of the farm for several successive years, after which the field is allowed to lie fallow from three to seven years, according to the number of lots into which the farm is divided. In Mecklenburg agriculture approaches to horticulture, inasmuch as many different kinds of fruit are raised on little plots of ground, one by the side of another. The culture of forests is conducted upon a more scientific basis than in any other country. Having in former times thoughtlessly destroyed their forests, many German states have been compelled to replant them in order to satisfy the wants of agriculture and industry. In many states the forests mostly belong to government and are as carefully kept as gardens; but even private owners are prohibited by law from wasting their forests without regard to the public good. The most extensive forests are found in central and southern Germany and in the eastern provinces of Prussia. The entire superficies of wood land in Germany is 52,939 sq. m., of which Prussia has 51,423, Bavaria 9,376, and Württemberg about 2,296. Of all European countries, Germany has the oldest manufactures. In the last century it had fallen in regard to the extent of its mechanical pursuits behind England and Belgium, but within 50 years it has advanced rapidly, and is now in a fair way to recover its former position. As early as the 18th century Germany was celebrated for its cloths and linen manufactures, its glass wares, carved and chiseled wares, &c. In the 14th century the silk manufacture was introduced, and the first paper mill was established as early as 1390. During the 15th century Germany became celebrated for its watch manufacture. Printing works were established at Augsburg and the lace manufacture introduced into Saxony in the 16th century. At that time Germany was to Europe, in regard to industry and commerce, what England is now. The thirty years' war destroyed all prosperity for a long time. At the beginning of the 18th century German industry again flourished, principally in consequence of the immigration of the Huguenots expelled from France. Frederick II. of Prussia and Joseph II. of Austria strove to raise it to its former eminence, but the French revolutionary wars blighted it once more. Since then it has recovered the lost ground, principally by means of the Zollverein, a commercial union of German states, which was inaugurated in 1819 and gradually joined by the majority of the states. According to the constitution of 1871, the German empire constitutes one customs and commercial union, except a few small communes which on account of their situation remain excluded from the common line of customs, and the two Hanse towns, Hamburg and Bremen, which as free ports may remain outside of the union "until they themselves demand admittance." Besides the states of the empire, the Zollverein embraces the grand duchy of Luxemburg and the Austrian commune of Jungholtz on the southern frontier of Bavaria. By the Zollverein free commerce was established among all its members, while a high tariff protected their industry against foreign competition. The progress made by Germany under this system is truly remarkable. While 50 years ago it had become primarily an exporter of raw products of the soil, it is now one of the principal exporters of industrial products and importers of raw materials. The centres of German industry are the kingdom of Saxony, Westphalia, Rhenish Prussia, and Alsace-Lorraine. The linen manufacture stands highest in Saxony, Silesia, and Rhenish Prussia. The cotton industry of Germany has of late assumed very large dimensions. The number of spindles in Germany in 1869 was estimated at 5,000,000. The imports of cotton into the territory of the Zollverein were 2,271,000 cwt., of cotton yarn 318,384, and of cotton goods 28,700 cwt.; while on the other hand the exports of cotton were 988,397 cwt., of cotton yarn 66,861, and of cotton goods 198,562. How the woolen manufacture of Germany has been increased by the Zollverein may be seen from the fact that in 1825 Germany exported to England alone 280,000 cwt. of raw wool, while in 1869 the quantity of woolen yarn imported into Germany amounted to 800,000 cwt., and the quantity exported to 94,000, leaving not less than 206,000 cwt. as the net import of raw material. In the same year the quantity of woolen cloth exported amounted to 306,581 cwt. The German silk fabrics equal in quality the French and English, but are somewhat inferior in design. The principal silk manufactories are in Prussia (Berlin, Elberfeld, and Crefeld) and Saxony. The export of silk fabrics from Germany is nearly equal in amount to the domestic consumption. The paper manufacture has made considerable progress, although the finest qualities are still imported to some extent. In some fabrics of wood, as the choicest kinds of cabinet furniture, and all kinds of toys, Germany stands unequalled, and is a large exporter to all countries of the world. The iron manufacture has of late increased rapidly. The production of raw iron in the empire amounted in 1858 to 27,757,580 cwt. (21,066,199 in Prussia, 4,457,458 in Alsace-Lorraine, 961,382 in Bavaria), and in 1869 to about 38,000,000 cwt. The best iron and steel wares are manufactured in Rhenish Prussia and Saxony. The machine shops of Prussia, Saxony, Bavaria, and Baden rival, if they do not excel, the largest establishments of their kind in England. Other important branches of industry are gold and silver wares (Augsburg and Berlin), glass wares (Silesia), leather (Rhenish Prussia), por-
célain (Saxony and Berlin), mathematical and astronomical instruments (Munich and Berlin), clocks (Baden), &c. Bavaria is one of the most extensive branches of industry, especially in Bavaria. There were in the year 1870–71 in the empire (exclusive of Lorraine) 802 beet sugar manufacturing establishments (227 in Prussia, 85 in Anhalt, 25 in Brunswick, 5 each in the Thuringian states and Württemberg, 4 in Bavaria, 1 in Baden), which made 4,876,000 cwt. of sugar.—The foreign commerce of Germany is of great importance. The total value of imports in 1870 was estimated at $408,500,000, of exports at $346,600,000. The present customs law of the German empire bears date July 1, 1869; a new tariff was introduced on Oct. 1, 1870. All transit duties have been abolished; the duties on imports have been greatly reduced; of exports only rage are subject to a duty. The free towns, Hamburg, Bremen, and Lübeck, are the principal outlets of German commerce. Hamburg holds the third rank of all European ports, London and Liverpool only being superior. The income of the Zollverein in 1871 was $29,900,000. The merchant navy of Germany is larger than that of any other country except England and the United States. It numbered in December, 1871, 5,128 vessels (of which 179 were steamers), of an aggregate tonnage of 2,605,000. The number of vessels entering the German ports in 1871 was 68,155, of 5,735,000 tons; the number of vessels cleared 67,471, of 8,864,000 tons. The principal articles of export are wool, hops, grain, cattle, linen yarn, skins and hides, glassware, and antimony, to England; iron and steel wares, zinc, coal, lumber, hops, hemp, flax and seed, alcohol, and cattle, to France; grain, timber, coal, wine, leather, wool, metals, woollen and cotton fabrics, hosiery, hardware and china, and glass ware, to Holland; wool, wine, and salt, to Belgium; grain, salt, and brandy, to Switzerland; seeds, fruit, preserves, and sugar, to Sweden and Russia; linen and cotton goods, ribbons, and hosiery, to Italy, Spain, and Portugal; wine, cotton, woollen, linen, and silk goods, hardware, glassware, toys, &c., to America. The imports are, besides all kinds of raw material (cotton, pig iron, copper, and Hungary), cloth, lace, machines, the finer qualities of silk fabrics, jewellery, &c. The silver standard prevailed in Germany until the establishment of the empire, when the gold standard was adopted. The unit in the northern states was the Thaler (30 thalers to 1 Zollverein pound of silver, equal to 1.889 lb. avoirdupois); in the western the Golden Rheinischer florin (594 to 1 lb. of silver). The gold coins common to all Germany were the crown (50 to 1 lb. of fine gold) and the half crown; their value was regulated by commerce, and averaged about 9½ thalers ($0.59) the crown. These coins will be received at their old value until Jan. 1, 1875, when they will be superseded. According to the new law

for the uniformity of the coinage throughout the empire, published in 1873, the gold coins of the empire will be in future the twenty-mark (89½ to 1 lb. of fine gold), ten-mark, and five-mark; the silver coins, the five-mark (20 to 1 lb. of fine silver), two-mark, one-mark, 50 pfennige (200 to 1 lb. of fine silver), and 50 pfennige; the nickel coins, ten pfennige and five pfennige; the copper coins, two pfennige and one pfennige. The French metrical system of weights and measures has been adopted, and made compulsory from Jan. 1, 1872. The railways of Germany belong to the "Association of German Railway Companies," which was established in 1846, and also embraces various railways of the Austro-Hungarian monarchy and of the Netherlands. The aggregate length of the German railways in connection with the association which were in operation on Jan. 1, 1878, was 18,842 m., of which 8,459 m. belonged to Prussia, 1,910 to Bavaria, 787 to Württemberg, 689 to Baden, 708 to Hesse, and 518 to Alsace-Lorraine. The constitution of the empire obliges the particular governments to make the railways of their states a uniform part of the general German railway system, and authorizes the central government to build new roads even without the consent of the particular government, whenever the defence of Germany or the interests of the common traffic require it. The aggregate number of locomotives employed by the association in 1868 was 8,878; of tenders, 5,897. The total number of passengers carried was 117,000,000, and the aggregate earnings were $186,000,000. The administration of postal affairs and telegraphs (except those of Bavaria and Württemberg) also belongs to the central government; the surplus of receipts over expenditures flows into the imperial exchequer. The German-Austrian and Luxemburg postal union also embraces the Austro-Hungarian monarchy; the German-Austrian telegraph union, the Austro-Hungarian monarchy, and the Netherlands. The aggregate length of the telegraph lines of the empire (inclusive of Bavaria and Württemberg) in 1871 was 22,788 m.; that of telegraph wires, 79,918 m.; the number of stations, 8,726; the number of post offices, 6,892. Regular steamboat lines are established on the Rhine (since 1827), Danube (1838), Elbe, Oder, Vistula, Main, and Moselle. There are two transatlantic lines of steamers from Hamburg, one from Bremen, and one from Stettin. Politically Germany is divided into 26 states, 25 of which have a monarchical and three a republican form of government. The constitution of one (Alsace-Lorraine) was in 1876 not yet decided. The kingdom of Prussia embraces about two thirds of the area of Germany, and a majority of the population (24,600,000 out of 41,000,000). Besides Prussia there are three kingdoms, Bavaria, Saxony, and Württemberg; six grand duchies, Baden, Hesse-Darmstadt, Mecklenburg-Schwerin, Mecklenburg-Strelitz, Saxe-Weimar, and Oldenburg;
five duchies, Brunswick, Saxe-Meiningen, Saxe-Coburg-Gotha, Saxe-Altenburg, and Anhalt; seven principalities, Schwarzburg-Sondershausen, Schwarzburg-Rudolstadt, Lippe-Detmold, Schaumburg-Lippe, Waldeck, Reuss senior, and Reuss junior; three free cities, Lübeck, Bremen, and Hamburg; and the imperial territory of Alsace-Lorraine. The constitution of the German empire bears date April 16, 1871. At the head of the empire is the king of Prussia, who has the title of "German Emperor." The emperor represents the empire internationally, declares war, concludes peace, and enters into alliance and treaties with foreign powers. For a declaration of war the consent of the federal council is required, unless an attack has been made upon German territory. The emperor is the commander-in-chief of the imperial army and navy. He convokes, opens, adjourns, and closes the federal council and the Reichstag, but the former must be convoked whenever two thirds of its members demand it. The emperor promulgates the laws and superintends their execution. The legislative functions are vested in the federal council (Bundesrat) and the Reichstag. The members of the former are appointed by the governments of the states. It consisted in 1878 of 88 members: 17 for Prussia, 6 for Bavaria, 4 for Württemberg, 4 for Saxony, 8 for Baden, 3 for Hesse, 2 for Mecklenburg-Schwerin, 2 for Brunswick, and 1 for each of the others except Alsace-Lorraine. It has, according to the constitution, eight standing committees: 1, for the army and fortresses; 2, for the navy; 3, for tariff, excise, and taxes; 4, for trade and commerce; 5, for railways, posts, and telegraphs; 6, for civil and criminal law; 7, for financial accounts; 8, for foreign affairs. Since the annexation of Alsace-Lorraine, a 9th committee for that territory has been added. The committee for foreign affairs consists of the representatives of Bavaria, Saxony, and Württemberg, and those of two other states who are annually elected by the federal council, under the presidency of Bavaria. The emperor appoints the committees for the army and navy, except one member in the committee for the army, who is appointed by Bavaria; all the other committees are elected by the federal council. The Reichstag is elected by universal direct suffrage and by ballot, at the average rate of one deputy for every 100,000 inhabitants. It consisted in 1878 of 882 members: 288 for Prussia, 48 for Bavaria, 38 for Saxony, 17 for Württemberg, 14 for Baden, 9 for Hesse, 6 for Mecklenburg-Schwerin, 5 each for Oldenburg, Saxe-Weimar, Brunswick, and Hamburg, 3 each for Saxe-Meiningen, Anhalt, and Saxe-Coburg-Gotha, and 1 for each of the other states. The legislative period is three years. The Reichstag can be dissolved by a resolution of the federal council with the consent of the emperor. In case of a dissolution, the new election must take place within 60 days, and the convocation of the new Reichstag within 90 days. The Reichstag cannot be adjourned without its own consent for a period exceeding 90 days, and not oftener than once during one session. It elects its president, vice presidents, and secretaries. Its members receive no pay or indemnity, are during the exercise of their functions free from responsibility, and enjoy the usual constitutional immunity. For an imperial law (Reichsgesetze) the agreement of the majority of the federal council and the Reichstag is requisite and sufficient. Such sections of the imperial constitution as provide for the rights of particular states can only be changed with the consent of the state concerned. States which fail to fulfill their federal duties can be coerced by means of an "execution," which is ordered by the federal council and carried out by the emperor. Disputes between states are decided by the federal council. The revenue and expenditures of the empire must annually be estimated and presented in the imperial budget. The expenditures of the empire are first met by the surplus of previous years, and by the income arising from customs, from the common branches of exchequer, and from the administration of postal affairs and telegraphs. If these revenues are insufficient, the balance is raised, as long as no imperial taxes are imposed, by contributions from the several states. The distribution is made by the imperial chancellor, who has annually to give an account of it to the federal council and the Reichstag. In the budget for 1878, the ordinary expenditures were estimated at $79,580,000, and the extraordinary at $5,900,000. The direct revenue was estimated at $70,000,000, leaving a balance of about $15,000,000 to be distributed among the states. The public debt on April 8, 1878, amounted to only $1,294,000, which was soon to be paid off.—The military system of the empire is the same which has for many years been in operation in Prussia. Every German capable of bearing arms must serve for three years in the standing army, for four years in the reserve, and for five years in the landwehr. No substitution is allowed. The emperor is the commander of the entire German army in time of war, and, with the exception of the Bavarian troops, also in time of peace. All the German troops are bound to obey unconditionally the orders of the emperor; the Bavarian troops have this duty only in time of war. The emperor appoints (except in the Bavarian army) all the higher officers, orders the erection of fortresses in any part of the empire (in Bavaria and Württemberg with certain reservations), and in case of threatened disturbance of order can declare any country or district in a state of siege. The army of the empire is made up of the following contingents: 1, the army of Prussia, with which, in virtue of special military conventions, the troops of Oldenburg, Schwarzburg-Sondershausen, Lippe, Schaumburg-Lippe, Waldeck, Lübeck, Bremen, and Hamburg have been incorporated; 2, the contingents of Baden,
GERMANY

Hesse, Saxe-Weimar, the three Saxon duchies, Schwurzburg-Rudolstadt, and the two principalities of Reuss and that of Anhalt, the troops of which states are likewise by special conventions most closely united with the Prussian army, and have all their officers appointed by the emperor; 3, the contingents of the two grand duchies of Mecklenburg; whose officers are likewise appointed by the emperor; 4, the contingent of Brunswick; 5, the contingent of Saxony, forming a separate army corps; 6, the contingent of Wurtemberg, one corps; 7, the contingent of Bavaria, two corps. In time of war several corps are formed into an army, each army embracing from two to four corps. The army corps, both in peace and war, is subdivided into divisions, brigades, regiments, and battalions. In 1875 the army on the peace footing embraced 17,086 officers and 401,656 men in four regiments of field artillery, 19 battalions of foot artillery, 19 battalions of engineers, 18 battalions of train, and 268 battalions in depots of landwehr. On the war footing the army numbered 31,006 officers and 877,636 rank and file, of whom 877,456 were field troops with siege train, 245,793 reserve troops, and 354,247 garrisons. The fleet of war of the empire consisted of 42 steamers (of which 5 were ironclads), of 45,070 horse power and carrying 277 guns, and 5 sailing vessels, with 94 guns; 8 additional steamers were in course of construction. The navy was manned by 6,840 seamen and boys, and officered by 1 admiral, 1 vice admiral, 3 rear admirals, 24 captains, and 297 lieutenants. Germany has four ports of war, Kiel, Danzig, and Stralsund on the Baltic, and Wilhelmshaven in the bay of Jutland on the North sea.—Protestantism is professed by 62.3 per cent. of the population, Roman Catholicism by 36.2. The Protestants of the state churches, who are divided into Lutherans and German Reformed church, or united under the name of Evangelical church, in 1871 numbered 25,581,709; the free Protestant churches, as the Baptists, Methodists, Moravians, Free congregations, Irvingites, &c., number 114,000. In Prussia, the Protestants constitute 65 per cent. of the total population; in Alsace-Lorraine, 17%; in Bavaria, 27%; in Baden, 38%; in Württemberg and Hesse, 68%; in Oldenburg, 76%; in Hamburg, 91%; in all the other states, from 96 to 99. The Catholics have thus a majority in only three states, Bavaria, Baden, and Alsace-Lorraine. Of the German princes two, the kings of Bavaria and Saxony, are Catholics. The number of Old Catholics was estimated in 1873 at 55,000. The Jews number 499,000, or about 1.2 per cent.; they are most numerous in Hamburg, where they constitute 4.4 per cent.; they are 3.1 per cent. in Hesse, 2.7 in Alsace-Lorraine, 1.8 in Baden, 1.3 in Prussia, from 1 to 1.3 in Bavaria, Lippe, Waldeck, Anhalt, Lübeck, and Schaumburg, and less than 1 per cent. in all the other states. The Protestant state churches in all the larger and most of the smaller states have now a synodal constitution; only in a few of the latter the government still clings to the consistorial constitution, in virtue of which the church is wholly ruled by consistories appointed by the state governments. There has been since 1846 a bond of union for all the states (inclusive of Austria) in the Evangelical church conferences, consisting of delegates of the several church governments, who meet biennially for the discussion of the common interests of the German Protestant churches. An agitation for the convocation of an imperial synod (Reichszyndod) has begun, and is gaining ground. The Roman Catholic church has five archbishops (Cologne, Posen, Munich, Bamberg, and Freiburg), 20 bishops, and three vicars apostolic. At the general meetings of the German bishops, the archbishop of Cologne presides. The Old Catholics in 1873 elected a missionary bishop for the German empire, who was recognized by the governments of Prussia, Baden, and Hesse as a bishop of the Catholic church.—There are 20 universities: Berlin, Bonn, Breslau, Erlangen, Freiburg, Giessen, Göttingen, Greifswald, Halle, Heidelberg, Jena, Kil, Königsberg, Leipzig, Marburg, Munich, Rostock, Strasbourg, Tübingen, and Würzburg. Each of these has the four faculties of theology, law, medicine, and philosophy. Breslau, Bonn, and Tübingen have two theological faculties, Catholic and Protestant; in Munich, Würzburg, and Freiburg, the theological faculty is Catholic, in all the others Protestant. Among the universities is sometimes also reckoned the academy of Münster, with two faculties, Catholic theology and philosophy. Munich, Würzburg, and Tübingen have each a faculty of political economy, and Tübingen one of natural sciences. Altogether the German universities in 1873 had 1,687 professors and 17,463 students. Germany has 10 polytechnic institutes, a number of theological schools, agricultural colleges, mining academies (Freiburg, Berlin, and Clausthal), and other special schools of every kind. There are 830 gymnasia, 14 Realsymnasi, 214 gymnasium and Latin schools, and 486 Realschulen and Bürger- schulen of a higher grade. Together, these secondary schools have 177,000 pupils. The number of normal schools is 190; of public primary schools, 58,000, with 5,900,000 pupils. On an average there are 150 pupils to every 1,000 inhabitants; this proportion is considerably exceeded in Brunswick, Anhalt, Oldenburg, Saxony, and the Thuringian states, but it is not reached in Mecklenburg and Bavaria. In all German states the attendance of all children at school for at least five years is made compulsory by law; and in some states, especially in central Germany and in Würtemberg, those who are unable to read and write are very rare exceptions. Nearly all the capital cities have large public libraries, museums of art, scientific
collections, &c. Anatomical and mineralogical museums, zoological and botanical gardens, observatories, &c., are connected with most of the universities. The number of associations of scholars in all the different sciences is very great. The fine arts are as carefully fostered as science. Not even Italy is in advance of Germany in musical composition, many of the greatest composers of modern times being Germans, as Handel, Gluck, Mozart, Haydn, Mendelssohn, Beethoven, Weber, Meyerbeer, and Richard Wagner. In the art of painting the members of the two principal German schools, of Munich (Corneilleus, Kaulbach, Piloti), and of Düsseldorf (Schadow, Lessing, Bendemann), rival the best artists of all times. In sculpture Rauch, Danneker, and Rietschel take rank with Thorwaldsen and Canova. German literature is exceedingly prolific, and contains a very great number of works of sterling merit. The number of new publications exceeded 9,000 annually from 1860 to 1868, and 10,000 from 1868 to 1873.—Of the earliest history of Germany no records remain. The Romans before the time of Julius Caesar knew little or nothing of the people living E. of the Rhine and N. of the Danube, though some German tribes had invaded the Roman empire toward the end of the 2d century B. C. At the time of the conquest of Gaul, the Romans learned that the country beyond the Rhine contained a numerous people, who, although barbarians according to the standard of civilization of that time, had fixed settlements and were agriculturists. They were called Germani, either, as Strabo asserts, because they were nearly related (brothers German) to the inhabitants of Gaul, or, which is more probable, from the weapons they carried (per, spear, staen, man). They were tall, light-haired, blue-eyed, warlike, and fond of independence, intoxicating liquors, and gambling, in which they often staked their personal liberty. Their chief occupations were hunting, care of cattle, and the use of arms. They were divided into noblest, freemen, and serfs. They paid peculiar respect to their women and the aged, and honored chastity not less than valor. They elected their chiefs, whom the Romans often call kings. They had priests, barbs, and sacred groves, and worshipped or feared gods, demigods, and giants. Woden and his wife Friga or Frigg, Ziu, and Fro, were among their chief divinities. They believed in the immortality of the soul, or in life in Walhalla. Their sacrifices consisted of domestic animals, including horses, and sometimes of human victims. They had no cities, but mostly lived in hamlets, or small communities, which held several species of property in common. They were divided into more than 50 tribes, of which the following principally (though not simultaneously) figure in the history of the Romans: the Teutons, Ubii, Chanci, Catti, Rugi, Batavi, Usipit or Uispetae, Tenceteri, Bruterner, Angrivari, Tribocci, Cheruscii, Longobardi, Suevi, Goths, Marcomanni, Hermunduri, Burgundians, Vandals, Gepidae, Franks, and Alemani. These tribes did not all live within the limits of the Germania proper of the Romans, which was bounded by the North sea and the Baltic, the upper Elbe, Danube, and Rhine. The districts S. of the Danube and W. of the Rhine, which became Roman provinces under the names of Rhedia, Vindecolana, and Noricum, and Germania Prima and Secunda (in Gaul), were mostly inhabited by non-German tribes, and often exposed to the incursions of the Germans. One of these incursions was headed by Ariovistus, who was driven from Gaul by Caesar, in the first year of his Gallic campaigns. Caesar and the generals of Augustus nominally subjected Germany; but when the Romans attempted to convert their nominal dominion into real possession of the country, they were ignominiously defeated, and Germany was liberated by the chief of the Cheruscan tribe, Arminius, A. D. 9. The subsequent expedition of Germanicus was of little avail. From that time the history of Germany is in part lost in vague traditions and in part connected with the history of the Roman empire for several centuries, until the country, over which the whole torrent of the great migration of nations had swept, became gradually united with the great Frankish empire of Clovis (481-511) and his successors. Among these Charlemagne, or Karl the Great (771-814), consolidated the empire by subjecting the Saxons, the last German tribes who had until then succeeded in maintaining their independence, and was in 800 proclaimed Roman emperor by the pope and the people of Rome. Charlemagne's rule extended from the Ebro in Spain to the Elbe in the northeast, the Rhine in the west, and beyond the Po in Italy. He compelled the Saxons to become Christians, and introduced among them a feudal aristocracy and a strong temporal power of the clergy. The contest between these and the imperial power fills the history of Germany for centuries. The feeble successor of Charlemagne was unable to keep the vast empire together. In 843 it was divided between his three sons, Italy falling to the share of Lothaire, France to Charles the Bald, and Germany to Louis. The German kingdom was at that time bounded W. by the Rhine, E. by the Elbe, the Saale, and the Bohemian Forest, and S. by the Danube. The sons of Louis subdivided Germany into three lesser kingdoms, but these were reunited by Charles the Fat, and for a brief time even France was once more joined to Germany (585-887). Arnulf, a nephew of Charles, was elected German king, and was succeeded (899) by his son Louis, surnamed the Child, with whom the Carolingian dynasty became extinct (911). Germany at that time consisted of a number of great territories (duchies), the rulers of which, together with their most powerful vassals, elected the king, whose power, however, depended very much upon the good will of the dukes. The Fran-
conian, Conrad I. (911–918), unsuccessfully endeavored to make his authority respected by the mighty Saxon duke Henry, and on his deathbed entrusted his subjects to elect the duke his successor. Henry I. (919–988) restored the empire by victories over the Danes, Slavs, and Magyars. His son Otho I. (988–973) extended the boundaries beyond the Elbe and Saale rivers, defeated the Magyars, who had invaded the country, so completely (955) that they never ventured to return, and conquered Lombardy. From that time the conquest of Italy became one of the principal aims of nearly all rulers of Germany. For many of them the barren honor of being crowned by the pope emperor of the Roman empire became the chief object of all their desires, to obtain which they allowed their power in Germany to be encroached upon more and more by the vassal princes. The Saxon dynasty ruled till 1034 (Otho II. 973–988, Otho III. 988–1002, Henry II. 1002–1024), and was succeeded by the Franconian, Conrad II. (1024–39), an energetic and well-meaning man, conquered Burgundy for the German empire. His son, Henry III. (1089–56), extended the German influence over the Slavio countries and Hungary, and succeeded for a time in maintaining the royal authority against all attacks of the aristocracy and hierarchy. But the youthful Henry IV., who succeeded to the throne in 1056, was unable to resist the power of the papacy, then at its zenith under Gregory VII., and was obliged to yield some of the most important prerogatives of the crown. His son, Henry V. (1106–25), was the last ruler of the Franconian dynasty. After the brief reign of Lothaire II., the dynasty of the Hohenstaufen (Swabians) succeeded to the throne, and gave to the country five sovereigns: Conrad III. (1138–52), Frederick I. (1152–90), Henry VI. (1190–97), Frederick II. (1215–50), and Conrad IV. (1268–54). Between Henry VI. and Frederick II., Philip of Swabia and Otho IV. of Brunswick reigned as rival kings, and after the death of Philip Otho alone. The reign of the Hohenstaufen dynasty represents the most glorious period of German history during the middle ages. Frederick I., surnamed Barbarossa (der Röthbart), still figures in the popular songs and traditions of Germany as the ideal emperor, the representative of German national power and splendor. To conquer Italy and to break the temporal power of the pope were the great objects of the emperors of this house. After a gigantic struggle, lasting nearly a century, they succumbed. From 1220 to 1278 anarchy prevailed in Germany. Several rival kings were elected (William of Holland, Richard of Cornwall, Alfonso of Castile, and Henry Raspe), but none of them obtained any authority. At last, in 1273, Count Rudolph of Hapsburg was elected king, and, by vigorously suppressing the feuds of the knights and barons, re-established at least the semblance of royal authority. At the same time he obtained for his family several important territories (Austria, Styria, Carinthia, Carniola, and Tyrol). After his death (1291) Adolph, count of Nassau, was elected king by the dukes, who were jealous of the growing power of the Hapsburgs; but Albert, Rudolph's son, wrested the crown from him. Under Albert's reign (1298–1308) the Swiss cantons declared their independence of Austria. His successors were Henry VII. of Luxemburg (1308–18), Louis IV. of Bavaria (1313–47), Charles IV. of Luxemburg (1347–78), who by a sort of written constitution (golden bull) defined and increased the power of the prince electors, Wenceslas or Wenzel (1378–1400), so miserable a ruler that it was found necessary to dismiss him, Rupert of the Palatinate (1400–10), and Sigismund, brother of Wenceslas. During the reign of the latter the attempt of Huss to reform the doctrines of the church was the principal event. Huss was burned at the stake (1415), at the council of Constance, the emperor having ignominiously broken his pledge to protect him during his stay at Constance. This treachery provoked the bloody war of the Hussites. After Sigismund's decease (1437), the royal or imperial crown of Germany (the title of Roman emperor having gradually supplanted that of German king) remained continuously with the Hapsburg family. The energetic and liberal Albert II. (1438–39) was succeeded by the inert and feeble Frederick III. (or IV., as Frederick the Fair, the rival of Louis the Bavarian, had borne the title of king as Frederick III.), who bore the royal title for more than half a century (1440–93). His son, Maximilian I. (1498–1519), a chivalrous man of noble impulses, but lacking perseverance, organized the empire more systematically than had ever been attempted, but was unsuccessful in his efforts to establish a national army. Under his reign the reformation of the church was begun by Luther (1517). Once more Germany became the ruling power of Europe under Charles V., grandson of Maximilian, who united the crowns of Spain, the Netherlands, Germany, and Naples, and vigorously opposed the efforts of France to obtain control of Italy. But even during his reign the germs of civil and political dissension contained in the reformation of the church began to be developed in Germany. A formidable insurrection of the peasants, who longed for civil as well as religious liberty, was quelled with difficulty by the princes under the sanction of Luther, who was only too ready to scout the idea of an amelioration of the political condition of the people. The Protestant princes of northern Germany leagued themselves against the imperial authority, and though Charles defeated them (1547) by the aid of Maurice of Saxony, he was compelled by his former ally to grant important privileges to the Lutheran church (1562). In the mean time the bishoprics of
Toul, Metz, and Verdun had been wrested from the German empire by France. Disgusted with the successes of his adversaries, Charles resigned the crown. He was succeeded by his brother Ferdinand I. (1566–84). The imperial authority was rapidly sinking to utter insignificance. France in the west and Turkey in the east were hovering on the borders of Germany, ready on every occasion to foster the internal dissensions of the empire and to conquer it from valuable possessions. The feeble Maximilian II. (1564–76), the visionary Rudolph II. (1576–1612), and his brother Matthias (1612–19), were unable to arrest the political decay. The thirty years' war (1618–48), which devastated and impoverished Germany, destroying all industry and commerce, left the imperial authority completely shattered, and Germany cut up into a multitude of petty states, whose rulers were absolute monarchs in fact, if not in name. The persecutions perpetrated by Ferdinand II. (1619–37) on his Protestant subjects almost equalled those of Philip II. of Spain. The peace of Westphalia (1648), concluded by Ferdinand III. (1637–57), tore Alsace from the German empire. Under the pedantic and feeble-minded Leopold I. (1658–1705) Germany took part in the coalition against the rising power of France, but, although successful in war, did not obtain any signal advantages by the peace. From that time the title of German emperor appeared only as an empty surname of the rulers of Austria (Joseph I., Charles VI., Francis I., the husband of Maria Theresa, whose enemy, Charles Albert of Bavaria, was also crowned as Charles VII., &c.). In fact, Germany was merely a maze of little despots, among which a few larger states were endeavoring to obtain a voice in the councils of Europe. Prussia (a kingdom since 1701), through the genius of Frederick the Great, established a great Protestant power, too to cope with Austria, but at the same time anxious to prevent the reconstruction of a great united empire. Thus the attempts of the emperor Joseph II. (1785–90, or rather 1780–90, when he reigned himself) to reestablish the imperial authority in southern Germany were baffled by Prussia. At last the tempest of the French revolution prostrated the tottering fabric of the German empire. Vanquished by the armies of France, the emperor Francis II., son and successor (1792) of Leopold II., ceded by the treaties of Campo Formio (1797) and Lunéville (1801) the country on the left bank of the Rhine. The petty rulers who lost their possessions in this way were indemnified with the territories of ecclesiastical princes. In 1806 several states seceded from the empire and became allies of France, and in 1809, in 1815, the number of German states formed the Rhinish confederation under the protectorate of Napoleon, the emperor Francis resigned the German crown, and the empire was formally dissolved. A number of the smaller territories were annexed to the larger states, and most of the free cities, which while under the nominal authority of the emperor had enjoyed a sort of republican government, lost their independence. The efforts of Prussia to compete with this confederation a North German league having been frustrated, nearly the whole of Germany, with the exception of Austria and Prussia, was reduced to a state of French vassalage. The terrors of the emperor Napoleon ruled the country with an iron rod, and if they removed many of the most glaring remnants of feudal despotism, they introduced in their stead all the abuses of an irresponsible military régime, and carried their exactions to a frightful extent. The sums drawn from Germany by Napoleon under the designation of contributions or subsidies must be counted by hundreds of millions. The independence of the country was reestablished by the coalition of Austria, Russia, Prussia, Sweden, and Great Britain (1815). A reconstruction of the old empire having been rendered impossible by the position which Prussia had assumed, a confederation was formed by all those states which had contrived to maintain their sovereignty during the Napoleonic troubles (June 8, 1815). Their number, which had exceeded 800 at the time of the dissolution of the empire, had then been reduced to less than 40, and a further reduction was made afterward by the extinction of several petty dynasties. The enthusiastic hope of the German people that Germany would once more appear as a powerful united nation was sorely disappointed. The diet, being only a permanent convention of the representatives of princes, all jealous of their individual sovereignty and unwilling to recognize the claims of the nation, became an abject tool of political oppression, and a harmonious cooperation of the states existed only in regard to repressive measures against all progressive movements. Whether the people of a single state endeavored to obtain free institutions, the diet found occasion to interfere in favor of absolute monarchical power. None of the promises contained in the act of confederation in regard to a general tariff legislation, a common currency and postal system, &c., were fulfilled. Whatever was attained in this respect was due to the efforts of single states. Thus the Prussian Zollverein united a large portion of the German states on the basis of common material interests, and, by the great advantages it secured to its members, kept alive the longings for a still more complete national union. The French revolution of 1830 found an echo in some of the smaller German states, whose rulers were compelled to grant written constitutions to their subjects. A vigorous political life began to be developed in the southwestern states. In the autumn of 1831 the Prussian throne of Frederick William IV. (1840), in northern Germany also the demands of the people became more distinctly defined, while in Austria all popular aspirations were suppressed by the despotic rule of Prince Met-
ternich. Immediately on the downfall of the Orleans dynasty in France (Feb. 24, 1848), insurrections broke out in all the German states. The princes, unable to resist these movements, hastened to yield to the popular demands. A national congress of representatives of the people (German parliament) was convoked by a provisional self-constituted assembly (Vorparlament), and met at Frankfort, May 18, 1848. It formed a provisional national government, consisting of a vicar of the empire (Reichskanzler) and a ministry. Archduke John of Austria was elected vicar, June 29; but in spite of his professions of zeal for national liberty and union, it soon became evident that his principal aim was the frustration of all energetic action on the part of the parliament. Disttracted by the troubles in Holstein, which Denmark endeavored to wrest entirely from its connection with the German confederation, the parliament made but slow progress in framing a national constitution. When at last the bill of rights had been agreed upon (December, 1848), the counter-revolution had already been victorious in Austria and Prussia, and it became apparent that these great powers would not submit to a constitution framed by the popular congress. Then a strong party began to advocate the exclusion of Austria from the new empire. This party, whose principal leader was Gagern, prevailed in the parliament, and elected the king of Prussia German emperor (March 28, 1849); but he declined the honor. Despairing of success, a number of members of parliament resigned their position, thus giving a majority to the democratic party, who elected a provisional regency of the empire, consisting of Raveaux, Vogt, Schröder, H. Simon, and Becher. Reduced to less than one third of its original number, the parliament adjourned to Stuttgart, May 30, 1849, and endeavored to raise a popular revolution in favor of the new national constitution. But only the people of Baden, a small part of Württemberg, and the Palatinate (Bavaria) followed the example of Saxony, which had already risen in revolution. The insurrection at Dresden had been suppressed after a sanguinary battle by Prussian soldiery; and the revolution in Baden, although successful for a few weeks, was likewise crushed in a brief campaign by the Prussian army (June). The rump parliament of Stuttgart had in the mean time been forcibly dissolved by the government of Württemberg. Having thus got rid of all revolutionary support, the Prussian government attempted to obtain the mastership of Germany on its own account. Austria, almost prostrated at the time by the Hungarian war, would have been able to offer little or no resistance to such a movement if carried on energetically and rapidly; but the Prussian government was no match for the bold and shrewd Prince Schwarzenberg, at that time the soul of the Austrian government. In March, 1850, Prussia assembled at Erfurt a new parliament of representatives of those petty states which were too powerless to resist its demands, and a sort of federal constitution was adopted by it, but never obtained any real existence. To cut short all further attempts of Prussia, Austria convoked the old diet, which had been formally dissolved in 1848. Prussia refusing to recognize the diet, a hostile conflict between Austria and Prussia seemed almost inevitable. The armies of both were marching to Hesse-Cassel, and a skirmish of the outposts had taken place near Bronzell (Nov. 8, 1850), when suddenly the Prussian government lost courage and submitted to all the demands of Austria. The first fruits of the restoration of the diet were the intervention in Schleswig-Holstein in favor of Denmark, the abolition of the national bill of rights and of free constitutions in several of the smaller states, and the sale by auction of the national navy which had been created by voluntary contributions of the people during the revolution. While in these questions the influence of Austria prevailed, Prussia balanced its loss of political power by the enlargement of its commercial influence. Hanover became a member of the Zollverein (September, 1851), and was soon followed by Oldenburg and Schaumburg-Lippe. The efforts of Austria to enter the Zollverein, in order to destroy the Prussian influence even there, were successfully resisted by Prussia, but a postal and telegraph union of all German states was accomplished. During the eastern war (1859-60) the German confederation followed a vacillating policy, swaying to and fro between Austria and Prussia. In April, 1854, those two powers concluded a treaty of alliance, guaranteeing to each other their respective possessions against all enemies whatsoever. The diet joined in this treaty July 24, and in December added another clause, promising the assistance of all Germany to Austria if its army of occupation in the Danubian principalities should be attacked. Preparation for war was resolved upon by the diet, Feb. 8, 1855. After that the position of Prussia toward Austria became more reserved, and Austria, despairing of active assistance on the part of the confederation, was compelled to relinquish its intention to take part in the war against Russia. In November, 1856, the diet adopted a resolution promising to assist Prussia in its attempts to reconquer Neuchâtel, but the proffered assistance was not required. In 1857 the interference of the diet was requested against the attempts of Denmark to merge the duchies of Holstein and Lauenburg completely in the Danish kingdom. After long hesitation and delay a resolution was adopted in 1858, by which the Danish government was compelled to submit its project of a new political organization to the legislative assemblies of the duchies. When, in the beginning of 1859, difficulties arose between France and Austria on account of the state of Italy, a violent anti-Napoleonic feeling
manifested itself in Germany. The Prussian government, though willing to defend Austria's German provinces, and even the Lomb of the Po, Veneziain kingdom under certain restrictions, would not stir unless it should obtain the military leadership of all Germany, irrespective of all limitations contained in the act of confederation. After long and angry discussions the leadership was conceded to Prussia by the smaller states. A circular despatch of the Russian government, covertly threatening Germany if it should interfere in the Italian war, had no effect but the assumption by Prussia of a more defiant attitude toward France, and the issue of an order by the prince regent to mobilize two thirds of the Prussian army (June, 1859). A few days later, the Prussian delegate in the diet moved that two federal army corps under the command of Bavaria be stationed on the upper Rhine, and one Prussian corps on the Main, and that the 9th and 10th federal army corps be united with the Prussian army. This motion was followed by another, to the effect that the diet should appoint a commander-in-chief of the non-Prussian and non-Austrian army corps. Thus the German confederation appeared to be on the very point of waging war against France, under Prussian leadership, when all at once Austria, unwilling to sacrifice its preponderating influence in Germany to the doubtful project of preserving its Italian provinces, introduced in the diet a resolution to mobilize the whole federal army, and to appoint the Prussian prince regent commander-in-chief, subject to the control of the diet, or rather of Austria, the latter being always certain of a majority in the diet. This movement at once neutralized all advantages Prussia had obtained. And when the preliminaries of peace were agreed upon by the emperors of France and Austria at Villafranca, July 11, the disension and jealousy between Austria and Prussia, those great impediments to German unity, were more apparent than ever before. A passage in the Austrian emperor's proclamation of peace, in which he asserted that his natural allies had forsaken him, and that the neutral powers would have imposed upon him less favorable terms of peace than were offered by his adversary, gave rise to an acrimonious correspondence between the Austrian and Prussian governments. The latter succeeded in proving that the assertion of the emperor had no foundation in fact, and that he had been purposely misled by false representations of the French ruler at the interview of Villafranca. This singular discovery did not render the feeling of Austria any more friendly toward Prussia. A paper war was carried on by the presses of southern and northern Germany, and while the governments of those petty states who had been the most forward in their hostile demonstrations against France were eagerly courting the favor of Napoleon III., the most sinister threats against Prussia came from Vienna, Munich, and Carlsruhe. The opinion became prevalent that, Austria having been humbled by France, if a war which had cost the life of the chief of the Rhine should be waged by France against Prussia, the latter would not obtain any assistance either from Austria or the smaller German states. The hostility of the two great sections of Germany manifested itself in sanguinary riots in the mixed Prussian and Austrian garrison of the federal capital (Aug. 6-8). Feeble movements were initiated by the liberal party to arrest the progress of disunion, and to prompt the Prussian government to take the lead in reforming the federal constitution. But Prussia, disheartened and unwilling openly to oppose the influence of Austria, declined the destiny which the liberal party pressed upon it, and would promise nothing more than the promotion of liberal institutions by the power of its example. Austria, on the other hand, made some show of concessions to the popular wishes, in order to divide the current of the sympathies of the popular party in Germany. A committee was appointed by the emperor (August) to draw up a constitution on the basis of provincial representation for the Austrian empire. At the same time another movement was initiated in Bavaria, the object of which was the creation of a separate confederation of the central German states, as a third great power within Germany. The same idea had been promoted by Bavaria in 1850, and then led to confusion and disunion. Notwithstanding the discouraging conduct of the Prussian government, the liberal party of Germany on Sept. 16 established a national association, the Nationalverein, to agitate and promote in all the particular states the conversion of the confederation (Staatenbund) into one compact federal state with a national representation (Bundestag), under the headship of Prussia. Prussia in no way expressed approval of this project, but it soon took occasion to oppose in the federal diet the policy of Austria and its allies. It moved on Oct. 10 that the liberal constitution of Hesse-Cassel of 1881, which in 1862 had been abolished by the elector in an illegal way, be restored. The legislature of Hesse-Cassel fully approved of this proposition, but in the federal diet the Austrian influence led to its rejection. In May, 1860, the motion of Prussia for a reform of the military constitution of the German confederation was likewise rejected. The dissatisfaction which this attitude of Austria caused among the liberals of the central and southern states was somewhat mitigated by the publication of the new fundamental law in Austria, on Oct. 20, 1860, which appeared as a concession to constitutional principles. Prussia, on the other hand, greatly offended the liberals by the ultra-conservative principles professed by King William I., who on Jan. 2, 1861, succeeded his brother Frederick William IV. In December the Saxon minister Von Brent, one of the most ardent champions of greater national unity,
presented to Prussia a new project of the federal constitution, according to which a representation of the German nation at the federal diet was to be created by the establishment of an assembly of delegates chosen by the diets of the several states. Austria declared its readiness to accept this project, which gave to Austria and Prussia an equal number of delegates, if she should be allowed to enter the confederation with her entire territory. Prussia in a note of Dec. 20 declared it to be impracticable, and instead advocated the establishment of a federal state, on the plan which had been tried ten years before. This idea was promptly rejected by all the middle states in February, 1863, on the ground that it would involve the loss of their sovereignty. In August they united with Austria in submitting another plan of reform, according to which an assembly of delegates of the several German diets was to be convoked at Frankfort for the special purpose of deliberating on some reforms in the civil and commercial legislation of the German states. An assembly of liberal German deputies, held in September at Weimar, declared against this plan as wholly unsatisfactory, while on the other hand it was approved by the new national reform association (Reformverein), which in October was organized at Frankfort as the organ of those who unconditionally opposed the exclusion of Austria from Germany and the establishment of a Prussian leadership. In the federal diet, in January, 1863, it was defeated by a small majority. In the mean while the incessant conflicts between the Prussian liberals and their ultra-reactionary government had led, in September, to the entrance into the ministry of Otto von Bismarck, who soon after became its president and minister of foreign affairs. The uncompromising firmness with which he opposed the views of the Prussian diet on a reduction of the military budget filled even the Prussian friends of national unity with despair. Little was known of the ultimate plans of Bismarck with regard to German unity; but it was apparent that Prussia desired to be emancipated from the federal diet, and that her plans would henceforth be pushed with greater energy than at any previous time. The union movement was steadily gaining among the German people, and Austria made a bold bid for the continued headship in a reconstructed Germany. Francis Joseph invited the princes of all the German states, as well as the ruling burgomasters of the free cities, to a diet of princes (Fürsten-tag), to discuss the question of a new constitution. This assembly sat at Frankfort Aug. 17 to Sept. 1. The king of Prussia declined to attend it. The great majority of princes assented to the project of the emperor of Austria, according to which a directory of five princes (Austria, Prussia, Bavaria, and two others) was to be at the head of the nation, assisted by a federal council and a federal assembly of 600 members, which was to meet every third year.

Although Prussia was to have an equal number of deputies in the federal assembly, the presidency in the directory and federal council was to remain with Austria. The reform association declared for accepting the new constitution as a step in advance; while all the liberal parties of Germany decidedly rejected it. Soon a foreign complication turned the attention of all parties from the conflict of their schemes of reconstruction to a common defence of the German nationality. Frederick VII. of Denmark, in union with the predominant party of the country, had issued in March, 1863, a patent separating the duchy of Holstein from the common Danish monarchy, in order to unite Schleswig with Holstein from the common Danish monarchy, in order to unite Schleswig with Holstein under one constitution with Denmark proper. The federal diet summoned the Danish government to repeal the patent, as it encroached upon the right of Holstein, and thus of Germany, and threatened, in case of refusal, a "federal execution." On Nov. 15 Frederick VII. died, and was succeeded, according to the stipulation of the London conference of 1852, by Christian IX., who on Nov. 18 proclaimed the incorporation of Schleswig with Denmark. But as the federal diet had never recognized the London conference, the people of the duchies, as well as a number of the smaller German states, recognized Prince Frederick of Augustenburg as duke of Schleswig-Holstein. Public opinion throughout Germany strongly sympathized with this view, but Austria and Prussia decided to stand by the stipulations of 1851 and 1852, and insisted on carrying out the federal execution. The federal diet on Dec. 7, by 8 votes against 7, acceded to their demand and intrusted the execution to Hanover and Saxony. The German troops entered Holstein on Dec. 28, and the Danes withdrew without offering resistance. Prussia and Austria on Dec. 28 moved in the federal diet the occupation of Schleswig, in order to enforce the repeal of the law of Nov. 18. The motion was rejected, because the majority believed the question of succession would be prejudged by its adoption. In defiance of this resolution, Austria and Prussia declared that they would now act in the matter, not as members of the confederation, but as great powers of Europe, and at once (February, 1864) marched their troops into Schleswig. On Feb. 5 the Danes evacuated the strong Dannevirke, and withdrew behind the intrenchments of Dippel, which were stormed by the Prussians on April 18. A peace conference of representatives of the great powers, which met in London on April 26, remained without result. The Danes evacuated Jutland and confined themselves to the islands; but when the Prussians on June 29 occupied Alsen, they gave up all further resistance, and in the preliminary peace concluded in July ceded Schleswig, Holstein, and Lauenburg to Austria and Prussia. The cession, which was confirmed in the definitive peace of Vienna,
Oct. 30, was based entirely on the right of conquest, the question of the lawful succession in the duchies and the claims of the federal diet being ignored. When Prussia after the conclusion of peace called upon Hanover and Saxony to withdraw their troops from Holstein, Saxony showed some intention to resist by force. A collision was averted by a resolution of the federal diet, which in accordance with the demand of Austria and Prussia declared the execution to be ended. The disagreement between Austria and Prussia now began to widen. Austria desired to have the administration of the duchies transferred to Prince Frederick of Augustenburg; Bismarck entered into negotiations concerning the annexation of the duchies to Prussia. The federal diet took an unavailing interest in the cause of Prince Frederick, and finally confined itself to a protest against the illegal solution of the Schleswig-Holstein question, while the crown jurists of Prussia undertook to prove that Christian IX. of Denmark was the lawful duke of Schleswig-Holstein, which therefore, in virtue of the peace of Vienna, belonged to Austria and Prussia. A better understanding between Austria and Prussia appeared to be established when the latter power, in April, 1866, concluded a commercial treaty with the Zollverein. On Aug. 14 the Gastein convention gave Austria the exclusive occupation of Holstein, to Prussia that of Schleswig, and annexed Lauenburg to Prussia. The resolution of another general assembly of deputies of all the German states, which was held at Frankfort in October, and which demanded the convocation of the diet of Schleswig-Holstein, was entirely disregarded by the two great powers. Soon a new difficulty sprang up between Austria and Prussia. The permission given by the Austrian governor of Holstein, Gen. von Gablenz, to hold an anti-Prussian meeting at Altona, Jan. 23, 1866, led to a very angry exchange of diplomatic notes. Austria warned the other states against the ambitious schemes of Prussia in a circular note of March 16, and began to arm. As the states of the second rank did not conceal their entire sympathy with Austria, Prussia in April strengthened her position by an alliance with Italy, and also began to arm. At the same time Prussia made a bid for the sympathy of the masses of the people in the smaller states by moving in the federal diet, on April 9, the convocation of a general national assembly, to be elected by direct and universal suffrage. An understanding arrived at between Prussia and Austria to begin the disarmament on April 26 and 28 failed, as Austria refused to withdraw her army from the Italian frontiers. A peace congress, proposed by England, France, and Russia, likewise failed, because Austria demanded the exclusion of all negotiations concerning the extension of the territory of either disputant. On June 1 Austria transferred the decision of the Schleswig-Holstein question to the federal diet. This was regarded by Prussia as a termination of the Gastein convention; her troops were at once marched into Holstein, and the Austrian governor of Holstein was invited to reenter into the joint occupation of Schleswig. Austria denounced this act as a violation of the federal constitution, and on June 14 the federal diet, by a majority of 9 against 8, adopted the view of Austria and ordered the mobilization of the entire federal army, except the troops of Prussia. The states voting for this resolution were Austria, Bavaria, Saxony, Hanover, Württemberg, Hesse-Cassel, Hesse-Darmstadt, Nassau, and the small states forming the 16th class. The representative of Prussia at once declared that the majority of the federal diet had exceeded its authority, and that Prussia regarded the confederation as dissolved. On the following day, the governments of Hanover, Saxony, and Hesse-Cassel were requested by Prussia to take back their vote of the preceding day, to disarm, and to enter into a new confederation with Prussia, which in that case would guarantee their sovereignty; in case of refusal, the immediate opening of hostilities was announced. The three governments on the same day refused this demand, and on June 16 their territory was occupied by Prussian troops. The brilliant campaign of the Prussians (see Prussia) against the Austrians, who had been joined by the Saxon troops, in Bohemia and Moravia (June 23 to July 22), and against the other federal troops in Thuringia and in the region of the Main (June 27 to the beginning of August), completed the dissolution of the confederation and secured the reconstruction of Germany on an entirely new basis. The preliminary peace of Nikolsburg, July 26, which was confirmed by the definitive peace of Prague, Aug. 28, excluded Austria from Germany, and provided for the establishment of a new confederation of the states N. of the Main. The states S. of the Main, Bavaria, Württemberg, Baden, and Hesse-Darmstadt, were left at liberty to establish a South German confederation. Schleswig-Holstein, Hanover, Hesse-Cassel, Nassau, and Frankfort were incorporated with Prussia. Even before the conclusion of the definitive peace Prussia had entered into offensive and defensive alliances with Württemberg (Aug. 18), Baden (Aug. 17), and Bavaria (Aug. 22). On Aug. 24 the last representatives of the old German confederation, who from Frankfort had removed to Augsburg, declared the work of the federal diet to be at an end. The North German confederation (Norddeutscher Bund) was established by treaties between Prussia and the smaller states during the period from Aug. 18 to Oct. 21. On Dec. 15 an assembly of plenipotentiaries met in Berlin to draft the constitution of the confederation, which was then submitted to the constituent North German Reichstag, which met in Berlin on Feb. 24, 1867, and on April 16 adopted by 260 against 58
votes the draft submitted to it. The king of Prussia, as president of the confederation, appointed Bismarck federal chancellor, and on July 1 the constitution went into operation. In February the South German states had held military conferences in Stuttgart to promote a greater conformity of their army organization with that of Prussia. Baden favored the adoption of the entire Prussian system; and when the other three states declined to go so far, though they admitted the desirability of greater uniformity, Baden concluded a special military convention with Prussia. Next to the adoption of the federal constitution, the most important event in the constituent Reichstag was an interpellation of Herr von Bennigsen, one of the leaders of the liberal party, concerning the right of Prussia to garrison the federal fortress of Luxemburg. The grand duchy of Luxemburg, which formed a part of the old German confederation, showed the most decided opposition to entering the new North German, and Prussia had given her consent for the grand duchy to remain outside of the reconstructed Germany. Soon after negotiations had been begun between France and Holland for a sale of the grand duchy to France, Prussia had entered an emphatic protest against this scheme, and on March 80 the king of Holland had officially denied any intention to sell Luxemburg. The full details of these negotiations only became known officially in consequence of the interpellation of Benning sen, and created an extraordinary excitement throughout Germany. The expression of public opinion against the transfer of Luxemburg to France was no less decided in the south of Germany than in the north. The grand duchy of Hesse concluded in April a military convention with Prussia, in virtue of which its military system was reorganized according to the Prussian, and the Russian troops were placed under the chief command of the king. Wurttemberg also introduced several features of the Prussian system. No doubt could be entertained that, in case of war, northern Germany might safely rely on the support of all the South German states. But a conference of the powers which had signed the London treaty of 1819 found a peaceable solution for the Luxemburg question. The grand duchy was declared neutral territory under the guaranty of all the powers represented at the conference; and the federal fortress was to be razed. This peaceable solution was hastened by the declaration of Bismarck that if the result of the conference should not be favorable to the preservation of peace, he would at once mobilize 900,000 men. On May 28 the ministers of the South German states were invited by Prussia to come to Berlin in order to put the Zollverein's treaty of 1866 safely on a sure foundation. An agreement was arrived at, according to which, for the legislation on affairs of the Zollverein, the South German states would send a specified number of members to the North German federal council, and order the election of a proportional number of deputies, who in union with the North German Reichstag would constitute the customs parliament. A new attempt of Napoleon to meddle in the progress of German reconstruction by demanding that, in accordance with one article of the treaty of Prague, the people of northern Schleswig be allowed to express by a plebiscite their preference for Denmark or Germany, was sharply repelled by Prussia. Bismarck declaring that Prussia was unwilling to recognize the right of France to watch over the fulfillment of the treaty of Prague. An interview of Napoleon with the emperor of Austria in August was looked upon as a threatening movement against Germany, and not only the North German states, but even the Germans of Austria, strongly expressed themselves against the endeavors of France to interfere in any way in the internal affairs of the German nation. In the grand duchy of Hesse, the second chamber demanded that the entire grand duchy, instead of only the northern portion as hitherto, be admitted into the North German confederation. In Baden both the government and the chambers expressed a wish to enter the confederation. Bismarck issued a circular note on the demonstrations of public opinion, which he declared to be significant proofs that the national feeling of the Germans would never brook a foreign interference in German affairs, and would never allow the development of the affairs of the German nation to be guided by any other considerations than the national interests of Germany. But while South Germany gave no encouragement to the schemes of Napoleon against the progress of German unity, there remained a widespread dissatisfaction with the policy of Prussia, and an unwillingness to tighten the bonds of union. At the election for the first German customs parliament, the South German party, which opposed any advances toward a closer union, elected 50 out of 89 South German deputies. Even in the grand duchy of Baden it met with an unexpected success. When, in reply to the opening speech of the king of Prussia, the national liberal party moved an address which asked for an enlargement of the functions of the customs parliament, and distinctly hinted at the complete union of north and south, the ultra-conservative feudal party of Prussian deputies, the radical party of progress (Fortschrittspartei), the Catholic party, and the socialists united with the South German party and caused its rejection by 188 against 150 votes. The conciliatory but firm attitude of the Prussian government prevented the progress of the centrifugal sentiments in South Germany. The governments of Saxony and Wurttemberg, having declined to make further concessions on the union question, were on the other hand no less uninclined in the observance of the treaties which regulated their relation to northern Germany. Baden,
on May 25, 1869, concluded a new military convention with Prussia, which established an entire uniformity between the armies of Baden and Prussia. The North German Reichstag, in December, expressed a decided opinion in favor of restricting the right of particular states and enlarging the functions of the central authorities. The first six months of the year 1870 were unusually quiet, and it was the common opinion that great changes in the relation of the four South German states to the North German confederation were not likely to be made for a long time to come, when suddenly the action of France precipitated the final solution of the German question. The Spanish crown having been offered to Prince Leopold of Hohenzollern, and rejected, the emperor Napoleon demanded the guarantee of Prussia against its acceptance at any time thereafter by any prince of its house. This being scornfully refused, war was at once declared by France (July 19, 1870), and after a brilliant series of victories for the Germans and almost uninterrupted defeats for the French, was in effect concluded by the preliminary peace of Versailles, Feb. 26, 1871. (See France.) In this war all the states both of North and South Germany, except Austria, participated; and in view of the common danger through which all had passed, and the common victory which all had won, the governments and the people of South Germany now waived any further opposition to a consolidation of all the German states under the leadership of Prussia. On Nov. 15, 1870, a treaty was concluded between the North German confederation, Baden, and Hesse concerning the establishment of the German confederation (Deutscher Bund); on Nov. 28 the entrance of Bavaria into the confederation was regulated by treaty; on Nov. 29, that of Württemberg. Bavaria asked and received important concessions, which to many unionists appeared to be going too far in favor of particularism; but the treaty was unanimously ratified by the federal council of the North German confederation, and by the Reichstag by 195 against 82 votes. On Dec. 8 the king of Bavaria invited the king of Prussia to restore the dignity of German emperor; most of the other governments gave their assent to the proposition before Dec. 8. In the name of the federal council the federal chancellor on Dec. 9 moved in the Reichstag, and the motion was adopted on the following day, that the German confederation assume the name German empire, and the king of Prussia, as president of the confederation, the title emperor of Germany. On Jan. 18, 1871, the restoration of the imperial dignity was solemnly proclaimed by the king of Prussia at Versailles; on March 21 the first German Reichstag assembled at Berlin, and was opened by the emperor in person. On April 14 this Reichstag ratified the constitution of the German empire, with but three dissenting votes; and on May 4 the constitution went into operation. By the peace of Versailles Germany recovered the province of Alsace and the German-speaking district of Lorraine. The definitive peace was concluded at Frankfort on May 10, and on June 9 the new Reichsland of Alsace-Lorraine was proclaimed as incorporated with Germany. The majority of the Reichstag, in full harmony with the imperial government and the majority of the federal council, was intent upon consolidating the new empire by centralizing the legislation and extending the functions of the central authorities. As two German states, the grand duchies of Mecklenburg-Schwerin and Mecklenburg-Strelitz, were still without a constitutional government, the Reichstag on Nov. 8 adopted the resolution of the deputy Busing that every German state must in future have a constitutional form of government. On Nov. 15, on motion of Lasker, it was resolved to embrace the whole of the civil law within the sphere of the imperial legislation. Of the political parties which opposed the advancing consolidation of the empire, by far the most powerful was the Catholic, or the centre, as it was called from the central seats which its representatives occupied in the Reichstag. On the opening of the first session of the Reichstag, in March, 1871, they moved an amendment to the address by which the Reichstag was to reply to the speech from the throne, asking for the protection of the temporal power of the pope. On this question the other parties united against them almost unanimously, and the address moved by the majority of the Reichstag was adopted by 243 votes against 63, the minority consisting of the Catholic party and a few socialists. The conflict between them and the imperial government became more intense in 1872. One expression in a speech which the pope had made on June 25 was regarded by the majority of Germans as a direct wish for the overthrow of the empire, and intensified the sore feelings which had been produced by the pope's rejection of the cardinal prince Hohenlohe, whom the German government wished to appoint as minister at the papal court. As it was a common opinion that the religious excitement prevailing in the Catholic districts of Germany was largely due to the influence of the Jesuits, the Reichstag and federal council adopted in June a law which provided for the suppression of all the houses of the Jesuits and of affiliated orders. This law, which toward the close of the year 1872 was gradually executed, did not define which other religious orders were comprised within its terms; but the Redemptorists, Lazarists, ladies of the Sacred Heart, and a few others shared at once the fate of the Jesuits. The bishops of Germany assembled in November in a general conference at Fulda, and bitterly complained of this persecution; and the pope, in an allocution made in December, in terms still more severe, denounced the impudence of the anti-Catholic legislation, to which
the imperial government of Germany replied by breaking off all diplomatic intercourse with
the papal court. Thus the relation between
the Catholic church and the imperial govern-
ment at the beginning of 1873 was one of open
war. This was particularly the case in the
kingdom of Prussia, where the relation be-
tween church and state was regulated by a
number of new laws which all the bishops
positively refused to obey. The government
then imposed heavy fines upon the bishops,
and in many cases withdrew the support which
the ministers and institutions of the church
had received from the state government.
An interesting correspondence on the subject took
place between the pope and the emperor. The
pope expressed the hope that the cruel laws
against the church did not meet the appro-
bation of the emperor, and asked for his
personal interference in the interest of the church; to
which the emperor replied that in a constitu-
tional state like Prussia every law required the
sanction of the sovereign, and that the former
peace between the different Christian churches
had been wantonly disturbed by the unlawful
conduct of the bishops. A germ of new difficul-
ties between the state governments and the
Catholic church was the legal position claimed by
the Old Catholics, who maintained that the
pope and the bishops who adhered to the
decree of the Vatican council had abandoned
the Catholic church, and that they alone were
entitled to be regarded as the true representa-
tives of that Catholic church which in Germa-
ny until 1870 was regarded as one of the state
churches. Although the state governments,
in view of the comparatively small number of
the Old Catholics, declined to accept their
view of the ecclesiastical situation, they at
the same time refused to treat them as seceders
from the Catholic church, and took the ground
that the movement was an internal affair of
that church, with which the state had no right
to meddle. In Prussia, the missionary bishop
of the Old Catholics was accordingly recog-
nized in October, 1873, as a bishop of the Cath-
olic church, and as such he at once received a
salary from the state. The political changes in
France greatly encouraged the hopes of the
Catholic opposition in Germany, and in several
southern districts of Bavaria led to threatening
demonstrations against the very existence of
the German empire. As a similar effect was
produced by the political attitude of the French
government in Italy, the visit of the king of
Italy to Berlin was enthusiastically hailed by
the liberal parties, both in Italy and in Ger-
many, as an indication that the two govern-
ments intended to act in full concert against the
common enemy. The relations between
the governments of the smaller states and the em-
peror up to the close of 1873 were friendly,
and no serious discrepancy of opinions on any im-
portant subject was shown in the deliberations
of the federal council.—Among the best histori-
cal works on Germany are K. A. Menzel's Ge-
schichte der Deutschen (8 vols., 1815-'92), and
Neuer Geschichte der Deutschen (12 vols., 1896-
'48); Luden's Geschichte des deutschen Volkes
(to the 18th century, 12 vols., 1829-'39); and
Giesebrecht's Geschichte der deutschen Kaiser-
zeit (vols. 1.-III., 3d ed., 1862-'8).
n, r are employed with nouns, d, e, e, w with verbs. The following is a synopsis of all grammatical endings of words: nominative (of the definite article) der, dis, das, plural die for all genders; genit. des, der, des, plur. der; dat. dem, der, dem, plur. den; accus. den, die, das, plural die. These are the endings of adjectives, nouns, and adjectival pronouns. Comparative dicker, superl. dickem; receiving the preceding endings when declined. Endings of substantive nouns: singular genit. as or s, as Doyfer, or like the nominative; dat. e, or like the nominative; plur. e, dat. en—new declension everywhere en or n (des Falten, d.).

Some substantives take s after s in the plural, and undergo metaphony, as in Baden, Bäder, Volk, Völker, Tuch, Tücher. The verbal endings are as follows: 1. Strong verbs (commonly called old conjugation): indicative present, et or et or t, plural, en or n, et or t, en or n; past, first and third persons have no ending; second est, or et, plural, est, et, en; imperf. singular, first person wanting, second and third e; plural, en, et or t, en; participle past, prefix ge, suffix en. 2. Weak verbs (improperly called regular, really inorganic conjugation) have the same terminations as the preceding, except in the past tense, where et or t is inserted between the stem and the ending; participle past, prefix ge, suffix en or et. In both the ending of the participle present is end, infinitive en. The subjunctive of both has the endings always preceded by e, and the part of the strong verbs undergoes metaphony, as ich gab, ich gab, ich habe. The strong verbs, whose conjugation is called irregular, exhibit the phonetic vicissitudes of words, and are therefore to be regarded as organic and containing the rules of the language; while the so-called regular verbs are weak, undergoing no change, and only admit of mechanical additions. All words of Teutonic physiognomy have the accent on the radical syllable; those taken from or resembling French, generally on the last effective syllable; and those from other languages on that syllable which to the German ear seems to be the radical; thus: Empfindlichheit, sensibility; unverlässlich, untrustworthy, e.; but Regiment, Solidarität, Kapitän, e. The German language has in a very high degree three qualities which render it both very plastic in its material and very flexible in its adaptability to all forms and categories of thought. These qualities are: 1. intuitiveness of expression, owing to the organic etyma of the Indo-European family of languages, which are clearest in the Latin (see Languages); 2. facility of composition of simple words into double or manifold agglomerates, requiring long paraphrases in other languages, and power of poly-syllabic derivatives from radical words. These latter qualities do not impair the first.—Among the most eminent of the founders of German philology are Benecke, J. and W. Grimm, and Lebmann. See J. Grimm, Deutsche Grammatik, comprising also the Scandinavian branch (Göttingen, 1610–97); Hoffmann von Fallersleben, Deutsches Leben (Berlin, 1883), with a bibliography of dialects; Fischer, Denkmäler der deutschen Sprache (6 vols., Berlin, 1888–91); Wackernagel, Deutsches Lexbuch (3 vols., Basel, 1889–93); J. Grimm, Geschichte der deutschen Sprache (Leipzig, 1848). For grammars of new High German, see Ickeke, (about 1528); Albertus (1873); Oelinger, Unterricht der hochdeutschen Sprache (1874); Clauss, Grammatik der deutschen Sprache (1878); Martin Opitz, on German prose (1694); Schöttel, Deutsche Sprachkunst (1641); Morh, Unterricht von der deutschen Sprache (1882); Bödiker, Grundzüge der deutschen Sprache (1860); Braun (1768); Heynatz (1770); Basedow (1789); Bodmer (1778); Fulda, Grundregeln der deutschen Sprache (1778); Adelung (1781–82); Heinsius (1788); J. Ch. A. Heyse (1814); F. Becker (1825); or dictionaries, see Frisch, Latein-deutsches Wörterbuch (1741); Ade (1774–80); Moritz, Grammatisches Wörterbuch der deutschen Sprache (1798); Campe, Verzeichnis der deutschen Sprachbereicherung (1791–94), and Wörterbuch zur Aufklärung und Verfeinerung der der deutschen Sprache aufgedrungenen fremden Ausdrücke (1801; modified by Brandt, 1807–10); Heyse, Allgemeines Wörterbuch der deutschen Sprache, &c. (1804); Hein- sius, Volkstümliches Wörterbuch (1815–18), Adler, German and English (New York, 1848); K. W. L. Heyse (1888–90); J. and W. Grimm, a gigantic work, begun half a century ago, and not yet completed. On synonyms, see Gottsched, Beobachtungen über den Gebrauch und Missbrauch vie der deutschen Wörter (1768); Heynatz (1790); Eberhard (1802); Mass, Wiegang, Ch. F. Meyer, &c.—GERMAN LITERATURE.
GERMANY (LANGUAGE AND LITERATURE) 763

and the latter (Heiland, first published in Munich, 1830–40) preserving the ancient alliterations. A translation of the Psalms by Nosker, which dates from about the same period, is regarded as one of the best specimens of old High German literature. The Ludwigspredig, a poem in honor of the victory of the Frankish king Louis III. over the Normans about 880, which Herder extols as one of the best specimens of early German poetry, was composed in the old High German dialect by a Frankish churchman. The preservation of the songs of Hildebrand, which is associated with the legends of Theodoric and Attila, is also due to churchmen, who transmitted it partly in the old High German and partly in the Low German dialect.

Several Latin poems were also based upon Hunnish and Burgundian legends, but with these exceptions the priesthood were generally opposed to the national poetry on account of its pagan associations. Many Latin chroniclers and poets flourished in Germany and the following period; there was also a Latin poetess, Roswitha, or Helena von Rossow, who wrote Latin religious plays. The learning which flourished under the Saxon emperors was superior to that of the times of Charlemagne. The study of mathematics was next in importance to that of theology and Latin. The Greek language, although it was but little cultivated, was not unknown. From the 10th to the 13th century Germany probably possessed a higher mental cultivation than any other country in Europe, but on the whole it was of a Latin and ecclesiastical cast, and the people had no share in it.

In the 12th century appeared a hymn in praise of Hanno, archbishop of Cologne, which Herder calls a truly Findorfo song. Among the last poems which appeared in this era from the pen of churchmen were the Rolandlied and the Alexanderlied. In the 13th century poetry passed from the monasteries and ecclesiastical schools to the palaces of princes and the castles of nobles. Most of the poets who then came forward were nobles by birth, some of them princes. Heinrich von Veldeke was the first to introduce into his heroic poem Einhard, which he is said to have composed after a French version of Virgil, the spirit of devotion to woman, or Minne (an old German word for love, whence the name Minnesänger). Veldeke is regarded as the originator of the heroic minnesängel song, although he is far surpassed in genius, elevation of thought, and depth of feeling by Wolfram von Eschenbach. The other masters of the heroic muse were Gottfried of Strassburg, Hartmann von der Aue, and Konrad of Würzburg. Their longer heroic poems treat chiefly of the exploits of Charlemagne and of the story of Arthur and the round table. At the same time they composed many songs. Love was their principal theme, but from a sense of delicacy the name of the lady who was the special object of adoration was never mentioned. Respect for womanhood, which was reckoned among the virtues of the ancient Germans even in the days of the deepest barbarism, contributed to make the German love songs more reverential than those of the French troubadours. A species peculiar to the barbarous districts was called the watch song, consisting in a dialogue between a lover and the sentinel who guards his mistress. Walther von der Vogelweide was the most gifted of these lyric poets. Next to him rank Heinrich von Otterdingen, Reimar der Alte, Heinrich von Morungen, Gottfried von Neiden, and the Austrian baron Nithard und Tanhäuser. Several hundred of these poets were engaged in wandering from palace to palace and from castle to castle. The minstrels constituted what is called the Swabian school of poetry; the songs were mostly in the Swabian dialect. The accession of the Swabian emperors of the house of Hohenstaufen to the throne of Germany was the signal for the rise of the bardic art (1185). Its golden age was shortly before the fall of that dynasty (1264). The crowning event of the minstrel era was the appearance of the lays of the Nibelungen. It was followed by the "Book of Heroes" (Heldenbuch), consisting of a collection of fragmentary pieces treating of the same legends as the Nibelungen, but mixed up with traditions of the crusades. Didactic poetry began to be cultivated with some success in the 18th century. The dawn of historical works is heralded by several local chronicles; that of writings on natural history in the so-called Meinauer Naturlehr; of popular religious literature in the sermons of David of Angsburg and Berthold of Winterthur; and of works on jurisprudence in compilations of Saxon and Swabian laws (Sachsenspiegel and Schwabenspiegel). Ulrich von Lichtenstein deplores, in 1275, in his famous poem on Frauenkünst (devotion to woman), the decline of chivalry, but his attempt to revive its spirit was hopeless. Poetry now passed from the abodes of princes and knights to the homes of burgbers and the workshops of artisans; and instead of Minnesänger we hear of Meisterdänger, as the plebeian songsters were called. The 18th century, the greater part of which was so rich in poetical productions, was one of the most unfruitful for the cause of learning. Leibnitz says that the 18th century in Germany was a golden age in that respect compared with the 18th. In the 14th century Germany possessed several mystic theologians, followers of Meister Eckart, the principal of whom was Johann Tauler (1290–1361), whose sermons and writings contributed to pave the way for the reformation. An important event of this century, in its general influence upon the future development of German literature, was the establishment of the university of Prague in 1434, soon followed by universities in almost all parts of Germany. The last echoes of the period of chivalric poetry were two allegorical romances, Teuterdank in verse, and Weiskunig in prose (first published at the beginning of the 16th century), of which the emperor Maxi-
milian is the hero and probably the author, although Melchior Pfingst is said to have composed the former romance at the emperor’s request. The only good poetry published in the 14th and 15th centuries was the spirited songs of Halb- suter and Veit Weber, celebrating the victories of Switzerland over Austria and Burgundy.— The progress of classical culture was stimulated at the opening of the 16th century by the establishment of learned societies and schools in different parts of Germany and the Low Countries. Hegius, Langius, Dringberg, Reuchlin, Agricola, and other eminent men were among the scholars. Fürbach was the first restorer of mathematical science, and his pupil Regiomontanus (Johann Müller) was the greatest mathematician of the 16th century; while Gutenberg was one of its heroes. His invention of the art of printing produced a steadily increasing literary activity, and the books printed in Germany between 1470 and 1500 amounted to several thousand editions.— The 16th century opened with the foundation of the university of Wittenberg (1502), and inaugurated along with the reformation a new era in literature by Luther’s translation of the Bible, which he rendered into German so harmonious and beautiful that it is considered even at the present day as a model of terse expression. The High German, as used by Luther, is so pure that all the antiquated and anomalous dialects which had until then alternately predominated in German composition were from that time more or less banished from the language, and the idiom of the Bible has since become the sole medium of cultivated conversation and of German literature. Hymns and psalms were now brought to perfection. That famous religious lyric, Ein feste Burg ist unser Gott, and others of Luther’s finest hymns, have become classic, and have found hosts of imitators, the most distinguished of whom were Decius and Speratus, and, in the 17th century, Paul Gerhard. Michael Weiss translated the hymns of Huss into German. The writings of Luther, Zwingli, Johann Arndt, Melanchthon, Ulrich von Hutten, Bugenhagen, Bullinger, and other reformers and scholars, constitute the principal theological literature immediately connected with the reformation. In historical works, the influence of the reformation manifested itself in the superior style and greater comprehensiveness of the universal histories of Sebastian Frank and Sebastian Münster; also in chronicles of Switzerland by Tschudi, and of Bavaria by Aventinus. Frank also published a collection of German proverbs; in which branch of literature, however, he was preceded and excelled by Johann Agricola’s Auslegung deutscher Sprichwörter. All the literature of the modern era formed the basis of original views of the fine arts in their connection with mathematical science. The principal events in prose belles-lettres were the translations into German of Latin tales, in which Boccaccio, Poggio, and other Italian novelists and poets were for the first time introduced to German readers. Translations of Tasso and Ariosto also appeared. Many of the ancient chivalry romances, which had been published in prose in the 15th century, were republished in the 16th; collections of them were made and called Volksbücher (books for the people), of which the Buch der Liebe (“Book of Love”) became the most popular. The period before and after the reformation was especially fruitful in satirical and allegorical works. One of the most remarkable of the former kind was the Narrenschiff (“Ship of Fools”), by Sebastian Brant of Strasburg (new ed. by Zarnaka, Strasburg, 1854), a metrical satire on the follies of the century, which in the opinion of Hallam may possibly have suggested to Erasmus his Encomium Moriae. Thomas Murner imitated this in his Narrenbeschworung (“Conjuration of Fools”), and published one of his bitterest satires on Luther under the title Von dem grossen Lutherischen Narren (“Of the Great Lutheran Fool”). The fables of Reinkea Fuchs (afterward immortalized by Goethe’s poem), the origin of which is identified by many authorities with the ancient epic or didactic poem of the Thiernage, and which in different periods had appeared in a variety of forms, was revived in a Low German edition (translated from the Dutch) in the latter part of the 16th century, and was looked upon in the 16th as a satire on the government and state of society of Germany. It was followed by a great number of poems of the same kind, of which one whose characters are feasts is the most witty. Among the purely didactic fabulists were Alberus and Burkard Waldis, both also eminent as composers of hymns. Among the more comical of the Volksbücher was the story of Till Eulenspiegel, relating the freaks, pranks, drolleries, fortunes, and misfortunes of a wandering jester (new ed. by Leppen- berg, 1854). The ablest satirical and didactic poet of the 16th century was Johann Fischart, the author of more than 50 works, including the above mentioned fable on feasts (Flohate), and of a romantic poem (Das glückhafte Schiff) which was regarded as a model for romancers. He has been called the German Rabalais. The story of Faust and the autobiography of Götz von Berlichingen, afterward adorned by Goethe, were also among the popular works of this century. The Volkslieder or popular songs of this period were much admired by Herder, who was the first to collect them. The Meisterdörfer, upon whom the mantle of the minstrels had fallen since the 14th century, had established metrical schools in various German towns, in the same spirit in which they would have founded guilds of trade. Their highest ideal was the family. They laid down the rules of versification which were adopted by their school committees. In the 16th century their corporation derived great prestige from the genius of Hans Sachs, the poet and cobbler of Nuremberg (then the headquarters of the
Meistersänger), whom Herder calls the Meister of Meistersänger, and who excelled more than any poet before him in all styles of composition, from the most tragic touch of feeling to the most comic turn of thought. His song dedicated to a Luther (Minsterberg), which it was especially fine. Frauenlob and Michael Behaim were also poets, and Rosenblatt and Foltz playwrights of some note, the former of whom was also one of the best tale writers of his time. Among the contributors to the drama who succeeded Hans Sachs, he excelled in skilful arrangement of plots by Jakob Ayer (died in 1606), and in grace and refinement of composition by Andreas Gryphius (1618–84). —During the excitement occasioned by the reformation almost all branches of composition were cultivated, but in learned and scientific literature the 16th century was most prolific. Besides Melancthon, whose influence secured the preponderance of the Aristotelian philosophy in the Protestant schools of Germany for more than a century, were Luther, Camerarius (classics and philology), Cornelius Agrippa, Theophrastus Paracelsus (mystical philosophy and natural history), Copernicus (astronomy), Leonhard Fuchs (botany and medicine), Conrad Gesner (botany, zoology, and classics), and Agricola (mineralogy). At the expiration of the 16th century few of the great scholars of Germany were left, and classical culture was declining in the early part of the 17th. The numerous universities and schools which had sprung up under the influence of the reformation were no longer animated by the zeal of the reformers, but engrossed by subtle polemical and scholastic strife. The deliverance of the German intellect from the scholastic bonds of the middle ages, which was the cherished endeavor of Luther, was again retarded.

—Poetry, in passing from the Meistersänger to scholars, lost in national what it gained in elaboration. Most aspirants to poetical fame in the 17th century were free from the influence of the universities, and learned societies were formed at its beginning, with a view of improving the German language and literature. These societies became notorious for their imitations of the Italian academies as the corporations of the Meistersänger had been for attempting to mimic the minstrels. After their dissolution they were replaced by many literary and scientific associations in Leipzig, Berlin, Hamburg, Königsberg, Halle, and in others of those principal central and university towns of Protestant Germany which had become the leaders of German culture. A new school of poetry was established, of which the forerunners were Friedrich von Spee (died in 1635) and Georg Rudolf Weckherlin (1584–1651), the first author of sonnets in German. Johann outlets (1697–1680) became the leader of this school. Johann Wolfgang von Goethe, his native country was called the first Silesian school. He wrote the language with a purity of idiom in which he rivalled Luther. He imparted more vigor to the versification, and wrote many lyrical, mixed, and didactic poems. Although more scholastic than poetical, he exerted a great influence on literature, at a time when the thirty years' war and the growing taste for bad Italian and French modes of composition threatened to annihilate all vestiges of pure German poetry, and when the reforms introduced by Luther into the language still required to be steadily urged and followed up in order to become established. Paul Flemming (1609–40) was the principal lyrical, and Simon Dach (1685–59) a gifted sentimental poet of this school. Von Zesen (1619–98) was the greatest purist of them all, strenuously opposing the admixture of French words, which was becoming more and more common in Germany. Halsdörfer was one of the principal poets of the pastoral Nuremberg branch of the school. Among the other eminent poets were Christian Weise, who excelled in popular songs and the drama, and afterward opposed the Silesian schools, and Friedrich von Logan (1604–65), a witty epigrammatist. Andreas Gryphius did much to improve the German drama, and his poetry was as excessively passionate as that of Opitz was conventional and cold. This conventionalism gave rise to a formidable opposition, at the head of which stood Hofmannswalden (1618–79) and Lohenstein (1635–88), who took the most inflated Italian and French writers as their models, and became proverbial for bombast and artificiality. They in their turn were opposed by Canitz, the Berlin statesman and poet (1634–90), Besser (1654–1729), and König (1688–1744), most of whom were court poets, who endeavored to imitate the then fashionable verses of Bollean, but were unable to resist the success of Lohenstein's affected and extravagant effusions. Imitativeness was the bane of literature in Germany; only a few, as Brockes of Hamburg (1680–1747) and Gütther (1695–1728), were free from it, while Kassner, especially Wernike of Hamburg (died about 1720), were almost the only poets who dared to protest against it. —The most successful authors of novels in this period were Buchholz, Von Zesen, Ziegler, Klipphausen, Lohenstein, and Duke Anton Ulrich of Brunswick. The most entertaining book of the century was a collection of tales of adventure (Simplicissimus) by Grimmelshausen, a style of composition in which he had been preceded by the satirist Moscherosch. The writings of the Roman Catholic preacher Abraham a Sancta Clara (1642–1709) are distinguished by a broad humor, especially his Judas. Among the prose writers of the 17th century were S. von Pufendorf in political philosophy, Kepler (who wrote in Latin) in astronomy, and Gottfried Arnold in ecclesiastical history. Among critics in etymology and ethics, Fehmer, the founder of Protestant piety, takes a prominent position. In philosophy and learning Latin continued to be the sole medium of literature; and Jakob
Boehm (1575–1624), the great mystic, stood for a long time almost alone in the use of the vernacular tongue, until toward the end of the century, when Leibnitz (1644–1716) and Wolf (1679–1754) appeared. Christian Thomasius (1655–1728), the able jurist and pietistic philosopher and writer, was the first, in his lectures at Leipsic and afterward at Halle, to substitute the German for the Latin language as the medium of instruction. He was also among the very first to use the German language in his writings, and established the first German learned periodical in Leipsic (1688–90). Leibnitz was the first to lay a scientific basis for the study of philosophy in Germany, but his works were chiefly written in Latin and French. Wolf, his disciple, shaped the views of Leibnitz into a comprehensive system, and published his works in the German language.—Under the impulse of the new philosophical ideas, Germany became in the 18th century excited on the subject of literature, as it had been on that of theology in the 16th. The 17th closed with the foundation of the Berlin academy by Leibnitz (1700). The general clamor was for reform in education, in literature, and soon for reform in all departments of thought. Gottsched in Leipsic (1700–1766), laboring in the same direction as Thomasius, exerted himself to make the German language the sole medium of instruction, and published in it manuals and abridgments of philosophy and science. He advocated the classical rules of composition of Racine and Corneille, but aimed above all at correctness. His views brought him into conflict with Bodmer (1698–1788) and Breitinger of Zürich (1701–76), who were admirers of Milton and rigidly orthodox in religion, while Gottsched was friendly to Voltaire. They carried on a paper war in their respective journals until at length many who had rallied round Gottsched became disgusted with his pedantry, and separating themselves from him, established a periodical celebrated in German literature under the name of Bremer Beiträge, edited by Gärtner (1712–91), in which they opposed their former friend; at the same time they formed a poetical union to which Hagedorn was friendly, although he did not join it, but which was eventually joined by Klostock, who became its hero. Among the contributors to this journal were Rabener (1714–71), a popular satirist, of a correct and easy style; Zacharias (1726–77), a writer of poetry in imitation of Pope's "Rape of the Lock;" Gellert (1715–69), a famous fabulist; Kästner, the poet and mathematician; Gieseke; Johann Elias Schlegel, dramatist, and Johann Adolph Schlegel (1721–95), poet; Fuchs, Kramer, Ebert, translators of Young's "Night Thoughts," and several others. The journal was printed in Bremen, but the poets resided for some time at Leipsic, whence they adopted the name of the second Saxon school, while the followers of Bodmer (of Zürich) styled themselves the Swiss school.

Related to the latter was the school of Halle, to which belonged Lange, Pyra, Uz, and Götz. The most distinguished of the poets of this school were Kleist (1718–59), author of descriptive and picturesque poetry in the manner of Thomson and Pope, and Ramler (1725–98), a composer of odes, and the first to introduce the language, versification, and manners of the ancients into Germany. Gleim (1719–1808), the celebrated fabulist and poet, at first a follower of Bodmer, gathered a knot of writers around him, and exercised for about 40 years a considerable influence on German poetry; but his fame was diminished by the criticisms of Herder. Salomon Gessner of Zürich (1780–87) gained in his time a high reputation as a writer of idyls, but Herder thinks that he was overrated by his contemporaries. Bodmer's prestige was also soon broken by the criticisms of Lessing. Of greater influence than any of the poets as yet named were Hagedorn of Hamburg (1705–94), whose fables and songs have immortalized him in Germany, and Albert von Haller (1708–77), the illustrious physician and savant, who was remarkable as a writer of descriptive and didactic poetry.

They were followed by Klostock (1724–1809), whose "Messiah" made a profound impression upon the religious world by its mystic, devout, and rapturous faith, while as a work of art it was greatly admired. The fashionable and elegant portion of society was attracted by the semi-Grecian, semi-Parian muse of Wieland (1733–1813). But it was reserved for Lessing (1729–81) to give a new direction to German literature. He did for it what Luther had done for the German language. He established a new school of criticism, and struck a final blow at Gallic influence, at the same time that Frederick the Great was conducting a war with the French graces. His tragedy Emilia Galotti, his comedy Minna von Barnhelm, and his philosophical drama Nathan der Weise, are models of dramatic composition. He exerted a powerful influence on the progress of the German drama by unfolding for the first time all the beauty, vigor, and originality of Shakespeare before the German mind, and by the profound and philosophical criticism in his Dramaturgie. He pronounced a condemnatory judgment upon all foreign models except Shakespeare and the ancients, and demonstrated that the spirit of the age shrank from the mediæval sentimentality of epic poetry, and desired literature to reflect its own stirring energies, as the drama alone can do. Most celebrated among the many literary publications which were identified with Lessing's critical labors was a periodical (Literaturzeitung) which he founded in Berlin in 1759, in conjunction with Nicolai (1738–1811), the publisher and author. Lessing was the master spirit of this publication, and the principal contributor next to himself was his friend Moses Mendelssohn (1729–86). Both Klostock and Wieland were criticised in that peri-
odical, and it was the first to discover the merit of Winckelmann the archaeologist, of Hamann the mystic philosopher, and the philosophic genius of Kant, although at that time he had only written some short treatises. Shortly after the commencement of the Literaturbriefe, a new influence was infused into the literary world by Herder (1744–1803), who while at Königsberg became acquainted with Hamann and Kant, and who was known as a scholar as early as 1763. He brought to bear upon literature an almost universal knowledge, the study of the poets of all nations, an intimate acquaintance with Hebrew, Greek, and Latin writings, and above all a cosmopolitan humanitarian spirit, which, together with his poetical genius, manifested itself most suggestively in the crowning work of his life, Ideen zur Philosophie der Geschichte der Menschheit. He contributed powerfully to promote the study of oriental poetry, and was the first to call attention to the beauty of the ancient popular songs of different nations, and particularly of his own. Another great impulse was given by Winckelmann (1717–98). His examinations of the remains of ancient art and his writings modified all the old theories of the beautiful; and by his efforts, combined with those of Lessing, whose celebrated work Laokoön was elicited by Winckelmann's suggestions, the spirit of art and poetry was brought back to the genuine and simple taste of the Greeks. Hayne, the accomplished critic and commentator, propounded the theories of Winckelmann at Göttingen, then the most brilliant university of Germany. The young men there became deeply impressed with the new theories, and, under the influence of the reforms which were then initiated in religion, philosophy, literature, art, and education—in almost all departments of thought and life—founded in 1770 the Göt-

GERMANY (LANGUAGE AND LITERATURE) 767

quainted with Herder and other poets, but keeping himself aloof from all unions and parties, came forward in 1773 with Göts von Ber-

lichegen, which was greeted as the commencement of an entirely new period in German dramatic literature. In 1774 appeared Wer-

ther's Leiden. The reformatory period of literature was now over. The revolution had set in, or the Sturm- und Drangperiod, as it was called after a drama of that name by Klinger (1758–1811), whose high-browed tragedies and novels, as well as the writings of Schubart (1739–91), Heinse (died in 1803), Lenz (1750–92), and Müller (1759–1825), reflect most forcibly the excitement of this epoch. In the mean time Schiller (1759–1805) produced his Räuber, followed by Fiesco and Ca-

bale und Liebe. These impassioned tragedies gave a new impetus to the literary excitement. His Don Carlos, however (1779), shows greater moderation, and opens a long series of tragedies in which the highest aspirations for liberty and humanity are interwoven with historical associations, expressed in language of the most classical purity. But it was only after Schiller's union with Goethe (1790) that by their combined labors German literature was brought to that classical perfection which, from a purely national, has since given to it a universal influence. Schiller, by his enthusiastic and sympathetic eloquence and tenderness, became the favorite of the people; and Goethe, with his many-sided intellect and boundless sensibilities, controlled by a strong will, encased in a body of exuberant health, and disciplined by an all-embracing culture and knowledge, became the acknowledged sovereign of German literature. While this golden era of letters was in a great measure accelerated by the philosophic spirit of the age which had prompted the labors of Lessing and the other reformers, that spirit itself gathered strength from the light which it diffused, and in rapid succession gave birth to Kant (1724–1804), Fichte (1762–1814), Hegel (1770–1831), and Schelling (1775–1854). Lessing, especially by his comprehensive essay on the "Education of the Human Race," Herder, Moses Mendelssohn, and Hamann are philosophical writers of great eminence. In a popular style wrote Engel, the author of Lorenz Stark, and the psychological novels of Jacobi are among the most suggestive of German prose writings. Among other prose writers are Reinhold and Barth; Alexander Gottlieb Baumgarten, generally considered the founder of the science of aesthetics (in Latin); Meier, the German interpreter of his theories; and Sulzer, who wrote on the same science. Abbt, Garve, Liscow, the philosopher and elegant fabulist, Lavater the physiognomist, his friend Zimmermann, and his sarcastic and polished opponent Lichtenberg; the historians Dohn, Möser, Schröck, Schlözer, and Beck; Spittler, the celebrated Göttingen historian; Möselin, the ecclesiastical historian; Johannes von Müller, the his-

886 VOL. VII. — 49
torian of Switzerland, one of the classical historiographers of Germany (1752–1809); Georg Forster, the teacher and friend of Alexander von Humboldt, an admirable writer; the publicist Friedrich Karl von Moser; the educator Basedow, and afterward Pestalozzi; Campe, the writer of books for children; Nicolai, the friend of Lessing and author of the satirical novel Schubals Nothunker; Adelung, the philologist; Böttiger, the antiquary; Storck, the biographer; Reimarus, Jerusalem, Spalding, Michaelis, Rosenmüller, and Ernsti, in theology; Eichhorn in theology and universal and literary history; Blumenbach, Bloch, Herschel, Euler, Vega, and many other eminent writers in various branches of learning and science, belong to this period.—A peculiar and powerful writer, who stood quite alone in his idiosyncrasies, was Jean Paul Friedrich Richter (1789–1835). He puzzles the reader by his inability to assort his thoughts, which he pours out with the reckless natalé of a childlike soul; but the obscurity is lighted up by flashes of humor and brilliant gems of thought and feeling. The influence of this genial philosopher was great, especially upon the women of Germany. Novalis (Von Hardenberg, 1772–1801) was another strangely constituted writer, who uttered himself in poetic sighs rather than in vigorous words; but amid his morbid sentiments are scattered thoughts of such wisdom and spiritual insight that his poems and prose writings, although few and fragmentary, gave him a place among the classical authors of his country. He is regarded as the head of the so-called romantic school, which draws its inspiration from the fabulons, mediaval and chivalric era of literature and history. Among the most brilliant masters of this school was August Wilhelm von Schlegel (1767–1845), the author of an antique tragedy, Jon, and of romances and elegies, but chiefly distinguished for his admirable metrical translation of Shakespeare, his critical and aesthetic writings, his lectures on the drama and its literature, and his labors connected with Indian literature and the Sanskrit language. His brother Friedrich von Schlegel (1772–1829) was also engaged in the study of Hindoo literature; but his specialty was the history of ancient and modern literature and the philosophy of history. The most original representative of this school was Ludwig Tieck (1773–1853), whose poetical dramatization and collection of ancient fairy and popular tales reflect the romance of mediaval poesy with beauty and genius, but with a mystic feeling bordering almost on superstition. The writings of Tieck’s friend Wackenroder (1772–98) were the first to enlist the sympathies of the German artists for the esthetic principles of the romantic school. La Motte Fouqué (1777–1843), of the same school, stands alone in German literature by his remarkable delineations of fairy lore, as for instance in his tale of Undine. Chamisso (1791–1868), the author of Peter Schlemihl and of many fine lyrics, Tiege (1759–1841), the author of the philosophical poem Urania, the Aristophanic Platen (1796–1885), and the mystic religious poems of Werner, all belong to this romantic school; and with but few exceptions, as for instance the patriotic and spirited poet Senne (1789–1810), most writings of this period are tinged with a morbid passion for romantic and sentimental views of life. This epoch comprises the lyrical poets Schenkendorf (1783–1817), Stagglmann (1783–1840), Kosegarten (1758–1818), Baggesen der Dane (1764–1826), Matthiessen (1761–1881), Mahlin (1771–1826), Salis (1762–1884), and Eichendorff (1788–1857), several of whom belong to the romantic school. Among novelists and tale writers are Achim von Arnim (1784–1851) and Clemens Brentano (1777–1842), the compilers of a series of celebrated popular songs (Die Huniën Wunderhorn), and Ernst Theodor Amadeus Hoffmann (1776–1822), the author of many wild, fantastic tales and legends (Elfzib des Teufels, Kathe Murr, etc.), which cap the climax of the supernaturalistic element of the romantic school. Among favorite novelists of this period are J. T. Hermès (1789–1851); Hippel (1741–96), the indiscreet friend and disciple of Kant; Muskus (1735–97), the author of a collection of Völkermärchen or popular fairy tales; Lafortaine (1759–1831), a type of the most sentimental novelists; Blumauer, J. G. Mäller, and Thammel (1788–1817), the author of a novel in imitation of Sterne’s "Sentimental Journey;" Jung-Stilling (1740–1817), the inspired tailor in whose naive and original autobiography Goethe, Schiller, and Herder took so much interest; Knigge (1798–96), the author of the Träine nach Braunäscheig; and Immernann (1796–1840), the author of the famous story of Münchhausen. Ghost stories were for a time made popular by Schiller’s Geisterseher, and to this department of literature Jung-Stilling also contributed. Associated with the romantic school, in the earlier part of her literary career, was Bettina von Arnim (1785–1869), celebrated by her correspondence with Goethe. Rähe, the wife of Varnhagen von Ense (1771–1838), was a literary woman of much greater talent and originality of thought. Among other distinguished authoresses are Auguste von Paullow, Ida von Hahn-Hahn, Amalie Shoppe, Johanna Schoenauer, Friederike Brun, and many others. Talvij (Mrs. Robinson) contributed to diffuse a knowledge of Servian popular songs and of Slavio literature generally, and won great distinction in this and other spheres of literature. The efforts of Klopstock, Herder, and other authors to revive the popularity of the early German poetry, as well as the sentiment of nationality which was roused at the beginning of this century by the aggressive policy of Napoleon I, contributed to give a powerful impulse to the researches into the ancient German literature, which was to some extent fostered by Jahn’s spirited work on Deutsches Volksthum. Von der Hagen, by his
editions of the *Nibelungen*, did much to promote a love for the study of the old German dialects and the poetry connected with them. The brothers Wilhelm and Jakob Grimm are the more immediate founders of this new branch of philological and poetical investigation. Benecke, Lachmann, and Simrock labored in the same direction, and more recently Moritz Haupt; also Franz Pfeifer, Oskar Schade, Zarncke, Holtzmann, Hoffmann von Fallersleben, Bartsch, &c.—The German war of independence against Napoleon I. produced some striking patriotic songs from Prof. Arndt of Bonn (1789-1860), and Theodor Körner (1791-1813), the gallant soldier-poet, and author of *Leiter und Scherert* ("Lyra and Sword"). Some of the lyrical poets of the romantic school whom we have named also became distinguished for their patriotic effusions, especially Schenkendorf and Stägemann. Wilhelm Müller of Dessau (1794-1827), author of the admirable *Grieschenlieder*, may be classed among patriotic poets. The maiden efforts of Friedrich Rückert (1789-1866), one of the best lyrical and didactic poets of Germany, and celebrated as much for his imitations of troubadour songs as for his versions of oriental poetry, were also inspired by the war against the French. Another who came forward as a champion of national independence was Uhland (1787-1862), the chiefstay of the modern Swabian school, and one of the leading poets of Germany. Stuttgart, the seat of the great publishing house of Cotta and of the critic Wolfgang Menzel, was the head-quarters of this school. Hebel (1760-1826), whose *Alemannische Gedichte* were greatly admired by Goethe, belonged to it by the Swabian dialect and spirit of his songs, although he lived at an earlier period. An eminent lyrical poet of this school was Justus Kerner. Gustav Schwab, Füsser, the critic and historian, Karl Mayer, and Mörike, all belong more or less to the romantic school. None of them was given to literary activity by the political excitement immediately preceding and succeeding the French revolution of 1800. Ludwig Börne (1785-1887) and Heinrich Heine (1800-1885) are regarded as its heralds, the former by his pungent and comprehensive political satires, the latter by his keen insight and peculiar lyrical genius. Heine exercised a wide influence in the literary world. As a poet, he had a peculiar gift of uniting the tragic and comic in a felicitous and racy manner, which made him the idol of a new school of authors who styled themselves "Young Germany," but who partook much less of Heine's poetical gifts than of his political sympathies. Karl Gutzkow (born in 1811) was the head of this school. He is the author of *Die Ritter vom Geiste und Zauberverbrauch* and *Die Kultur der Welt* and several dramas. The other principal representatives of "Young Germany" are Heinrich Laube (born in 1806), Gustav Kühne (1806), and Theodor Mundt (1808). An eminent author of this period is Baron Sternberg (1806), author of *Diane und Paul*, and of many other works which hold up the mirror to the social and political condition of his country. Another famous writer and amateur liberal politician of this class is Prince Pickler-Muskau (1785-1871), author of *Briefe eines Verstorbenen*, and of other piquant books. The taste for novels of a political and social tendency has been characteristic of German writers since the early part of this century. The novels of Gutzkow, Laube, and many other contemporary German writers, all belong to this category, while Gustav Freytag has gained a high reputation by several excellent novels, among which the best known is *Soll und Haben* ("Debit and Credit"). The line of historical novelists was opened by Meissner (1753-1807); he was followed by Karoline von Pichler (1769-1849), Tromlitz (Von Witzleben, 1773-1839), Van der Velde (1779-1824), Karl Spindler (1796-1865), author of *Der Jude, Der Bastard*, and other novels, which enjoyed great popularity; Rellstab, Storchi, Ra, and Koenig (1790-1889), author of *Die Clubisten in Mann*, (1847); Berneck or Bernd von Guseck (born in 1808), Mügge (1806-81), author of *Toussaint* and other excellent novels, Kühne and Heller (1818-71), are all contributors to this class of novels. Here belong also the semi-historical novels of Louise Mühlbach (Mme. Mundt, 1814-73), which have enjoyed a very wide popularity, but are not entitled to high rank either from a literary point of view or as interpreters of history. A far higher merit must be awarded to Zschokke (1771-1848), one of the best German prose writers of recent times, author of many excellent historical and romantic works, and of *Stunden der Andacht*, a religious work, which has passed through many editions. Heinrich Steffens, the Norwegian philosopher and naturalist (1773-1845), wrote German novels based upon Scandinavian history, which archetypal is not. Another historical novelist is Wilhelm Haring, known by the pseudonym of Wilibald Alexis (1797-1871), who imitated so skilfully the manner and style of Sir Walter Scott that several of his works were translated into foreign languages and passed for some time as the productions of the great English romancer. The most famous of the kind is "Walladmore." Hauff, a genial novelist, whose *Lichterleuchte* takes high rank among historical romances; Clarenz, a licentious writer, but one whose novels have been read extensively; and Hackländer, the author of *Soldatenleben, Handel und Wandel*, and many other works, and the founder and conductor of the widely known journal *Ueber Land und Meer*, may be mentioned here; also Berthold Auerbach (1812), who attracted immediate notice by his historical work, *Schwarzwälder Dorfgeschichten*, and has since taken his place among the leaders of German fiction, his novel *Auf der Höhe* having gained a very wide reputation in Germany,
England, and America, which has been increased by his later works. Among German novelists of the last decade whose works possess permanent value, the leading place is undoubtedly occupied by Friedrich Spielhagen, whose *Problematische Naturen, Durch Nacht zum Licht, Hammer und Amboss*, and other works, enjoy a great popularity and high esteem. Heinrich Laube, Alfred Meissner (a grandson of the historical novelist), Max Ring, Edmund Hofer, Fanny Lewald, Levin Schützing, Karl von Holtei, and others, have been prolific contributors to the recent literature of fiction. Eugenie John, best known under the nom de plume of E. Marli, has written several excellent novels, among which *Goldelse* (1866), *Das Geheimnis der alten Mansell* (1867), and *Reichsgänzlein Gisela* (1869) have been exceptionally popular, and have been translated into English. Paul Hoye is another contemporary novelist whose works have attained and deserved much success. Among the poets who have expressed liberal political tendencies with most point are Hoffmann von Fallersleben, the author of *Unpolitische Lieder*; Herwegh, author of *Gedichte eines Leidensgenossen*; Dingelstädt, author of *Lieder eines kosmopolitischen Nachtwächters*; Prutz (born in 1810), Kinkel (1815), and Freiglarch. Among other recent poets who have acquired some eminence are Grabbe, Gottschall, Emanuel Geibel, Redwitz, Paul Heyse, Wolfgang Müller, Max Waldau, Gerok, Bodenstedt (especially distinguished for his versions of Persian poetry), Böttger, Simrock, Kulger, Keller, Schefer, and Hammer, many of whom excel in ballads and songs after the style of the Schwabian school. A circle of poets in Vienna cluster round Anastasius Grün (Count Anersberg), the greatest lyric poet of Austria, author of *Später glyphen eines Wiener Poeten*, *Schott*, *Der letzten Ritter*, etc. Lenau and Karl Beck were the principal and most gifted of his followers. Alfred Meissner and Moritz Hartmann belong to this school. A few other names of writers who have acquired a passing reputation by attractive or melodious verses might be added here; but during the past decade no really great poet, whose fame is likely to be lasting, has appeared in Germany. The war against France in 1870 called forth, it is true, many national and martial lyrics, among the best of which were several by Freiglarch and Geibel, as well as some stirring songs by the newer writers Gottschall, Grosse, Ritterhaus, and Jensen. Several of those named in the list of recent poets given above also produced noteworthy war lyrics. *Die Wacht am Rhein*, written long before (about 1840) by Schneck- enburger, became the popular war song of the armies of 1870; but its literary worth was such that many others of the national poems published during the period of its popularity.—Dramatic literature has also fallen from the high estate which it had reached through Lessing, Goethe, and Schiller. Gers- tenberg (1737–1828) was the author of the high-wrought tragedy *Ugelino*, noticeable only for its extravagance. Among his contemporaries were some excellent dramatists and poets, as Cronegk, Leisewitz, Weisse, etc. Iffland (1749-1814), in a long series of plays, reflected the life of respectable people of the middle classes; they are eminently moral in their tone, but long and heavy. Werner (1768–1828) became the founder of the so-called tragedy of fate (Schiesskalaborgie) by his piece called *Der Vierundneunzehnte Februar*. The imitators of his extravagant style are Müller (1774–1829) in his *Schuld, Howald (1778–1845) in his *Bild*, and Grillparzer (1790–1872) in his *Alma* *Kotzebae* (1781–1819) succeeded in obtaining a higher popularity than all his contemporary playwrights. His forte was in comedy. He wrote more than 200 plays, some of which have been adapted to the English and French stage. Münch-Bellinghausen (nom de plume, Friedrich Halm) has written an excellent drama, *Der Sohn der Wildnis*, a national tragedy, *Der Pfarrer von Krommer*; another work, *Mozart, Elchendoff, Julius Mosen, Gutzkow, R. Lambe, Hebbel, Griepenkerl, Prutz, and Brachvogel have all cultivated dramatic literature. Charlotte Birch-Pföffer (1800–58) dramatized a great number of stories. Karl Immermann belongs to a higher class of dramatists; his trilogy *Alexis*, and his mythical play *Merlin*, and many of his tragedies and comedies, are excellent reading plays, but they are not well suited to the stage. M. Beer’s *Strenuus* is also a work of high poetical merit. Raupach (1784–1859) was one of the most fertile of German dramatists. Eduard Duller (1809–58) wrote several historical dramas. The comedies of Hackländer, and particularly of Benedix, display considerable ability; and among other writers of comedy are Feldmann, Töpper, Albini, Gutzkow, Gustav Freytag, and Bauerfend. Paul Heyse, Wilhelm Jordow, Krum, Moseenthal, Wellen, Wilbrandt, Gustav von Pultitz, and Schaufert are among the more noteworthy of the very recent dramatists. Among their works are many of positive excellence, though none for which it is possible to predict an enduring fame.—Bellelettres, on the whole, have in recent years fallen into comparative insignificance in Germany. The most eminent minds no longer devote themselves to poetic and dramatic literature, but to the exploration of the spheres of science and learning. Alexander von Humboldt (1769–1859) gave a powerful impulse to almost all departments of knowledge by his “Cosmos,” “Travels,” “Views of Nature,” and the general suggestiveness of his labors. While he marks a new epoch in the pursuit of the natural sciences, another great movement was initiated in historical research by Niebuhr (1742–1811), the illustrious historian of ancient Rome; Schlosser (1776–1861), the vigorous and truthful exponent of universal history, and particularly of the history of the 18th century; Heeren (1760–1842), the investigator of history in connection
with political and commercial relations; Rau-
mer (1781-1873), the historian of the Hohen-
stanfen; Leopold von Ranke (1793), whose
labors embrace a vast field of modern history;
Dahlmann (1783-1860), the German Guizot,
author of “Sources of German History,” and
the historian of Denmark and of the English
and French revolutions; and Gervinus (1805-
’71), the historian of German literature, Shakes-
pearian critic, and author of the great history
of the 19th century. Here may be mentioned
also Rotteck (1775-1840), whose excellent uni-
versal history has been very popular on account
of its liberal political views, and Weber, the
author of several universal histories. While
Niebuhr introduced a profounder method in
the study of early Roman history, Bunsen,
Lepsius, and others made discoveries in Egyp-
tian and oriental antiquities, and a third im-
pulse proceeded from the discoveries in the
field of classical archaeology and philology.
These combined influences are more or less
manifest in the labors in ancient history of
Böckh, Karl Otfried Müller, Duncker, Droysen,
Mommsen, Kortüm, Adolph Schmidt, Pless,
Wachsmuth, Tittmann, Flathe, Manso, Abeken,
Schwegler, E. Curtius, Lassen, Jahn, Hermann,
Teuffel, and Movers. In the special study of
Sanskrit Roth, Böhltingk, Benfey, Pick, A.
Weber, and others have won distinction.
The history of the middle ages has been treated by
Rühs, Rahtm, and Wilken, and more especially
by Leo, Hammer, Fallermayr, Aschbach, Lapp-
enberg, Dahlmann, Schäfer, Röpell, Krieg,
and Gregorovius. Various branches of orien-
tal history and literature have been actively
explored by Joseph von Hammer-Purgstall,
Flügel, Flath, Radeloff, Ewald, and Nol-
decker. Among writers on modern history are
Dohm, Saalfeld, Bülau, Männich, Häusser,
and Treitschke. The humanitarian and cosmo-
politan direction given to historical studies by the
writers and philosophers of the 18th and 19th
centuries, and especially by Herder and Kant,
is manifest in the comprehensive views which
Rotteck, and chiefly Schlosser, bring to
bear upon their labors, as well as in many
works on particular sections and occupations of
the people. This has culminated in what
may be designated as a new science, which the
Germans call Culturgeschichte, i. e., a history
which treats of the moral, intellectual, social,
and politico-economic, as well as political
development of the people. Among the principal
labors in this new sphere of investigation are
Wachsmuth (1784-1860), author of Europäische
Sittengeschichte and of Allgemeine Culturges-
chichte; Scherr, author of Geschichte deutcher
Cultur und Sitte; Klemm (1802-’69), author of
Allgemeine Culturgeschichte der Mensch-
heit, and of Allgemeine Culturwissenschaft; and
Henne-am-Rhy, author of Culturgeschichte
der neueren Zeit. The same tendency to dwell
upon the practical realities of life extends over
many other departments of literature in Ger-
many, and is most strongly expressed in recent
biographies and autobiographies, especially in
that of Perthes. A more physiological method
in these branches of investigation has been
adopted by Riehl in his Naturgeschichte des
Volks als Grundlage einer deutschen Socialpoli-
itik. The literature of travels was greatly
stimulated by Johann Georg Adam Forster,
commonly called Georg Forster (1754-’94), who
accompanied Cook on his second voyage round
the world, and who, in Alexander von Hum-
boldt’s opinion, inaugurated a new era of sci-
entific voyages. A still more powerful im-
pulse was given by Humboldt himself, by his
travels in the equinoctial regions of America,
and in central Asia. The travels of Lichten-
stein (1780-1857) in southern Africa were of
great scientific importance. The travels of
Prince Maximilian of Wied (1789-1867) fur-
nished valuable additions to the knowledge of
the natural history and ethnology of Brazil
and the United States. The explorations of
Martius (1794-1868) in Brazil are important
for the studies of botany, ethnology, geography,
and statistics. Pöppig (1797-1888) visited
Chili, Peru, and the river Amazon. Among
the other explorers of South America are
Burmester (born 1807), who travelled more
particularly in Brazil, and Johann Jakob von
Tscharudi (1818), a relative of Friedrich von
Tscharudi, author of Das Thierleben in der Al-
penwelt, and an active traveller, especially in
Peru. Sir Robert Hermann Schomburgk (1804-
’65), a German by birth, but employed in
the service of the British government, travelled
in British Guiana, Barbadoes, Hayti, &c. His
works were published in German by his broth-
er, Otto Schomburgk (1810-’37). Another
brother, Moritz Richard Schomburgk, travel-
ed in British Guiana at the expense of the
king of Prussia, and afterward in Australia in
company with a fourth brother, Julius Schom-
burgk. The East has been visited by G. H.
von Schubert (1780-1860), especially Egypt,
Palestine, and Greece, and by Seetzen (1767-
1811), whose Reisen durch Syrien, Palastina,
die Trans-Jordan-Länder, Arabia Petræa und
Unterägypten, were edited by F. Kruse. Minu-
toli (1772-1849) wrote on his travels to Upper
Egypt. Röppel (born 1794) explored Nubia,
Kordofan, Arabia Petræa, and is best known
by his travels in Abyssinia. The most eminent
writers on Egypt are Lepsius, Brugsch, Baron
Bunsen, Ebers, Dümichen, and Lauth. The
historian Raumer gave graphic descriptions of
his travels in Venice, England, Italy, and the
United States; and Joseph Russegger (1809-
’69) wrote comprehensively on his travels in
Europe, Asia, and Africa. Venédey (1805-
’71) gave accounts of England, Ireland, and
southern France. Moritz Wagner (born 1818)
has published his travels in Algeria, the Cau-
casus, Colchis, Persia, and Kurdistan, and, in
conjunction with his companion Scherzer, in
North America and Costa Rica. Froebel
(born 1806) has described “Seven Years’ Trav-
els in Central America, Northern Mexico, and
GERMANY, WINES OF. The wine-producing area of Germany is limited chiefly to those parts watered by the Rhine and its tributaries, the Moselle, the Nahe, the Neckar, the Main, and several smaller streams, so that the terms Rhine wine and German wine may be considered almost synonymous. Bonn, in Rhenish Prussia, and Freiburg, in Baden, mark approximately the northern and southern limits of the grape culture. Both red and white wines are produced, but those known to commerce are, with a few exceptions, white. The red varieties are mostly of inferior quality and are consumed within the country. All are distinguished by their comparative freedom from alcohol, which barely exceeds 12 per cent, and at the same time by their durability, the finer growths frequently retaining their excellence for half a century or more. Liebig attributes their distinctive character and bouquet to the free acid which they contain, and their valuable hygienic properties to the tartar present in them. To this cause he ascribes the immunity enjoyed by persons dwelling on the Rhine and the Moselle, and indeed by all who use German wines, from calcareous complaints. The most favored and celebrated viticultural district in Rhineland is that known as the Rheingau, a strip of territory about 15 m. in length, and not exceeding 3 m. in width, lying between the Tamus range of mountains, in Nassau, and the right bank of the Rhine. It extends from Walldorf, just below Mentz, to Lorch, 6 m. below Bingen. The river, after following a northerly course for many miles, turns abruptly at Mentz to the west, in which direction it flows as far as Bingen, when it again turns northward. Having thus a southern exposure, and being protected from the north winds by the mountains behind it, and from the southwest winds by a range on the west bank of the Nahe, with the further advantage of having the rays of the sun reflected from the river directly upon its slopes, the Rheingau affords a site for vineyards unequalled perhaps in Europe, and has a climate peculiarly favorable to the production of the fragrant and delicate wines for which the district is famous. In connection with the Rheingau may be considered the neighboring district of Hochheim, on the north bank of the Main, about 4 m. from Mentz, and from the first syllable of which is derived the name, hock, by which all Rhenish wines were once designated in Great Britain and the United States. The vineyards of Hochheim have a southerly exposure, and are essentially an easterly continuation of those of the Rheingau. The vine appears to have been cultivated throughout this whole region as early as the 6th or 7th century, but to the monastic foundations established there during the middle ages belongs the credit of discovering and perpetuating the system of viticulture which has brought its wines to their present high degree of perfection. During the religious and civil conflicts which disturbed Germany from the 16th century to the end of the Napoleonic wars, the most famous vineyards gradually passed from the hands of the monks to those of the dukes of Nassau, the princes of Metternich, or less distinguished proprietors. In the latter half of the last century many new vineyards were planted by persons of means from Mentz, Frankfort, and other neighboring cities; and by the conjunction of capital with intelligent labor the Rheingau has become the most highly cultivated wine-growing region, perhaps, in the world. Within a comparatively recent period the discovery has been made that the Riesling grape, which yields the bouquetted wines, develops its finest qualities only when in a state of over-ripeness, without concurrent acidification. This has led to a complete reform in the treatment of the wines in the cellar. While formerly young wine required from ten to twenty years to ripen, it is now perfected in from three to five years, with a perceptible improvement in quality. In like manner the large casks previously used, to diminish to the utmost the loss by diffusion and evaporation, have been discarded, as they were found to be impediments to the quick maturation of wine by diminishing the surface accessible to oxygen. The vineyards of Hochheim lie about three quarters of a mile from the banks of the Main, above which they are elevated 100 ft., and embrace an area of between 700 and 800 acres. The finest wine is produced on the estate known as the Dechanel, or deanery, eight acres in extent, which has an admirable exposure. The Stein, a continuation of the Dechanel, yields wines which are sometimes said to surpass the best products of the Rheingau. These vineyards, formerly the property of the dukes of Nassau, now belong to the emperor of Germany. — Entering the Rheingau proper, we shall find a famous series of vineyards extending from the village of Elsfeld to Assmannshausen. In the centre of the district, on a gentle eminence half a mile from the Rhine, lies the estate, about 46 acres in extent, of Schloss Johannisberg, a name long associated with the choicest products of the Rhenish vines. It yields a white wine, which in respect to fullness of taste and richness of bouquet has been called "the finest and most powerful drink on earth." Johannisberg was originally a Benedictine abbey, founded in 1106, which, after various changes of ownership, became in 1815 the property of the emperor of Austria, who bestowed it upon Prince Metternich, with whose descendant it now remains. Notwithstanding the limited area of the estate, the soil varies considerably in different parts, which are marked off by stakes with numbers affixed; and the cultivation and the vintage are especially adapted to each part. A similar practice prevails in other celebrated vineyards of the Rheingau. Great care is exercised in the selection of grapes for the press, the first picking, or Auslesen, of overripe fruit yielding the highest quality of the
wine of each year. The quantity of wine annually produced has varied from 25 pieces of 240 gallons each to 60 pieces. The wines of inferior quality, produced in poor years, are sold by auction immediately after the spring racking, and only the select qualities are kept in the cellars of the estate. At the age of four or five years they are bottled, after which they greatly improve in bouquet. The largest yield was in 1857, when 60 pieces, or 14,400 gallons, realized at auction $60,000. The difficulty of obtaining genuine Schloss-Johannisberger is very great, and large quantities of spurious wine are sold under the name. The first quality has been known to command from $5 to $8 a bottle; but the auction wines are much less valuable, and sell for from $250 to $1,000 the piece, according to the qualities they possess for mixing.—Next in reputation to the Johannishberger wine, if not its equal, is that produced on the estate of Steinberg, which until 1866 was the property of the dukes of Nassau, but in that year passed into the possession of the crown of Prussia. The Steinberg is a hill 3 m. from the Rhine, the vine-growing portion of which occupies an area not exceeding 60 acres, enclosed by a massive wall of masonry. This, with the mountain barrier in the rear, effectually screens the vineyard from chilling or injurious winds. The estate, which once belonged to the wealthy cloister of Eberbach, includes also a farm of 450 acres, maintained for the sole purpose of producing the manure necessary for the vineyard. The latter has various undulations and hollows, by which it is divided into districts yielding different qualities of wine. The soil is heavier than that of the Schloss Johannisberg, and on this account in warm seasons the ripening of the grape is not as a rule effected before the latter has reached its full maturity. The opposite result is often witnessed in the Johannisberg vineyard. Thus, during the years 1857, 1858, and 1859, which were exceptionally warm, the Steinberg wines showed a marked superiority over those of the Johannisberg. The discovery that the overripe grapes yield the best wine was made on this estate about 50 years ago, and since then the vintage has always been very late. In ordinary years there are two or three selections of grapes, from the first of which is made the best wine, the rest hanging 10 or 16 days longer. The annual product of the estate varies from 14,000 to 20,000 gallons, valued at $350 to $8,500 the piece, the latter price being paid for the choicest cabinet wines only. The Auslese of certain exceptionally fine years has sometimes sold in the cask as high as $85 a bottle. The ordinary qualities, like those of the Johannisberg wine, are sold annually by auction.—Scarcely inferior to these wines are those produced on the Rüdesheim-Berg and Hinterhaus, which have a southerly exposure, and lie so near the Rhine that the reflection of the sun from the surface of the river greatly facilitates the ripening of the grape. The vineyards, comprising an area of about 800 acres, divided among a number of proprietors, are terraced from the base to the summit of the hills, and yield wines of considerable body and fine bouquet, the best qualities of which are high-priced. A short distance below Rüdesheim is Asmannshausen, which yields the only good red wine of the Rheingau. This is produced from the black Burgundy grape known as the pinot noir, whence the wine is often spoken of as a species of Rhenish burgundy. It has a soft and exceedingly delicate flavor, but like the higher class of burgundies suffers from transportation. The wines produced on the estates of Marcobrunn, Hattenheim (first growth), Gräfenberg (first growth), and Geisenheim-Rothenberg, also rank as of the highest quality, and in favorable seasons command enormous prices. Of the second growth of the Rheingau the most esteemed varieties are the Johannisberg-Clara, Vollraths, and Rautenthal-Berg. Among the third growths may be mentioned Hanffheimer, Winkel, Hallgarten, Rüdesheimer, Geisenheimer, Erbach, Elsfield, and Lorch, which may be regarded as the ordinary wines of commerce. In good seasons, and when the best grapes only are selected, these latter growths sometimes reach a high degree of excellence, and command a correspondingly high price.—The banks of the Rhine from Asmannshausen to Coblenz are thickly planted with vineyards, but the situations being for the most part unfavorable, little or no wine of first-rate quality is produced on this part of the river. But in the valley of the little river Ahr, which enters the Rhine about 20 m. below Coblenz, is grown a pale red wine, called the Ahr-Bleicher, having certain strengthening and astringent qualities, and an agreeable burgundy flavor.—Rhenish Bavaria or the Palatinate produces an immense quantity of wine, the yield in favorable seasons reaching 16,000,000 gallons, which is noted for its medium good quality, its purity and freshness of taste, and its cheapness. While never approaching the wines of the Rheingau in bouquet, it is not infrequently surpasses them in richness. The vineyards occupy a fertile, undulating plain, somewhat elevated above the valley of the Rhine, and bounded on the west by the Haardt mountains, a northerly continuation of the Vosges range. About 25,000 acres are under cultivation. The wines of the first growth are Rupertserberg, Deidesheimer, Wachenheimer, and Forster; of the second, Ungsteiner, Dürkheimer, and Königsbach.—Rhenish Hesse produces wines partaking of the qualities of those of the Palatinate and of the Rheingau. Well known growths are the Liebfrauenmilch, produced in and around the convent garden of the Liebfrauen-Stift, near Worms, an agreeable middle-class wine of fine bouquet; the Scharrlacherberg and Feuerberger of Bingen and its neighborhood; and the wines of Laubenheim, Bodenheim,Oppenheim, Nierstein, and Selzen, several of which have considerable local repu-
tation, and are often substituted for wines of the Rheingau. The district of Oberingelheim produces much red wine, resembling burgundy grapes. The produce of the Nahe is nearly related to the middling growths of the Palatinate.—The Bavarian wines, grown in Lower Franconia, in the valley of the Main, are distinguished rather for their body and strength than for their bouquet, and are mostly consumed within the country. The only varieties exported are those produced in the neighborhood of Würzburg, where about 4,500 acres are under cultivation. The best vineyards are the Leiste and the Stein, the products of which are of fine quality and very expensive. Both are situated on the Main, and the former is principally owned by the king of Bavaria, who stores the wine made from the estate in the cellars which underlie the royal castle of Würzburg. The cellars then are more than 900 years old, one having a capacity of 2,500 gallons. Though considered in the last century indispensable to the proper ripening of wine, they are now but little used. The Leiste wine of good quality is mostly carried to Munich and drunk at court, and only a small quantity enters into trade. The Stein wine, which is also very celebrated, is sold in short-necked bottles of a peculiar shape, called Bockaberteil. Much of the wine passing under this name in England and the United States is the product of the Palatinate, which at Mentz and elsewhere is put into bottles of the shape of the Bockaberteil and sold as Stein.—In Baden a large quantity of third or fourth class wine is produced, the best growth being the white Markgräfler and the Affenthaler, a light, agreeable red wine. The great fun in the castle of Heidelberg was nearly filled with a wine grown in a district known as the Bergstrasse, which commences at Zwingenberg, in the province of Starkenbourg, and follows a range of hills to Heidelberg. More than half of the wine grown in Württemberg is produced in the valley of the Neckar, and though not of high grade is agreeable to the taste and wholesome. From its changeable color it is termed Schiller. The general character of the wines grown in the valley of the Moselle is that of thin Rhine wine. They are lighter and less spirituous than those heretofore described, and are noted for an aromatic flavor, which, however, is said to be generally communicated to the wine by mixing with it a tincture of elder flowers, called also the “essence of muscatel,” because it resembles the concentrated flavor of the muscatel grape. Messrs. Thindicum and Dupré, in their “Treatise on the Origin, Nature, and Varieties of Wine” (London, 1872), say: “It must be declared with emphasis that there is not a grape of muscatel grown upon the Moselle fit for wine making; that there is not a single barrel of wine made there which naturally has the muscatel flavor; and that all the wine having the flavor which imitates it is made up with tincture of elder flowers.” The better sorts are highly esteemed in Germany for their supposed medicinal properties. The wines held in highest repute are the Brauneberger and Scharzburger, the latter grown on the Saar, a tributary of the Moselle; and scarcely less noted are the Zeltinger, Grascher, Dun, Piesporter Auslese, Josephhaff, Berncastel, Grünhausen, and Scharzhofberger. The area under cultivation comprises about 18,000 acres, yielding in favorable seasons 180 gallons to the acre. About 50 years ago sparkling wines were first manufactured in Germany at Esslingen and Heilbronn, from the Neckar grape; and the process has since been so successfully carried on that these wines may be considered in some degree the rivals of champagne. Upward of 2,000,000 bottles of sparkling Moselle and sparkling hock are annually made at Hochheim, Mentz, Coblenz, and other places, much of which, by means of false labels, is sold as champagne, and readily passes for such. The process of manufacture is precisely similar to that employed in making champagne. (See France, Wines of.) The seasons of 1871, 1872, and 1873 were the most disastrous known to German viticulturists.

GERMERSHEIM, a fortified town of Rhenish Bavaria, at the confluence of the Queich and the Rhine, 7 m. S. W. of Spire; pop. in 1871, 6,292. It has several churches and schools, and an active trade in grain, hemp, flax, and fruits. Ship building and fisheries are carried on, and gold is washed from the sands of the Rhine. Originally a Roman stronghold, the present town was founded by the emperor Rudolph of Hapsburg, who died here in 1291. It formed part of the electoral Palatinate from 1380 to 1802, when it was conquered by Austria. From 1844 to 1850 it was occupied by the French, who retook and devastated the place in 1874 under Turenne. After the death of the elector Charles (1885), the French again claimed possession, whence arose the Germersheim war of succession, which came partly to an end through the treaty of Ryswick (1697), and finally through the arbitration of the pope (1702). It was subsequently the scene of important military operations up to July, 1798, when the French were here defeated by the Austrians. Germersheim having been made a fortress of the German confederation, works begun in 1885, together with the fortress of Landau, distant 10 m., and with a tête-de-pont on the right bank of the Rhine, make it a strong strategical position.

GERM THEORY OF DISEASE. See supplement.

GERON, Karl, a German poet, born at Vaihingen, Württemberg, Jan. 30, 1815. He studied at Stuttgart, held ecclesiastical offices, and in 1868 became first preacher of the court and chief consistorial councillor. His published sermons have passed through many editions, and his religious poems, including

GÉROME, Jean Léon, a French painter, born in Vesoul, May 11, 1824. In 1841 he went to Paris and studied under Paul Delaroche, whom he accompanied to Italy. He returned to Paris in 1845, and exhibited his first picture in 1847. For several years afterward he travelled in the East, his journeys furnishing him with numerous subjects for pictures. He obtained medals in 1847, 1848, and 1855, and in the last year received the decoration of the legion of honor. In 1868 he became professor of painting in the school of fine arts, and in 1869 was decorated with the order of the red eagle. He has produced many pictures of the life of the ancients, which have placed him at the head of a school of art designated as the Pompeian or New Greek; and several of his pictures have been criticised as indelicate to the last degree. Among his works are "The Virgin, the Infant Jesus, and St. John," "Bacchus and Cupid," "A Greek Interior," the frieze of the vase commemorating the London exhibition of 1851, "The Plague at Marseilles," "The Death of St. Jerome," and "A Lioness meeting a Jaguar." His masterpieces in historical art is "The Age of Augustus and the Birth of Jesus Christ," exhibited in 1855, and purchased by the French government. He exhibited in London in 1871 a naked Nubian girl, entitled "To be Sold," and "Cleopatra brought to Caesar in a Basket," the latter inferior to most of his other works. One of his latest pictures, "The Gladiators," was purchased in 1873, by Mr. A. T. Stewart of New York, for $60,000.

GERONA. A province of Spain, in Catalonia, forming the N. E. extremity of the peninsula, bordering on France and the Mediterranean, and on the provinces of Barcelona and Lérida; area, 2,272 sq. m.; pop. in 1870 (estimated), 526,110. The surface is chiefly covered with the ramifications of the Pyrenees, but fertile valleys frequently intervene. The inhabitants of the interior are mostly engaged in agriculture and cattle rearing; those of the coast in ship building, fishing, and navigation. The principal rivers are the Ter and the Fluvià. Among the towns are Rossas and Figueras, both fortified, Olot, and Ripoll. II. A city (anc. Gerunda), capital of the province, at the confluence of the Ter and Ona, 53 m. N. E. of Barcelona; pop. about 10,000. The chief manufactures are linen and woollen fabrics, paper, soap, earthenware, and hardware. It was captured by the Moors in 915, recaptured by the Franks in 918, and is famous for the sieges it has sustained.

GERBY, Elbridge, an American statesman, fifth vice president of the United States, born in Marblehead, Mass., July 17, 1744, died in Washington, Nov. 28, 1814. He graduated at Harvard college in 1762, and was elected in 1772 representative from Marblehead to the legislature. He at once became a political leader, and an associate of Samuel Adams, Hancock, and Warren. He was placed on the two most important committees, those of safety and supplies, which sat at Cambridge, on the day preceding the battle of Lexington. In January, 1776, he was elected a delegate to the continental congress, signed the Declaration of Independence, was placed on the most important committees, and was generally chairman of the committee of the treasury till the organization of the treasury board in 1780, of which he became presiding officer. He retired from congress in that year, but resumed his seat in 1788. As delegate to the convention which met in Philadelphia in 1787 to revise the articles of confederation, he refused to sign the constitution proposed, but lent his support as member of congress after it had received the sanction of the people. He served four successive years in congress, and in 1795 retired to private life, residing in Cambridge, till in 1799 he was appointed to accompany Pinckney and Marshall on a special mission to France. He was invited to remain in Paris, though his associates were ordered to quit France, and he then obtained the evidence and assurances upon which the subsequent commission acted. On his return he was unsuccessfully supported by the democratic party of Massachusetts for the office of governor in 1799, and again in 1801, but was elected after an excited canvass in 1810, and was reelected in 1811. In 1819 he was elected vice president of the United States, but died suddenly in the second year of his term.

GERS, a S. W. department of France, formed from parts of Gascony and Guienne, bordering on the departments of Lot-et-Garonne, Tarn-et-Garonne, Haute-Garonne, Hautes-Pyrénées, Basses-Pyrénées, and Landes; area, 2,428 m.; pop. in 1872, 284,717. The surface is in general hilly. It is watered by the Gers (which rises in Hautes-Pyrénées, and flows N. into the Garonne), Save, Adour, and several other rivers. The most important vegetable products are the cereals, flax, and onions. Fruit is scarce. Large quantities of wine and brandy are made, but of ordinary quality. The minerals are of little consequence, but gypsnum and a fusible spar used in making glass and porcelain abound. The only manufactures are brandy, coarse woollens, leather, bricks, glass, and earthenware. It is divided into the arrondissements of Auch, Mirande, Condom, Lectoure, and Lombez. Capital, Auch.

GERSON, Jean Charles de, a French theologian, born at Gerson, near Rheims, Dec. 14, 1808, died in Lyons, July 12, 1849. At the age of 19, he entered the Paris faculties of sciences, humanities and theology, and in 1837 he was selected by the university as one of its deputation to the antipope Clement VII. at Avignon upon the controversy concerning the immaculate conception. About 1839 he was made chancellor.
of the university of Paris. Charles VI. had just fallen into insanity, and while divisions menaced the state, the church was rent by a schism which produced two and afterward three pretenders to the pontificate. Gerson exerted himself for the reform of morals and the banishment of scholasticism from the university, combated astrology, and resisted the invasion of the pantheistic doctrines which then had their seat in Brabant. When the duke of Orleans was assassinated by the duke of Burgundy in 1407, Gerson denounced the murderer and delivered the funeral oration of his victim. Pursued by John the Fearless, he saw his house pillaged, and was obliged to conceal himself in the vaults of Notre Dame. He was present in the council of Constance as theologian of the bishop of Paris; and, as the council had been convened for the purpose of electing a pope whom all Christendom would acknowledge, he urged the deposition of the two pretenders to the papacy, John XXIII. and Benedict XIII., in a treatise De Auseptabilitate Popo. He wished to prove that there were circumstances in which the assembled bishops of the whole church can compel pretenders to the papal dignity to renounce their claim, and depose them if they refuse to abdicate. The schism was at length ended, but Gerson's efforts to check the abuses which reigned in the church were ineffectual; and as civil dissensions did not permit his return to France, he retired to the mountains of Bavaria, where he wrote De Consolatione Theologiae, and the Monotessaron, a harmony of the four Gospels. He returned to his country after a voluntary exile of two years, and found an asylum in a convent. Though one of the most active men of his age, he was also the most mystical of his thinkers. He was the first who sought to give to mysticism the character of a science. He recognized in the soul two classes of faculties: the cognitive or intellectual, whose highest act is simple intuition of divine things; and the affective faculties, whose highest act is ecstatic delight in God. To substitute this mystical philosophy for scholasticism was the aim of his writings. As many manuscripts of the "Imitation of Jesus Christ" bear the name of Gerson, that work is often ascribed to Gerson. (See Kempis, Thomas.) See Vie de Gerson (Paris, 1893); C. Schmidt: Essai sur Jean Gerson (Strasburg, 1839); and R. Thomassy, Jean Gerson (Paris, 1843). The best edition of Gerson's works is that of Dupin (5 vols. fol., Antwerp, 1706).

Gerson Ben Judah, a rabbi of France, distinguished by the appellations Rabbeno (our master), Hayyaken (the old man), and Meor hayyolah (light of the exiled), born in Germany about 960, died about 1080. He wrote a commentary on the portion of Hosea and slight fragments remain, and is celebrated for the introduction of various reforms among the European Jews, including the abolition of polygamy and repudiation, known under the name of "institutions (gerethoth) of Rabbeno Gerson."
Leipsic, 1871) these two works are comprised under the general title Geschicht der deutschen Dichtung. In them the author traces the development of poetry in its relations to the progress of civilization and of society. He lost his chair at Gottingen in 1837 by signing the famous university protest against the abolition of the Hanoverian constitution. In 1838 he made another journey to Italy, renewed his historical researches at Rome, and returned to Heidelberg, where he became honorary professor in 1844. He now took part in the political affairs of Germany, advocating liberal ideas. In 1847 he was one of the founders of the Deutsche Zeitung, the organ of the constitutional party, and in 1848 was elected a member of the Germanic diet, and subsequently of the parliament at Frankfort, and had a prominent part in forming the constitution eventually adopted by the latter assembly. In 1850 he went to England, where he made unsuccessful efforts in behalf of the duties of Schleswig and Holstein, and on his return to Heidelberg resumed his historical writings. Among his later works are: Shakespeare (4 vols., 1849-50); Geschichte des neunzehnten Jahrhunderts (9 vols., 1855-56, besides an introductory volume published in 1864), beginning with the fall of Napoleon and brought down to the year 1831; Händel und Shakespare (1868); and Händel's Oratoriente, published posthumously by his son in 1873.

GESNIEUS, Friedrich Heinrich Wilhelm, a German orientalist, born in Nordhausen, Feb. 3, 1786, died in Halle, Oct. 28, 1842. He studied at the universities of Helmstedt and Göttingen, and was appointed in 1806 magister legum at Göttingen, in 1809 professor of ancient literature in the gymnasion of Halle, in 1810 subordinate, and in 1811 ordinary professor of theology in the university of Halle, where he remained to the end of his life. Devoting himself to the study of the Semitic languages, and particularly of the Hebrew, Gesenius founded a new school of Biblical exegesis, chiefly based on an accurate, rational, and historicistic study of philology. His works are: "Hebrew and Chaldaic Lexicon for the use of the Old Testament" (2 vols., Leipsic, 1810-12; 4th German ed., 1854; 2d Latin ed., 1846; translated into English by J. W. Gibbs, Andover, 1824, and by Edward Robinson, Boston, 1836; new and greatly enlarged editions, 1850 and 1855); "Elementary Course of the Hebrew Language" (2 vols., comprising a "Hebrew Grammar" (Halle, 1813; 15th ed. by Rödiger, Leipsic, 1851; translated into English by Moses Stuart, Andover, 1826, and by T. J. Conant, Boston, 1889), and a "Hebrew Reader" (Halle, 1814; several times republished by different editors); "Critical History of the Hebrew Language" (Leipsic, 1815; 2d ed., 1827); "De Pentateuchi Samaritani Origines, Indole et Autoritate" (Halle, 1815); "A Grammatico-Critical System of the Hebrew Language" (2 vols., Leipsic, 1827); "Translation of the Prophet Isaiah, with a Philologicocritico-historical Comment" (3 vols., Leipsic, 1820-21); "Scriptura Linguaque Phainicis Monumenta" (3 vols., Leipsic, 1837); and "Thesaurus Philologicocritico-historicus Hebraicus et Chaldaeus veteris Testamenti" (3 vols., Leipsic, 1829-58; part of vol. iii. by Rödiger).

GESNER, Conrad von, a Swiss naturalist and philologist, born in Zürich, March 26, 1516, died there, Dec. 13, 1565. He studied at Zürich, Strasburg, Paris, Basel, and Montpellier, and was successively master of a school at Basel, teacher at Lausanne, and practising physician and professor at Zürich. His first important work was Bibliotheca Universalis (Zürich, 1545-9), containing the titles of all the books then known in Hebrew, Greek, and Latin, with criticisms, summaries, and specimens. In 1555 appeared his Mithridates de Differentiis Linguarum, having accounts of 180 ancient and modern languages. His most important work, Historia Animalium, published between 1551 and 1558, is a summary of all that was then known of zoology. His Opera Botanica (published by Schmedel, Neurenberg, 1783-9) gives particular attention to the flower and the fruit, and suggests the possibility of a classification by means of the organs of fructification.

GESNER, Solomon, a Swiss painter and poet, born in Zürich, April 1, 1720, died there, March 2, 1788. His father attempted in vain to engage him in his own business of bookselling, and allowed him to follow his inclination for poetry and landscape painting. He resided successively at Berlin, Hamburg, and Zürich, first becoming known by his poem Die Nacht, which was followed by Daphnis, a pastoral in three cantos, by Idyllen, Der Tod Abels in prose, some moral tales and dramas, and lectures on landscaping. Some of the engravings with which he illustrated his poems are excellent.

GETA, P. Septimius. See Caracalla.

GETE, a Thracian tribe mentioned by Herodotus and Thucydides as living S. of the Ister (Danube), and by later writers among the tribes N. of that river. Some critics regard them as identical with the Dacians, others with the Goths. Rawlinson, in his notes on Herodotus, favors the latter opinion, and points to the "striking analogy of the compounds Massagetis, Thyssagetics, and Tryrigetas, to the later names of Visigoths and Ostrogoths."
are eight ancient olive trees, with several younger ones, which have been planted or have sprung up from the roots of older trees. This spot was several years ago bought by the Latin church, and laid out in walks and flower beds. In it is pointed out the grotto of the agony, excavated in the rock, the descent to which is by a flight of rudest cut steps. The form of the interior is circular, about 15 ft. in diameter, the roof, supported by pilasters, being perforated to admit light. The Armenian and Greek churches deny that this is the true site of Gethsemane, and they have fixed upon another place a little to the north. Dr. Robinson thinks that the site claimed by the Latins is that believed to be the true one by Eusebius and Jerome, and as likely to be so as any. Dr. Thomson thinks both sites are too near the city, and that Gethsemane was in the secluded valley still further to the northeast.

GEETYSBURG, a borough and the capital of Adams co., Pennsylvania, is situated on elevated ground in a rich farming country, at the terminus of the Susquehanna, Gettysburg, and Potomac railroad, 86 m. S. W. of Harrisburg; pop. in 1870, 3,074. The court house and public offices are commodious brick structures; the residences are generally neat and substantial. The borough is extensively engaged in the manufacture of carriages, is supplied with good water conveyed in iron pipes from a neighboring spring, and has two national banks, a female seminary, two weekly newspapers, a theological quarterly, and eight churches. It is the seat of Pennsylvania college (Lutheran), founded in 1832, and having in 1871-2 11 professors and instructors (8 in the preparatory department), 92 collegiate and 97 preparatory students, and libraries containing 18,500 volumes; and of a Lutheran theological seminary, founded in 1825, and having 4 professors and 2 lecturers, 48 students, a library of 10,100 volumes, and an endowment of $100,000. The buildings belonging to these institutions are large and beautiful edifices. The national cemetery, containing the remains of Union soldiers who fell in the battle of Gettysburg, occupies about 17 acres on Cemetery hill adjacent to the village cemetery, and was dedicated with imposing ceremonies, and an impressive address by President Lincoln, Nov. 19, 1863. A monument occupying the crown of the hill, dedicated July 4, 1869, is 60 ft. high, and is crowned with a statue of Liberty. At the base of the pedestal are four buttresses, surmounted by statues representing War, History, Peace, and Plenty. Around the monument, in semicircular slopes, are arranged the dead, the space being divided by alleys and pathways into 29 sections, one for the regular army, one for the volunteers of each state represented in the battle, and three for the unknown dead. The number of bodies interred here is 3,564, of which 994 have not been identified. Adjoining the national cemetery is a national soldiers' orphans' homestead, founded at the close of the war by benevolent contributions of Sunday schools and individuals, containing usually about 100 orphans. One mile W. of the borough, near the spot where Gen. Reynolds fell on the first day of the battle, are the Gettysburg springs, whose waters, denominated katalysine, have acquired a wide reputation for their medicinal qualities. A fine hotel near by accommodates the patients who resort in large numbers to these springs during the summer. Since the battle Gettysburg has attracted tourists from all parts of the world.

GETTYSBURG, Battle of, fought July 1, 2, and 3, 1863, between the Union army of the Potomac under Gen. Meade, and the confederate army of Northern Virginia under Gen. Lee. After the battle of Chancellorsville (May 2-4, 1863), the confederates resolved upon an invasion of the north, believing that a decided success there would bring the war to a speedy close. Their whole disposable force except that in the west was to be employed in this enterprise. Southern Virginia and North Carolina were almost stripped of troops to augment the army of Northern Virginia, and early in June a force of nearly 100,000 men, of whom 15,000 were cavalry, was concentrated in the vicinity of Culpeper. This was nearly the largest and by far the best organized and equipped army which the confederacy ever placed in the field. It was supposed to be the corps, under Longstreet, Ewell, and A. P. Hill, the cavalry being commanded by Stuart. It began to move slowly down the valley of the Shenandoah, whereupon Hooker, who then
commanded the Union army, broke up his camp opposite Fredericksburg, and moved northward, on a line parallel with that of Lee, the Blue Ridge being between them. Lee endeavored by an ostentatious stretching out of his force to induce Hooker to pass the mountains and assail him. Finding this unsavory, he moved toward the Potomac, Winchester being the point of concentration of all his corps. Milroy, with 10,000 men, had been lying here, where on June 18 he was assailed by the confederate van, and his force dispersed, losing 2,900 prisoners. Raids were then made into Maryland and Pennsylvania, meeting with so little resistance that an invasion in force of Pennsylvania was resolved upon. On the 24th and 25th the Potomac was crossed at two points, almost within sight of the battle field of Antietam. The two columns, uniting at Hagerstown, Md., pressed on toward Chambersburg, Pa. Hooker on the 28th also crossed the river lower down, and headed toward Frederick City, Md. Lee had by this time gone so far from the river as to leave his communications exposed, and Hooker resolved to fall upon these rather than precipitate a general battle. There were at this time 10,000 Union troops at Harper's Ferry, who could be of no use there. Hooker asked that these should be united with his army. The request was refused by Hallock, who was then general-in-chief, and Hooker thereupon sent in his resignation, which was accepted, and on June 28 Meade was appointed in his place. The confederate corps of Ewell had in the mean while reached Carlisle, Pa., and was preparing to advance to Harrisburg, while Longstreet and Hill halted at Chambersburg. The position was now such that Meade by a rapid march could throw his whole force in Lee's rear, isolating him in a hostile country, and cutting off his sources of supply. Lee perceived that the movement northward could be carried no further until he had routed the army which hung menacingly upon his flank and rear; and he resolved to concentrate his whole force in the direction of the enemy, Gettysburg being fixed upon as the place of union. Meade, learning of this movement, resolved to concentrate his columns, which were spread over a wide space, a part under Reynolds being at Gettysburg, and a part under Sedgwick 55 m. southward. The advance was to be drawn back, and the rear brought forward to a point on Pipe creek, 15 m. S.E. of Gettysburg, where Meade resolved to await the attack of the enemy. Lee was wholly ignorant of the position of his enemy; for when he crossed the Potomac, Stuart with the cavalry had been left behind to harass the Union rear in Virginia, and then between them he was to encircle and rejoin the army at Carlisle. Stuart, crossing at a point below that where Hooker had just crossed, found the enemy between him and Lee, and could reach Carlisle only by making a wide detour; on reaching it, July 1, he found it evacuated, and the army in movement toward Gettysburg, whither he hastened, but arrived too late to take part in the actions of the first two days; however on July 1, the morning of July 1 Hill, whose corps was in the advance, learned that Gettysburg, from which he was distant about 6 m., was occupied by a Union force. Sending back to urge Longstreet to hasten his march, he moved on. In the mean while Reynolds had sent out a cavalry reconnaissance in the direction whence Hill was coming, and the forces came in collision about 2 m. N. W. of Gettysburg. Reynolds sent infantry to the support of his cavalry, and the action opened. He was killed at the beginning of the fight, and the command here devolved upon Howard. At first the Union forces were superior, and they gained decided advantages, taking nearly 1,000 prisoners. But in a few hours nearly the whole of Hill's corps came up from Chambersburg, and Ewell's from Carlisle, both numbering about 50,000, while their opponents were less than half as many. The Union force was driven back in confusion through Gettysburg, losing about 5,000 prisoners. The remainder took up a strong position on Culp's hill, just south of the town. The Union loss in this action was about 10,000, half of whom were killed and wounded. The confederate loss in killed and wounded was probably somewhat greater; in prisoners much less. Meade, who was 16 m. distant, had learned that there was fighting at Gettysburg, and sent Hancock with orders to take command of the force there, and to decide what should be done; for, as it happened, Meade knew nothing of Gettysburg. Hancock decided that this was the place to give battle, and sent back word to Meade to hurry all his troops to the place. Some of these came up during the night, others early in the following morning, and finally, after a march of 35 m., Sedgwick's corps in the afternoon. Lee had in the mean while suspended operations until he could bring up his whole army.—July 2, Early in the morning the bulk of the two armies was in position. Southward of Gettysburg, at the distance of a mile, rises Cemetery ridge. It curves northward, then westward, and finally runs southward, the whole length being about 8 m., the shape being like a fish hook. It rises in places into several craggy hills, each having its own name. That on the extreme south, forming the stem of the fish hook, is Round Top, separated by a ravine from Little Round Top; at the bend of the hook is Cemetery hill; Culp's hill forms the barb. The Union army was posted along the whole line of Cemetery ridge. Opposite this is Seminary ridge, upon which the greater part of Lee's army was posted; Ewell's corps, however, was the most to the right, about 2 m. distant. The forces present or close at hand were about equal, each numbering from 70,000 to 80,000 infantry and artillery. Between the two ridges is a valley in which and on the slope of Cemetery ridge were fought the

Union Lines.
Confederate -
Scale of 1 Mile.
actions of July 2 and 3. It is clear from what followed that Lee greatly underestimated the force opposed to him, and he resolved to attack it in its strong position. Longstreet was to assail the Union left at Round Top, while Ewell was to make on the right, at Culp's hill, "a demonstration, to be converted into a real attack should opportunity offer." Meade had intended that his line should be posted on the ridge directly between Round Top and Cemetery hill. But this ridge, in the centre where Sickles was placed, is comparatively low, sinking down into a valley a few hundred yards wide, beyond which rises another wooded crest running diagonally to the former; and Sickles supposed this to be the one which he was to occupy. Before the error could be corrected the confederate attack had begun, and Meade decided to support Sickles in his present position, although it left an unoccupied space between him and Round Top. As it happened, Hood's division of Longstreet's corps struck this opening. Moreover, by some mischance Little Round Top had been left unoccupied, and this was the key to the entire Union position; for if the enemy could seize this, and place a few guns upon it, the whole line would be enfiladed. The confederates perceived this, and began to swarm up the rugged sides. But just in time Warren, who as engineer was examining the line, discovered the error, and brought up a few regiments. They reached the summit just a moment ahead of the enemy, and forced them back. Again and again until nightfall the assault was unsuccessfully renewed. In the mean time the remainder of Longstreet's corps were pressing fiercely upon Sickles, who was soon borne from the field with his leg shattered. His corps made a stubborn resistance, but was forced back until it reached the crest of the ridge, where a new line was formed. The confederates charged this, but were met with a fire from which they recoiled. Hancock, who now commanded the centre, ordered a countercharge, by which the enemy were driven back to the ridge previously occupied by Sickles, which they continued to hold. Ewell's demonstration on the Union right was delayed until the action on the left was nearly over; but as most of the Union force had been withdrawn from Culp's hill to aid Sickles, he succeeded in effecting a lodgment within the Union intrenchments. The Union loss in this action was fully 10,000, half of which was in Sickles's corps, which lost nearly half its numbers. This action decided nothing; for the ground which the confederates had won on the Union left was never meant to be held by Meade, and he would gladly have withdrawn from it without a fight; and Ewell's foothold on the Union right was of no importance unless it could be followed up. Still the confederates had gained some apparent advantages; and, says Lee, "These partial successes determined me to continue the assault the next day." From what he could then know, he was justified in this; for he had every reason to suppose that he had encountered the entire Union force, while less than half of his own had been engaged.—July 3. Lee's general plan of attack was similar to that of the preceding day. Ewell was to follow up his advantage, while the main attack was to be made on the centre. But early in the morning Meade had taken the offensive against Ewell, and forced him from the foothold which he had gained. By some unexplained accident Lee was never informed of this mishap, by which a third of his force was left out of action, while Meade was at liberty to concentrate his whole strength upon any point which might be assailed. All the morning was spent in preparation. Seminary ridge formed an admirable position for the confederate artillery, and here directly in front of the Union line they placed 120 guns. A great part of Cemetery ridge is so rugged that artillery could not be placed there; so that although Meade had 200 guns, he could use only 80 at a time. At 1 o'clock the confederates opened fire, which was immediately returned. Many of the Union guns were disabled, but their place was supplied by others. The infantry were so well sheltered behind the crest that they suffered little. After two hours, Hunt, the chief of artillery, gradually suspended fire, "in order to see what the enemy were going to do." Lee, supposing that the Union batteries had been silenced and that the infantry must be demoralized, now ordered the grand attack of the day. This was to be made mainly by Pickett's division of Virginia veterans, who had not yet been engaged. They were to be aided by the brigades of Wilcox and Pettigrew. Exclusive of Wilcox, who did not fairly advance, the attacking column numbered about 18,000. Lee had intended to advance his artillery to support the infantry, but found at the last moment that the ammunition was nearly exhausted, and there was no time to replenish it. The column moved swiftly down the slope of the ridge, and across the plain. All the Union batteries, from Round Top to Cemetery hill, opened upon them, ploughing great furrows through their lines, which were closed up as fast as made. The column at first headed for the left of the Union centre, where Doubleday was posted with 2,500 men, a little in advance of the main line and protected by breastworks of rails and stones. To avoid this the column bent to its left and exposed itself to a severe flank fire. Still it pressed on, until Pettigrew's brigade was within 800 yards of Hancock's line, which had reserved its fire. In five minutes the whole brigade was streaming back in wild disorder. Pickett's division pressed steadily on until it reached Gibbon's front line thinly posted behind a low stone wall. They charged straight over this, among the federal batteries, and for a quarter of an hour there was a struggle with pistols and clubbed muskets. The Union troops hurried from all sides and drove the enemy back down the slope, which was completely
of about two miles are more than 100 springs which send forth hot water, 50 or more in the space of a few acres. These are on the lower slope of a small hill of trappean rock, and above them in the steeper part of the hill under the cliffs of this rock are banks formed by the incrustations of ancient and now nearly extinct geysers. The springs are of different dimensions, and exhibit various degrees of activity; some are uniformly full and quiet, others are constantly boiling, and others only at intervals, with explosive discharges of water and steam. The vapors rising from them form clouds that are seen miles away. They are attended with sulphurous odors; and the geysers of other localities on the island deposit sulphur derived from the decomposition of the iron pyrites in the clays through which the hot waters penetrate. The chief spouting springs of the group are the Great geyser and the Great and Little Strokr. The Great geyser when quiet presents the appearance of a circular mound of silicious incrustations, enclosing a pool, with sides sloping inward at an average angle of 18°, and outward at a mean inclination of 8°. The height of the mound is about 20 ft. on the lower side, but only half as much on the upper side. The diameter of the basin varies from 50 to 80 ft., and its average depth is 4 ft. In its centre is the mouth of the vertical tube which connects it with the subterranean passages. This tube is about 9 ft. in diameter at its mouth, and 70 ft. in depth. When the geyser is inactive, the basin is filled to the edge with clear water, which has a mean temperature of 185° F. and runs gently down the mound, emitting clouds of steam; but for several hours after an eruption the tube is empty to the depth of 4 or 5 ft. At intervals of about an hour and a half a rumbling noise is heard, and the water heaves up in the centre, throwing an increased quantity over the margin. The great eruptions take place at irregular intervals, sometimes exceeding 80 hours. At these times loud explosions are heard beneath the surface, the water is thrown into violent agitation, it boils furiously, and at last is suddenly sent forth in a succession of jets, which increase in force till they become an immense fountain that is lost to view in the clouds of steam in which it is enveloped. The heights reached by these jets have been variously estimated by different travellers. The lowest estimate is 60 or 70 ft.; that of Von Troll in 1772 is 90 ft.; of Sir John Stanley in 1789, 90 ft.; of Lieut. Ohlsen, a Danish officer, in 1804, determined by a quadrant, 212 ft.; of Sir George Mackenzie in 1810, 90 ft.; and of Henderson in 1815, 150 ft. Later visitors, Lord Dufferin, Mme. Ida Pfeiffer, J. Ross Browne, and others, estimate the height at from 60 to 70 ft. The eruptions appear to be diminishing in force and frequency, and it is not improbable that they will cease altogether before the lapse of another century. The discharge continues only about five minutes, when the geyser subsides to a state of tranqui-
lity. The Great Strokr, so named either from the Icelandic word meaning churn, or from stroka, to agitate, is only 300 or 400 ft. from the Great geyser, from which it differs in appearance in being an irregularly formed well, incrusted with silicious deposits, but having no basin at its mouth. Its orifice is about 8 ft. in diameter, diminishing to about 10 in. at the depth of 27 ft.; the whole depth is a little over 44 ft. The water for the greater part of the time is 10 or 12 ft. below the surface, and is continually boiling and seething, but at intervals of about half a day it breaks forth in a great eruption, throwing its water generally from 40 to 60 ft.; but Bunsen, who saw it in 1848, estimates it to be 151 ft. high. By throwing turf or stones into the well of the Strokr, an eruption can be brought on in a few minutes. The Little Strokr exhibits the same phenomena on a smaller scale. In the same vicinity are two large and quiet wells remarkable for their beautifully blue water. These were once active, and one of them is described by an English traveller as the Roaring geyser. It became tranquil immediately after an earthquake in 1789, when the Great Strokr first broke forth. The deposits of silica which accumulate around the geyseres are derived from the small amount of this material which is taken up in solution by the hot water. By the analysis of Dr. Black, made upon 10,000 grains (about 54 gills), it would appear that the whole amount of solid matter remaining dissolved in the cold water is only a little more than \( \frac{1}{1000} \) of the whole, the quantity examined yielding as follows: soda, 0'95; alumina, 0'48; silica, 5'40; muriate of soda, 2'46; dry sulphate of soda, 1'46; in all, 10'75. An analysis of the geyserite, or solid deposit, made by Forchhammer, gave the following result: silica, 84'43; water, 7'88; alumina, 8'07; iron, 1'91; lime, 0'70; soda and potasses, 0'92; magnetia, 1'06; total, 99'97. As the water evaporates and is chilled, the excess of silica is added to the surface around, filling the interstices of the mosses and grass, and making of these silicious petrifications, while the living plants still thrive and shoot above the strong substance that binds together their roots and stumps. Where the waters are found at a temperature of 98° O. (208° F.), M. Descloiseaux observed that the conserve still flourished. The true theory of the cause of geyser eruptions is due to Bunsen. When in Iceland in 1846, he proved by a series of careful experiments that the temperature of the water in the geyser tube varies at different depths, as also at different periods between two eruptions, the changes always taking place in the same manner and with considerable regularity. Immediately before the eruptions there is a maximum temperature at the bottom of the well estimated at 260°–6° F., and a minimum immediately after of 253°–4°. The temperature of boiling water at the depth reached by the thermometer should be about 276° F. The water therefore in no part of the tube is hot enough to generate steam under the conditions. But the higher you ascend in the tube, the lower is the temperature at which water will boil. If then the column be thrown up by the generation of steam in the underground channels, the water at the bottom, which is near the boiling point, is brought to a height where it is sufficiently relieved from pressure to be converted into steam. The water in the tube is lifted still higher, until the steam condenses by contact with the cooler water, to which it imparts its latent heat. Each condensation makes a detonation, the subterranean explosion which precedes an eruption. By successive efforts of the superincumbent column is thrown off to raise nearly all the water in the tube to the boiling point, until at last the relief from pressure is sufficient to permit the ejection of the contents of the tube. This ejection continues until all the reservoirs around the geyser are emptied, when it subsides until the proper conditions are established again. A boiling spring becomes in time a geyser if, in building up around itself a mound of precipitated mineral, it forms a vertical tube of sufficient height and regularity to give a certain pressure of confined water; and when the tube reaches such an altitude that the water below cannot, in consequence of the increased pressure, reach the boiling point, the eruptions cease and the geyser becomes a mere cistern. It is a singular fact in the history of Iceland that no mention is made of the geyseres until they are spoken of by Svenson, bishop of Skalholt, in the 17th century; and this is the more remarkable, as Ari Frode, who wrote of the geography and history of the island in the 11th century, spent his youth in their immediate vicinity. They bear unmistakable evidences of having been in operation in this district, if not in the exact places where they are now found, from remote periods.—The geyseres of New Zealand are in the island of New Ulster, the most northerly of the group. About the centre of the island, near the ever active volcano of Tongariro, thermal springs, mud fountains, and geyseres rise in more than 1,000 places, exhibiting phenomena more remarkable than those in Iceland. A portion of Lake Taupo boils and smokes as if heated by subterranean fires, and the average temperature of its water is about 100° F. North of it, a valley through which the Waikato river flows contains a great number of geyseres, 76 having been counted in one group. These jets of water are of various height, and play alternately. About half way between the lake of Taupo and Plenty bay, on the coast, is the little lake of Rotomahana, covering 120 acres, whose temperature, raised by the hot springs which feed it, is about 78° F. This lake is surrounded by springs and fissures, from which steam, sulphurous gases, water, and mud are continually escaping. The most remarkable of these, the Tetarata (tattooed rock), is at the N. E. end of the lake, about 50 ft. above its
GEYSERS

level. It is described by Von Hochstetter as a crater-like excavation, with steep reddish sides, 80 to 40 ft. high, which are open toward the lake only. The basin of the spring is about 80 ft. long and 60 wide, and is filled to the brim with clear transparent water, which against the white incrustated sides appears of a beautiful blue color. Immense clouds of steam continually rise from it, obliterating the view of the surface, and the noise of boiling is always audible. At the margin the temperature is 183° F., but in the centre, where the water is continually in a state of ebullition to the height of several feet, it probably reaches the boiling point. The deposit, like that of the Iceland springs, is silicious, and the incrustations made by the overflow have formed on the slope a system of terraces, from 2 to 6 ft. in height, as white and almost as regular as if cut from marble, on each of which are circular basins, resplendent with blue water. These terraces, which cover an area of about three acres, have the appearance of a cañon plunging over natural shelves, which as it falls is suddenly turned into stone. Each stage has a small raised margin, from which slender stalactites hang down on the next below. At ordinary times but very little water ripples over these terraces, and only the principal discharge on the side forms a hot steaming fall; but sometimes, say the natives, the whole body of water is thrown up in an enormous column, emptying the pool. On the highest stage is an extensive platform, with a number of basins, from 5 to 6 ft. deep, the water showing a temperature of from 90° to 110° F. In the middle of this platform rises, close to the brink of the main basin, a rock island, about 12 ft. high, covered with mosses and ferns. From it a full view may be had of the interior of the boiling caldron, without danger. The rocks from which these springs derive their silica are rhyolites and rhyolitic tufs, which contain over 70 per cent. of it. An analysis of the solidified incrustation of the Tetharata, made by Mayer, gave the following result: silica, 84.78; water and organic substances, 12.96; sesqui-oxide of iron and alumina, 1.27; lime, magnesia, and alkalis, 1.09; total, 100.—In the United States, volcanic boiling springs exist in numerous localities west of the Rocky mountains. In the Colorado desert, between lat. 38° and 84°, and long. 115° and 116°, are remarkable mud volcanoes and boiling springs. The desert at this point is below the level of the sea. The springs cover a space not more than a quarter of a mile square. This area is covered with soft mud, through which water and steam are constantly escaping, with a noise audible at a distance of ten miles. In some places a loud explosion is heard, with a sharp hissing sound; in others it bursts forth with a loud explosion, throwing water and mud to the height of 100 ft. Some of the boiling springs throw up a column of water 20 or 80 ft.; some have cones formed around them, and some have basins 100 ft. in diameter, in which the blue paste-like mud is ever bubbling and hissing. Many are incrusted with carbonate of lime, others with deposits of sulphur. The steam which rises from them is strongly impregnated with sulphur. Similar springs exist in New Mexico and in some of the other territories.—The so-called geysers of California are in Sonoma county, in a lateral gorge of the valley of Napa, called the "Devil's Cañon," near the Ploton river. The narrow ravine, which is always filled with vapor, is shut in by steep hills, the sides of which, marked with evidences of volcanic action, are smoking with heat and bare of vegetation. A multitude of springs gush out at the base of the rocks. Hot and cold springs, boiling springs, and quiet springs lie within a few feet of each other. They differ also in color, smell, and taste. Some are clear and transparent, others white, yellow, or red with ochre, and still others are of an inky blackness. Some are sulphurous and fetid in odor, and some are charged with alum and salt. The "Steampipe" is an orifice in the hillside, about 8 in. in diameter, from which a volume of steam rises with a continuous roar to a height varying from 50 to 200 ft. In a cavity called the "Witches' Caldron" a mass of black fetid mud is ever bubbling with heat, the vapor from it depositing black flowers of sulphur on the rocks around. The surface of the ground about the springs, which is too hot to walk upon with thin shoes, is covered with the minerals deposited by the waters, among which are sulphur, sulphate of magnesia, sulphate of aluminum, and various salts of iron. These springs, none of which are properly geysers, are about 1,700 ft. above the sea.—The geysers at the head waters of the Yellowstone and Missouri rivers are probably the most wonderful on the globe, even those in Iceland and New Zealand sinking into insignificance when compared with them. The country lying between lat. 46° and 47° N., and long. 110° and 114° W., comprising portions of the territories of Idaho, Wyoming, and Montana, is dotted with groups of hot springs, the remains of most remarkable volcanic manifestations, which began probably in the tertiary period. Earthquake shocks are still common throughout this region, and at some seasons of the year are very severe. The most of these springs are not geysers, but simply boiling mineral springs and mud volcanoes. The geysers proper are in the NW. corner of Wyoming territory, on the Fire-Hole river, the middle fork of the Madison, which is one of the three principal sources of the Missouri. The basin in which they are situated was visited first by a party under Cook and Folsom in 1869. In 1870 Gen. Washburne, surveyor general of Montana, explored the region. The leaders of the party were Lieut. C. C. Doane and N. P. Langford; and in 1871 it was surveyed by Dr. F. V. Hayden, United States geologist, and by Col. J. W. Barlow and Capt. D. P. Heap, of the United States engineer corps. Dr. R. W. Raymond,
United States commissioner of mining statistics, also visited and described the region in the same year. The geysers lie in two large groups, in what are called the upper and lower geyser basins. The lower basin, beginning near the junction of the East and Middle forks of the Madison, comprises an area of about 80 sq. m. The springs are divisible into three classes: 1, those which are constantly boiling; 2, those which are agitated only at particular periods; 3, those which are always tranquil. In the geysers proper the water is usually quiet until a short time before an eruption. Dr. Peale, who examined them in 1871, in connection with Prof. Hayden, divides the springs into seven principal groups. In the first group, at the N. end of the basin, the temperature of 67 springs, occupying a space of about a quarter of a mile wide by two miles long, was recorded. The lowest was 106° F., the highest 198°. The temperature of the air was 60°. Some of these are geysers, projecting the water from 2 to 5 ft., but most of them are simply silicious springs, a few being chalybeate. The second group, which lies 2½ m. further S., nearer the centre of the basin, occupies an area of about three fourths of a mile. Sixteen springs here ranged in temperature from 140° to 196°. The temperature of the air was from 55° to 66°. This group is composed principally of geysers, many of them throwing water from 5 to 10 ft. high. The principal one, on the slope of a hill, is about 20 ft. in diameter, with a rim 5 ft. wide and 5 ft. high. The column of water thrown from it is very wide, and reaches the height of 50 ft. Another is named the Thud geyser, from the dull suppressed sound given off as the water rises and recedes. It has a beautiful scalloped rim, with small basins around it. This group of geysers is said to resemble a factory village, the steam rising in jets from more than 100 orifices. The third group lies three fourths of a mile S. E. of the second, at the base of a spur of the mountains, and extending up a ravine about 1,000 yards. They cover a space 800 yards in width. The temperature of 20 springs ranged from 130° to 196°. Near the centre of the group is a small lake, 800 ft. long by 150 wide, on the E. shore of which is a geyser spouting to the height of from 15 to 20 ft. There are three sulphur springs here, the only ones in the region, and S. E. of the lake is an iron spring. About 1,000 yards further S. is the fourth group, in a ravine about 1½ m. long and 300 yards wide. It contains many springs and geysers, the temperature of 42 of which ranged from 112° to 196°, the temperature of the air being about 60°. The principal geyser is at the mouth of the ravine. Its basin is circular and about 60 ft. in diameter, and its spring, in the centre, from 18 to 20 ft. The water is blue, and is constantly agitated. When in eruption the column is projected 100 ft. high, and is accompanied by immense clouds of steam. Near the upper end of the ravine is a spring around which the deposit is black, instead of the usual white. The fifth group, on the banks of the Fire-Hole river, is the largest of all, covering nearly a square mile and comprising a great number of springs and geysers. The temperature of 95 examined ranged from 112° to 196°, the air at the time being 70°. None of them are of much importance. One, from its resemblance to a shell, is named the Conch spring; its basin is triangular, from 8 to 10 ft. in diameter. A little below it, on the bank of the river, there is a fine geyser, with a crater 3 ft. high. The Horn geyser has a crater like a horn, about a foot in diameter at the top and 6 ft. at the base; it is in constant ebullition. The Bath spring has a square basin 30 ft. across, of unknown depth. The Cavern has a basin 15 by 20 ft. wide and 20 ft. in depth; the water is of a bright blue tint, and of wonderful clearness. The mud springs of this group are from an inch or two to 20 or 30 ft. in diameter, their contents varying from turbid water to stiff mud. They are in a constant state of agitation. The mud is of different colors, being pure white in some, in others brown, black, or blue. The sixth group is 2 m. S. W., on a small stream flowing into the Fire-Hole. They are in an open, prairie-like valley, for the most part marshy. The temperature of 54 of the springs varied from 106° to 198°. One of them is strongly chalybeate. The seventh group is on the Fire-Hole river, about 2½ m. S. of the preceding. The temperature of 20 of the springs ranged from 132° to 196°, when the air was from 70° to 76°. The largest has a basin over 400 ft. in diameter. Below it is another huge spring, named the Caldron, the view of which is almost obscured by the dense clouds of steam rising from it. The upper geyser basin lies in the valley of the same river, about 8 m. S. of the lower basin. It is not so large as the latter, covering an area of only about 3 sq. m., and it contains fewer springs; but the phenomena exhibited are far more remarkable. Most of the springs and geysers are near the river, extending along on both banks about 3 m. The temperature of 106 of them ranged from 112° to 196°, the average being over 170°, the temperature of the air being 67°. At the head of the valley, at its southern extremity, stands Old Faithful, a geyser so called for its regu-
GEYSERS

dainty; it spouts at intervals of about an hour, throwing a column of water 6 ft. in diameter to a maximum height of 180 ft., and holding it up by a succession of impulses from 4 to 6 minutes. The great mass of water falls directly back into the basin, flowing over the edges and down the sides in streams. When the action ceases, the water recedes out of sight, and nothing but the occasional hiss of steam is heard until the time approaches for another eruption. Its crater is a conical mound of geyserite about 12 ft. high, measuring at the base 145 by 215 ft. and at the top 54 by 86 ft. Near it are four extinct geyser cones. On the opposite side of the river are the Beehive and the Giantess. The former is an alabaster cone 3 ft. in height, 20 ft. in circumference at the base, and 3 by 4 ft. in diameter at the top, with an oval orifice 3 by 2 ft. in diameter. When in action, which occurs in about 24 hours, it throws a column of water entirely filling the crater to a height which, says Langford, was found by triangular measurement to be 219 ft. The eruption lasted 18 minutes, and the stream did not deflect more than 4° or 5° from a vertical line. Dr. Hay-
ter, immediately after which the water bursts forth in a succession of jets, apparently 6 ft. in diameter at the bottom, and tapering to a point at the top, to a height of from 175 to 200 ft., while the steam ascends to 1,000 ft. or more. This immense body of water is kept up to this height for about 20 minutes, when it gradually recedes and again becomes quiescent. On the opposite side of the river is the Castle, so called from its resemblance to the ruins of a tower. It stands upon a platform measuring 75 by 100 ft. and 3 ft. in height, above which it rises about 12 ft. Prof. Hayden witnessed three eruptions of this geyser in 1872. The maximum height of the first was 34 ft., and of the second 29 ft.; that of the third was not ascertained. The eruptions lasted each about an hour and 20 minutes. The Giant geyser has a rugged crater, like a broken horn, 10 ft. in height and 24 by 25 ft. at the base. The top is about 8 ft. in diameter, with an irregular orifice of 5 or 6 ft. in width. The cone is open in a system of terraces, ornamented with semi-circular basins, and with beadwork of beautiful colors on a snow-white ground. These calcareous deposits cover an area of about two miles square. The active springs extend from the margin of the river to an elevation of 1,000 ft. above, the highest being 6,522 ft. above the sea. The geysers of the Fire-Hole basin are from 6,900 to 7,000 ft. above the sea. The valley of the Madison, with its branches, is shut in by high volcanic mountains, gashed with deep gorges, strown upon their sides and at their bases with fragments of trachyte and obsidian, and covered with tall pines. Between the sources of the Madison and the Yellowstone these mountains rise to 9,000 or 10,000 ft. above the sea. The valley of the Fire-Hole river is covered with the silicious deposits of the springs, and resembles an alkali flat. The bed of the stream is lined with white silica. Beneath this formation are lake or local drift deposits, and still lower basalt. The surface deposit is chiefly geyserite. The most of it is of an opaque white color, but in the lower basin pink specimens are found which are translucent. Some of it is greenish gray and some pearly, like enamel; and it assumes forms similar to those in Iceland. Some have a cauliflower-like form, and break very easily; others are beaded, and others covered with small stalagmitic processes. The texture varies from porous to compact, the most being porous and arranged in layers. The geyser cones are generally compact, and often have an enamelled-like coating. A specimen of the white geyserite, of cauliflower form, contained silice 89·93, water 11·02, chloride of magnesium 4; total, 99·93. The water contains very little solid matter. A specimen brought back by Dr. Peale was as clear as when bottled at the springs, showing no deposit; it contained 854 milligrammes of solid matter to the litre, consisting mainly of silica; chloride of lime and sulphate of magnesia were present in small quantity, and there was a slight trace of iron.

The geysers of Iceland are treated of in "Letters on Iceland," by Von Troil (1772); "Travels in Iceland," by Sir George Mackenzie (1810); "Journal of a Residence in Iceland during the years 1814 and 1815," by Ebenezer Henderson; "Visit to Iceland in the Summer of 1834," by John Barrow, jr.; "A Visit to Iceland," by the Hon. A. Dillon (1840); observations of M. Desclois en in "Annales de chimie et de physique" (April, 1847), and "Philosophical Magazine" (vol. xxx. p. 397); "Tracings of Iceland and the Faroe Islands," by R. Chambers (1846); "A Yacht Voyage," by Lord Dufferin (London, 1858); "Iceland. Its Scenes and Sagas," by Sabine Baring-Gould (1863); "The Land of Thor," by J. Ross Browne (1867); and "A Summer in Iceland," by C. W. Pajkull, translated from the Swedish by the Rev. M. R. Barnard (1868). For an account of the New Zealand geysers see "New Zealand," by Ferdinand von Hochstetter (Stuttgart, 1869).
sers in the United States, see report of
Lieut. G. C. Doane (1871), and the fifth and sixth annual reports of the “United States
Geological Survey of the Territories,” by F. V.
Hayden (1872 and 1873).

GRÖRER, August Friedrich, a German his-
torian, born in Caiw, March 5, 1803, died in
Carlsbad, July 10, 1841. He studied theology
at Tübingen from 1821 to 1825, was appointed
in 1832 tutor in the theological seminary of
that city, in 1830 librarian at Stuttgart, and
in 1846 professor of history in the university
of Freiburg. His first work, Philo und die
jüdisch-alexandrinische Theosophie (2 vols.,
Stuttgart, 1831), was written from the critical
standpoint of the Tübingen school; but while
preparing his Geschichte des Urchristenthums
(4 vols., 1838), he changed his views, and ar-
rived at length, during the publication of his
Allgemeine Kirchengeschichte (4 vols., 1841–
6), at the opinion that the Roman Catholic
church is the true church of Christ; but he
did not join that communion till 1853. Besides
the works already mentioned, he wrote Gustav
Adolf, König von Schweden (2 vols., 1865–7);
Geschichte der ost- und westfränkischen Karo-
linger (3 vols., Freiburg, 1898); Urgeschichte
des menschlichen Geschlechts (2 vols., Schaff-
hausen, 1855); Papst Gregor VII. und sein
Zeltalter (7 vols., 1869–81); Geschichte des 18.
Jahrhunderts (edited by Weiss, 3 vols., 1862–
8); and Zur Geschichte deutscher Volkerrechte
(edited by Weiss, 2 vols., 1865).

GHADAMES, or Kadames, a town of Africa, in
an oasis near the S. E. corner of the Algerian
part of the desert of Sahara, about 800 m.
S. W. of Tripoli; pop. about 7,000, mainly
Arabs, Moors, and negroes. It contains many
gardens, several hot springs, six mosques, and
seven schools. Woolen goods are manufac-
tured, and there is a large trade in ivory, wax,
hides, ostrich feathers, caoutchouc, &c. The
adjacent region abounds with relics of Roman
cities, and the town is believed to occupy the
site of the ancient Cydamum. It retains
considerable importance from being the focus
of four commercial roads. The first crosses
Fezzan, the second passes through the great
desert and leads to Timbuctoo, the third con-
nects with Lake Tchad, and the fourth passes
S. of the Atlas chain of mountains, and con-
nects with Morocco.

GHARL. See SULLEW.

GHARDELIA. See GANDIA.

GHAUTS (literally, mountain pass; whence,
through the Teutonic languages, the English
word gate), the name of two ranges of moun-
tains in S. Hindostan. The principal of these
is the Western, which extends nearly 1,000 m.
N. N. W. from near Cape Comorin to the river
Taptew, at the mouth of which is Surat. The
general direction of the chain is parallel with
the coast of the Indian ocean, which it ap-
proaches in one place within 6 m.; but it is
for the most part at a distance of 20 to 40 m.
On its western side it presents a front which
rises boldly from the hilly country between
the ranges and the coast; but on the east it
gradually slopes away, or spreads in table
land, having an average elevation of about
3,000 ft. above the sea, or is continued in long
spurs, which stretch out through this central
region, known as the Deccan. The country on
the west, which embraces the Malabar coast, is
comparatively low, its average elevation being
roughly estimated at 200 ft. above tide. It is
hilly, but also penetrated by creeks and bays
making back from the sea; and it is traversed
by extensive ravines, which are shaded with
forest and jungle. But few gaps break the
continuity of the chain, and only one of these
is deep enough to drain the waters on the E.
slopes into the Indian ocean. This point is in
the S. part of the range against the Coimbat-
tore country, from which the river Ponnuy
flows through a break 15 m. wide. Opposite
this break it is thought that ships navigating
the Indian ocean experience the N. E. mon-
soons in greater fury than elsewhere. The
average height of the Western Ghauts is esti-
\nimated at 4,000 ft., but some of the peaks rise
much higher. Bonasson is said to be 7,000 ft.
high, and Dodabetta in the Nilgherries 8,760
ft. The range is not remarkably rough or
rocky. A deep rich soil covers the surface,
and even upon the summits supports stately
forests. The bamboo attains an unusual height;
the teak covers the mountain sides; and on
the lower hills are forests producing pepper,
cassia, frankincense, and other aromatic spices
and gums. In the most elevated regions no
undergrowth or jungle is encountered, but
roads are maintained only at great cost, owing
to the violence of the torrents of water during
the rainy season; hence the passes across the
range are few and difficult. These are occu-
pied by fortresses.—The Nilgherries, among
which are some of the most elevated peaks of
the range, occupy a tract of some 7,000 sq. m.
E. of the main chain N. of Coimbatore. Here
the Eastern Ghauts are usually regarded as
diverging from the Western; but some trace
them further S. through the Carnatic in the
range of hills which meet the Western Ghauts
a short distance from Cape Comorin. Both
this range and the Nilgherries extend across
toward the Coromandel coast, meeting near
lat. 12° N., and thence the chain of the East
Ghauts continues with the coast, some say
even to Balasore, which is within 125 m. of
Calcutta; but it is commonly regarded as run-
ning out before reaching the river Kistnah,
the range being thus limited to about 500 m.
in length. Its hills are naked and rocky, and
seldom attain the altitude of 3,000 ft. The
drainage of this region is all toward the bay
of Bengal. The S. W. monsoons commence
in May and June, with terrific storms of thun-
der and rain, which vent their greatest fury
upon the Western Ghauts. This continues
until October, and during this time that part
of the Coromandel coast under the lee of the
Eastern Ghauts receives no rain. In October these winds fail, and the regular N. E. trades or monsoons set in with terrible thunder and lightning and inundations, on the bay of Bengal, producing while they last, which is to about the close of the year, the rainy season on the Coromandel coast and the Eastern Ghauts. But under the lee of the western range this is the dry season, a season of fair weather with occasional southern gales. The quantity of rain which falls on the Western Ghauts during the summer is unequaled in any other part of the world in the same length of time. At the station of Mahabaleshwar it has been found to measure 289 inches.—In their geological structure both ranges of the Ghauts appear to agree with other great N. and S. mountain chains of the world. Their rocks are the metamorphic schists, which contain rich metals and valuable ores. Gold is diffused along their course, and is especially abundant in the Nilgirrrieas. Copper ores are worked in the Eastern Ghauts in the neighborhood of Cuddapah. In the same region of the Carnatic diamonds have been found; and 8° farther N. is Golconda, celebrated as the depot of precious gems found in the regions watered by the Pen- nar and Kistnah rivers. From the table lands of Mysore, which border the Eastern Ghauts on the west, are brought the ruby, topaz, chrysolite, cat's-eye, garnet, beryl, &c. The region of the carnallite in is the province of Guzerat, which is beyond the N. extremity of the Western Ghauts, the outlet of which is Cambay. (See Carnelian.) The famous diamond region of Pannah in Bundelcund is also beyond the limits of the Ghauts, in the Vindhya mountains, which, stretching across central Hindostan, connect the N. terminations of the E. and W. chains. Rich iron ores are found in abundance near the Ghauts.

Ghawazi. See Almeh.

Ghazepeor, or Ghazepore, a town of British India, in a district of the same name, division of Benares, North Western Province, situated on the left bank of the Ganges, 42 m. N.E. of Benares; pop. about 40,000. It stands on high ground, enclosed by beautiful groves of banyan and pipal, and is noted for its healthy climate; but it presents a mean appearance, the principal buildings being in ruins and the dwellings being mostly of mud. The Chales- toon, or palace of the 40 pillars, at the end of the town, now ruinous but used as a custom house, is the only edifice worthy of notice. In the plain N. of the town is a monument to Lord Cornwallis, who died here in 1805.—The district, which is contiguous to Azimgurb, Shahabad, Benares, and Jaunpore, has an area of 2,187 sq. m.; pop. in 1871, 1,487,388. It is a low, level country, with many shallow lakes, drained by the Ganges and its tributaries, the Gogra, Karamnass, Tons, &c. The chief productions are rice, water and attar of roses, grain, rice, indigo, oil seeds, gram, tobacco, cotton, opium, and sugar.

Ghee, a kind of butter used in many parts of India, prepared generally from the milk of buffaloes. The milk is successively boiled, cooled, and curded with a little curdled milk. The process is completed by churning the curdled mass, to which some hot water is once added. It is an article of commerce in India, but unpalatable to Europeans from its strong smell and flavor. It may be kept from rancidity by boiling till all the water is evaporated, and then adding curdled milk and salt, and preserving it in close jars.

Ghent, a town and commune of Belgium, in the province of 26 m. E. by S. of the city of Antwerp; pop. in 1867, 11,200. It has several churches and some manufactures. The commune has been from the 18th century a sort of asylum for insane persons, who are lodged and boarded in the houses of the peasantry, by whom in many cases they are employed in field and other labor.

Ghent from Gendt; Fr. Gand; Ger. Gent), a city of Belgium, capital of the province of East Flanders; pop. in 1871, 123,765. It is situated at the junction of the Scheldt and the Lys, 30 m. N.W. of Brussels, and intersected by a great number of navigable canals, which communicate with those rivers, and form 26 islands connected with each other by about 80 bridges. The streets are spacious, and the fantastic variety of gardening, rising stepwise or ornamented with scroll work and carving, imparts great picturesque ness to the stately houses. It has about 300 streets and 30 public squares, fine promenades, and a great number of churches. The sumptuous cathedral of St. Bavon contains the masterpieces of Jan and Hubert van Eyck. The city hall, with its Moorish front, the famous belfry, and the Veer drugen markt, or Friday square, where Jacob van Artevelde kindled the flames of civil war, and where the duke of Alva lighted the fires of the inquisition, are celebrated for their historical associations. The city is rich in charitable, industrial, artistic, literary, and scientific institutions, and possesses a university attended by about 400 students, with an extensive library and a botanical garden. There are about 20 public hospitals, of which that called Bylogue, founded in 1228, can accommodate 600 persons. The palais de justice, the central prison, and the Beguinage, the principal establishment in Belgium of the Beguin nuns, are worthy of special mention. The cotton manufacture employs upward of 30,000 persons. Sugar refining is also extensively carried on. The principal articles of trade are corn, oil, seeds, wine, and Flemish linens.—Ghent is first mentioned as a town in the 7th century. Toward the end of the 13th century it became the capital of Flanders, subsequently joined the Hanse league, and obtained the free navigation of the Rhine and other privileges; and by the end of the 13th century it had so much increased in wealth and power that it surpassed Paris. Charles V. was born
in Ghent, as was also John of Gaunt, “time-honored Lancaster,” who derived from it his appellation. As early as the latter part of the 14th century, Froissart estimated the number of fighting men that Ghent could bring into the field at 80,000. Under Jacob van Artevelde it revolted against the count of Flanders, and, with all Flanders, maintained its independence from 1388 to 1445. The revolt was renewed under his son Philip in 1382. (See Artevelde.) Soon afterward it passed into the possession of the dukes of Burgundy, against whom it rose in vain in 1450. At the end of the 16th century there was no town in Christendom to be compared with it for power, political constitution, or the culture of its inhabitants. By its jurisdiction over many large but subordinate towns, Ghent controlled more than its own immediate population, which has been estimated as high as 200,000. The constitution of the city was very liberal, and in all but name it was a republic. All this prosperity was destroyed by the insurrection that broke out in 1589, occasioned by an attempt to force upon Flanders the payment of 400,000 ducats, being the third part of a subsidy granted by the Netherlands to Charles V. This claim was resisted by Ghent as a violation of the great charter granted to the city by Mary, sister of the emperor and regent of the Netherlands. Charles V. punished this resistance by depriving the city of all its privileges and immunities (1540). A number of the principal citizens were executed; the revenues, and all property held by the corporation or the traders in common, were confiscated; the ancient form of government was abolished; the right to appoint the city magistrates was vested in the crown; a new system of laws and political administration was established; and or-

ders were given for erecting a strong citadel in order to bridle the revolutionary spirit of the population. A fine of 160,000 ducats, in addition to the 400,000, was imposed upon the citizens, as well as an annual contribution of 6,000 for the support of the garrison. A congress assembled in Ghent in 1576 to form a confederacy for the expulsion of the Spaniards from the Netherlands. The massacre of Antwerp and the eloquence of the prince of Orange produced a quickening effect upon its deliberations, which had proceeded with decorum while the citadel was being cannonaded. The latter fell on the same day (Nov. 8, 1576) which saw the conclusion of the treaty known as the “Pacification of Ghent,” and in the following year it was razed to the ground. In the stormy period which followed, in which the revolt against the Spanish authority was varied by intestine dissensions, the city became a prey to riot and anarchy. Early in the spring of 1584 a formal resolution was passed by the government of Ghent to open negotiations with Spain, and within three months after the murder of William of Orange, whose policy had saved the city on many occasions, it fell into the hands of the duke of Parma, the Spanish viceroy (Sept. 17, 1584). The citadel was rebuilt, and about a third of the population left the city. In 1596 Ghent, with the other cities and provinces of the Netherlands, was severed from the Spanish crown in favor of Isabella, daughter of Philip II., who married Albert, son of the emperor of Germany. Louis XIV. took it in 1678, but restored it soon after to Spain in the peace of Nimeguen. During the war of the Spanish succession, at the end of which it was given by the treaty of Rastadt to Austria, Ghent was
alternately in the hands of both contending parties. It was also taken by the French in the war of the Austrian succession, and twice in the campaigns of the revolution, when it became the capital of the French department of the Scheldt. After the downfall of Napoleon in 1814, it was attached to the kingdom of the Netherlands. During the hundred days Louis XVIII. took refuge in Ghent. The revolution of 1830 made Ghent, with Flanders, a part of the new kingdom of Belgium. Ghent is associated with American history by the treaty concluded there, Dec. 24, 1814, which terminated the second war between Great Britain and the United States.

GHERARDESCA, Ugolino della, an Italian partisan leader, died in Pisa in 1298. His ancestors originally came from Tuscany and removed to Pisa as prominent Ghibellines. In order to secure his supremacy in Pisa, he induced the Guelph leader Giovanni Visconti to marry his sister, but he and his brother-in-law were expelled. Aided by the forces of Florence and Lucca, he soon gained victories over the opposing faction, and was recalled to Pisa in 1276. In the wars between Pisa and Genoa in 1284 he contrived the defeat and capture of the Pisan squadron near the island of Meloria (Aug. 6). The Pisans, unaware of his perfidy, continued to accord him their confidence, and he again betrayed them by sending a number of castles and forts to the enemies of the republic, who thereupon established a protectorate over Pisa with his connivance. His grandson Nino de Gallura led an unsuccessful revolt against him in concert with both Ghibelline and Guelph leaders; and Ugolino wreaked unspiring vengeance on his opponents. Ruggiero Ubaldini, the archbishop, whose nephew had been one of the victims, subsequently headed a general rising against Ugolino, who was at last (July 1, 1288) arrested, together with his sons, Gaddo and Uguccione, and three grandsons. At the instigation of the archbishop they were doomed to starvation in the Gualandi tower, hence called torre di fame. Dante describes their terrible death in the 83d canto of the Inferno.

GHERIAH, or Vizia droog, a town and fort of the province of Bombay, British India, in the collectorate of Rutnaghere, South Concan, 170 m. S. of Bombay. It has a safe harbor at the mouth of the river KunVee, unobstructed by a bar and with a depth of three or four fathoms. The fort, built by the Mahtrast chief Sevaje in 1602, stands on a bold promontory on the coast of the Indian ocean. It received the name of Gheria from the Mohammedans, while by the Mahrattas it was commonly known as Vizia droog. During the maritime contests of the latter people with the Mogul emperors in the 17th century, one of their chiefstains, named Conajee Angria, revolted against the Mahrattas with part of the fleet, and made himself master of the coast from Tanna to Rajapoor. Under this adventurer and his successors, who all bore the family name of Angria, Gheria became the centre of a vast system of piracy, which infested the adjacent seas for upwards of 50 years. Several attempts were made to disperse the corsairs. The Portuguese and English attacked them in 1719, and the English again in 1722; the Dutch in 1724. In March, 1755, a British fleet, followed by some Mahratta vessels, attacked the Angria's fleet at Severndroog. The pirates escaped by fast sailing, but the town was bombarded and partly burned. Toward the end of the same year reinforcements arrived from England, and the reduction of Gheria was at once determined upon. On Feb. 11, 1756, Admiral Watson, with 800 Europeans and 1,000 sepoys commanded by Col. Clive, arrived off the monitory, while a Mahratta army approached on the land side. The pirate fleet was soon burned; a furious bombardment silenced the guns from the fort; the troops were landed, and on the 18th the place was taken. It was given up to the peishwa under a treaty concluded with the Mahrattas the same year, and passed with the rest of his dominions into the hands of the East India company in 1818.

GHIABELLINE. See GUELPHS AND GHBIELLINE.

Ghiberti, Lorenzo, an Italian sculptor, architect, and painter, born in Florence about 1380, died there about 1455. The son of a goldsmith, he early learned to imitate ancient medals, and began to exercise himself in painting. The seignory and merchants of Florence determined in 1401 to procure for the baptistery of San Giovanni a bronze folding door to correspond with that already made by Andrea Pisano, for which a prize was offered. Each artist was allowed a year in which to execute a panel in bronze representing in bass relief the "Sacrifice of Isaac." Ghiberti was proclaimed victor even by his most eminent rivals, Donatello and Brunelleschi. Intrusted therefore with this immense labor, he devoted 21 years to its accomplishment, dividing each half of the door into ten panels, each of which contains a bass relief representing a subject taken from the New Testament. In 1424 this door was placed in one of the side entrances of the baptistery, and its success led to his being commissioned to execute another. This was commenced in 1428, was divided into ten panels filled with subjects from the Old Testament, occupied him nearly as long as the other, and was superior to it, being declared by Michel Angelo worthy to be the gate of paradise. During the 40 years that he was engaged upon these doors he executed several other works in bronze, among which were a statue of John the Baptist, two bass reliefs for the cathedral of Siena, a "St. Matthew" and "St. Stephen," and the reliquary of St. Zenobius surmounted by six angels. The last, and the "St. Matthew," are the second door of San Giovanni, and the masterpieces of modelling in the 15th century, and the door is perhaps still unrivalled. As an architect,
Ghiberti was associated with Brunelleschi in constructing the cupola of Sta. Maria del Fiore. He excelled in painting upon glass, and in the goldsmith’s art. He also left a treatise on sculpture, a part of which has been published by Goognara; a treatise on proportions, yet unpublished; and a treatise on Italian art, first published in 1841.

Ghil, a province of Persia, bounded N. by Russia, E. and N. E. by the Caspian sea, S. E. by the province of Mazanderan, S. and S. W. by Irak-Ajemi, and N. W. by Azerbaijan. It is about 120 m. long and 40 m. wide; pop. about 100,000. Its inland boundary on the south and west is formed by the Elburz range of mountains, averaging from 6,000 to 8,000 ft. above the sea. The interior is covered, excepting where cleared for cultivation, with dense forests, and much of the country is level and swampy. The rainfall is excessive, and the climate unhealthy. In the woods lurk the tiger, the panther, the wild boar, and the jackal; and the marshes are filled with wild fowl. The soil is fertile, and the productions include barley, hemp, hops, fruits, and especially rice, the production of which has more than doubled since 1865, on account of the failure of the silk crop, which, however, has greatly improved since 1870. There are extensive sturgeon fisheries along the Caspian, but they are mostly in the hands of Russians. There are few towns, most of the people living in small hamlets. The capital, Resht, is a clean town, with extensive bazaars. Enzeli, the only seaport, has a harbor deep enough for vessels of 200 tons.

Ghirlanoio (otherwise called Corrado, or Bighodi), Domenico del, an Italian painter, the master of Michel Angelo, born in Florence in 1451, died there in 1495. His father was a goldsmith, called Ghirlanoio from the silver ornaments in the shape of garlands which he manufactured; and the son, who was brought up to the same calling, inherited the name. Domenico early manifested an extraordinary aptitude for portraiture, and, after studying under Alessio Baldovinetti, went to Rome to assist in the decoration of the Sistine chapel. Of the pictures executed by him there, but one now exists, the “Calling of St. Peter and St. Andrew.” Upon returning to Florence he painted a chapel of the Vespucchi family in the church of Ognissanti, in one of the compartments of which he introduced a portrait of the navigator, Amerigo Vespucci. Of greater excellence was his series of frescoes in the Sassetti chapel in Santissima Trinità, representing the life of St. Francis. In these works, as in the frescoes in the choir of Sta. Maria Novella depicting the lives of John the Baptist and the Virgin, he introduced excellent portraits of many eminent Florentines of the period. He painted many easel pictures in oil and distemper; but his frescoes, in the coloring of which, as well as in the mechanical and technical parts of his art, he excelled all previous painters, are incomparably his finest works. He is said to have created aerial perspective, and to have perfected the art of mosaic. Two brothers, Benedetto and Davide, and a son, Ridolfo, were also painters of some distinction.

Gizber. See Gizer.

Guzni, Ghizne, or Ghazna, a fortified city of Afghanistan, on the river Ghuzni, 80 m. S. S. W. of Cabool; pop. estimated at from 3,000 to 10,000. It is a commercial entrepot between the Punjab and Cabool. It lies on the W. extremity of a range of low hills, which rises above the plain; and as the plain itself is high, the site is 7,726 ft. above the sea. The fortress is an irregular square, with a circuit of about a mile and a quarter. The wall, which is flanked by numerous towers, has a wet ditch supplied with water from the river Ghuzni, which flows around the W. angle. In the N. part of the enclosed town is the citadel. In former times Ghuzni was a magnificent city, filled with palaces, mosques, fountains, reservoirs, and baths. Two lofty minarets, the smaller of which is more than 100 ft. high, several tombs, and a quantity of ruins scattered over a wide area 3 m. N. E. of the modern town, are the only relics of its former grandeur.——About 970 Alp-Teghin, governor of Khorsan under the king of Bokhara, revolted against his sultan and established at Ghuzni the seat of an independent empire, including Cabool and Candahar. Under Mahmoud, the third prince of this new dynasty, Ghuzni acquired historical importance as the centre of the first permanent Mussulman conquests in India. Mahmoud extended his victories from the Tigris to the Ganges, from the Indian ocean to the Oxus. He made twelve great military expeditions, breaking idols, plundering temples, and rendering his capital one of the richest cities of Asia. He built a mosque of granite and marble, and lavished upon it ornaments of such magnificence that throughout the East it was known as the “celestial bride.” He founded and endowed a university, patronized literature, and filled his court with poets and philosophers. After his death (about 1060) Ghuzni declined. In 1182 it was taken by the princes of Ghors. In 1880 it was stormed by the British under Sir J. Keane. In 1842 it surrendered to the Afghans, but was retaken by Gen. Sir William Nott, who brought back to India the famous gates of Somnauth, which Mahmoud had carried off from Guzerat.

Giant (Gr. γίγας, gen. γίγαντας; from γῆ, the earth, and obsolete ἄγειος, to be born, earth-born), a person of extraordinary stature. The Hebrew word נָפָהָלִים (Gen. vi. 4.), which the Septuagint renders giants (γίγαντες), has had a variety of interpretations. Some suppose it to mean men of great size; others, men surpassing in physical or mental strength; and others, apostates from the worship of the true God. But there are other passages in the Old Testament which indicate the existence of men of huge dimensions. The Rephaim, the
Anakim, the Emim, and the Zuzim are described as giants. The sons of Anak were "men of great stature," before whom the children of Israel, as their frightened scouts reported, were "as grasshoppers." Of Og, king of Bashan, and of Goliath, sufficient particulars are given to leave little room for doubt that they were of enormous stature. The fables of the giants and Titans in classical mythology probably had their origin in terrestrial natural phenomena. The scene of their contests is usually laid in volcanic districts. According to Homer, a race of giants who dwelt in the distant west were destroyed by the gods; Hesiod represented the giants as divine beings, who sprang from the blood of Uranus as it fell on the earth; and by later poets they were described as enemies of Jupiter, who vainly attempted to take Olympus by storm. Scandinavian mythology is peopled with giants (Gimmes), who dwell in forests and caves, amid treasures of gold and silver. They may be a reminiscence of some hostile race of the early times, who had sought refuge in the natural fastnesses of the land. Giants abound in German legends, and may often be traced, like the classical myths, to an origin connected directly with meteorological or terrestrial phenomena. In considering the accounts of giants with which classical literature is filled, it must be borne in mind that all the ancient nations were accustomed to magnify the stature of their kings and heroes. To be thought a giant in strength and in size was the ambition of every warrior. Alexander the Great, in one of his Asian expeditions, caused to be made and left behind him a suit of armor of huge proportions, for the purpose of inducing a belief among the people he had conquered that he was of great stature. Homer exaggerates the size and strength of the heroes of the Trojan war, and declares that the race of man in his day had degenerated in size. More recent writers are not free from similar fictions. King Arthur and his knights and Charlemagne and his paladins were represented to be greater in stature than common men. Roland, the hero of Roncesvalles, was said to be of gigantic size; but when Francis I. opened his tomb and tried on his armor it fitted him, although he was no larger than other men of his age. The body of William the Conqueror, examined 400 years after burial, was only 8 feet in length; but Stowe says that when his tomb in Caen was broken open in 1662, his bones were found to be not remarkable for size. The Germans and Gauls appeared to the Romans to be of immense stature. Caesar says: "Our shortness of stature, in comparison with the great size of their bodies, is generally a subject of much contempt to the men of Gaul." Tacitus describes the Germans as of robust form and of great stature; and Strabo says that he had seen Britons at Rome who were half a foot taller than the tallest Italians. Yet there is no proof that the men of those nations were any larger in ancient times than now; on the contrary, the remains found in graves and barrows are usually under the average height of men of the same races of the present day. It is the same with Egyptian mummies. According to Athenaeus, a man of four cubits or six feet in height was considered of "gigantic size" in Egypt. Apollodorus gives the height of the "gigantic Heracles" as four cubits; and Phys, the woman who was selected on account of her great height to personate Minerva at Athens, in the time of Pisistratus, was only about 5 ft. 10 in. Were it possible to get at the truth concerning the accounts of the giants of antiquity, there is little doubt that half of them would prove to be myths, and the greater part of the remainder gross exaggerations. Pliny's assertion that mankind is gradually decreasing in size rests on no good foundation. On the contrary, a vast amount of evidence can be adduced to show that the men of to-day are equal if not superior in stature to the ancients. The size of the armor, weapons, finger rings, and architecture of antiquity, and the measures of length derived from the human form that have come down to us, all go to prove this. But we must not therefore conclude that all the giants of the classical writers are imaginary. The diversity in the height and size of the human family that now prevails has doubtless existed in all ages. Instances are not wanting of individuals of 8 and even 9 ft. in height. Pliny tells of an Arabian giant named Gabbar who was over 9 ft. high, and of two others, Pusis and Secondilla, whose skeletons, 9 ft. in length, were preserved in the Sallustian gardens. According to Julius Capitolinus, the emperor Maximin exceeded 8 ft. In more modern times we have numerous records of men of gigantic stature. Dieremberck says that he saw in Utrecht, in 1665, a man 8 ft. high, who was born of parents of ordinary stature. Charles Birne, an Irishman, measured 8 ft. 4 in.; he died in 1788, aged 22, and his skeleton, now in the college of surgeons, London, is 8 ft. long. Edmond Malone, also Irish, born in 1682, stood 7 ft. 7 in. with his shoes off; and Patrick Cottar, still another Hibernian, is said to have been 8 ft. 73 in. high. Walter Parsons, porter to King James I. of England, was 7 ft. 7 in.; and Maximilian Christian Miller, a native of Leipsic, who died in London in 1734, was nearly 8 ft. The brothers Knipe were each about 7 ft. 2 in.; and M. Louis, a Frenchman, was 7 ft. 6 in.; the latter had two sisters nearly as tall as himself, and a brother who was still taller. Miles Darden, of Tennessee, was 7 ft. 6 in. (See DARREN.) Buffon gives a number of well authenticated cases in which men have reached an extraordinary height. The giant of Thoresby, England, was 7 ft. 5 in.; a porter of the duke of Wurttemberg was 7 ft. 7 in.; Cajenus, of Finland, was 8 ft., as was also a Swedish peasant. One of the guards of the duke of Bruns-
GIANTS' CAUSEWAY

wick measured 8½ ft.; Gilli, a giant of Trent, in Tyrol, was 8 ft. 2 in.; and a Swede in the celebrated grenadier guard of Frederick William I. of Prussia stood 8½ ft.—There is probably not a single well authenticated case, among the many given by ancient writers, of men whose stature has exceeded the natural limits, that has not been equalled in a comparatively modern period. Giants fully 8 ft. high are not unfrequently exhibited. The enormous skeletons, found in times past, of 20, 30, 50, and 100 ft. in length, were without doubt the fossil remains of animals of the primitive world, which only ignorance could have ascribed to a human origin. The progress of comparative anatomy has aided to dispel the errors long prevalent in relation to giants, and there is little fear that men of science of the present age will be deceived, as Buffon was, into representing as human the bones of an elephant.

*GIANTS' CAUSEWAY*, a series of columnar basaltic rocks in the county Antrim, on the N. E. coast of Ireland, between Bengore Head and Port Rush. For 8 m. along the coast, from Bengore to Fairhead, the land abuts upon the sea in cliffs of basalt, many of which are made up in great part of rude vertical columns which alternate with layers of amorphous beds of the same class of rock. Ranges of these piled upon each other sometimes reach the height of 400 and at Fairhead even 550 ft. As seen from the sea in front, the uniformity of the arrangement of vertical columns and horizontal beds suggests rude resemblances to architectural forms. At the base of the cliffs is a talus of ruins that have fallen from the structures above and slope down to the water. But though the name of Giants' Causeway is often applied to all this coast range, it is properly applicable to but a small portion of it, a locality quite unpretending in its extent or in the grandeur of its features. It is a platform of basalt, composed of closely arranged columns, ranging from 15 to 36 ft. in height. This platform extends from a steep cliff down into the sea, till it is lost below low-water mark. Its

Giants' Causeway.

length exposed at low water is differently given, but probably is less than 600 ft. It is divided across its breadth into three portions, which are called the Little, the Middle, and the Large or Grand Causeway; the first being that on the east. These are separated from each other by dikes of amorphous basalt. The Great Causeway, which is the principal object of interest, is only from 20 to 30 ft. wide, though detached outliers of the same columnar structure standing on the shore near by might be added to increase the width. They no doubt connect with the same group below the surface. The columns are for the most part hexagonal prisms; but they are found also of five, seven, eight, and nine sides, and in one instance at least of three sides. They are all jointed into short irregular lengths from a few inches to a few feet each, the articulations being perfectly fitted by a convex end entering the concavity of the adjoining piece, so that the blocks form a true column. There is no uniformity in the arrangement of the convexities and concavities, but generally the upper part of this section is concave. The diameter is variable, but ranges generally from 15 to 28 in. The columns fit together with the utmost precision, the corresponding faces of adjacent prisms being always equal, and so continuing from the top of the platform till the lines of separation are lost beneath the ground. It is said that water even cannot penetrate between adjoin-

The page contains a passage from a text discussing the characteristics of certain animals. It mentions the gibbons, describing their agility, size, and coloration, as well as their habitat in the trees. The text also touches on the historical context, mentioning Edward Gibbon, an English historian, and his writing style, which is noted for its clarity and precision. The passage concludes with a reference to Gibbon's work on the decline of the Roman Empire, highlighting his influence on historical scholarship.

Gibbon, Edward, an English historian, was born in Putney, April 27, 1737, and died in London, Jan. 16, 1794. He was the eldest of a family of six sons and a daughter, all of whom died in infancy, and he was so feeble in his youth that he seemed likely to share their fate. At the age of seven a domestic tutor, John Kirby, taught him the elements of Latin. In his ninth year, during a "lucid interval of health," as he says in his "Memoir," he was sent to the grammar school of Kingston-upon-Thames, where he remained two years. His mother having died in 1747, he removed with his father and aunt to Buriton, Hampshire, where he began to read voluminously. In January, 1749, his aunt opened a boarding house for Westminster scholars, and Gibbon enjoyed her care while he attended the school, but, owing to delicate health, learned little. In his 16th year his health improved, a sudden change took place in his constitution, his mind seemed to gain new activity, and he read assiduously, chiefly on historical subjects. In 1752 he went to Oxford, and, neglected by his tutor, gave himself to general reading. He was then fond of oriental research, and bought the Bibliothèque orientale of D'Herbelot with his spare money. He began to write a treatise on the "Age of Sesostris," which was probably a crude effort, for he burned it 20 years afterward. He busied himself also with religious investigation, and having read Bossuet's "Variations of Protestantism" and "Exposition of Catholic Doctrine," as well as other controversial writings, became a Roman Catholic. He went from Oxford to London, and there, before a Catholic priest, abjured Protestantism, and announced his act to his father in a long letter. The father revealed the secret, and Gibbon was expelled from Oxford, after a residence there of 14 months. He was next consigned to Switzerland in a kind of exile, and placed under the care of M. Pavillard, a Calvinistic minister at Lausanne, who it was hoped would convert him. He lived in a plain manner in M. Pavillard's house, and at first lamented the loss of English luxury. But soon his passion for study revived; he read systematically the Latin, Greek, and French classics, Crousaz, Locke, and Grotius, and was especially delighted with the "Provincial Letters" of Pascal, from which he learned "to manage the weapon..."
of grave and temperate irony, even on subjects of ecclesiastical solemnity." During the five years of his exile he made the French language more familiar to himself. On his return toJA.,

GIBBON 797

by whom it was at once condemned, and the work went no further. He next, in connection with Deyermond, started the *Mémorial* de la Génie, but his health was so precarious that the publication was in deserts. He had resigned to be annual, but two volumes only were printed (1767-8), when Deyermond went abroad. His next work was an anonymous and acrimonious attack on that portion of Warburton's "Divine Legation of Moses" in which the 6th book of the *Aeneid* is represented as containing an allegorical account of the initiation of Aeneas in the character of a lawyer into the Eleusinian mysteries. Though Warburton was the ruling critic of the time, Gibbon's "Critical Observations" (1770) were admitted to have overthrown his hypothesis. The subject was one that could have but little general interest, but the unknown author was mentioned by Heyne of Göttingen as a docteur et elegantissimus Britannus. His father having died in November, 1770, Gibbon settled in London, and, with a considerable though somewhat embarrassed estate, lived in studious ease, and began to labor more directly upon his "Decline and Fall," which he had been wont to "contemplate at awful distance." In 1774 he entered the house of commons as member for the borough of Liskeard, and held the seat for eight years a silent supporter of the measures of Lord North. Such was his timidity that he was never able to address the house; more than once he prepared himself to speak, but when the moment for action came his courage wholly deserted him. Near the close of 1775 the first volume of his history was completed. It was refused by the bookseller Elmsley, but accepted by Cadell and Strahan. It appeared in February, 1776; its success was immediate, and, for a quarto and a grave historical production, unprecedented. The first edition was exhausted in a few days; a second and third were soon called for. Hume and Robertson, to whom he sent copies, wrote him congratulatory letters. His splendid theme and imposing style fixed the attention of the public, while his views of Christianity in the last two chapters called forth numerous replies. Watson, Taylor, Milner, Lord Hailes, Davies of Oxford, and Dr. Priestley were the most noted of his assailants; but to Davies alone would the historian consent to reply, because this critic had questioned not his faith, but his historical fidelity. His "Vindication" soon appeared, in which he freed himself from the charge of misquotation. Meantime he studied chemistry and anatomy for recreation. He wrote a political pamphlet in French, in defence of the ministry, and was rewarded with a sinecure place in the board of trade worth £800 a year. He was a member of the Literary club, and a noted conversationist. The second and third volumes of his history were published in 1781, and were received with avidity. On the fall of Lord North's ministry and the loss of his salary by the abolition of the board of trade, Gibbon thought himself too poor to live in England, and went to Lausanne in
GIBBON

1788 to reside with his friend Deyvendun. His fourth volume, embracing the reign of Justinian and the chapter on the Institutes, was already finished, but on the borders of the lake of Geneva he allowed nearly a year to pass before he vigorously resumed his work. He was fond of society, and became highly popular among the Swiss; he gave balls and suppers, frequent assemblies, received many eminent visitors, and even after he was fairly seated at his task mingled gayety with constant study. He wrote steadily and rapidly till he completed his work, June 27, 1787. He went to England bearing the manuscript of the last three volumes with him, and on his 51st birthday, the period selected by himself, they were issued. The work was already established in fame; it was translated into German, French, and Italian. His profit from all the volumes is stated to have been £6,000, and that of the booksellers £20,000. The first four volumes were reproached for indecencies, veiled for the most part in the learned languages in the notes. Gibbon returned to Lausanne in July, 1788, to find his friend Deyvendun dying. He now wrote his own "Memoirs," which were published posthumously. The French revolution disturbed his repose. Lausanne was filled with French emigrants; the Neckers with their daughter, afterward Mme. de Staël, were his neighbors at Coppet. Lady Sheffield, the wife of his intimate friend Lord Sheffield, died about this time, and Gibbon, partly in the hope of consoling his friend, partly in fear of the revolution, set out for England in the spring of 1793. He had long suffered from hydrocele, which he had studiously concealed, and he died calmly after undergoing three painful operations. He was buried in Lord Sheffield's family burial place at Felching, in Sussex, and his epitaph was written by Dr. Parr.—In appearance Gibbon was heavy and dull, his countenance showed no trace of intellect, and his features were unattractive. He was fond of fine dress, and his manners were well bred but pompous. He conversed with fluency in sounding language and well ordered periods. His "Decline and Fall of the Roman Empire" is admitted to be the greatest historical work in the English language, and one of the greatest creations of any single intellect. It is hardly less than the history of the world for nearly 13 centuries, for it comprises an account of all the nations who influenced the destinies of the Roman empire both in the West and East. Its vast design, including the decay and ruin of an ancient civilization and the birth and formation of a new order of things, its lucid arrangement, subordinating an infinite variety of subjects to one main and preeminent idea, tracing the progress of hostile religions, the influx of successive hosts of barbarians from remote and opposite quarters, the development of the Roman law, the details of ecclesiastical history, and the general rise of modern states, according to the impressions which they made on the tottering fabric of Roman greatness; its singular condensation of matter of general accuracy, and of vivid, connecting, and picturesque style, are among the qualities which secure its eminence in historical literature. "Christianity alone," says Milman, "receives no embellishment from the magic of Gibbon's language; his imagination is dead to its moral dignity; it is kept down by a general tone of jealous disapprobation, or neutralized by a painfully elaborate exposition of its darker and degenerate periods." The best editions are those edited by the Rev. H. H. Milman (12 vols., London, 1886-9; 2d ed., 1845), which embodies notes by the editor, and by Guizot and others, and that by William Smith (8 vols., 1854-5), containing many new notes. Dr. Smith's abridgment, "The Student's Gibbon," is valuable as a concise summary of the work. Gibbon's memoirs and miscellaneous writings were published under the care of Lord Sheffield (2 vols., London, 1796, to which a third volume was added in 1815).

GIBBONS, Grisling, an English wood carver and sculptor, born about 1650, died in London, Aug. 8, 1721. He was the son of a Dutchman who settled in London; and as he early excelled in his art, Evelyn recommended him to Charles II., who attached him to the board of public works, and employed him in the chapel of Windsor castle, for which he carved the foliage, and in the choir of St. Paul's and the great room at Petworth, the decorations of the latter being regarded as his masterpiece. Among his other carvings are the fonts in St. James's, Piccadilly, and the base of the equestrian statue of Charles I., in Charing cross. His best known sculpture is the statue of James II. in front of Whitehall. His fame, however, rests mainly on his wood carving, in which his touch was so sure and delicate that his carved feathers can hardly be distinguished from real ones.

GIBBONS, Orlando, an English composer, born in Cambridge in 1558, died in 1625. At the age of 21 he was made organist of the royal chapel. In 1622 the degree of doctor of music was conferred on him by the university of Oxford. He was principally distinguished for his church music, his anthems being regarded in their day as model compositions of that class. He was also a skilful composer of madrigals.

GIBBS, Judah Willard, an American philologist, born in Salem, Mass., April 30, 1790, died in New Haven, March 25, 1861. He graduated at Yale college in 1809, and was tutor in that institution from 1811 to 1815. In 1824 he was appointed professor of sacred literature in the theological department of Yale college, a post which he held until his death. In his special department, and in philological and grammatical studies generally, he was a thorough and accurate scholar. His principal publications are: a translation of Storr's "Essay on the Historical Sense of the New Testament" (Boston, 1817); translation of Gesenius's "Hebrew
Lexicon of the Old Testament" (Andover, 1824); "Manual Hebrew and English Lexicon" (ibid. from Godwinus (Andover, 1826); "Philological Studies" (New Haven, 1827); and "Latin Analyst" (New Haven, 1858). He contributed also to several important philological works, including the revised edition of Webster's dictionary and W. C. Fowler's work on the English language; and furnished valuable papers to the "American Journal of Science" and other critical periodicals.

GIBBS, Welles, an American chemist, born in New York, Feb. 21, 1822. He graduated at Columbia college in 1841, and studied chemistry under Prof. Hare at Philadelphia, and medicine at the New York college of physicians and surgeons, taking his degree in 1844. He then went to Europe, and studied under Liebig and Rammelsberg. On his return, in 1849, he was elected professor of chemistry and physics in the New York free academy. In 1850 he became professor in Harvard university and lecturer on the application of science to the useful arts, which chair he still occupies. He was a member of the United States sanitary commission during the civil war, and was appointed by President Grant scientific commissioner to the Vienna exhibition in 1873. His writings relate exclusively to chemical and physical subjects. He has published about 50 papers, mainly in the "American Journal of Science."

GIBBON (Iheb., hill city), one of the principal cities of Palestine, about 5 m. N. W. of Jerusalem. Before the conquest of Canaan by Joshua, it was inhabited by Hivites, who by stratagem secured their own safety and protection from Israel; though when the deception was discovered the Gibeonites were degraded to the condition of hereditary "beers of wood and drawers of water unto all the congregation." It is not mentioned as one of the royal cities of the Canaanites, though described as a great city, and as one of the royal cities. When the five kings of the Amorites besieged Gibeon because of its having made peace with Israel, Joshua marched against them, and at his command, as we are told after the poetical book of Joshua, "the sun stood still, and the moon stayed, until the people had avenged themselves upon their enemies" (Josh. x. 1-14). The Gibeonites were persecuted and nearly exterminated by Saul. On the division of Canaan, Gibeon fell to the tribe of Benjamin; afterward it was given to the Levites; toward the close of David's and in the beginning of Solomon's reign, the sanctuary was there, and there dwelt the high priest. Near to it was a pool, probably the "great waters" referred to by Jeremiah, where Absalom was defended by Joab and also the great stone, or monumental pillar. It is identified with the modern El-Jib, an irregular village, seated on the summit of a hill, and containing massive ruins.

GIBRALTAR (Arab. Jebel al-Tarik, mount of Tarik), a fortified rock on the S. coast of Andalusia, Spain, belonging to Great Britain, and giving name to a town and bay on its W. side, and to the strait connecting the Atlantic and the Mediterranean. Europe point, its S. extremity, is in lat. 36° 6' N., lon. 5° 21' W. The rock forms a promontory, 3 m. long from N. to S. and about 7 m. in circumference. A low sandy isthmus, 14 m. long and 2 m. broad, connects it with the mainland of Spain, having the bay of Gibraltar on the west and the Mediterranean on the east. Two parallel rows of sentry boxes across this flat mark the Spanish and English lines, the space between them being called the "neutral ground." The N., E., and S. sides of the rock are steep and precipitous, and almost inaccessible. On the west it slopes down to the water; here are the town and the principal fortifications. The highest point is about 1,400 ft. above the sea. The rock is composed of gray primary limestone and marble, and was uplifted probably at a recent geologic period, as a marine beach exists more than 400 ft. above the sea. It is perforated by a number of remarkable natural caverns, all of which are difficult of access. The largest, called St. Michael's, has a hall hung with stalactites reaching from roof to floor. Its entrance is 1,000 ft. above the sea, and it is connected with other caverns beneath it of unknown depth. From the sea the surface appears barren; but acacia, fig, and orange trees, and a variety of odoriferous plants, grow in sheltered places. The animal productions are a few kinds of birds, wild rabbits, snakes, and monkeys. The latter, the only wild monkeys in Europe, are of a fawn color and without tails. The climate is temperate and generally healthy, but about once in 12 years an endemic fever, known as the Gibraltar fever, prevails. Immense sums of money and a vast amount of labor have been expended on the fortifications of this stronghold. The most remarkable of the works are the galleries tunnelled in tiers through the solid rock, along the N. front. They are 2 or 3 m. long, and are wide enough to admit a carriage. At every 12 yards they are pierced with ports for guns, so as to command the bay and neutral ground. On the summit of the rock are barracks and fortresses, and strong batteries frown all along the slope on the W. side. More than 1,000 guns are now in position. The garrison consisted in 1875 of 4,308 men. The cost of maintaining the fortress in 1867-8 was £420,465; estimate for 1872-3, £219,417. — The town of Gibraltar lies on a shelving ledge on the W. side of the rock, near its N. extremity, 85 m. S. E. of Cadiz; pop. in 1871 (exclusive of the garrison), 16,454, English, Spaniards, Jews, and Moors. It consists chiefly of one spacious street, called the Main or Western street, about 3 m. long and well paved and lighted. The town appears to be more populous than it really is, from the number of strangers visiting it. Great care is taken to prevent the increase of new residents, and
foreigners are allowed to remain only during specified periods, and on giving security for good behavior. The principal buildings are the residences of the governor and lieutenant governor, the admiralty, naval hospital, barracks, and storehouses. There are also Protestant and Roman Catholic churches, four Jewish synagogues, seven regimental and two public schools, a theatre, several hotels, a lunatic asylum, and an almshouse. The garrison library, founded in 1793, contains upward of 20,000 volumes. The water used in the town and by the garrison is collected entirely from the roofs in the rainy season and kept in tanks under the houses. Although a free port, Gibraltar has but little trade. British manufactures for the Barbary states and for other countries bordering on the Mediterranean are distributed through it to some extent. The chief imports are cotton and woollen goods from England; tobacco, rice, and flour from the United States; sugar and rum from the West Indies; and wines, silks, spices, tea, and wax from the East. The chief export is wine. The revenues are usually about £30,000, and the expenditures nearly the same. The entire administration of affairs is in the hands of the military governor. The bay of Gibraltar, sometimes called Algeciras bay, is formed by the promontory of Gibraltar on the east and the mainland terminating in Point St. Garcia on the west. It is 44 m. wide from E. to W., and about 6 m. long from N. to S. Its depth of water, which is 260 ft. at the entrance, gradually diminishes toward the head of the bay, affording good anchorage. The tide rises 4 or 5 ft. Several small streams empty into it on the west and north. Opposite Gibraltar, on the W. side, is the Spanish town of Algeciras. On the British side shipping is protected by two long molesthe strait of Gibraltar, the channel connecting the Atlantic and the Mediterranean, lies between the southernmost part of Spain, from Cape Europa to Cape Trafalgar, and the African coast opposite, from Ceuta point on the east to Cape Spartel on the west. Its length from E. to W. is about 38 m. The narrowest point is S. of Tarifa, where the opposite coasts are but 9 m. apart. From Europa to Ceuta point is about 15 m., and from Trafalgar to Spartel about 25. The greatest depth of water is 960 fathoms. Through the strait a strong central current, from 3 to 6 m. an hour, sets constantly from the Atlantic into the Mediterranean; and two smaller currents, one along each coast, ebb and flow with the tide, running alternately into the Atlantic and the Mediterranean. The excess of water thus flowing into the latter sea is necessary to supply the loss by evaporation. The rock of Gibraltar, though well known to the ancients, was not occupied until a comparatively modern period. By the Phoenicians it was called Alube, which the Greeks corrupted into Calpe. Ceuta, the African point opposite, called by the English Ape’s hill, was the ancient Abyla. These two hills constituted the pillars of Hercules, named, not from the Greek hero, but from the Tyrian deity, whose worship the Phoenicians introduced into all their settlements. The strait was long regarded as the western boundary of the world. The value of Gibraltar as a strategic point was first discovered by the Saracens, who, under their leader Tarik (or Tarif) ben Zeyad, landed there in April, 711. In the following year Tarik built a fortification on the height, and it was called thenceforward after his name. In 725
was erected the castle which is still standing at the N. end of the rock. The fortifications were further strengthened in 1161 under the direction of Alphonso X., the celebrated Moorish engineer. In 1309 the place was captured by the Christians under Guzman the Good, and recaptured by the Moors in 1333. In 1349 the siege was laid to it again by Alfonso XI. of Castile, but raised in the following year on account of the plague, which carried off the king. Gibraltar was finally captured by the Christians under the duke of Medina Sidonia in 1462. Under the Spanish crown it was so strengthened as to be considered impregnable; but it was taken Aug. 4, 1704, by a combined English and Dutch fleet under Sir George Rooke and the prince of Hesse-Darmstadt, and held till 1718, when it was confirmed to Great Britain by the treaty of Utrecht. Early in 1727 the Spaniards attacked it with a large force, but raised the siege on the signing of preliminaries of peace with Great Britain in May of the same year. But the most memorable siege of Gibraltar was that of 1779-83, sustained against the combined land and naval forces of France and Spain. By June 21, 1779, all communication between the rock and the mainland was cut off, and in July the fortress was completely blockaded. The cannonading began in September on the part of the besieged, but the Spaniards did not open their fire until January, 1780. The attack and defence which followed fixed the attention of Europe for the next three years. On the part of the besiegers all the resources of war were brought to bear both by land and sea. The best engineers of France and Spain directed the approaches; a powerful fleet anchored in the bay, and for three weeks an incessant bombardment was kept up from 20 mortars and 200 pieces of battering cannon. The garrison, commanded by Sir Gilbert Elliot (afterward Lord Heathfield), and numbering 7,000 men, made a herculean resistance. On Nov. 27, 1781, they destroyed the enemies' works in a sortie, but the allies at once reconstructed them, and soon brought 1,000 pieces of artillery to play against the fortress, while 47 ships of the line and innumerable smaller vessels menaced it by sea, and an army of 40,000 men conducted the operations on land. The whole enterprise was directed by the duke de Crillon. Meanwhile Admiral Rodney, having defeated the fleet of Count de Grasse, succeeded in throwing relief into the fort. In September, 1782, the allies attempted to silence the British fire by means of 10 enormous floating batteries constructed by the chevalier d'Arçon in such a manner as to be deemed invulnerable. Each was manned by a picked crew and mounted from 6 to 21 guns. On May 30 they were put in motion, and one of the most dreadful calamities known in history was opened on both sides. It continued for several hours with little advantage to either party, but late in the afternoon the effect of the red-hot shot from the garrison became apparent, and soon after midnight nine of the batteries were on fire. Of their crews about 400 men were saved by the exertions of the British; the rest perished by the flames, explosions, or drowning. The besieged had 16 killed and 68 wounded. Several attempts to storm the rock by land proved equally disastrous. The British received fresh reinforcements, and in February, 1783, the siege was raised on the signing of preliminaries of peace. In 1868 a proposal to surrender Gibraltar to Spain was agitated in England, but did not meet with public favor. As the key to the Mediterranean and one of the chain of fortresses connecting Great Britain with her East Indian possessions, it is of incalculable value for a coaling station, a depot for war material, and a port of refuge.

GIBSON. L. A. W. county of Tennessee, drained by Forked Deer and Obion rivers; area, 520 sq. m.; pop. in 1870, 25,666, of whom 6,856 were colored. The surface is generally even and covered with the soil fertile. The Mobile and Ohio and the Memphis and Louisville railroads pass through it. The chief productions in 1870 were 116,869 bushels of wheat, 108,775 of Indian corn, 16,819 of peas and beans, 23,440 of Irish and 60,275 of sweet potatoes, 243,746 lbs. of butter, 879 tons of hay, and 9,816 bales of cotton. There were 5,581 horses, 2,965 mules and asses, 5,470 milk cows, 6,883 other cattle, 14,115 sheep, and 63,108 swine; 6 manufactories of agricultural implements, 10 of bricks, 18 of carriages, 5 of furniture, 3 of iron castings, 1 of kindling wood, 7 of saddlery and harness, 1 of sashes, doors, and blinds, 6 wool carding and cloth dressing establishments, 11 flour mills, 1 planing mill, and 15 saw mills. Capital, Trenton.

GIBSON, John, an English sculptor, born at Conway, North Wales, in 1791, died in Rome, Jan. 27, 1866. His father, who was a market gardener, removed to Liverpool, and young Gibson, after endeavoring to prevail on his parents to allow him to study painting, was apprenticed at the age of 14 to a cabinet maker, and soon after to a wood carver. He attracted the attention of Messrs. Francis, marble cutters, who purchased his indentures and
took him into their employment. Through one of the partners in this firm he was introduced to William Roscoe, the historian, who encouraged him to pursue the career of a sculptor, and was instrumental in raising a fund in Liverpool to enable him to study in Italy. In 1817 he went to Rome, with letters from Flaxman to Canova, who received him as a pupil and gave him all the assistance in his power. In 1821 he produced his first important work, a group of "Mars and Cupid," now at Chatsworth. On the death of Canova in 1828, Gibson studied for a short time with Thorwaldsen. In 1827 he sent his "Psyche and the Zephyrs" to the exhibition of the royal academy, of which he was elected an associate in 1833, and a member in 1836. Most of his works are portrait statues, and ideal pieces founded on classic models. Of the former, the best known are his statues of Queen Victoria in Buckingham palace, at Windsor, and in the new palace at Westminster, those of Huskisson in Liverpool, and of Sir Robert Peel and George Stephenson. His ideal figures and bass reliefs are imbued with the spirit of Greek art. Refinement of feeling, high poetical imagination, exceeding gracefulness of form and expression, and an almost unrivalled delicacy of execution characterize this class of his sculptures. He was the first of modern sculptors who had the daring to introduce color into their works. In some of the subordinate details the statue of the queen and the Aurora were slightly tinted, but the Venus, which attracted much attention at the international exhibition in 1862, showed the innovation carried to its furthest limit. This statue is entirely colored of a flesh tint, and the eyes, hair, and parts of the drapery counterfeit the resemblance to actual life as nearly as color can do it. Gibson also adhered to the practice of habitting his modern figures in classic costume. With the exception of a few short visits to England, he lived almost uninterruptedly in Rome.—See "Life of John Gibson," edited by Lady Eastlake (1869).

GIDDINGS, Joshua Reed, an American statesman, born at Athens, Pa., Oct. 6, 1796, died in Montreal, May 27, 1864. In his infancy his parents removed to Canandaigua, N. Y., where they remained till he was 10 years old, when they emigrated to Ashabula co., Ohio, among the first settlers in that part of the Western Reserve. In 1812 he enlisted as a soldier, and was one of the expedition sent to the peninsula north of Sandusky bay, where, in two battles on one day with a superior force of Indians, it lost nearly one fifth of its number in killed and wounded. At the close of his term of service he commenced school teaching, and in 1817 began the study of the law, and was admitted to the bar in 1820. In 1826 he was chosen a representative to the state legislature, and in 1838 was elected to congress, where he became at once a prominent champion of the abolition of slavery and the slave trade in the District of Columbia and the territories under the jurisdiction of the national government. On Feb. 9, 1841, he delivered his first antislavery speech, upon the Indian war in Florida, which he contended was begun and carried on in the interest of slavery. In 1842 he brought before congress a series of resolutions in relation to the slaves on the Creole, who had captured that vessel on her passage from Virginia to New Orleans, and carried her into Nassau, where their right to freedom was recognized by the British authorities. His resolutions justified the conduct of the slaves on the ground of their abstract right to freedom, and declared that they had violated no law of the United States, and that any attempt to recapture them was unauthorized by the constitution and incompatible with the national honor. The great excitement which they caused induced him to withdraw them, but he was nevertheless censured by a congressional vote of 125 to 69, and resigned. He was replaced by a large majority, and resumed his seat after an absence of but six weeks. He was returned by successive elections until March 4, 1859, making his period of service 20 years, during which he continued upon every opportunity (acting in conjunction with John Quincy Adams till his death) to advocate his views on slavery, while attending closely to the general business of legislation. He acted generally with the Whig party till 1848, giving his hearty support to Gen. Harrison and Henry Clay, but refused on anti-slavery grounds to support Gen. Taylor. In the election of 1848 he acted with the free-soil party. In 1850 he took a prominent part in opposing the enactment of the "compromise measures," especially the fugitive slave law. He was conspicuous also in the debates upon the repeal of the Missouri compromise, and in those upon the subsequent troubles in Kansas. On May 8, 1856, while addressing the house, he suddenly fell to the floor in a state of unconsciousness, from which he soon revived, though in a condition of great weakness. On Jan. 17, 1858, he fell again in the same way, and for some minutes was supposed to be dead. He slowly returned to consciousness, but was compelled for a time to be absent from his post. His disease was an affection of the nervous system operating upon the heart. In 1861 he was appointed consul general for the British North American provinces, a position which he held until his death. In 1848 Mr. Giddings wrote a series of political essays, signed "Pacificus," which attracted considerable attention. A volume of his speeches was published in 1853. He also wrote "The Exiles of Florida" (Columbus, 1868), and "The Rebellion, its Authors and Causes" (New York, 1864).

GIDEON, surnamed Jerabbaal, the fifth judge in Israel, was the son of Joash, of the tribe of Manasseh, and dwelt at Ophrah. His history is narrated in Judges vi.—ix. Israel had been for seven years humbled by the Midianites and Amalekites, when Gideon by a double miracle was roused to become their deliverer. When
he had fulfilled his mission, the Israelites solicited him to become their king, but he declined, and held for 40 years the office of judge.

GIEN, a town of France, in the department of Loir et Cher, on the right bank of the Loire, surrounded by a fine stone bridge of 12 arches, 38 m. S. E. of Orleans; pop. in 1866, 6,717. It is built on a hill, and has an ancient castle, now used for public offices. The lower part of the town is often overflowed by the rising of the Loire. Pottery, leather, and fine carriages are manufactured, and there is a trade in wine, wool, saffron, coal, etc. Giens is first mentioned at the close of the 8th century as the site of a castle built by Charlemagne. The castle was restored and enlarged in 1494 by Anne de Beaujeu, daughter of Louis XI.

GIEXEBRECHT, Friedrich Wilhelm Benjamin von, a German historian, born in Berlin, March 5, 1814. His father, Karl Heinrich Ludwig, was a dramatist, and his uncle, Heinrich Ludwig Theodor, was a poet and historian. He studied under Ranke, and became a professor at the gymnasmium of Berlin, in 1827 at the university of Königsberg, and in 1862 at that of Munich, where he also presided over the historical seminary, and succeeded Sybel as permanent secretary of the historical committee. He wrote the history of the emperor Otho II. for Ranke's Jahrbücher des deutschen Reiches (Berlin, 1840); and having discovered and published the Annales Alamanniae, a long missing manuscript of the 11th century, the Prussian government enabled him to reside from 1849 to 1855 in Italy to collect original materials for his most important work, Geschichte der deutschen Kaiserzeit (3 vols., Brunswick, 1863-5; 8th ed., 1868). In 1874 he undertook a revised edition and continuation of Heeren and Ukté's Europäischen Staatsengeschichte (72 vols., Gotha, 1823-74 et seq.).

GIERSCH, Johann Karl Ludwig, a German chronicle historian, born at Petershagen, March 8, 1792, died in Göttingen, July 8, 1854. He interrupted his studies in the university of Halle to serve as a volunteer in the campaign of 1813. In 1815 he resumed his studies, which he combined with teaching. In 1818 appeared his Historisch-kritischer Versuch über die Entstehung und die früheren Schicksale der schriftlichen Evangelien, and in 1819 he was appointed professor of theology in the university of Bonn, and in 1831 at Göttingen. His principal work is Lehrbuch der Kirchengeschichte. The five volumes published during his lifetime brought the history down only to the peace of Westphalia in 1648; but from the notes and manuscripts which he left, it was continued to the present century by his pupil Redepenning. An English translation of the entire work was made in 1854 by an assistant in the editorial care of Prof. Henry B. Smith (4 vols., New York, 1856-8). It is especially valuable for the fulness of its citations, the source for each important statement being given at length in notes, which in volume far exceed the text.

GIessen, a town of Germany, capital of the province of Upper Hesse, in the grand duchy of Hesse-Darmstadt, situated at the confluence of the Wiesach with the Lahn, 30 m. N. of Frankfurt; pop. in 1871, 12,345. It was originally fortified, but its ramparts have been levelled and converted into promenades. The town is well though irregularly built, and contains an old castle, a hospital, arsenal, and two churches. The university, which was founded in 1607, has 58 teachers and about 400 students, a library of 40,000 volumes, an observatory, botanical garden, and museum. Its school of organic chemistry under Liebig has been especially distinguished. Besides the university Giessen has a gymnasium and several other superior schools. Its manufactures consist of hosiery, hats, soap, candles, red and white leather, jewelry, weapons, liqueurs, vinegar, and tobacco. It has also breweries and oil mills, and a considerable trade in castle.

GIFORD, Helen Selina, countess of an English poetess, born in 1807, died June 18, 1867. She was a daughter of Richard Brinsley Sheridan, and sister of the duchess of Somerset and of the Hon. Mrs. Norton. She married in 1825 Price Blackwood, a captain in the navy, afterward fourth Baron Dufferin, who died July 21, 1841. In order to be better able to attend her intimate friend, the earl of Gifford, in his illness, she married him in 1865, about ten weeks before his death. She was celebrated for her wit, and in her early days for her beauty, and wrote many songs and ballads, including "The Irish Emigrant's Lament" and "The Farewell of Terence." The present Earl Dufferin, governor general of Canada, is her eldest son.

GIFORD, Robert Swan, an American painter, born in Naushon, Mass., Dec. 28, 1840. He studied in New York with Albert Van Beest, and in 1869 made an extensive sketching tour through California and Oregon, and furnished for Appleton's "Picturesque America" (1872-'3) views of the Columbia river, northern California, and the coast of California. He spent the year 1870 and a part of 1871 in Europe, Egypt, and northern Africa, making sketches. Among his best works are "The Rock of Gibraltar" and "A Lazy Day in Egypt.

GIFORD, Sanford Robinson, an American painter, born in Greenfield, Saratoga co., N. Y., July 10, 1823. His childhood and youth were passed at Hudson, and in 1842 he entered Brown university, where he remained till 1844, when he went to New York and studied drawing, perspective, and anatomy, with a view to figure painting; but in 1845 he determined to devote himself to landscapes. In 1851 he became an associate of the national academy; and in 1854 an assistant in the editorial care of Prof. Henry B. Smith (4 vols., New York, 1856-8). It is especially valuable for the fulness of its citations, the source for each important statement being given at length in notes, which in volume far exceed the text.
he passed in Rome, and the summer of 1857 in a sketching tour, in company with Albert Bierstadt, through the Abruzzi and around Naples, and later through parts of Austria. He returned to New York in September. In 1861, at the outbreak of the civil war, he joined the 7th New York regiment and accompanied it to Washington. He was also out with it in 1862 and 1863. In 1868 he went abroad again, and spent two years sketching in Italy, Greece, Syria, and Egypt. Among the best of Gifford's pictures are the following: "Kauterskill Clove," "Twilight" (1869), "Rivouac of the 7th Regiment at Arlington Heights" (1861), "Baltimore, 1862," "A House in the Wilderness" (1866), "Hunter Mountain" (1866), "Sunrise on the Seashore" (1867), "Shrewsbury River" (1869), "Mansfield Mountain" (1869), "San Giorgio" (1869), "Fishing Boats of the Adriatic" (1870), "Pallanza" (1870), "Tivoli" (1870), "A Venetian Twilight, Santa Maria di Salute" (1871), "Monte Ferro, Lake Maggiore" (1871), "The Golden Horn" (1872), "Schloss Rheinstein" (1873), and "Sunset on the Sweetwater, Wyoming Territory" (1874).

Gifford, William, an English author, born in Ashburton, Devonshire, in April, 1757, died in London, Dec. 31, 1826. He was left an orphan in childhood, and apprenticed to a shoemaker. His master refused to allow him time for reading, but he contrived by stealth to acquire a considerable knowledge of mathematics, and occasionally wrote verses. Some of the latter came into the hands of Mr. Cookesley, a surgeon, who raised a subscription to purchase his freedom. In two years he entered Exeter college, Oxford, where he was appointed Bible reader. Lord Grosvenor invited him to live with him, and subsequently sent him to the continent as the travelling tutor of his son. After his return to England, he published in 1794 his "Baviad," a paraphrase on the first satire of Persius, in which the popular Della Cruscan poetry of the day was happily ridiculed and effectively put down; and in 1795 the "Meviad," an imitation of Horace, directed against the corruptions of the drama. His "Epistle to Peter Pindar," published in 1800, is one of the bitterest attacks ever directed against an opponent. Being now known as a keen political writer, he wrote with George Ellis and Freer for the "Anti-Jacobin" upon its commencement by Canning, and from this connection received two offices under government, which he held for life. In 1802 he published a spirited translation of Juvenal, with his own autobiography. He also translated Persius, and edited the dramatic works of Massinger, Ben Jonson, Ford, and Shirley. Upon the establishment of the "Quarterly Review" in 1809 he became its editor, a post which he retained until about two years before his death.

**Gift, a voluntary transfer of property of any kind.** The word "give" is generally employed among the words of transfer in deeds of land; but by gifts, in law, are usually meant transfers of chattels or presents which are wholly without any pecuniary consideration, or any other consideration which the law recognizes as valid. They are usually divided into gifts *inter vivos* and gifts *causa mortis*. The latter are called in English gifts in prospect of death; and the former phrase, or gifts between the "living," is not accurate, as describing but one class of gifts, because it applies to all, as only the living can give, and they can give only to the living. But gifts *causa mortis* may be defined as gifts made by one believing himself, or reasonable grounds, to be very near his death, and made in view of and because of this apprehension; and gifts *inter vivos* are all those which are not gifts *causa mortis*.—First, as to gifts *inter vivos*. Any person competent to transact ordinary business may give whatever he or she owns to any other person. The usual disabilities for legal action would apply here. Thus, a gift by an infant (i.e., a minor), a married woman, an insane person, or a person under guardianship, would be wholly void, or would be voidable by the giver or one having authority to represent the giver, in much the same way that a transfer for consideration would be. Gifts, by persons competent to give, of property which they have a right to give, to persons competent to receive, and which are completed and effectual, are regarded by the law as executed contracts, founded upon mutual consent. It is absolutely essential to the validity of a gift that it should go into effect at once and completely. If it be not a thing of the present, now done and finished, then it is no longer an act, but a promise. And as it must be, if a promise, wholly without consideration, because otherwise it is not a gift, it comes under the rule of law which makes promises without consideration of no legal validity, and incapable of legal enforcement. Hence, the very first rule in the law of gifts is, that delivery is essential to a gift. And this delivery must be to the donee; even if the giver deliver the money to a third person with orders to give it to the donee, and will therefore be bound if this third person give it to the donee before revocation, the giver may, at any time before the delivery to the donee, annul his directions to the party holding the money, and revoke and reclaim the gift. Generally, a court having equity powers will not interfere to enforce or complete a gift which is merely intended and promised. Nor will the transfer, if without delivery, be any the more effectual for being made in writing. As there must be actual delivery, so there must be actual acceptance; in other words, the thing given must pass out of the present power and possession of the giver, and into that of the donee. It is nevertheless in the power of a thing of which the present and immediate manual delivery is impossible. The delivery may, in such a case, be constructive, or symbolic, or
any such delivery as the nature and actual position of the thing at the time may permit and require; as a delivery of a key which commands access to the thing; or a delivery of a part for the whole, where the whole is too bulky to be delivered otherwise. So also the delivery may be by an order upon a warehouseman or other person having the thing in his custody; but in this case the gift is not complete and effectual until the order has been presented and completed or performed by the party on whom it is drawn. From the same necessity of completing the gift by delivery and acceptance, and from the same rules which make a mere promise without consideration voidable, it follows that if a gift be made by a note, or any instrument not under seal (for a seal is the equivalent of a consideration), it may be revoked by the donor. So if it be made by a check, draft, bill, or order, the giver may revoke it at any time before it is paid or executed, or accepted in such a way as to bind the drawer. A gift by a competent party, made perfect by delivery and acceptance, is then irrevocable so far as the donor himself is concerned; but it may still be revoked or annulled, and the property resumed, by the creditors of the giver, if the giver at the time of the gift was insolvent, and by the gift diminished the fund to which his creditors were entitled. But it is thus void only in reference to existing creditors, and not as to persons becoming creditors subsequently, unless made when the insolvency was actual or immediately expected, or with actual fraudulent purpose as to future creditors. All voluntary transfers, as settlements of every kind and the like, if made in fraud of creditors, are considered as gifts in the law, and are void. In most of the United States the statutes respecting insolvency provide especially for all cases of this kind.—Gifts causa mortis can be made only when the donor has reason to believe that death is impending. The law watches over gifts causa mortis with great jealousy, and restrains them by rigorous principles and wise precautions, for the same reasons which induce it to lay down such precise and rigid rules in relation to wills and all testamentary dispositions. This reason is not any unwillingness that the wishes of the dead or of the dying should have their full effect; but from the extreme difficulty of giving them this effect, and yet closing the door effectually against, on the one hand, false and supposititious expressions of his will, or, on the other hand, undue and injurious influence exerted upon him as to the disposition of his property. Both of these reasons apply as strongly and directly to gifts made in prospect of death as to wills, or perhaps more so. Indeed, as these gifts are sometimes made in substitution of wills, and to avoid the special requirements made by the law in respect to wills, this is another reason why the law regards them with the suspicion felt toward acts which are evasions of law. Much that was said of gifts inter vivos is equally or indeed much more strongly applicable to gifts causa mortis. Thus, there must be not only delivery and acceptance, but this must be strictly actual, if that be possible without extreme inconvenience; and if impossible, in that case it must be something that is as near actual delivery as may be possible. It has even been said that no mere possession, although previous and continuous, is sufficient without delivery; as if the giver should say, "You may have and keep as your own the watch I have permitted you to wear for a year, and which is now in your pocket," this would not pass the property in the watch unless the giver took it into his own hands and gave it back to the donee; but we doubt whether the rule would be applied with so much severity. We have no doubt that the giver, if physically incapable, or perhaps if only unwilling to make the effort, might, without doing anything himself, as well and effectually direct another in his presence to take such a thing and give it to such a donee, to be kept by him as his own. After some fluctuation it seems now to be settled that the donor's own note, or his own check, draft, or bill, not paid or accepted before his death, is not a valid gift causa mortis; that is, the executor or administrator of the deceased may refuse to pay his note, and may revoke his bill or draft, and order the drawer not to pay it. But bank notes certainly, and probably all notes of other parties payable to bearer, or indorsed in blank, and perhaps all notes, bonds, and other written contracts of other parties, may be the subjects of a valid gift causa mortis. One rule is perfectly certain: one who makes a gift in prospect of death may revoke his gift at any time during his life, although it be completed and executed by delivery and acceptance. Any such distribution of his property is, in the language of the law, ambulatory, or changeable at his own pleasure, so long as he remains alive; and it is sometimes said that his recovery does of itself revoke and annul such a gift made in prospect of death, because the cause and ground of it have ceased to exist. We should say, however, that if the giver, with full means of actual revocation, did not choose to revoke his gift, it became changed by his recovery from a gift causa mortis to a gift inter vivos. Within these rules and restrictions there seems to be no limit in law to the possible amount of a gift causa mortis. It should be added that gifts in prospect of death are equally void as against existing creditors with gifts inter vivos.

GILOUX, François Magis, a French painter, born in Lyons in 1816. His art education was acquired chiefly in Paris, where he was under the instruction of Delaroche, Vernet, and other eminent masters. In 1840 he settled in New York, and devoted himself to landscape painting. Among his best works are "The Dismal Swamp in Autumn," "Niagara in Winter," "Virginia in Indian Summer," "Four Seasons.
in America." "First Snow," "Winter in Vermont," and "Bernese Alps by Sunrise." Since 1870 he has lived in France.

GIROUX, Jean François, a French painter, born in Besançon in 1806. He is said to have been originally a blacksmith, and became famous in 1855 by his "Death of Leonardo da Vinci." In 1856 he exhibited "The Dead Christ" and "The Death of Cleopatra," and in 1852 "Galatea," which he has also engraved. One of his largest works, executed for the council of state and representing "Charlemagne dictating his Capitularies," was burned in 1871.

GIJON, a seaport of Asturias, Spain, on the bay of Biscay, in the province and 15 m. N. N. E. of the city of Oviedo; pop. about 10,500. It is built on a low headland, surmounted by a hill. Some ancient walls surround the upper or old town, and a fortress and batteries guard the new town. The harbor reaches down to the shore. The former Augustinian convent is used as a cigar manufactory, employing 1,400 persons. There are active fisheries, and some coasting trade. The harbor is safe, though not easily accessible. The first quay was built here under Charles V. in 1532-4, and a new one was constructed in 1768. The Spanish armada was repaired here in 1588. In 1810 the town was sacked and its shipping destroyed by the French, under Bonnet.

GLA, a river of New Mexico and Arizona, the principal tributary of the Colorado river of the West. It rises in the Sierra Madre mountains in Socorro co., New Mexico, flows S. W. to near the Arizona boundary, where it bends S. and then pursues a general W. course through that territory to its junction with the Colorado, about 180 m. above its mouth. Its sources are about 6,000 ft. above the sea. The principal tributaries from the north are the Río Nutroso, Prieto, Bonito, San Carlos, Salt river or Río Salado, and Agua Frias creek; from the south the Río San Domingo and San Pedro. The Santa Cruz river, after a course of nearly 100 m., is lost in the sands of the desert, and seldom discharges its waters into the Gila. For more than half its entire length, which is nearly 450 m., the Gila passes through mountains, and in some places is unapproachable, being buried between walls of perpendicular rock nearly 1,000 ft. high. It emerges from the mountains in lon. 111° 25' W., after which its course is through an open and comparatively level country to its termination. In the last 300 m. it has an average fall of 5 ft. per mile, and averages 60 ft. in width, 3 ft. in depth, and in velocity 2 m. an hour. In the lower portion the valley is from 1 to 3 m. wide; about 150 m. from its mouth there is a considerable bend to the north, where the valley for 25 m. is from 5 to 10 m. wide. The valley is in many places covered with mezquite and cottonwood, and on its margin with the willow. Several varieties of cactus, including the pitahaya (cereus giganteus), grow on the table land near the river, but never in the alluvial lands in its valley. The ruined edifices, broken pottery, and traces of irrigating canals found along this river, show that its former population was much larger than at present. One of these structures is three stories high and in good preservation. The others are in a ruined state, and present little more than dilapidated walls, tumuli, mounds, &c., of crumbling adobe, of which the buildings were constructed. (See CASAS GRANDES.) About 200 m. from the Colorado, in one of the finest portions of the valley, is the reservation of the Maricopa and Pimo Indians. It is intersected in all directions by irrigating canals, and produces abundant crops. Further E., among the mountains, are many luxuriant valleys where once existed a considerable population, as is evident from the traces of cultivation and the ruins which remain.

GILBERT, Sir Humphry, an English navigator, half brother of Sir Walter Raleigh, born at Dartmouth in 1539, lost at sea about the end of 1588. He was educated at Eton and Oxford, followed the military profession, and was knighted in 1570 for his services in Ireland. Being interested in geographical discovery, both from love of fame and of adventure, he sailed in 1588 with five vessels and 260 men, prepared to take possession of the northern parts of America, and founded a colony in Newfoundland, which, however, did not prove permanent. On the return his vessel, of only 10 tons burden, foundered, and all perished. He published a book in 1576, "A Discourse of a Discovery for a new Passage to Cathay," to prove the possibility of a N. W. passage.

GILBERT, Sir John, an English painter, born in 1617. He exhibited in 1636 a water-color drawing, "The Arrest of Lord Hastings," in the Suffolk street gallery, and an oil painting in the royal academy. In 1639 he first exhibited in the British institution, where he has been represented almost every year since. He has made many illustrations for books and pictorial newspapers, especially for the British classics, concluding with an edition of Shakespeare, and for the "Illustrated London News." In 1832 he was elected an associate, in 1833 a member, and in 1871 (when he was knighted) president of the society of painters in water colors. He is an associate of the royal academy, and honorary president of the Liverpool society of water-color painters. His best known oil paintings are "Don Quixote giving advice to Sancho Panza," and other subjects from Cervantes; "The Education of Gil Blas;" "A Scene from Tristram Shandy;" "Othello before the Senate;" "The Murder of Thomas à Becket;" "The Plays of Shakespeare," introducing the principal characters in each play; "Charge of Cavaliers at Naseby;" "A Drawing-room at St. James's;" "A Regiment of Royalist Cavalry;" "Rubens and Teniers;" "The Studio of Rembrandt;" "Wolsey and Buckingham;" "A Convocation of Clergy," and "The Entry of Joan of Arc into Orleans."

GILBERT, William S. See supplement.
GILBERTINES, an English religious order, so called from the founder, St. Gilbert of Sempringham (born in 1033, died 1134). They were also called the "Order of Sempringham," and Gilbert, who was by birth lord of Sempringham and Tirlington, had become a priest pastor of both places. He first built a convent near the church of St. Andrew for seven poor maids, which became so flourishing that he was called upon to establish several others in various parts of the kingdom. Having in vain endeavored to unite these houses to the order of Citeaux, Gilbert built a monastery of canons regular near each convent, gave to the canons the rule of St. Augustine, to the nuns that of St. Benedict, and placed the lay brethren who served them under the rule of Citeaux. This order with its constitutions was approved by Eugenius III., and confirmed by his successors. It numbered at the founder's death 18 double convents, besides hospitals for the sick and almshouses for widows, orphans, and the poor, with 600 monks and upward of 1,200 nuns. The Gilbertines were confined to England, Sempringham afforded an asylum to Thomas à Becket during his quarrel with Henry II. At the suppression of monasteries under Henry VIII. the order possessed 21 houses and 11 double convents. The Gilbertine rule is given in full by Holstenius. See also Hurter, Geschichtte des Papstes Innocenz III. und seiner Zeitgenossen.

GILBERT ISLANDS, or Kingsmill Group, a cluster of coral islands in the Pacific, on both sides of the equator, between lon. 172° and 174° 30' E.; pop. estimated at 60,000. The largest are Tapotouea or Drummond, and Tarawa or Cook islands, the former 80 m. long by about 1/2 or 1 m. wide, and the latter 20 m. long. Almost the only cultivated products are the coconuts and pandanus. They form the staples of food, and a species of taro (arum cordifolium), highly prized by the natives. The breadfruit is found on the northern, though not on the southern islands. The climate is equable, and though warm is not very oppressive. The inhabitants resemble the Malays. The people are divided into three classes, chiefs, landholders, and slaves. There is no general authority recognized throughout the group, but there are several kings, one of whom rules over three of the islands, while others are scarcely respected in any. In some places the government is administered by public assemblies. The islanders are fond of war and prone to suicide, but they are kind to their children, generous, hospitable, and more considerate of women than is usual among savages. They are said to eat human flesh occasionally, but are not habitual cannibals. Their clothing is made of the leaves of the pandanus; their houses and canoes, though constructed of rude materials, are superior in size, strength, and elegance to any others in the Pacific. The islands have several good harbors, but are seldom visited by vessels.

GILBOA, a mountain in Palestine, between the river Jordan and the plain of Esdraelon; the scene of the defeat and death of Saul and Jonathan. The name Gilboa signifies a bubbling fountain, and was probably taken from a large fountain at the northern base, called in Scripture the well of Harod, or the fountain of Jehoel. The ancient name is preserved in the village on the mountain, called now Jelub, and in the time of Jerome Gebus. The fountain is now known as Ain Jalud. The mountain rises not more than 800 ft. above the plain, but extends E. and W. about 10 m. Its sides are white and barren. Near the fountain of Jezreel was the ancient city of that name, and at this place the Israelites encamped before the battle; while the Philistines pitched at Shunem (now Solam), 8 or 10 m. north, upon the opposite rising ground. The battle was fought, according to the common chronology, in the year 1055 B. C.

GILDAS, surnamed "the Wise," a British historian, born, according to some authorities, in 498, according to others in 511, died in 570 or 590. He was the son of Caw, a British prince who emigrated to Wales to avoid subjection to the Anglo-Saxons, and the Welsh bard Aeneurin is supposed to have been the same person or his brother. (See Aneurin.) His only complete work extant is a short Latin composition on British history, entitled De calamitate, excitio et conquestu Britanniarum, in which he mourns over the ruin of his country, and inveighs against the British kings and clergy. It was first published by Polydore Vergil in 1525, and has been often reprinted. The best edition is by Stevenson, under the care of the English historical society (London, 1888). Translations have been published by Hasting (1830), and by Dr. Gille in "Bohn's Antiquarian Library," Vol. ii. It is said by Wright that there is no independent authority for the existence of Gildas, or for the historical truth of the work attributed to him, which he regards as a forgery of the 7th century.

GILDEMEISTER, Oto, a German writer, born in Bremen, March 13, 1823. He studied at the university of Bonn, and became in 1845 connected with and in 1850 editor-in-chief of the Weserzeitung. In 1852 he was chosen secretary of the Bremen senate, in 1857 senator, in 1866 representative in the diet of the North German confederation, and in October, 1871, burgomaster. He has translated into German the complete works of Byron (6 vols., Berlin, 1864), and many plays of Shakespeare for Bodenstoff's complete edition; and his version of Shakespeare's sonnets was published in 1871.

GILDING, the covering of the surfaces of bodies with a thin coating of gold. This method of economizing the precious metal, and imparting to solid bodies the appearance of being wholly composed of it, was practised at very remote periods. The sacred books allude to it; in Exodus xxvi. 29 there is a com-
Gilding

mand to overlay boards and bars with gold. That the early Egyptians understood it well is evident from the gilding of the coffins of Theban mummies and from the gold ornaments of those now prepared. Homer makes mention of it, and the later Greeks thus decorated the exterior sculpture of their temples and statuary. The Romans after the destruction of Carthage applied the process to ornamenting the ceilings of their public buildings, and at last of their private houses also. The thickness of the leaf is spoken of by Martial as like a vapor, and by Lucretius the substance is compared to a spider's web. According to Pliny, an ounce of gold was made into 750 leaves, each four fingers square. This is about three times the thickness of the leaf now in common use; but some qualities are so thin that 500,000 sheets make a pile only one inch in height; and specimens have been made only 20/40 of an inch thick, which is 1,300 times thinner than ordinary printing paper. In modern times the use of gilding in architecture has been carried to the greatest extent by the nations of Further India. It is practised by them with great skill and in the most profuse manner.—Besides the method of gilding by covering objects with gold leaf, there are processes of modern invention, distinguished as chemical gilding, in which the gold is incorporated with the substance of the article it covers, and the same quantity is thus made not merely to spread over a much larger surface, but to be permanently attached to metallic bodies, so as to withstand the action of heat and of atmospheric agents without injury; an art incompatible with the attainments of the ancients in chemistry.—Gilding with gold leaf is distinguished as the mechanical branch of the art; and of this there are two distinct processes, one of which is called burnish gilding or gilding in distemper, and the other oil gilding. In the former the article to be ornamented, as the moulding of a picture frame, is received from the joiner before it is made up. A priming of hot size and whit is first applied, and when dry all irregularities in the moulding are corrected with the same composition, made of the consistency of putty, which then receives four or five coats of the priming. This, which is now 1/8 to 1/4 of an inch thick, is carefully trimmed around the edges and smoothed with pumice stone and glass paper. This is the foundation for the so-called gold size (the bed upon which the gold leaf is to be laid), a composition of clay, red chalk, plumbago, suet, and bullock's blood; or, as used by the French, of a pound of Armenian bole to two ounces of red hematite and as much galena, each ground by itself in water, then mummies, in which the latter is added, as a thin layer of oleum, and at last tempered with a clear white glue carefully prepared from sheep skins. When used, it is first melted with thin size, and while warm is laid on with a brush. The leaf is then laid on by means of a brush called a tip, an operation which requires considerable dexterity. When the whole is covered and dried, the work, or any portion of it, is burnished with smooth agate or flints set in handles for this use.—Oil gilding is practiced by several different methods. For large objects, especially those exposed to the weather and of metallic composition, the priming used in Paris is white lead mixed with linseed oil and a little oil of turpentine. For equipages and indoor work a varnish polish is much used over the gold. For elaborately designed frames oil gilding and burnish gilding are often employed upon the same piece, care being taken that the applications for the former do not touch the spots intended to be burnished, which are treated in the manner already described. The frames intended for this process are furnished to the gilder made up. They are then thoroughly washed, and afterward receive two or three coatings of thin white, and more upon the parts to be burnished. A strong size called clear size is then laid in several coats over those parts only intended for oil gilding, and upon this the oil gold size, a mixture of boiled linseed oil and ochre. By standing over night this becomes ready for the gilding, which is effected without using water. The gold leaf is pressed with cotton wool into all the depressed portions, and when all is laid the work is smoothed over with a brush, by which its irregularities are removed, and the gold is uniformly distributed.—Book covers are ornamented with gilt letters and figures in the following manner. If of cloth, the leaf is laid on over the parts to be ornamented, and the cover is then placed in a press, in which a heated metallic block, having the intended design cut upon its face, is powerfully pressed against the cover as in printing. The heat of the block causes the glue on the back side of the cloth to melt and come through, and thus fasten the figure to the fabric. Leather covers receive an application of gelatine or of the white of egg dissolved in water, upon which when dry an almost imperceptible application of oil is made with a rag, and the gold leaf is then laid to be pressed as in the case of the cloth. The edges of the leaves are gilded in the bookbinder's press, the same gelatine solution and oil being applied, upon which the gold leaf is laid and afterward burnished. Chemical gilding is particularly applicable to metallic surfaces, but other surfaces, as of wood, leather, or paper, may be coated with some preparation by which they are rendered fit for it.—Wash or water gilding is the branch of this art in which the gold is applied by means of an amalgam of gold and mercury. In other processes it is deposited from its solution. Copper, or an alloy of copper with a little zinc or antimony, or the like, is well suited for the amalgamation process; the nearer the color is to that of gold the better. The surface to be gilded must first be thoroughly cleaned and brightened and freed from oil; and it is then advisable to wash it over with a
solution made of 100 parts by weight of mer-
cury in 110 of nitric acid, of specific gravity 1.53, diluted with 25 times the weight of the
whole of pure water. This application leaves
a coating of mercury upon the metal, which is
more ready to take the amalgam than is the
metal itself. Both the mercurial solution and
amalgam are sometimes applied together by
means of the gilder's scratch brush, which is
dipped into the former and immediately rubbed
over the latter, and then applied to the metal;
the process being repeated as often as neces-
sary. After the application the article is
washed in water and exposed to glowing char-
coal to expel the mercury. The amalgam is
prepared by heating small particles of gold to
redness and throwing them into a quantity of
mercury heated so as to emit fumes, and stir-
ing with an iron rod till the gold is dissolved.
There should be about eight times as much
mercury as gold, the excess of the former be-
ing removed by squeezing the amalgam through
buckskin. The composition then contains about 67 parts of mercury to 33 of gold. The gold
thus deposited is of a dull yellow, and still re-
tains some mercury, which is removed after
washing and scrubbing the article with a scratch
brush acidulated with vinegar, by applying
gilding wax, and again heating. The wax is
a mixture of beeswax with some of the following
substances, viz.: red ochre, verdigris, copper
scales, alum, vitriol, borax. When the wax is
burned off, the color of the gilding is found to
be improved, and it is still further heightened
by burnishing. The amalgamation process is
not well adapted for gilding articles of iron and
steel, an oxide of iron being produced by the
acid applications, which prevents the adhesion
of the amalgam. For these the best method
is to cover them with gold leaf. Copper may
be treated in the same way. The metal is
heated till it begins to assume a blue color; a
sheet of gold leaf is then flattened and gently
pressed with a burnisher, and the article is
again heated. Other sheets are laid over the
first to the desired thickness and heated, and
the last is burnished down cold. The surface
of iron, whether wrought or cast, or of steel, is
sometimes covered with a coat of copper. To
gold silver, a very good process is that called cold
gilding. Sixty grains of fine gold and 12 of rose
powder are dissolved in two ounces of aqua regia.
The whole of the solution is absorbed by linen
rags, which are then dried and burned to ashes.
The black powder thus obtained is applied
upon the silver, which has been annealed and
polished, and is rubbed with a piece of moist-
ened cork or washed leather. Burnishing com-
pletes the process. — A method of gilding but-
tons and other articles by immersing them in
solutions of gold was introduced into the estab-
lishments of the Maccabees in Birmingham,
in 1836, by which the injurious effects of the
amalgamating process on the health of the
workmen were avoided. To a solution of chlo-
ride of gold prepared from one part of gold,
80 parts of bicarbonate of potassa are gradu-
ally added, and then 50 parts more of bicar-
bonate dissolved in 200 parts of water. The
whole is then boiled two hours, and the color of
the liquid changes from yellow to green. The
articles, being perfectly well cleaned and an-
nealed, are immersed for an instant in a mix-
ture of equal parts of nitric and sulphuric acids,
to which, if the gold is intended to have a dead
appearance, a little chloride of sodium is add-
ed. The articles, washed in water, are plunged
in the gold solution, and left half a minute,
when they are removed, again washed, and
dried in hot sawdust. Articles of German sil-
ver, of platinum, or of silver, may be gilded by
suspending them by copper or zinc wires for a
time in the liquid. — For gilding porcelain or
glass, gold precipitated by sulphate of plumbate
is mixed with its weight of oxide of bismuth
and a small quantity of borax and gum water,
and the mixture is then applied with a camel's
hair penell. The article is heated in a muffle,
and when taken out the gold is burnished, and
finally cleansed with vinegar or white lead.
Vases and articles not exposed to wear may be
gilded by fixing gold leaf upon them with copal
varnish. Silks or other woven fabrics may be
gilded by immersing them in a neutral solution
of perchloride of gold, or moistening them with
it in design, and then exposing them to the
action of hydrogen, which reduces the gold to
a metallic state.

GILEAD, the name of a mountain group in the
eastern division of ancient Palestine. From it
the southern districts of the same division
were also called Gilead, which is often men-
tioned in contradistinction to Bashan in the
north, but exceptionally also as including the
latter region. This was rich in pastures, and
renowned for its aromatic simples, from which
balsam was prepared. Among its rivers were
the Jabbok and the Arnon.

GILES. I. A S. W. county of Virginia, inter-
sected by Kanawha or New river; area, 350 sq. m.; pop. in 1870, 5,875, of whom 598
were colored. The surface is high and rugged,
the mean elevation being 1,600 ft. above the
sea; the principal summits are Peter's and
Walker's mountains. The soil of the uplands
is poor, but the valleys and river bottoms are
very fertile. The chief productions in 1870
were 58,598 bushels of wheat, 12,689 of rye,
105,402 of Indian corn, 28,474 of oats, and
1,931 tons of hay. There were 1,295 horses,
1,346 milk cows, 2,095 other cattle, 4,471
sheep, and 5,247 swine. Capital, Pearisburg.

II. A S. county of Tennessee, bordering on
Alabama, watered by Elk river and some of
its branches; area, 600 sq. m.; pop. in 1870,
32,413, of whom 12,738 were colored. It has
a slightly uneven surface and a fertile soil.
The chief productions in 1870 were 145,833
bushels of wheat, 2,054,168 of Indian corn,
70,512 of oats, 32,556 of Irish and 28,074 of
sweet potatoes, 228,560 lbs. of butter, 1,644
tons of hay, and 8,867 bales of cotton. There
were 7,672 horses, 3,458 mules and asses, 6,536 milk cows, 9,886 other cattle, 18,658 sheep, and 47,700 swine; 2 manufactories of cotton goods, 7 of saddlery and harness, 1 of tin, copper, and sheet-iron ware, 2 flour mills, 11 saw mills, 6 tanneries, and 5 currying establishments. Capital, Pulaski.

GILES, Henry, an American clergyman and lecturer, born in county Wexford, Ireland, Nov. 1, 1788. He was educated in the Roman Catholic church, but after various changes of opinion joined the Unitarians, and officiated as pastor in Greenock for two years, and in Liverpool for three years. In 1840 he came to America, where he has been extensively engaged in lecturing, with occasional services in different parishes as a preacher. He has published "Lectures and Essays" (2 vols., Boston, 1846), "Christian Thoughts on Life" (1850), and "Illustrations of Genius in some of its applications to Society and Culture" (1854). He has also written much for periodicals, has addressed literary societies and library associations, and given a course of lectures before the Lowell institute in Boston on the "Genius and Writings of Shakespeare." He now (1874) resides in Quincy, Mass.

GILES, William Branch, an American statesman, born in Amelia co., Va., Aug. 12, 1762, died at "The Wigwam," in the same county, Dec. 4, 1880. He entered Princeton college, N. J., but left it before completing the usual course. He studied law with Chancellor Wythe, was admitted to the bar, and practised for five or six years. In 1790 he was elected by the federal party in the Petersburgh district to fill a vacancy in congress, and was several times reflected. His opposition to the bill creating a bank of the United States led to his estrangement from the federal party, and to his affiliation with the democrats. On Jan. 23, 1793, he made in the house an attack upon Alexander Hamilton, then secretary of the treasury, charging him with corruption and peculation. Hamilton vindicated himself triumphantly in a report, and Giles replied by proposing resolutions censuring the secretary for undue assumption of power, and for want of respect for the house. These resolutions were laid on the table by very large majorities. In 1796 Giles strongly opposed the creation of a navy and the ratification of Jay's treaty with Great Britain, and in 1798 the proposed war with France for her outrages on American commerce. In the latter year he became a member of the legislature of Virginia, where he co-operated with Madison in procuring the passage of the celebrated resolutions of '98. In 1801 he was again elected to congress. In 1804 he was chosen United States senator, and took at once the position of democratic leader in the senate, and held it till 1811, when he openly manifested his opposition to the administration of President Madison. He abandoned public life in 1815, and remained in retirement till 1828, when he was induced to become a member of the legislature of Virginia, principally from his strong opposition to the project of calling a convention to revise the constitution of the state. In the same year he was elected governor, and held the office for three years. The bill for calling a convention was revived and passed at the session of 1827-8, and Mr. Giles while governor was chosen a member of it. The convention sat in 1829-30, and he took a distinguished part in its deliberations. He published in 1818 "Political Letters to the People of Virginia," and subsequently various letters.

GILL, Edmund. See supplement.

GILLESPIE, a S. W. central county of Texas, watered by affluents of the Colorado; area, 925 sq. m.; pop. in 1870, 3,566, of whom 77 were colored. It has a hilly surface, about one tenth of which is suitable for farming, while the remainder furnishes good pasturage. Iron ore, limestone, and coal are the most important minerals. The chief productions in 1870 were 16,588 bushels of wheat, 83,185 of Indian corn, and 916 tons of hay. There were 890 horses, 20,024 cattle, 2,178 sheep, and 3,846 swine. Capital, Fredericksburg.

GILLESPIE, William Mitchell, an American author, born in New York in 1816, died there, Jan. 1, 1868. He graduated at Columbia college in 1834, and spent nearly ten years in Europe in travel and study. On his return to New York in 1845, he was appointed professor of civil engineering in Union college, a post which he held until his death. His published works are: "Rome as seen by a New Yorker, 1843-44" (1845); "Roads and Railroads; a Manual for Road-making" (1846; 10th ed., 1871); "Philosophy of Mathematics," from the French of Auguste Comte (1851); "The Principles and Practice of Land Surveying" (1856); and "Treatise on Levelling, Topography, and Higher Surveying," edited by C. Staley (1870).
was educated at the university of Glasgow, where he became professor of Greek. In 1778 he published a translation of the "Orations of Lysias and Isocrates." In 1786 he published in London his "History of Ancient Greece." In 1793, on the death of Dr. Robertson, he was made historiographer royal for Scotland. His principal works, besides those above named, are a "Translation of Aristotle's Ethics and Politics" (1804); the "History of the Ancient World from Alexander to Augustus" (London, 1807), which was afterward republished as the second part of his "History of Greece;" and a "Translation of Aristotle's Rhetoric" (1829).

**GILLIFLOWER**, the trivial name of the garden species of *Mathiola*, usually called stocks by the florists, and sometimes stock gilliflowers and gillies. The name gilliflower has a curious origin: the French applied to this and other spicy-smelling flowers the term *girrofle*, clove-scented; this, through the old spellings of *gillofer* and *gilefro* (with the *o* long), has become our gilliflower. Florists divide the plants into ten-weeks, intermediate, Brompton, and emporo stocks, and each of these into several subdivisions. The ten-weeks and intermediate stocks are annuals, and are garden varieties of *M. annua*, a native of the seacoast of Europe, and a member of the large order *Erucastrum*; the flower in the wild state is reddish, but cultivation has produced a great variety of colors from pure white to dark purple; the seedsmen's catalogues present new varieties each year. The double varieties do not produce seeds, but each is the tendency to depart from the normal state that the seeds of single flowers will produce plants one half or more of which will be double; the seeds are imported from Germany, where great pains are taken in their production. The seeds of these varieties may be sown in the open ground when the soil becomes warmed, and treated as ordinary annuals, or they may be sown in a hotbed, the young plants potted when large enough, and later turned out into the open border. Seeds may also be sown in August and September, and the young plants potted and kept over winter in a cool greenhouse, to be turned out in spring. The Brompton stocks must be treated as biennials, as the original species, *M. incana*, is a biennial or a short-lived perennial. It does not endure our winters, and the plants must be potted and kept either in a frame or a light cellar until spring, or brought into bloom in the greenhouse or window during winter. Choice varieties may be increased by cuttings; and if the plant after flowering is headed back, it may be kept for several years.

**GILLOLL**, **Quincy Adams**, an American soldier and engineer, born at Black River, Lorain co., Ohio, Feb. 28, 1825. He graduated at West Point in 1848, and served in the engineer corps and as assistant instructor at West Point till the outbreak of the civil war, when he distinguished himself by his services at Hilton Head, S. C. (1861), in the siege and capture of Fort Pulaski, G. A. (1862), and especially in the reduction of Forts Sumter and Wagner (1863-4). He was made major general of volunteers July 10, 1863, resigned this commission Dec. 5, 1865, and now (1874) ranks as major in the corps of engineers, and is engineer in charge of the defences of the Atlantic coast. He has published "Siege and Reduction of Fort Pulaski" (New York, 1868); "Practical Treatise on Limes, Hydraulic Cements, and Mortars" (1863); and "Engineer and Artillery Operations against the Defences of Charleston Harbor in 1863" (1865).

**GILLOT, Joseph**, an English manufacturer, born in Warwickshire about 1800, died in Birmingham, Jan. 5, 1872. He began life as a grinder of cutlery in Sheffield. Then he removed to Birmingham, and with the assistance of his wife began the manufacture of steel pens. It is said that he made them in a garret and sold them to small shopkeepers about the town.
They were the black "barrel" pens, and were very stiff and scratchy compared with the quills which they were intended to supersede. In 1820 Gillott made the first great improvement by cutting three slits instead of one, which gave an immediate impetus to the trade. Then by the introduction of machinery he greatly reduced the price, and by successive minor improvements made his pens still more popular, until he was able to build a large factory in Birmingham, and they were sold all over the world. The price of one steel pen when he entered business would buy 900 at the time of his death. His works now use five tons of steel weekly, and make 150,000,000 pens annually. Gillott acquired immense wealth, and was a connoisseur in the fine arts, having a celebrated gallery of paintings at his country residence, near Edgbaston.

**GILRAY, James,** an English engraver and caricaturist, born in Chelsea about 1757, died in London, June 1, 1815. He was the son of a Chelsea pensioner, studied in the royal academy, and about 1784 became known as a successful engraver. Between 1779 and 1811 he published 1,200 caricatures, many of which were etched at once upon the copper without the assistance of drawings. The royal family and prominent cabinet ministers and politicians of the day were ridiculed by him without mercy. He died of delirium tremens. His works appeared singly, but a collection of them was published in London in 1880; an edition edited by Bohn in 1851; and a new and complete edition, with a "History of his Life and Times," by Thomas Wright, in 1874.

**GILMAN, Chandler Robbins,** an American physician, born at Marietta, Ohio, Sept. 8, 1802, died at Middletown, Conn., Sept. 26, 1868. During his childhood his father removed to Philadelphia. He took the degree of M. D. in 1824 at the university of Pennsylvania, and soon afterward removed to New York, where the whole of his active professional life was spent. In 1840 he was appointed professor of obstetrics and the diseases of women and children in the college of physicians and surgeons, to which was added in 1851 the subject of medical jurisprudence. In this chair Prof. Gilman continued until his death, although for the last year or two he was incapacitated by failing health. His principal publications were: a translation, prepared with the assistance of Dr. Theodore Tellkamp, of Bischoff's monograph "On the Periodical Discharge of the Ovum" (New York, 1847); "On the Relations of the Medical to the Legal Profession" (1856); and an edition of Beck's "Medical Jurisprudence" (Philadelphia, 1860).

**GILMAN, John Taylor,** an American statesman, born in Exeter, N. H., Dec. 19, 1758, died there, Sept. 1, 1828. On the morning after the news of the battle of Lexington and Concord reached Exeter, he marched with 100 other volunteers to Cambridge, Mass., where he served in the provincial army. Soon after, his father being made treasurer of the state, he became his assistant in the office. In 1780 he was a delegate from New Hampshire to the convention which met at Hartford to take measures for the defence of the country. In 1782 and 1788 he was a member of the continental congress, and in the latter year succeeded his father as treasurer of New Hampshire. He was one of the three commissioners appointed by the government of the old confederation to settle the accounts of the state. In 1797 he was chosen governor, was annually reelected for 10 successive years, and again in 1818, '14, and '16, after which he declined to be a candidate. He was a zealous federalist, and his popularity in New Hampshire was so great that he was frequently chosen governor when his party was in the minority.

**GILMAN, John Samuel**, an American clergyman, born in Gloucester, Mass., Feb. 10, 1791, died in Kingston, Mass., Feb. 9, 1858. He graduated at Harvard college in 1811, studied theology, and was tutor in mathematics at Cambridge from 1817 to 1819, when he married Miss Caroline Howard, and was ordained pastor of the Unitarian church in Charleston, S. C., in which office he remained till his death. He contributed many papers to reviews and other periodicals, on subjects connected with philosophy and general literature, and in 1856 published in Boston a volume of "Contributions to Literature, Descriptive, Critical, and Humorous, Biographical, Philosophical, and Poetical." His other prose works are the "Memoirs of a New England Village Choir" (1829), of which three editions were issued, and the "Pleasures and Pains of a Student's Life" (1852). He translated the satires of Boileau, and published some original poems, among which are the "History of a Ray of Light," and a poem read before the Phi Beta Kappa society of Harvard college. In Charleston he took a prominent part in promoting the temperance cause, as well as the interests of literature.  

**Gilman, Caroline**, an American authoress, wife of the preceding, born in Charlestown, Oct. 8, 1794. She is a daughter of Samuel Howard of Boston. At the age of 16 she wrote a poem entitled "Jephthah's Rash Vow," and soon after another on "Jairus's Daughter," which was published in the "North American Review." In 1819 she married the Rev. Samuel Gilman, and removed with him to Charlestown, S. C. She has published "Recollections of a New England Housekeeper," "Recollections of a Southern Matron," "Ruth Raymond, or Love's Progress," "Poetry of Travelling in the United States," "Verses of a Lifetime," "Mrs. Gilman's Gift Book," "Oracles from the Poets" (1854), "The Sibyl, or New Oracles from the Poets" (1854), and "Stories and Poems by a Mother and Daughter" (1872). Since the civil war she has resided in Cambridge, Mass.

**GILMER, I.** A N. W. central county of West Virginia, watered by Little Kanawha river; area, 512 sq. m.; pop. in 1870, 4,358, of whom
27 were colored. It has a rough surface, much of which is thickly wooded, and a rich soil, suitable for grain and pasturage. There are several salt springs and iron mines. The chief productions in 1870 were 9,880 bushels of wheat, 106,086 of Indian corn, 17,592 of oats, 44,929 lbs. of butter, and 1,538 tons of hay. There were 1,114 horses, 1,265 milch cows, 1,697 other cattle, 6,100 sheep, and 8,907 swine. Capital, Glenville. H. A. N. county of Georgia, drained by Coosawatee and other rivers; area, about 500 sq. m.; pop. in 1870, 6,644, of whom 117 were colored. Several spurs of the Blue Ridge, abounding in beautiful scenery, and alternating with fertile valleys, traverse parts of the country. The mineral products, comprising gold, marble, and iron, are valuable and abundant. The chief productions in 1870 were 8,108 bushels of wheat, 10,417 of rye, 169,099 of Indian corn, 12,338 of oats, 13,546 of sweet potatoes, and 67,786 lbs. of butter. There were 764 horses, 1,992 milch cows, 8,309 other cattle, 6,461 sheep, and 10,701 swine. Capital, Ellijay.

Gilo, or Halmahera, an island of the Indian archipelago, in the Molucca group, between Celebes and New Guinea, separated from the former by the Molucca passage and from the latter by Gilo strait; area, about 5,780 sq. m.; pop. estimated at 27,000. It is crossed by the equator, and lies between lat. 2° 30' S. and 1° S., and lon. 127° and 129° E. The outline somewhat resembles that of Celebes. The island consists of four peninsulas radiating from a central situation in about lat. 0° 40' N. Of these peninsulas two trend N. and S. respectively, along or near the 128th meridian; one extends toward the N. E.; and the fourth stretches to the S. E., terminating in Cape Tabo, the most easterly point of the island. The length of Gilo is nearly 250 m. The range of smaller islands to which the name Moluccas was originally applied, including Ternate, Tidore, Morty, Makian, and Batchian, skirts the southerly part of the W. coast. Gilo is of volcanic formation. From the sea coast, which is itself described as in many parts mountainous, lofty mountains are visible in the interior, some of which are said to be volcanoes. According to Wallace, the surface seems to have undergone changes of elevation within a recent period; and the upheaval of a mountain at Gamakonora in the northern peninsula is reported to have occurred in 1873. Fringes of coral reef interfere with navigation along many portions of the coast. The inland regions are but very slightly known; they appear to consist largely of elevated tracts of forest. The clove tree is indigenous to the island. About four fifths of the inhabitants are ruled by the sultan of Ternate, whose residence was formerly at the town of Gilo, on the W. coast of the northern peninsula. The Malay element predominates, but the active and energetic inhabitants of the northern peninsula belong to an indigenous race called Alturos, differing both from the Malays and the Papuans, yet possessing some of the characteristics of each. The government of the Netherlands maintains an insignificant military station at Dodingo, a village opposite Ternate. The principal products of Gilo are sage, spices, tortoise shell, and tropical fruits.

Gilpin, a N. central county of Colorado, lying chiefly in the foot hills; area, about 150 sq. m.; pop. in 1870, 5,495. The average altitude of the county is about 9,000 ft., but the climate is mild. The surface is broken by mountain ranges. The valleys, watered by small streams, are fertile. It is one of the richest gold-mining regions in the world, and contains more than 90 quartz mills. In 1870 it produced bullion to the value of about $2,000,000. There are 9 hotels, 6 churches, 5 schools, 2 foundries, 2 smelting works, 1 chlorine reduction establishment, and 2 newspapers. The chief agricultural productions in 1870 were 21,653 bushels of potatoes and 172 tons of hay. Capital, Central City.

Gilpin, Bernard, an English ecclesiastic, born in Kentmire, Westmoreland, in 1517, died in Houghton, Durham, in 1583. He was educated at Oxford, became a convert to Protestantism after a disputation with Peter Martyr, and in 1552 was made vicar of Norton in the diocese of Durham. On the accession of Mary he went abroad for three years. On his return his uncle, Dr. Tunstall, bishop of Durham, appointed him his archdeacon, and gave him the living of Houghton, of which he remained rector till his death, declining the bishopric of Carlisle, which was offered to him by Queen Elizabeth. His parish and the neighboring neglected parishes, which he regularly visited, comprised a wild rugged district on the Scottish border, whose inhabitants, from centuries of marauding warfare, were in a half savage state. He went fearlessly among them, and by his preaching and benevolence acquired great influence over them. He preached so boldly against the vices of the times, and especially of the clergy, that complaints were made against him successively to the bishop of Durham and the bishop of London. He built and endowed a grammar school in his parish for the instruction of the children of the poor, and regularly educated at his own house 24 lads of promise whom he ultimately sent to the university. His life has been written by George Carleton (London, 1628), and by William Gilpin (London, 1751).

Gin, or Generva (Fr. genèvre, juniper), an alcoholic liquor, distilled generally from rye and barley and flavored with juniper. It was made originally in Holland, whence it is sometimes called "hollands," and it is still manufactured largely at Schiedam, Gouda, and Amsterdam. In the distilleries of Schiedam two parts of unmalted Riga rye are used to one part of malted bigg or barley. This is mashed with water, at a temperature of from 162° to 168°, in the proportion of 36 gallons to every
14 cwt. of meal. When the magma has been made uniform by stirring, the tun is covered to confine the heat, and it is left thus for two hours. It is then stirred up again, the transparent spent wash of a preceding mashing is added, and afterward cold water enough to reduce the temperature to 85°. Flanders yeast is introduced next, in the proportion of 1 lb. to every 100 gallons of the mixture. Fermentation speedily sets in, and the attenuation is complete in from 48 to 60 hours. A part of the yeast is usually skimmed off from the fermenting tuns, by which the production of spirit is obstructed, but the quality of the liquor is improved by preventing its impregnation with yeasty particles. The wash and grains are then transferred to the still and converted into low wines, into every 100 gallons of which are put two pounds of juniper berries and about a quarter of a pound of salt. The whole is then put into the low-wine still and the spirit drawn off by a well regulated heat. The quantity of spirit varies from 18 to 21 gallons to the quarter of grain. There are 800 distilleries of this liquor at Schiedam. English gin, manufactured largely in London and other places in Great Britain, is made usually from the impure products of the distillation of Scotch and English whiskey, rectified by one or more distillations, and flavored with various substances, such as the oil of turpentine, oil of juniper, coriander seeds, cardamoms, capsicum, &c. This gin is the common alcoholic drink of the lower classes in England, and almost every London dealer has his private receipt for increasing its pungency and strength. It is adulterated probably more than any other liquor. Pure gin contains, according to Brande, 51 1/20 parts of alcohol in every 100 parts.

GINDELY, Anton, a German historian, born in Prague, Sept. 3, 1829. He became in 1853 professor of the German language and literature at the Bohemian Oberrealschule in Prague, and in 1862 of Austrian history in the university of that city and archivist of Bohemia. He has published many historical works, including Rudolf II. und seine Zeit (2 vols., Prague, 1862-65), Monumenta Historia Bohemica (4 parts, 1864-70), and Geschichte des Dreissigjährigen Krieges (1869).

GINGER, the scraped and dried rhizoma of *Zingiber officinale*, a plant of the order *Zingiberaceae*, a native of Hindostan, but cultivated both in the East and West Indies, and in Sierra Leone. It has a tuberous root, an annual stem 2 or 3 ft. high, and smooth, lanceolate leaves, 5 or 6 in. long. Its flowers are yellowish and emit an aromatic odor. Its medicinal virtues reside in its root, of which two varieties are found in the market, the black and the white or Jamaica ginger. The difference is chiefly in the retention or removal of the epidermis, and perhaps a subsequent bleaching process applied to the lighter variety. In commerce the whole ginger is called race ginger. A preserve is made by boiling the young and tender roots in sugar; large quantities of it are imported from China. Ginger is used both for cooking and as a medicine. Its odor is aromatic and characteristic, its taste spicy and pungent. It contains a volatile oil and resins, with other constituents of less importance, and enters into many official preparations, its virtues being usually extracted by alcohol; but an infusion may be used. The popular aromatic stimulant sold as extract of Jamaica ginger is a concentrated alcoholic tincture. Ginger is a grateful stimulant and carminative, and is chiefly used either alone or in combination in disorders of the alimentary canal. It will often relieve flatulence and the gripping pains of a mild colic. It renders bitter infusions and tinctures more acceptable to the stomach, and may be advantageously combined with tonic powders. In many cases it palliates, if it does not allay, the distress of seasickness. The dose of the powder is 10 grs. or more; the fluid extract and tincture are the best form for administration.

GINKGO (Selligeria adiantifolia), a large tree from China and Japan, belonging to the yew suborder of *Coniferae*. No tree can appear less like a member of the pine family than the ginkgo; it is a rapid grower, with a straight trunk clothed with a light gray bark; its deciduous leaves are alternate, fan-shaped or wedge-shaped, with the broad apex notched or cut more or less deeply, frequently two-lobed, thick and leathery, with fine longitudinal ribs, and of a light yellowish green color. The leaves are so like those of some maidenhair ferns that it is by some called the maidenhair tree. The staminate and pistillate flowers are borne upon separate trees; the former are in slender catkins about 1½ inch long, while the female flowers are either solitary or in small clusters at the ends of the branches; the female flower, which consists only of a naked ovule, is seated in a small cup-like disk; this increases
GINGKO

in size and covers the base of the ripe fruit, which is a globular or ovate nut. In its native countries the ginkgo attains a large size; Bunge mentions one 40 ft. in circumference and still vigorous; a specimen in the botanic garden at Pisa is 75 ft. high. It is supposed that it was introduced into Europe from Japan by the Dutch; it was first planted in this country in 1784 by Mr. Alexander Hamilton, who lived near Philadelphia; the trees are still standing, though the grounds have been converted into a rural cemetery; there are also some fine specimens in Boston. The wood is of a yellowish color without any resinous qualities, and useful as lumber, though the Chinese cultivate the tree mainly for its nuts, which are edible but insipid; medicinal virtues are attributed to them, and they are considered essential, roasted or boiled, at entertainments. Though the tree was for many years regarded as a great rarity in the United States, it is now not uncommon in cultivation, and is used in the ornamentation of lawns and pleasure grounds; it should be planted where the peculiarity of its foliage can be readily observed. By frequently heading back the branches, it can, if desired, be kept in the form of a large bush. As it is perfectly hardy at Boston, it will probably endure the climate in most parts of the country. It is raised from seeds, cuttings, and layers; it has not fruited to any great extent in this country, but has done so abundantly, in Europe, and the seeds are imported by seed dealers. Cuttings of the old wood or of the partly ripened new wood take root readily, as do layers. Trees grown from cuttings and layers are not likely to be so well shaped as those obtained from seed. Ginkgo is one of the Chinese names for the tree, and was adopted by Linnaeus as the generic name; he described it in 1771 as ginkgo biloba, but Sir James Edward Smith, considering the name "ungrown and barba-

GINGUENÉ

rous," in 1796 altered it to Salisburia, in honor of R. A. Salisbury, an English botanist; the specific name recognizes the resemblance of the leaves to the fronds of adiantum, the maidenhair fern. Although this change of name was against the rules of scientific nomenclature, and strongly protested against at the time, later botanists have generally adopted it.

GINGEAS, a N. E. co. of Dakota territory, recently formed, and not included in the census of 1870; area, about 1,450 sq. m. Dakota or James river rises here, and Cheyenne river flows through the N. part.

GINGUÉNÉ, Pierre Louis, a French historian, born in Rennes, April 25, 1748, died in Paris, Nov. 16, 1816. He went to Paris in 1772, being then acquainted with classical, French, Italian, and English literature, and music. He had written before leaving Rennes a poem entitled La conquête de Zulam. He showed it to many of his friends, copies were taken, and in 1777 it was published without his consent and disfigured by innumerable errors. Several persons claimed the authorship, and he finally published it correctly under his own name in 1779. He afterward published several other poems. In 1778 the celebrated composer Piccini arrived in Paris, and soon after a violent quarrel broke out between his admirers and those of Gluck, in which Ginguéné was the most effective supporter of Piccini's cause. About 1780 he obtained a clerkship in the office of the minister of finance. The moderation of his views brought upon him the hostility of the revolutionists, and in 1793 he was thrown into prison, and only released on the overthrow of Robespierre. He was soon after appointed a member of the executive commission of public instruction, and was director general of that branch of the administration from 1795 to 1797. In 1794, in company with Chamfort, he commenced the Décade philosophique littéraire et politique. After the abolition of the republican calendar the title was changed to Revue, and he continued to write for it till 1807, when it was merged in the Mercure de France. In 1798 he went to Turin as minister plenipotentiary, but remained only seven months. In 1799 he was chosen a member of the tribunate. His course there, especially his opposition to special tribunals, excited the anger of Bonaparte, and he was removed from the office in 1802. In 1802–3 and 1805–6 he delivered lectures on Italian literature at the atheneum of Paris, which attracted crowded audiences, including a large number of the most distinguished literary men of France. He was a member of the commission established to continue the Histoire littéraire de la France, of which 12 volumes had been completed by the Benedictines; to the succeeding volumes he contributed many articles, mostly on the lives and productions of the troubadours. He also wrote much for the Biographie universelle and the Moniteur. But his great work is the Histo-
toire littéraire d’Italie (9 vols., 1811–19). A small portion of the 7th volume and about half of the 8th and 9th were written by Francesco Salfi, who added a 10th entirely his own, bringing it down to the close of the 16th century. This work was received with great favor all over Europe, and especially in Italy, where many editions and translations of it have been published. A second edition (14 vols., Paris, 1824–35) was published under the supervision of Damou.

GINSENG, the root of the perennial herb formerly called *panax quingeofoitum*, but now placed in the genus *aralia*. The Chinese ginseng is probably derived from another species of the same genus. The root of the plant growing in the United States is of interest or value chiefly as an article of exportation to China, where it is supposed to possess remarkable virtues in the treatment of nearly all diseases. The fleshy root, from 4 to 9 in. long, throws up a simple stem about a foot high, which bears at the top three long-petioled leaves, each of which has five divisions, and a small umbel of inconspicuous, greenish white flowers, which are succeeded by small berry-like red fruits. Before the introduction of the American root, ginseng is said to have brought its weight in gold at Peking. There is no reason to suppose its efficacy is other than imaginary. It is chewed by some persons in this country, but is not used in medicine, except as a demulcent.

GIOBERTI, Giovanni Antonio, an Italian chemist, born at Mangardino, Piedmont, Oct. 26, 1761, died Sept. 14, 1844. He introduced the principles of Lavoisier into Italy; in 1790 became perpetual secretary of the society of agriculture at Turin, in which science he effected great improvements; was a member of the provisional government established by the French in 1798, and was imprisoned by the Austrians in 1799. In 1800 he was made professor in the university of Turin. The Giober-
man Catholic Europe, being elected by Provid-

cence to guard the second dispensation, as

Jesus had to guard the first. He informs us that

the priesthood has attempted to retain the

people in tutelage beyond the proper time,

after it has lost its former moral and intel-
llectual superiority over them. Hence a fatal

schism exists between the ecclesiastical and

temporal orders, between spiritual and secu-
lar culture, which is the source of all the evils

that afflict modern society. He proposes a

voluntary cession by the priesthood of a do-
mension which has become incompatible with

modern civilization, and a thorough alliance

of sacerdotal and lay culture. He calls upon

the Italians and the Italian clergy to inaug-

urate this new civilization, urging the latter

to put themselves at the head of social move-

ments, and to be the champions and not the

enemies of the demands of the age for free in-
isstitutions. He claims for the pope an arbitra-
torship in the affairs of the European nations,

founded on his spiritual authority. The pro-

gramme which he proposed for immediate

Italian politics was: a confederation of the

states; the introduction of reforms; a religious

head, the pope; a military head, the king of

Sardinia; a capital, Rome; a citadel, Turin;

and above all, a sentiment of nationality in the

Italian princes. From the publication of the

Prima, Gioberti was regarded as the leader

of the moderate liberal party. Few works

have been received with greater enthusiasm,
or have wrought a greater influence upon the

public opinion of a nation. It was, however,
distrusted by the Jesuits, to whom Gioberti re-
plied in the Prospormenti of the second edition

( Brussels, 1845). In 1846 he removed to Paris.
The accession of Pius IX., who had studied

with favor the writings of the exiled philoso-

pher, and the liberal measures which he grant-
ed at the same time that constitutional prin-

ciples were proclaimed by the court of Turin,
promised to Gioberti the speedy realization

of his ideal. He wrote a severe and passionate

answer to the attacks of the Jesuits, under the
title of II Gesuita moderno (6 vols., Lanneau,

1847), which was followed by their expulsion
from Sardinia. At the revolution of 1848 he

returned to Italy after an absence of 15 years,
and Turin was illuminated in his honor several

nights in succession. He advocated a union of

the states under the supremacy of the house of

Savoy, and he visited the principal cities of the

peninsula, haranguing the troops, the universi-
ties, and the populace, and was everywhere re-
ceived with enthusiasm. But Mazzini, the head
of "young Italy," was his rival in popularity
and his bitter opponent; and discord prevailed
also among the princes, some of whom with-
drew the forces which they had sent to aid Sar-
dinia against Austria. Gioberti, elected to the
Piedmontese parliament (which assembled on
May 8) by both Genoa and Turin, placed him-
self at the head of the constitutional royalist
party in the chamber of deputies, and was ap-

pointed its president by acclamation. In July

he entered the Casati ministry, which after the
military reverses of Chiari, was given plen-
ty to that of Revel, which accepted an armistice
that resembled an abandonment of the war of
independence, and therefore was at once un-
popular. Gioberti united with his opponents
of the extreme democratic party in efforts to
overthrow this ministry, and at the same
time resumed his idea of a political league,
and became president of the society for an
Italian confederation, representatives of which
from all parts of Italy assembled in Turin in
October. His conduct won general admiration,
even from "young Italy," and he was enthusi-
astically placed at the head of the cabinet which
in December succeeded that of Revel. Though
he had announced a new campaign in Lombardy,
he was convinced that it could only be fruitless,
and broke with the party which had yielded
to him and shared with him the ministry, ab-
sorbed in himself all the energy and respons-
ibility of the cabinet, and, renouncing the war
of independence, resolved to employ the Pied-
montese armies in restoring the thrones of the
peninsula which had been carried away by the
popular commotions. He designed to surround
them with constitutional guarantees, and to
make them not less liberal than anti-republican.
Two obstacles prevented his beginning the ex-
ecution of the plan: the refusal of the Italian
princes to trust their restoration to the court
of Turin, and the energetic resistance of the
other Piedmontese ministers to such a move-
ment. The king himself formally opposed the
programme, and Gioberti resigned his office
on Feb. 21, 1849, declaring that with him had
fallen the cause of Italian renovation. After
the disaster of Novara (March 23), he entered
the new cabinet as minister without a portfolio,
and was soon after sent to Paris as plenipoten-
tiary. The mission being hardly more than an
honorable exile, he solicited the appointment
of a successor, and retired from public life.
He resumed his studies, and published his Del
rinnovamento civile d'Italia (2 vols., Paris and
Turin, 1851), in which he criticises the conduct
of parties in the movement of 1848, and affirms
that he repents of no counsel which he gave
or political act which he performed during his
public career. The end of his efforts he de-
clares to have been "to establish in Italy a
Piedmontese hegemony, and in Europe the
moral supremacy of Italy." He resided from
this time in Paris, and was engaged in a phi-
losophical work on Protologia, or first science,
when his death occurred suddenly by apop-
lexy. Gioberti refused to submit to the papal
condemnation of his Gesuita moderno, and all
his works have been placed on the index at
Rome. Besides those already mentioned, he
wrote letters in French Sur les erreurs religi-

ouses de M. de Lamennais (Brussels, 1840),

and Sur les doctrines philosophiques et polit-
iques de M. de Lamennais (1843), and a treatise

Dei errori filosofici di Ant. Ressamini (1841),
having proposed the question, “Which of all free governments is the best for Italy?” he answered, “The republican,” in a dissertation which obtained the prize. He was subsequently appointed historiographer of the state. His liberal views caused him a temporary imprisonment in 1799. Having lost his situation as historiographer by a treatise on divorce (1803), and been removed from the board of statistics on account of articles criticising the management of public affairs, he revenged himself by a sarcastic article entitled Il povero diacono, in consequence of which he was obliged to leave Italy. He was recalled after some years, and intrusted with the elaboration of the statistics of the kingdom of Italy. Suspected of participation in the liberal movements of 1820, he was arrested by the Austrian government, but set free after eight months’ imprisonment. He was a disciple of Bentham and Locke, and his numerous works on political economy are among the best in the Italian language.

GIORDANO, Luca, an Italian painter, born in Naples in 1632, died there, Jan. 12, 1705. He studied at first under Ribera, and afterward went to Rome and studied under Pietro da Cortona. He painted with unequalled rapidity; which circumstance, as well as his nickname of Fa Presto, was perhaps due to the avarice of his father, an inferior artist, who in Luca’s youth sold his works at a high price, and was continually urging him on with the words, Luca, fa presto (“Luca, make haste”). He visited Parma, Venice, Bologna, and Florence, leaving everywhere products of his talent and facility. Invited to Madrid by Charles II., he remained in Spain a number of years, and executed an immense number of frescoes in the Escorial, and in the churches and palaces of Madrid, Toledo, &c. The skill with which he imitated the manner of other artists gained him the title of the Protos of painting. Among the most admired of his numerous works are the “Triumph of the Church Militant” in the Escorial, the “Virgin and the Child Jesus” in the Pitti palace at Florence, and the “Judgment of Paris” in the Louvre.

GIORGIONE (Giorgio Barbarelli), one of the founders of the Venetian school of colorists, born at Castelfranco, near Treviso, in 1477, died of the plague in 1511. He was called Giorgione, according to Lanzi, from a certain grandeur conferred upon him by nature, not less of mind than of form. He was educated in the school of the Bellini at Venice, where Titian was one of his fellow students; but following the bent of his genius, he broke away from their stiff and constricted manner, and formed a style of his own, distinguished by boldness of outline, grace and expression in the countenances as well as the motions of his figures, well graduated and rich coloring, and effective chiaroscuro. The last of these he probably acquired by studying the works of Leonardo da Vinci, although he approaches the style of Correggio more nearly than that
of any other Italian painter. Giorgione's works in fresco, of which he executed many on the façade of Venice, pale at first and later entirely obliterated, but his portraits in oil, among the most admirable ever painted, and remarkable for the warmth of their coloring, particularly in the flesh tints, as well as their grace and animated expression, are in good preservation, although they are not numerous. Of his historical paintings, the "Moses rescued from the Nile," in the Pitti palace at Florence, is esteemed his chef d'œuvre.

GIOTTO, called also GIOTTO DI BONDONE from his father, and by some AMBROGIO, the regenerator of Italian art, born at Vespignano, near Florence, in 1276, died in the latter place about 1337. Tradition relates that the painter Cimabue discovered him, a shepherd boy in the valley of Vespignano, in the act of drawing upon a smooth piece of slate the figure of a sheep grazing near him, and was so struck with the genius which the work evidenced that he took him into his own house in Florence and taught him his art. Giotto speedily excelled his master, who undoubtedly at the close of his life conformed his style to that of his pupil. Art was then feebly struggling to free itself from the trammels of the Byzantine style. Cimabue and Duccio di Siena had indeed attempted to improve on existing models, but Giotto rejected them altogether. The symbolic representation of a subject, according to conventional rules, had hitherto been the highest aim of the artist. Giotto first gave life to art by making his works truly reflect nature. From the remoteness of the epoch in which he painted, it is not surprising that many of his works have perished; but from the specimens that remain and the traditions of those that are lost it is easy to account for his influence over central Italy, from Padua to Naples. Social and political revolutions, the quality of the materials used, the effects of climate, and the vandalism of his own and of later times, have destroyed or hopelessly injured his choicest works. Some of them have been whitewashed over, among them his portraits of Dante and other eminent citizens of Florence, one of his earliest works painted on the walls of the chapel of the Podesta, now the Bargello or prison in Florence, which Mr. Richard H. Wilde and Mr. Bezzi brought to light in 1840. These are said by Vasari to be the first successful attempts at portraiture. The record of Giotto's life is not very clear, but it is certain that before the death of Cimabue his reputation was such that Pope Boniface VIII. summoned him to Rome, where he designed his famous mosaic of the Sacrestia, representing the disciples at sea in a tempest and Christ raising Peter from the waves. It is now in St. Peter's, but frequent restorations have left little of the original work beside the composition. We next hear of him at Padua, where about 1306 he executed in the chapel of the Madonna dell' Arena his 42 paintings representing the life of the Virgin. He here met his friend Dante, then exiled from Florence, to whose influence the allegorical tendency which the most of his subsequent works exhibit is justly ascribed. An instance of this is afforded in the majestic figures of Poverty, Chastity, and Obedience, representing the three vows of the order of St. Francis, over whose tomb they are painted in the famous abbey church of the Franciscan order at Assisi, the repository of so many curious specimens of old Italian art. Robert of Naples entertained him honorably at his court, where he painted the sacraments for the Incoronata; and he is even said to have followed Clement V. to Avignon, and to have painted there and elsewhere in France. The wonder and enthusiasm which his works excited are perhaps without a parallel in the history of Italian art. A contemporary writer naively illustrates the feeling of the time by expressing his surprise that in Giotto's pictures "the personages who are in grief look melodious, and those who are joyous look gay." Boccaccio says that "through Giotto that art was restored to light which had been for many centuries buried." Giotto excelled also in sculpture and architecture. The famous Campanile of Florence, erected in 1334, was from his designs. His school flourished for upward of a century after his death.

GIOTTO, Paolo (P'AUCLUS JovI't'US), an Italian Latin historian, born in Como, April 19, 1483, died in Florence, Dec. 11, 1502. He studied at Pavia, abandoned medical for historical inquiiry, was protected by Popes Leo X. and Clement VII., by Charles V. and Francis I., wielded a venal pen, was loaded with honors and favors, and having lost all that he possessed when in 1527 Rome was sacked by the army of the constable of Bourbon, was rewarded with the bishopric of Novara. His most important work is a "History of his own Time" in 45 books, 6 of which are wanting. His veracity is not to be relied on.

GIRAFFE, or Camelopard (giraffa camelopardalis of most authors; cerus camelopardalis of Linnaeus), an African genus of the ruminants, with persistent horns, common to both sexes, having but a single species, as above. The characteristics of this singular animal, which appears, in some particulars, to participate in the qualities of the camel, the ox, and the antelope, are these: The lip is not grooved, is entirely covered with hair, and is very much produced before the nostril; the tongue is extremely long and prehensile, capable of being protruded or retracted at will, and of being tapered so as to enter the ring of a small key; the neck is very long, the body short, hind part lower; false hoofs none; tail elongate, with a tuft of thick hair at the end. The horns constitute the principal generic characteristic, since they are of neither the bovine nor cervine form, but are in fact bones, exhibiting throughout precisely the same structure as the other bones, united to the frontal and parietal bones by a distinct suture, covered with a hairy skin,
and terminating in a ring of bristly hairs at the
summit, surrounding a bare apex. These bri-
stles, according to some naturalists, want only
the gluten to cement them into true horns, and
embody the animal in the systematic arrange-
ment of the cervicornis. The giraffe is assimil-
ated to the camel by the length of its neck,
by the callosities on its chest and knees, and
by its having no false hoofs; to the other rumin-
ants by the structure of its stomach and di-
gestive organs generally, and by its non-pos-
session of the reticulated water bag. To the
antelopes it is assimilated by the fact that the
coils of its colon are spiral, and that its oesum
is simple. With the solid-horned deer, which
shed and renew those appendages annually, it
is connected by the assumed fact of its having
no gall bladder. In its dental system, the gi-
raffe offers the same formula with the deer,
goat, antelope, sheep, and ox; namely: incisor
\( \frac{3}{3} \), canines \( \frac{3}{3} \), molars \( \frac{\text{3}+\text{3}}{\text{3}} = 82 \). The no-
cies of acacia peculiar to the districts which it
inhabits. The peculiar conformation of the
tongue, which is furnished with rough papillae
capable of voluntary erection, enables it to
gather and collect into little bundles the soft
leaves which it likes. Its speed, which is far
from contemptible, is shown by the statement
of hunters who have pursued it, particularly
Capt. Gordon Cumming; all of whom testify
that, being timid and wary, and always secur-
ing a good start, it is not easily overtaken, ex-
cept by a swift horse. Its pace is a trot,
a pace with both legs moved on the same side,
and a regular gallop, by changing from one to
the other of which, with no apparent diminu-
tion of its speed, it can keep up a considerable
rate of going for a long continued time and
distance. Le Vaillant, the first well informed
modern zoologist who saw it in a state of na-
ture, asserts that he “knows beyond a doubt
that by its kicking it often tires out, discourages,
and even beats off the lion.” The same fact
is shown by Capt. Cumming. Of the adaptation
of the giraffe to the country and scenery he
inhabits, this observant naturalist and sports-
man speaks as follows: “I have often traced
a remarkable resemblance between the animal
and the general appearance of the locality in
which it is found. ... And as the giraffe is
invariably met with among venerable forests,
where immeasurable blasted and weather-beaten
trunks and stems occur, I have been repeatedly
in doubt as to the presence of a troop of them,
until I had recourse to my spy-glass; and on
referring the case to my savage attendants, I
have known even their optics to fail—at one
time mistaking the dilapidated trunks for cam-
elopards, and again confounding real camelo-
pards with those aged veterans of the forest.”
This animal when full-grown sometimes attains
a height of 15, 16, and even 17 ft. It was for-
merly believed almost universally that the fore
legs are much longer than the hinder ones, but
in fact, taking the legs only from the setting on,
the hind legs are the longer by about one inch.
The great development and height of the withers, to give a proper base to the long neck
and towering head, have been the cause of this
error. The color of the giraffe varies, both in its
intensity and in the mode of its variegation.
The head is generally of a uniform reddish
brown; the neck, back, and sides, outside of
the shoulders and thighs, are varied with large
tesselated, dull, rust-colored marks of a square
form, with white narrow divisions; on the
sides the marks are less regular; the belly and
legs are whiter, faintly spotted; the part of
the tail next to the body is covered with short,
smooth hair; its trunk is very slender, and
toward the end the hairs are very long, black,
and coarse, and form a great tuft hanging far
beyond the tip of the tail. The coloring of the
female is less vivid than that of the male;
she is somewhat smaller, and has the peculiar
protuberance of the frontal bone between the
eyes, which by some writers has been called a
GIRALDUS CAMBRENSIS

rudimental horn, less strongly developed than the male.—The giraffe has been long known to history. It is represented on the painted walls of the seco of the Memnonium, discovered and described by Belzoni; and also on the celebrated Persephone pavement, said to have been constructed by the orders of Sulla, who had served as questor in Numidia. It was exhibited in the circus maximus by Julius Caesar, alive, for the first time in Europe, but was afterward a frequent spectacle at the cruel shows of Rome. Gordian, the third of the name, once exhibited 10 together. It continued to be known and described by travellers, but was not brought into Europe until a much later period. During the last 40 years several specimens have been seen in the zoological gardens of London and Paris, and many have been brought to this country, where they seem to thrive. The underside of his head, in a domesticated state, it gentle, timid, shy, and inoffensive; it is extremely docile in confinement, feeds from the hand, licks the hand which feeds it, and becomes the friend of those who are kind to it. Its natural range appears to be all the wooded parts of eastern, central, and southern Africa, from Sennar and Abyssinia to the vicinity of the settlements of the Cape of Good Hope, although, like all wild animals, it recedes before the approach of civilization. In domestication it serves no purpose but to gratify curiosity and to promote the study of nature, since it is unfit for draught; and although its flesh is said by hunters to be estatable, it is not suitable for furnishing either meat or milk.

GIRALDUS CAMBRENSIS. See BERTH, GERALD.

GIRARD, Philippe de, a French inventor, born near Avignon, Feb. 1, 1775, died in Paris, Aug. 26, 1845. In 1806 he exhibited an improvement in lamps, and in the same year made some improvement in the steam engine, producing a rotary motion without a walking beam. His principal invention was a machine for flax spinning, to which subsequently he applied steam, and for which he received the emperor’s medal in 1810, and another medal from the national exposition of Industry in 1844. He invented several other machines, and for many years was interested in extensive manufactories of linen in Poland and in Austria, as well as in France.

GIRARD, Stephen, an American merchant and banker, born near Bordeaux, France, May 24, 1750, died in Philadelphia, Dec. 26, 1811. He was the son of a seaman, and sailed about 1760 as cabin boy to the West Indies and New York. Rising by degrees to be master and part owner of an American coasting vessel, he accumulated in the course of a few years a sum sufficient to establish him in business as a small trader in Philadelphia in 1776. He married about this time the daughter of a ship builder of that city, but the union was unhappy. Mr. Girard applied for a divorce, and his wife ultimately died insane in a public hospital. Meanwhile, Girard trafficked with the West Indies with variable success, until his maritime ventures were suspended by the war of the revolution. He then opened a grocery and liquor shop, at first in Philadelphia, and during the British occupation of that city at Mount Holly, where he drove a profitable trade with the American soldiers. In 1789 he resumed his dealings with the West Indies and New Orleans, and some time afterward was in partnership for a few years with his brother John. The connection was dissolved in 1790, Stephen having gained while it lasted about $30,000. The foundation of his subsequent wealth, however, seems to have been a lease which he took of a range of stores, at a time when rents were much depressed by the war; these he underlet at a large profit. Another source of gain was the negro insurrection in Haiti. Two of his vessels were in one of the ports of the island, and many of the planters placed their treasures in them for safety, but were afterward cut out with their entire families. About $50,000 worth of property whose owners could not be found thus remained in Mr. Girard’s hands.

With a remarkable capacity for business and a habit of strictness in money matters, he rapidly multiplied his wealth, and before long came to be recognized as one of the richest merchants in the city. During the prevalence of the yellow fever in Philadelphia in 1793, ’7, and ’8, when it raged with a violence never before seen in America, Mr. Girard not only gave money liberally, but performed in person the duties of physician and nurse, undertook the most disagreeable offices in the hospitals, and for two months kept charge of the hospital on Bush hill. In 1812, having purchased the building and a large part of the stock of the old United States bank, he commenced business as a private banker, with a capital of $1,200,000, which was afterward increased to $4,000,000. Besides the benefit which this institution proved to the national currency, it enabled Mr. Girard to make heavy loans to the government in times of public embarrassment; and during the war of 1812, when out of a loan of $5,000,000 proposed by the secretary of the treasury only $30,000 could be negotiated, he subscribed for the whole amount. He was active in procuring the charter of the second United States bank, of which he became a director. He contributed liberally to all public improvements, and adorned the city of Philadelphia with many handsome buildings. He was frugal and parsimonious, but not avaricious; profuse in his public charities, but stern in exacting the last fraction that was due him. His kindness to the sick was extraordinary, but he never had a friend. His appearance was very plain. He was uneducated; was a free thinker in religion, and an admirer of the school of Voltaire and Rousseau, after whom he was fond of naming his ships. His property at the time of his death
GIRARD

amounted to about $8,000,000. Comparative-
ly little of it was bequeathed to his relatives.
To the Pennsylvania hospital he willed $30,-
000; to the Pennsylvania institution for the
defaf and dumb, $20,000; to the orphan asy-
lum of Philadelphia, $10,000; to the Phila-
delphia public schools, $10,000; to the city
of Philadelphia, for the distribution of fuel
to the poor every winter, $10,000; to the
society for the relief of distressed masters of
ships, $10,000; to the masonic loan, $20,000;
to the city of New Orleans, a large amount of
real estate; to the city of Philadelphia, for
improvement of its streets, buildings, &c.,
$500,000; for the improvement of canal navi-
gation in Pennsylvania, $300,000. His prin-
cipal bequest was $2,000,000, besides the residue
of a certain portion of his estate out of which
some legacies were to be paid, together with a
pavement ground in Philadelphia, for the erec-
tion and support of a college for orphans.

The most minute directions were given for the
construction, size, and materials of the build-
ing, which was begun in July, 1838, and open-
ed Jan. 1, 1848. It is surrounded by a stone
wall 10 ft. high, enclosing 41 acres laid out in
play grounds, grass plots, gardens, &c. The
main building is the finest specimen of Grecian
architecture in America, and is even said to be
the finest of modern times. The outer walls,
staircases, doors, and roof are of white mar-
ble; the inner walls of brick. It is in the
form of a Corinthian temple, surrounded by a
portico of 34 columns, each 55 ft. high and 6
ft. in diameter. Its length is 169 ft., its width
111 ft., and its height 97 ft. The entrances
are on the N. and S. fronts, each door being
16 ft. wide and 32 ft. high; the E. and W.

GIRARDIN

sides are pierced each by 24 windows. The
structure rests on a basement of 11 steps ex-
tending around the entire building. A marble
statue in the lower vestibule covers the re-
mains of Mr. Girard. There are five other
buildings within the enclosure, one of which
is used as a laboratory, bakery, wash house,
&c. The others stand two on each side of the
main building, and are of marble, each two
stories high, 125 ft. long, and 52 ft. wide.
The cost of the edifices was upward of $1,290,-
000. As many poor white male orphans as
the endowment can support are admitted be-
tween the ages of 6 and 10 years, fed, clothed,
and educated, and between the ages of 14 and
18 are bound out to mechanical, agricultural,
or commercial occupations. In a recent re-
port the directors say that, the apprenticeship
system as it existed in Mr. Girard's time hav-
ing become obsolete, the execution of that
part of the will is now difficult. By a provi-
sion of the will of the founder no ecclesiastic,
missionary, or minister of any sect whatever,
is to hold any connection with the college, or
be admitted to the premises even as a visitor;
but the officers of the institution are required
to instruct the pupils in the purest principles
of morality, leaving them to adopt their own

religions opinions. The officers consist of a
president, secretary, two professors, five male
and five female teachers, a physician, a matron,
a steward, and a superintendent of manual la-
bor; and there are about 500 beneficiaries.

GIRARDIN. 1. Émile de, a French journalist,
born in Paris, June 23, 1806. The natural son
of Count Alexandre de Girardin and Mme.
Dupuy, wife of a counsellor, and registered at
his birth under the name of Émile de Lamothe,
he struggled for years before he gained his
right name, and it was not till 1837 that his
filiation was definitely established by his pa-
ters' public avowal. After being inspector of
the fine arts under the Martignac ministry,
he established two periodicals: La Voleur,
which piffled from all the other journals, and
La Mode, a journal of fashion, which enjoyed
the patronage of the duchess of Berry. After
the revolution of 1830 he established the month-
ly Journal des Connaissances utiles, the price
of which was only four francs (less than 80
cents) a year, which soon obtained 120,000
subscribers. Through the agency of this paper
he organized a subscription for the establish-
ment of a model farm, known as the institut
agricole de Coëtlo, and greatly contributed to
increase the number of savings banks through
the country. He issued other cheap publica-
tions in connection with his monthly, as the
Journal des Instituteurs, at 36 cents a year; a
geographical atlas at one cent a map; and the
Almanach de France, at 10 cents a copy.
All these publications were issued as emanat-
ing from a société nationale pour l'émanci-
pation intellectuelle. He also published the
Journal des Gardes Nationales, and the Gastro-
nome, a culinary paper which was found in
every eating house. He was one of the found-
ers of the illustrated weekly Musée des Fa-
milles. In 1835 he projected the Panthéon
Littéraire, a series of 100 large vols. 8vo, which
were to embrace a mass of letterpress equal
to 1,000 ordinary volumes, and to present in
a cheap form the standard works of every
country. In 1836 he established the Presse,
a political daily paper, at a yearly subscription
of 40 francs, half the price before paid for
such journals. This attempt brought upon
him the wrath of nearly all the contemporary
journalists of Paris. Both his public and pri-
ivate life were assailed; he was charged with
claiming a name which was denied him, with
dishonesty in some of his numerous business
transactions, and with unscrupulous ambition
in his political course. He challenged Armand
Carrel, and killed him in the duel, when the
clamor against him increased on all sides. But
he was undaunted, and secured the full posses-
sion of his name and a seat in the chamber of
deputies, which was long contested on the
ground that he was not a Frenchman, but, as
was falsely reported, a native of Switzerland,
while he extended the circulation of the Presse
so as to place it beyond rivalry. He supported
the Molé ministry against the coalition in 1839,
and the ministry of Guizot during most of its duration. On Feb. 24, 1848, he presented himself at the Tuileries and persuaded Louis Philippe to an abdication in favor of his grandson, the count de Paris; but it was too late to save the dynasty. He vigorously supported the new order of things, tried to inspire the French people with confidence in it, and became for a while the most popular journalist in Paris. During a few weeks nearly 150,000 copies of the Presse were disposed of daily. His independent politics were deemed dangerous by Gen. Cavaignac, who ordered his arrest after the insurrection of June, and kept him 11 days in strict confinement. On resuming the charge of his journal, Girardin vehemently attacked the rule of the general, and greatly contributed to the election of Louis Napoleon to the presidency, but soon became his opponent, gave his journal a more and more radical and socialistic turn, and after the coup d'etat of Dec. 2, 1851, was ordered out of France. He afterward returned, but, unable to submit to the restrictions on journalism, sold his share in the Presse in 1856 for 800,000 francs. In December, 1862, he again became its chief editor, but he finally abandoned it in 1866, and established La Liberte. He attacked the administration vigorously, and in March, 1867, was fined 5,000 francs, and a month later the sale of his journal on the street was prohibited. He still continued to attack the administration, subjecting himself to further prosecution, and he also severely criticised the course of many of the opposition journals. After the formation of the Ollivier ministry (Jan. 2, 1870) he accepted several government commissions. After the proclamation of the republic (Sept. 4) an unpublished decree, bearing date July 27 and countersigned by Emile Ollivier, was found among the papers of the Tuileries, conferring upon Girardin the rank of senator. About the same time he sold La Liberte for 1,000,000 francs, and for a time withdrew from journalism. But he soon resumed his pen, and became a vehement supporter of the war against Prussia. During the siege of Paris La Liberte was transferred to the country, and he followed it, and on Dec. 24 purchased Les Cents Jours, in which he severely criticised the dictatorship of M. Gambetta. During the insurrection of the communists he published a journal called L'Union Francaise, in which he advocated the adoption of a federal system of government. In May, 1872, he purchased the Journal Officiel, whose management, however, was retained by its former conductor. The catalogue of his political pamphlets would fill columns. His contributions to the Presse from 1836 to 1856 were published in 1886 (12 vols. 8vo), under the title of Questions de mon temps. In 1859 he furnished a preface to a work entitled Les batailles celebres, by A. Chargueraud. His Du droit de punir (Paris, 1871), on which he was engaged for ten years, is mainly a supplement to Boccardia's De delitti e delle pene. In opposition to L'Homme-femme, by Alexandre Dumas fils, he published in 1872 L'Homme et la femme, l'homme eueurain, la femme cassee. After the death of his first wife he married (November, 1856) Countess Mina de Tieffenbach, daughter of a former Viennese postmaster, and widow, by morganatic marriage, of Prince Frederick of Nassau. He obtained a divorce from her in 1872. M. Delphine Gay, a French authoress, wife of the preceeding, born in Aix-la-Chapelle, Jan. 26, 1864, died in Paris, June 29, 1855. She was the daughter of Mme. Sophie Gay, and a poem written by her when scarcely 18 years old gained an extraordinary prize of the French academy. In 1824 she published a collection of Essais politiques. She was accustomed to recite her verses in society, and having extemporized some beautiful lines on the premature death of Gen. Foy in 1835, she was hailed as la muse de la patrie and received from Charles X. a pension of 1,800 francs. On a visit to Italy in 1827 she was elected by acclamation a member of the Tiber academy at Rome, and carried in triumph to the capitol. She married Emile de Girardin in 1851, and produced in 1888 Napoleon, one of her most charming poems. She had already begun to write novels. Le long jorn appeared in 1881, and was succeeded by M. le marquis de Pontzanne in 1885, and La canne de M. de Balseac in 1886. From 1886 to 1884 she furnished to the Presse, under the nom de plume of Vicomte Delaunay, 87 Lettres parisiennes on literature, art, and fashion. The only complete edition of these letters was brought out in 1888, with an introduction by Théophile Gautier. In 1889 she wrote a comedy, L'Ecole des journalistes, but its representation was prohibited by the government. In 1848 her tragedy Judith, designed for Rachel, was performed at the Théâtre Français. Another tragedy, Cléopatre (1847), and the comedy of Lady Tartufy (1888), were also written for that actress. Her comedies, C'est la faute du mari, ou Les bons maris font les bonnes femmes (1881), and La joie fait peur (1884), and her vaudeville Le chapeau d'un horloger (1884), were highly successful. Her last novels, Marguerite, ou Deux amours, et Il ne faut pas jouer avec la douleur, appeared in 1883, and a new edition of the former in 1888. An English translation of "The Cross of Berny," the joint production of Mme. de Girardin, Gautier, Sendeau, and Méry, was published in New York in 1878. A complete edition of her works has been published (8 vols. 8vo, Paris, 1890-'91). She was celebrated for beauty and wit.

GIRARDIN, Jean Pierre Louis, a French chemist, born in Paris, Nov. 16, 1803. He has popularized chemistry by teaching its application to art, industry, and agriculture, as professor at Rouen from 1838 to 1858, and at Lille and Clermont. In 1885 he published Logona de chimie élémentaire (3 vols.; 4th revised and illustrated ed., 1890-'92), which has been translated into Russian. His other writings include
He was patronized by Colbert, and received orders from the king for groups and statues in several of the royal palaces and gardens. In 1690 he was appointed general inspector of sculpture, to succeed Lebrun. Some of his most celebrated works were destroyed during the revolution. The most important of those that remain are Richelieu’s mausoleum in the chapel at the Sorbonne, and his groups of the “Bath of Apollo” and the “Rape of Proserpine” in the Versailles garden.

GIRAUD, Charles Joseph Barthélemy, a French jurist, born at Perbes, Vaucuse, Feb. 20, 1802. He studied at Aix, where he became professor of administrative science and president of the academy. In 1843 he became inspector general of the law schools in Paris and member of the French academy, and subsequently of the board of education; and he was vice rector of the academy of Paris till 1848. He was twice minister of public instruction in 1851 and member of the consultative council, from which he retired in August, 1852, in consequence of the confiscation of the property of the Orleans family. He has since filled the chair of Roman law in the faculty of Paris, and succeeded Laferrière in 1861 as inspector general of the judiciary. His principal works are: Histoire du droit français au moyen âge (2 vols., Paris, 1846); Le traité d’Utrecht (1847; translated into German and Spanish); Les tables de Salpêtrière et de Malaga, relating to the bronze tables found in the latter locality (2d ed., revised and enlarged, 1866); and Études nouvelles sur Grégoire VII. et son temps, in the Revue des Deux Mondes of March 15, 1878, et seq.

GIRGENTI. I. A province of Sicily, on the S.W. coast; area, 1,491 sq. m.; pop. in 1872, 289,018. Its surface is mountainous, with numerous valleys, which are exuberantly fertile, and yield corn, wine, and oil in great abundance. There is good pasture, and the cheese made here is excellent. The chief natural productions are gypsum, bismuth, naphtha, salt, and especially sulphur. II. A city (anc. Agrigentum), capital of the province, 8 m. off the coast, and 58 m. S. E. of Palermo; pop. about 18,000. It is situated on the Girgenti river, formed here by the junction of the Drago (anc. Hyppasus) and San Bisgo (anc. Acragas), and on Mount Camicas, over 1,000 ft. high, which was the acropolis of ancient Agrigentum. It has four walls and gates, is called magnifica on account of its picturesque situation, and contains a fine English garden. But, excepting one long street, there are only steep and dirty lanes; yet the houses, wretched as they are, have fine balconies, and the inhabitants, including many beggars (though fewer than formerly), are dressed in a blue velveten costume, and the women wear black shawls over their heads. The cathedral is an inconspicuous specimen of architecture, owing to various changes since its foundation in the 13th century. It contains many chapels, monuments, works of art,
relics, an ancient sarcophagus with sculptures supposed to represent the story of Phaedra and Hippolytus, and a celebrated porta coae, from whence a conversation, though carried on in the lowest voice, may be overheard at a distance of about 800 feet. There are many other churches, and formerly, when the population included a large number of priests, there were many convents and nunneries. The college of Girgenti is among the most important in Sicily, and the Lucchesiàna library contains about 100,000 volumes. The palazzo Buonadonna is the principal of the palaces, and the most remarkable classical vestige is the temple of Zeus Polieus, now the church of Santa Maria de' Greci. Subterranean chambers filled with stalactites are supposed to have been quarries whence the stone was supplied for the buildings of the ancient city. There are immense galleries in Elide rock near the port, which is protected by a mole, built of fragments from the temple of Zeus Olympius. Sulphur is the principal article of trade, and the other chief exports are grain and olive oil. While the piscina or water reservoir was one of the most remarkable public works of the ancient city (see Assegiamo), Girgenti suffers from the utter want of a supply of water. The excavations of the ancient sepulchres have discovered painted vases more varied and larger than any others found in Sicily, and almost equalling those of Apulia and Campania. The spring or fountain near the city, to which Piny refers as yielding petroleum or mineral oil, still exists; and the mud volcano described by Solinus, and to which the Saracens gave its present name of Macalumba, continues to be one of the many curious sights in the vicinity of Girgenti.

GIRODET-TRIOSON, Anne Louis (Girouer de Courcy), a French painter, born in Montargis in 1767, died in Paris, Dec. 9, 1824. He was a pupil of David, and obtained the great prize, which enabled him to go to Rome in 1789. During a residence of five years in Italy he sent to Paris the "Sleeping Endymion" and "Hippocrates declining the Gifts of Artaxerxes." On his return to Paris in 1795, he painted portraits of Chateaubriand and Hor-tensem, and several large pictures, as "Danae," "The Seasons" for the king of Spain, "Fingal, Ossian, and their Descendants welcoming to their Aerial Palace the Muses of French Heroes," and in 1806 his most esteemed work, "A Scene of the Deluge," which created a great popular sensation and bore away the prize from David's "Sabines." In 1808 he completed his "Funeral of Atala," in 1810 his "Revolt at Cairo," and in 1819 his "Pyrmilion and Galatea." His literary remains were published in 1829, in 2 vols.

GIROZZI, a S. W. department of France, formerly a part of the province of Guienne, bordering on the bay of Bisac and the departments of Charente-Inférieure, Dordogne, Lot-et-Garonne, and Landes; area, 7,680 sq. m.; pop. in 1872, 706,149. The surface is almost entirely level, the W. portion being a vast sandy, arid flat, collectively called the Landes. The chief rivers are the Garonne and Dordogne, which unite to form the Gironde, the Isle, Dronne, Dropt, and Leyre. The climate is temperate, and, except in the Landes, generally healthy. The principal productions are wheat, rye, millet, maize, hemp, fruits, wine, cork, charcoal, turpentine, pitch, and timber. Wine is the staple product, 50,000,000 gallons being made annually. The most renowned Bordeaux wines are produced in the Gironde. Building stone, salt, and chalk are the principal mineral products. The manufactures include calicoes, muslin, earthenware, paper, leather, glass, tobacco, brandy, beer, vinegar, salt, chemicals, and cordage. Ship building is extensively carried on in Bordeaux. Railways connect Bordeaux with Paris, Bayonne, &c. The department is divided into the arrondissements of Bordeaux, Blaye, Lesparre, Libourne, Bazas, and La Rèole. Capital, Bordeaux.

GIRODISTS (Fr. Girondins), a French political party, which played a conspicuous part in the legislative assembly and the convention. They derived their name from the deputies of the department of Girond, whom they acknowledged as their leaders. Vergniaud, Geniscoë, Guadet, Brisot (from whom they were sometimes styled Brisotins), Condorcet, Ducos, Boyer-Fonfrède, Louvet, Pétion, Valazé, Buçot, Baronbouix, Isnard, Lanjuinais, Carra, and Rabaut Saint-Étienne were the most prominent of their members. They enthusiastically promoted the proclamation of the republic (September, 1792), but strongly opposed the ultra-revolutionary party, called the Montagnards; and although eloquence, talent, and virtue were mostly on their side, they succumbed to the violent assaults of their opponents after having been driven by the current to vote in part and reluctantly for the death of Louis XVI. The Montagnards charged them with plotting against the unity of the republic and aiming at a federal organization of the country. After a stormy debate on May 81, 1793, 29 of them were arrested on June 2, incarcerated at the Conciergerie, and on Oct. 81 executed. Mme. Roland, their inspirer, and her husband followed them soon after (November), the former dying by the guillotine, the latter by his own hand. The other Girondist leaders escaped from Paris, and, after vainly attempting to revolutionize several departments, were almost all either taken prisoners and beheaded, or committed suicide.—See Lamartine, Histoire des Girondins (9 vols., Paris, 1847).

GIELASON, Guðrøi, an Icelandic philologist and lexicographer, born July 8, 1806. He is the son of a popular poet, and studied at the university of Copenhagen, where he became professor of the Norse languages. Besides numerous editions of old Icelandic writings and commentaries on early Scandinavian poetry and philology, he has published a critical manual of the rudiments of the ancient Icelandic
according to the earliest records (1846); a Danish-Icelandic dictionary, the first ever published (1851); and an unfinished work on early Norse inflections (1858).

GISORS, a town of Normandy, France, in the department of Eure, in a fertile plain on the banks of the Epte, 33 m. E. S. E. of Rouen; pop. in 1866, 3,753. It is surrounded by gardens and beautiful promenades formed upon the remains of its ancient ramparts. Its castle, most of which is still standing, was very strong, and one of the chief fortresses of Normandy. It was built about the 11th century, but the donjon, an enclosed octagonal structure crowning a high artificial mound, was constructed in the 12th century by Henry II. of England. Under one of the towers is a dungeon, the walls of which are covered with carvings executed with a nail by some unknown prisoner. The parish church is filled with grotesque sculptures. The choir is said to have been built by Blanche of Castile.

GITSCHIN, a town of Bohemia, on the Cydlin, 50 m. N. E. of Prague; pop. in 1869, 6,870. It is walled, and has three gates and four suburbs. The parish church is built after the model of that of Santiago de Compostela in Spain. The former Jesuit college is used as barracks. It was a collection of wretched hovels before Wallenstein made it the capital of the duchy of Friedland in 1827, and the seat of a magnificent palace in 1880. The storming of Gitschin by the Prussians, June 29, 1866, ended the campaign in the territory of the Iser; and the overwhelming defeat of the Austrians here paved the way for the junction of the first and second Prussian armies and for the victory of Sadowa (July 2).

GIULIO ROMANO, an Italian painter and architect, whose family name was Pippi, born in Rome in 1492, died in Mantua in 1546. He was the most distinguished pupil of Raphael, whom he assisted in many of his paintings, and who made him his chief heir and appointed him to complete his unfinished works. After the death of his master, Leo X. and Clement VII. employed him, together with Gian Penni, to finish the history of Constantine in the Vatican; and he executed several works for the public edifices at Rome, was also employed there as architect, and painted his celebrated picture of the "Stoning of St. Stephen" for the church of San Stefano at Genoa. He was afterward invited to Mantua, and engaged both as architect and painter on the palazzo del Tè. The "Defeat of the Titans," in one of the halls of the palace, is one of the best examples of his style. He worked with his pupils on many other edifices at Mantua, and just before his death was appointed to succeed Sansovino as architect of St. Peter's.

GIURGOVO, a town and river port of Roumania, in Wallachia, on the left bank of the Danube, opposite Rastchuk, and 34 m. S. by W. of Bucharest; pop. about 18,000. Its citadel, the only one of its fortifications remaining, stands on an island in the Danube called Slobozde, and is connected with the town by a bridge. Next to Braila it is the most important port on the Wallachian bank of the Danube, and carries on a considerable trade with Germany and Hungary. Giurgevo has figured in almost all the Turkish wars on the lower Danube, from the 15th century down to the war of 1878.

GIUDICI, Paolo Emiliani, an Italian author, born at Mussomelli, Sicily, June 18, 1612. He removed to Florence in 1840, and in 1844 published Storia della letteratura italiana (2 vols., 2d ed., 1853). He was professor at the university of Pisa from 1849 to 1852, and of aesthetics at the royal academy of fine arts in Florence from 1859 to 1862, of which he became secretary. In 1867 he was returned to the Italian parliament as a deputy for Sicily. His Storia dei comuni (3 vols., 1853-8), a remarkable work, with new documentary evidence relating to the Italian communes, was followed in 1866 by his translation into Italian of Macaulay's "History of England," and in 1860 by his Storia del teatro italiano; and he has long been engaged upon a history of the Florentine democracy.

GIUSTI, Giuseppe, an Italian poet, born at Monsummano, in Tuscany, in May, 1809, died in Florence, March 31, 1880. He graduated as an advocate at the university of Pisa, and entered the law office of the future minister of justice, Capoquadri. But on account of a delicate constitution and disappointment in love, he abandoned the practice of his profession. He was in full sympathy with Manzoni, D'Azzio, and other opponents of Austrian domination in Italy, and his poem Il Dies Irae, on the death of the emperor Francis I. in 1835, attracted considerable attention. As a champion of moderate liberalism he was twice elected in 1848 to the Tuscan chamber of deputies; but after spending the summer of 1849 at the springs of Viareggio, he ended his life in the Florentine palace of his devoted friend Capponi. Though published anonymously, his writings had acquired a wide popularity all over Italy, when the appearance of a spurious edition in 1845 impelled him to have one prepared in his own name. But the most authentic and complete edition was published after his death, under the title of Verni editi ed inediti (Florence, 1852).

GIUSTINIANI, Agostino Pantaleone, an Italian prelate and philologist, born in Genoa in 1470, died at sea in 1536. Educated by the Dominicans of Florence, he became a professor member of that order in 1488, studied oriental languages, taught in several colleges, and in 1518 published his Pecratio Pietatis Plena (Vro, Venice), in Hebrew and Latin. About this time he was appointed against his will bishop of Nebbio in Corsica, was present in 1516 at the fifth Lateran council, and solicited in vain his removal from the episcopal office. He withdrew to the retirement offered by the bishop of Ivrea, continuing his linguistic labors, and
went to Paris at the invitation of Francis I., who appointed him his chaplain, and under whose auspices he published shortly afterward his Hebrew-Latin edition of the book of Job. After filling for five years the chair of Hebrew in the university of Paris, he returned to Genoa, then torn by factions, was seriously wounded while trying to quell a riot, and thence proceeded to Nobbio, where he spent the remainder of his life in his episcopal duties. The principal work of Giustiniani is his Psalterium Hebraenum, Graecum, Arabicum, Chaldaicum, cum tribus Latinis Interpretationibus et Glossis (fol., Genoa, 1516). In a note to one of the psalms is the first printed biographical sketch of Christopher Columbus. He also left in manuscript a polyglot New Testament.

Givet, a town of France, in the department of Ardenne, on the Meuse, 23 m. N. by E. of Mezières, on the Belgian frontier; pop. in 1866, 6,631. It is a fortified place of considerable importance, its principal defence being the citadel of Charlemont on an adjacent height. The town consists of Le Grand Givet, or Givet-Notre-Dame, on the right bank, and Le Petit Givet, or Givet-St.-Hilaire, with the fortress Charlemont, on the left bank of the Meuse, which are connected by a bridge built by Napoleon I., and all of which are within the lines of fortification. Givet has manufactures of wire, pencils, and leather, for the last of which it is celebrated.

Givors, a town of France, in the department of Rhône, on the Gier and the Rhône, 13 m. S. of Lyons; pop. in 1866, 9,957. It has extensive glassworks and tanneries, brick yards, founderies, and silk factories. The place is important as a shipping point for coal. Near it the Givors-Gier canal, begun in 1765 and completed in 1781, joins the Rhône, which is thus connected with the Loire. In the vicinity are the ruins of the castle of St. Gerald and the convent of St. Férreló.

Gizeh, Ghizeh, or Jizah, a town of Egypt, capital of a province of the same name, on the W. bank of the Nile, 8 m. S. W. of Cairo. It was once a large city, but is now a petty village surrounded by heaps of ruins. The khe-dive has a palace there. About 6 m. from the village stand the three great pyramids called those of Cheopa, Cephren, and Mycerinus. At Gizeh are ovens in which eggs have been hatched artificially ever since the days of the Pharaohs. (See PYRAMIDS.)

Glacial Theory. See Diluvium, and Glacier.

Glacier (Fr. glacier, from glace, ice), a vast body of ice, filling some alpine valley, down which it slowly moves, the outlet of the snows which accumulate in the elevated portions of the mountain group. Glaciers may be found in all countries where extensive tracts lie above the snow line. In such localities the snows are ever accumulating, and the temperature not rising sufficiently for any considerable proportion to be melted and flow down they fill the spaces between the summits. By the pressure exerted by these vast collections the yielding material is forced through whatever opening is presented for its passage, and the great valleys leading to the base of the mountains are packed full of ice, which results from the snow being solidified by pressure, or by its own melting and freezing again. This, solid as it appears, is steadily though imperceptibly urged onward, conforming to all the irregularities of its channel, split sometimes by immovable ledges of rock, which stand like islands in its course, yet closing again below them with no trace of the fissure. These bodies of ice extend down the valleys till they reach a region where the temperature is sufficiently elevated to melt away the supplies as they arrive. Though these have gradually diminished toward the lower extremities of the glacier, so that this has flattened away somewhat like a wedge, and has also become narrower, the termination is frequently abrupt and even inaccessible. It presents an apparently stationary wall of ice, which, though seen to be constantly wasting, may yet by observations continued several days be found steadily advancing from the mountain. During the summer currents of water formed from superficial thaw flow over its surface, at least in the daytime, and fall in cascades into the numerous chasms, which extend across the glacier. They continue their course, hollowing out through the lower layers of the ice arched channels, which at the lower end appear like dark caverns extending far up into the icy mass. In high polar latitudes, where the line of perpetual snow comes down to the sea level, the phenomena of glaciers are displayed upon the grandest scale. Thus they were seen in lat. 70°-80° by Dr. Kane in 1855, spreading over the western coast of Greenland, and sloping so gently toward the water that the effect of an inclined plane was perceived only by looking far into the interior toward the sea. In this long range the angle of the slope was from 7° to 18°. Yet the whole icy crust of this portion of the continent was always advancing and stretching itself out into the western bay, where masses of it were constantly detached and floated off as icebergs. From this glacier to the southern extremity of Greenland, more than 1,200 m., Dr. Kane imagined a deep unbroken sea of ice might extend along the central portions nearly the whole length of the continent.—The study of the geology of California had enabled Prof. Whitney to point out the traces of immense glaciers which at a time geologically recent had existed in the mountains of the Sierra Nevada. The alteration of the climate and the diminution of the rainfall consequent upon comparatively recent geological changes, have however caused the disappearance of the greater part of these, and it was not till 1870 that Mr. Clarence King discovered actual glaciers on
the N. side of the extinct volcano of Mt. Shasta in northern California. From the summit, 14,440 ft. above the sea, according to him, we look down on three considerable glaciers. One of these has a breadth of three or four miles, and sends branches four or five miles down the canions. Its thickness is estimated in places to be 1,800 ft. or more, and its surface presents great crevasses, some of them 2,000 ft. long, and 80 or 40 ft. wide. Mr. S. F. Emmons has also found glaciers on Mt. Rainier or Tahoma in Washington territory, and Mr. Arnold Hague on Mt. Hood in Oregon; while more recently Mr. John Muir has succeeded in finding small glaciers much further southward in the sierras near the Yosemite valley on Mts. Lyell, McClure, and Hoffmann. They have the structure and movement of true glaciers, but the largest is not more than a mile in length, and they vary in breadth from half a mile to a few feet.—The phenomenon of glaciers reaching the sea and becoming icebergs was noticed by Darwin in the gulf of Pellas, Patagonia. In northern Europe, it has been observed in Norway, in lat. 67° N., and in America on the W. coast of Greenland. Upon the Himalaya mountains the glaciers appear from the accounts of modern travellers to be exhibited in masses of stupendous height, as well as of vast extent. In the "Himalayan Journals" of Dr. Joseph Hooker, those of the eastern portion of the range, in the territories of Sikkm and Nepaul, are described in detail, and mention is made of one which presents a vertical height of 14,000 ft., the source of which is the great Khinchinjunga, whose summit reaches the elevation of 25,000 ft. above the sea. Other gigantic glaciers in the central Himalaya are described by Dr. Thomas Thomson ("Western Himalaya and Tibet"), and by Col. Madden and Capt. Richard Strachey, in the "Asiatic Researches," vol. xiv. Iceland, Spitzbergen, the Caucausa, and the Altai have their glaciers, which have been described by travellers; but no regions have afforded such convenient opportunities for studying them in detail as the Alps of Switzerland, Savoy, Piedmont, and Tyrol. Here, in the heart of Europe, they are found covering in detached portions an aggregate area computed at 1,484 sq. m. Between Mont Blanc and the borders of Tyrol 400 are reckoned, of which the greater number are between 10 and 20 m. long, and from 1 to 2½ m. broad. Their vertical thickness in many places is rated at 600 ft.; their range is from above the snow line, which is from 7,500 to 8,000 ft. above the sea, down to the level of 8,500 to 8,000 ft. Lateral ravines have their glaciers, which join as branches the ice currents of the great valleys. This interesting region was studied by De Sausmarez in the latter portion of the last century, and his views were published in his Voyages dans les Alpes (1796). Charpentier is distinguished among later explorers as the able advocate of the theory explaining the motion of the glaciers, afterward sustained by Agassiz in his Études sur les glaciers (1840); and Prof. James D. Forbes of Edinburgh published in 1848 his "Travels in the Alpes," &c., with observations on the phenomena of glaciers made in visits to them repeated in ten different summers, in which he crossed the principal chain 27 times by 23 different passes. Many other distinguished naturalists have aided not only to develop the true nature of glaciers, but to apply their phenomena to the explanation of past changes upon the earth's surface.—Spread over the broad valleys, glaciers appear immovable. The snow disappears from their face in summer, and thousands of streams are then produced, which waste their material; but with the return of winter the covering of snow is renewed, and no change may be perceived in the great mass except such as can be referred to these superficial causes. But by comparative observations made at different times, it is perceived that the great mass itself moves. The constant renewal of the waste at the lower extremity, already referred to, is one evidence of this. Objects on the surface, too, are found to be continually moving down, even when their position on the ice itself is not changed. From the high precipices at the sides masses of rock and stone fall along the edges of the glacier, but it is obvious that they do not remain there in an immovable talus; for where one glacier opens into another the piles of stones next the fork do not terminate as they join at this point, but are continued in a long mound of the same varieties of stone far down the glacier; and other branches come in, each adds its new mound, till sometimes as many as six parallel ridges are thus produced. These may come in contact below, and thus be reduced in number, and even be blended with the piles at the edges. In some form, however, the mounds continue to the foot of the glacier; and there ridges of bowlder-shaped stones and gravel are seen, which lie in front of the glacier, and are sometimes repeated in nearly parallel lines like the little ridges of sand and drift material along a sea beach, each one of which marks the limit of some previous high tide. So these great ridges of sand and stones, called moraines or borders, mark the limits reached by the foot of the glacier at former times; and as the tide marks are all removed when a high-couse tide again sweeps far up the breach, so the ridges at certain periods are observed to move on before the advancing glacier, and mix together in a new and larger moraine at a greater distance from the mountains. It is in these periods that the habitable valleys of Switzerland are sometimes invaded by the terrible ice wall. Imperceptibly but irresistibly it is found advancing upon the farms and cottages. The warm summer weather is obviously hastening its dissolution, yet its dimensions do not sensibly diminish. The green forests slowly disappear before it; and the growing wheat almost feels its icy touch, before the soil is lifted by its ruthless ploughshares. When, after such an
GLACIER

advance, the glacier recedes to its former bounds, the surface it covered is found to be changed into a dismal waste of loose stones. The gathering and distribution of these materials by action of glaciers have been subjects of special interest, from the resemblance in most of the phenomena exhibited to those connected with the distribution of the geological formation known as the drift. The loose rocks are worn into the rounded forms of bowl-
der, and are similarly stratified and grooved upon their surface, and sometimes polished. The rocks upon and against which the glaciers have pressed are found, wherever exposed to view, to be ground smooth and deeply marked with lines corresponding in direction with the course of the glacier at the spot. It is upon these resemblances, and others connected with minor details of the two classes of phenomena, that the glacial theory of Venezia and Charpentier, so fully elaborated by Agassiz, is based. Accounts for the distribution of geological formations like the drift. The transporting power of glaciers was recognized by Prof. Playfair of Edinburgh as far back as the year 1816, and the occurrence of the enormous bowlers on the Jura was attributed by him to glaciers, whose track he supposed lay at one time across the valley of Switzerland and the lake of Geneva, which now separate the Jura from the opposite summits of Mont Blanc. It is on these summits, at the distance of from 70 to 80 m., that are found the ledges of granite and other rocks, which are recognized as identical with the great bowlers scattered over the surface of the Jura limestone. (See Dr.-luvum.)—The quantity of stony material, and the enormous size of the masses of rock carried along by glaciers, are little appreciated, even by many who have seen the loads apparently resting quietly on their surface. Sometimes the ice is almost concealed by the accumulated piles of stone. These do not sink into the ice, except as they occasionally fall into the chasms, and even then they are sometimes brought again to the surface by the action of the forces which keep most of them there. As the rock protects the ice beneath it from the action of the sun, which has its melting effect around, the rock is thus gradually lifted upon a pedestal of ice, at the same time that the whole is slowly moving down to a lower level. When the pedestal at last gives way, the rock slips down and the process is repeated. When once in the ice, the superficial melting may bring it again to the surface. The size of the fragments is often immense. Prof. Forbes saw one in the valley which must have been brought down by the glacier, which was nearly 100 ft. long, and from 40 to 50 high; and at the foot of the glacier of Swartzburg in the valley of Saas was another estimated to contain 244,000 cubic feet, requiring an average diameter of nearly 63 ft.—The rate of progress of glaciers, dependent upon various conditions, is no more uniform than that of rivers. It can in no case be correctly estimated except by observations extending over many years. On the glacier of Asr M. Hugi erected a hut in 1827 at the foot of a fixed and well known rock. In 1836 the hut was 2,300 ft. from the rock, and in 1840 this distance had doubled. In the first period its progress had been 250 ft. per annum, and in the second 550. Forbes in 1843 found the remains of a ladder, which, it is believed, was the one left by De Sansour in 1768 at a point 16,500 ft. further up the glacier; if so, its yearly progress had been 375 ft. This movement extends through valleys in which the surface of the glacier appears to lie almost on a dead level. It is made manifest day by day by a row of stakes set up in a straight line across the glacier, and ranging with fixed points on the land at the sides. These are after a time observed to stand upon a semicircular line, the stakes near the middle moving faster than those near the margin. The importance of correctly estimating the rate of movement at short intervals and in different parts of a glacier, in order to determine the nature of the motion, appears to have been first appreciated by Agassiz in 1841, and by Forbes, who was engaged about the same time in his explorations. Agassiz discovered that the central portion moved faster than the marginal, and he was the first to correct the erroneous views into which he had been led by others on this point, from the fact of the great cracks generally lying in curved lines with the convexity directed up the course of the glacier. (Systéme glaciaire, by Agassiz, Guyot, and Desor, p. 469.) The upward convexity of the fissures is accounted for by the fact that, if the central portion moves fastest, the lines of greatest tension are downward and toward the middle, and the ice gives way at right angles to these lines. Forbes, by careful instrumental observations in 1842, detected the rate of movement in periods of 24 hours, and was able even to notice that which took place in an hour and a half. He proved the faster rate of the central portions, and also that the portions of the glacier near the surface moved faster than those near the bottom. The motion he found was greatest on the slopes of greatest descent; in warm weather more rapid than in cold; yet always continuous, and not exhibited in the manner of jerks. Such facts are opposed to the theory of De Sansour, that the glaciers move by slipping along upon their bed, the motion being made more easy by the buoyant property of the water flowing beneath them, and the propelling force being that of gravitation. Moreover, the ice, without being broken up, was observed not to be interrupted in its movement by the contracted passages through which it was sometimes forced to pass, nor by solid hills of rock, which lay like islands in its path. The theory maintained by Charpentier, and supported by Agassiz in his Études sur les glaciers, was that the glacier slid upon its bed, not necessarily in large bodies pushed on by gravitation, but that different
portions were impelled by different degrees of force, arising from the expansion of the water congealing in all the fissures and capillary tubes of the ice into which it found its way. The facts developed by Forbes—that the motion was greatest in the warm summer weather, when the temperature did not descend below the freezing point, and that it did not cease when the ice was no longer liquefied in the cold of winter—demanded some new explanation. With the other phenomena they were regarded by him as sufficient to establish the fact that ice in large bodies is not a brittle solid, but that it possesses, particularly when saturated with water, so much plasticity, that with time it can yield to a stupendous and steadily exerted force, and move somewhat like a body of viscous pitch or lava, which, while it appears brittle when suddenly struck, can yet mould itself in the mass to the surface upon which it rests. By this theory, which was generally received even by those who first opposed it, all the difficulties attending the explanation of the movement disappear. It was confirmed by a simple experiment made by Mr. Christie, secretary to the royal society. He filed with water a 10-inch hollow shell of iron, the shell itself being besides 1½ in. thick, and exposed this to severe cold. As the water expanded in freezing, a cylinder of ice was pushed up through the fuse hole, and it continued to increase in length as the water continued to freeze. As the outer portions of the water must have been first converted into ice, it is plain that it was this so-called solid material which was forced through the narrow aperture and made to assume the form of a cylinder of its diameter. But the peculiar nature of this quality of mobility belonging to ice has been more perfectly explained, together with some of the other phenomena of glaciers, by the researches of Tyndall and Huxley, an account of which is published in the "Philosophical Magazine," vol. xv. (4th series), 1868. The property of passing of ice when exposed to higher temperatures than the freezing point to adhere, and under pressure to unite in one mass, was observed by Faraday, and was afterward made the subject of various experiments by Tyndall and Huxley. They found that compact transparent ice might be crushed to fragments, and these be made by a hydraulic press to assume in a few seconds the shape of any mould, recovering in their new form perfect solidity and transparency. A straight bar of ice was bent into a semicircular form by using a succession of four moulds of gradually increasing curvature. As the prism conformed itself to these, cracks were produced, and crackling sounds were emitted, reminding one of those which are so often noticed among the phenomena of glaciers. By reference to this before unobserved property of ice the movement and uneven freezing point, gashes and valleys are now explained. The glaciers from their very source present a series of changes of structure, which have been critically observed and traced, and in some instances illustrated and explained by experiments on a small scale with other materials. The snowy region known by the French term neige is formed of dry and granular snow, which extends for miles, sometimes broken by immense chasms, and at others presenting no irregularities of surface such as are common to the glacier below, no streams, crevices, moraines, or cones. The snow lies in strata, which reach to great depth, each representing the accumulation of a single year, the lowest the most dense and approaching the blue color of ice. These bodies move onward to form the glacier proper; and as they pass into this, their material assumes more and more the character of compact ice. But a remarkable and peculiar feature is the veined or laminated structure, real or only apparent, which it assumes. This is noticed in the walls of the fissures, and is also displayed upon the surface of the glacier itself, when this has been wasted by rain. Thin laminae of transparent blue ice alternate with others of white porous ice, and standing together in a vertical position the edges of the former project a little above those of the latter, which more readily melt, and thus a ribbed appearance is produced. The direction of the lamination is across the fissures, and as observed by Tyndall and Huxley these are produced at right angles to the direction of greatest tension. They find an analogy between the lamination of the ice and the striated cleavage of the clays and slates, both which they refer to pressure causing the development of divisional planes in lines approximately at right angles to the direction of pressure. Hence the obliquity of the lamination to the sides of the glacier as the lines extend from the margin toward the middle and down its course; and the deviation directly across the glacier, or at right angles with this and parallel with its axis, as the form of its bed or other causes produce a pressure in the one case exerted longitudinally and in the other laterally with the line of the glacier. By submitting plastic materials, as wax, to pressure, and observing the laminated structure these assumed, these investigators were led to this explanation of the phenomenon as developed in glacier ice; but others, as Prof. Forbes, describe the white ice as produced merely by lines of cavities or of air bubbles in the blue ice itself, the result, according to the observation of Prof. James Thomson, of partial liquefaction induced by pressure; and Prof. William Thomson attempts to prove "that the first effect of pressure not equal in all directions on a mass of snow ought to be, according to the theory, to convert it into a stratified mass of layers of alternately clear and vesicular ice, perpendicular to the direction of maximum pressure." But the most interesting hypothesis will require experimental researches upon ice which have not yet been made.—Another in-
teresting feature in the appearance of glaciers, to which attention was first directed by Forbes, is the distribution of what he called the dirt bands, discolored streaks seen upon the surface, which he supposed were connected with the veined structure, appearing where this is more energetically developed than elsewhere, and caused by the collection of sand and dirt in the decomposed portions of the softer laminae. These are arranged in curves, the convexity of which is turned down the glacier, and are frequently so obscure that they are distinguished only by looking down upon them from some elevation. Tyndall and Huxley describe them as spread out upon the smooth ice below ice cascades, and caused a similar symmetrical arrangement of dark-colored sand distributed upon the surface of a current of fine mud, which they made to flow from a reservoir down an inclined trough, through a narrow channel, which spread out below over a widened area. Various other phenomena connected with the structure and motion of glaciers are discussed in the treatise, on this subject already referred to. Besides the works mentioned, see "Norway and its Glaciers" (1856), and "On the Theory of Glaciers" (1856), by James D. Forbes; Die Gletscher der Jütlande, by A. Mousson (1854); Neue Untersuchungen über die physikalische Geographie und die Geologie der Alpen, by the brothers Schlichtweits (1854); "The Glaciers of the Alps," by John Tyndall (1860); "The Old Glaciers of North Wales and Switzerland," by A. C. Ramsay (1860); and "The Land of Desolation," by Dr. Isaac J. Hayes (1871).

GLADBACH, the name of two towns of Prussia, in the province of the Rhine. I. MACHIA-Glädach, in the district and 16 m. W. by S. of the city of Düsseldorf; pop. in 1871, 26,958 (agains 4,990 in 1863). It is one of the chief seats of the industry of Rhenish Prussia, having numerous manufactories of cotton, linen, and silk goods, tobacco, machines, and wire, and a number of bleaching grounds. Formerly there was here a celebrated Benedictine abbey, which was founded in 972 by Archbishop Gero of Cologne. II. Bergisch-Gladdbach, in the district and 8 m. N. E. of the city of Cologne; pop. in 1871, 6,195. It contains manufactories of paper and percussion caps. In its vicinity is the village of Bennberg, with a castle built in 1710, and now converted by the Prussian government into a military academy.

GLADIATORS (Lat. gladius, a sword), in Roman antiquity, men who fought with each other or with wild animals at the public games, for the entertainment of spectators. They were originally captives, slaves, or condemned criminals; but under the republic free-born citizens, slaved by foreign enterprise, gladiators, and even women, fought in the arena. Those who were malefactors were divided into two classes: those condemned ad gladium, to be killed within a year, and ad ludum, who were discharged if they survived three years. Professional gladiators were trained in schools at Rome, Capua, and Ravenna, by overseers (laniatores), who either purchased and maintained them to let them out for public exhibitions, or only trained them for their owners. Gladii and Milo employed gladiators as a political force in their struggle; Caesar had 5,000 of them at Capua, who were not overlooked by Pompey. They were taught the postures to be assumed in falling and in dy- ing, and such food was chosen as would thick- en their blood in order to give the spectators a more leisurely view of their death. The public combat between gladiators began with weap- ons of wood, which were soon exchanged for deadly arms. Usually they were matched by pairs. According to their arms or modes of fighting, gladiators were divided into numerous classes. The andabatae fought blindfolded, the catenarii in troops, the cesarei in chariote, the equites on horseback, the hoplonomachii in full armor, the laquearii with the laso, the mir- milliones with the weapons of the ancient Gauls, the Samnites with those of the people of Sam- nium, the Thraci with a dagger and round buckler. The retiarii were lightly equipped, and fought by throwing a net laso-fashion over the head of their antagonist, and then dispatching him with a three-pointed lance or trident. If a combatant was vanquished, but not killed, his fate depended on the people, who turned their thumbs down if they wished him to be spared. A man who had once been a gladiator was always regarded as disgraced, and, if a knight, could not resume his rank. Gladiatorial contests were first exhibited at Rome in 264 B. C., as an entertainment at funerals, and they continued till the reign of Honorius (A. D. 404), when Telemachus, a Christian monk, rushed between two opposing gladiators at Rome, and by his self-sacrifice occasioned the decree for their abolition. The passion for them had risen to its height under the emperors. Titus ordained a combat of 100 days, and Trajan one of 128 days, in which 10,000 gladiators fought, and 11,000 fierce animals were killed. Rome was imperilled about 72 B. C. by a rebellion of gladiators. (See SPARTACUS.)

GLADIOLUS (Lat. gladius, a sword), a genus of ornamental plants of the iridaceæ or iris family. A flattened solid bulb or corm sends up a stem bearing several long, sword-shaped, strongly nerved leaves, and terminating in a spike of large and usually showy flowers, which are somewhat irregular from the difference in the size of the petals, and more or less two- lipped. Sword lily and corn flag are names sometimes applied to these plants, but they are generally called by their botanical name gladi- olus. There are both hardy and tender species. The hardy ones are planted in autumn at the same time with hysciths, tulips, &c.; the principal ones cultivated are G. communis, from Europe, which has been longer in the gardens than any other, and bears a few rose-colored, sometimes white flowers, and G. Byzantinus,
from the Levant, which has larger and more showy purple flowers. Among the tender species which are grown in pots in winter, or planted in the open ground in spring, are *G. cardinalis*, *G. blandus*, and *G. psittacinus*, from the Cape of Good Hope. The most popular and brilliant of these plants are hybrids from these and probably others; they originated in the garden of the duke of Aremberg, a noted amateur of Ghent; and as their characters are permanent and they are fertile among themselves, these hybrids have received the garden name of *gladiolus Gandavensis*. In size, beauty of form, and variety of coloring of the flower, these hybrids far excel any of the species, and they are constantly improving in these respects; new seedlings of merit are each year raised both in Europe and America, and the catalogues now offer named varieties in hundreds. The colors range from pure white through rose to crimson, scarlet, and violet; some have yellow as the predominating color, and there are various intermediate shades of salmon, chamois, and others; besides self-colored flowers, there are those variously striped, blazed, and shaded in the most brilliant and pleasing combinations. The cultivation is very easy, as they will grow in any light, rich garden soil; the bulbs are planted in spring, and, if a succession of flowers is desired, at intervals from March until May; they are set 2 or 3 in. deep, and 10 to 12 in. apart each way, and need no other care than to be kept clear of weeds, and to have such stalks as need it tied to sticks. A very effective plan is to plant the bulbs where the flowers will be seen against a background of evergreens; they may also be introduced among rhododendrons, azaleas, and other spring-flowering shrubs. In autumn when the stalks are dead the bulbs are taken up, labelled, wrapped in paper, and kept in a dry place, where they will not freeze, until spring.

The number of bulbs annually produced varies from one to several, according to the variety. At the base of the bulbs there will usually be found numerous bulblets, the size of a pea or smaller; planted the next spring, these make flowering bulbs in two years. New varieties are obtained from the seed; these produce flowers the third or fourth year after sowing.

**Gladstone, William Ewart**, a British statesman, born in Liverpool, Dec. 29, 1809. He is the fourth son of Sir John Gladstone, a wealthy merchant, who relinquished a small business in Glasgow about 1786, and removed to Liverpool, where he acquired a large fortune in the West India trade, and was created a baronet in 1846. The son was sent to Eton, and while there gave full promise of the special brilliancy which marked his course at Oxford, where he graduated at Christ Church in 1831, as double first class, the highest honor, and one rarely attained, and became a Fellow of All Souls. After travelling for a short period, he entered parliament in December, 1832, as member for Newark, a nomination borough belonging to the duke of Newcastle, which he continued to represent till 1846. In December, 1834, he was appointed by Sir Robert Peel a junior lord of the treasury, and in 1835 under secretary for colonial affairs, which office he filled for only two months, when the ministry was overthrown. He continued a useful and active as well as brilliant member of the opposition party led by Sir Robert Peel until that statesman’s return to power in 1841, when he was sworn a member of the privy council and appointed vice president of the board of trade and master of the mint. In this position he explained and defended in parliament the commercial policy of the government, and the revision of the British tariff in 1843 was almost entirely his work. He was a constant contributor to the “Quarterly Review,” chiefly on literary and ecclesiastical subjects. He also published in 1838 a work on church and state, in which he maintained extreme high-church views, and which was severely criticised by Macaulay in the “Edinburgh Review.” In May, 1843, he succeeded Lord Ripon as president of the board of trade, but in February, 1845, he resigned his offices on the introduction of the measure for the increase of the Maynooth grant, which was directly opposed in principle to the opinions he had expressed in his work on church and state. In November, 1845, Sir Robert Peel resigned, but, on the failure of Lord John Russell to form a government, he was recalled and reconstructed his cabinet. Mr. Gladstone becoming secretary for the colonies. In the free-trade measure announced by Sir Robert Peel in January, 1846, Mr. Gladstone fully concurred; but being unwilling to remain under obligations to the duke of Newcastle, he resigned his seat for Newark, and was out of parliament during the debates on this measure. At the general election of 1847 he was chosen to represent the university.
of Oxford, and one of his first speeches in parliament was in favor of the bill for the removal of the disabilities of the Jews, which he had opposed in 1841. His speech against the foreign policy of Lord Palmerston in the Don Pacifico debates was generally regarded as one of the most admirable pieces of English eloquence of recent times. In the ministerial crisis of 1852 he was invited by Lord Derby to enter his cabinet, but declined, and on the overthrow of that minister in December of the same year accepted the office of chancellor of the exchequer under the earl of Aberdeen. While holding this office he introduced in 1858 his celebrated budget in a remarkable series of addresses which were pronounced by Lord John Russell "to contain the ablest expositions of the true principles of finance ever delivered by an English statesman." On the resignation of Lord Aberdeen in February, 1855, and the elevation of Lord Palmerston to the premiership, Mr. Gladstone retained his office of chancellor of the exchequer; but he soon resigned, together with the other Peelite members of the government, in consequence of Lord Palmerston's refusing to oppose a motion of inquiry into the conduct of the Crimean war, which was considered indirectly to convey a censure on the duke of Newcastle and Mr. Sidney Herbert. On the overthrow of Lord Palmerston's government and the second accession of Lord Derby to power in 1858, Mr. Gladstone again declined the pressing overtures of that nobleman, but in November accepted an appointment as lord high commissioner extraordinary to the Ionian islands. In 1859, on Lord Palmerston's return to office, Mr. Gladstone again became chancellor of the exchequer. He was chiefly instrumental in procuring the repeal of the duty on paper, and the ratification of the commercial treaty between England and France, negotiated by Mr. Cobden and M. Chevalier. From this time Mr. Gladstone has been classed as an advanced liberal. He also during the few succeeding years exhibited a theoretical knowledge and a practical skill in the management of the national finances that excited the admiration of all Europe. At the general election of 1866 he was rejected by the university of Oxford, but was returned for South Lancashire. After the death of Lord Palmerston in the same year, Mr. Gladstone became the leader of the house of commons. He procured the adoption of the measures recommended by the ministry for the suppression of the Fenian disturbances in Ireland, but a reform bill introduced by him on behalf of the ministry was defeated, and he and his colleagues resigned, and were succeeded by one formed by Lord Derby and Mr. Disraeli, July 6, 1866. In the early part of the session of 1868 Mr. Gladstone introduced a series of resolutions in favor of the disestablishment and disendowment of the Irish church. Soon after a bill for effecting this object was passed by the commons, but rejected by the peers. In the general election of that year Mr. Gladstone was defeated as a candidate for Southwest Lancashire after an exciting contest, but was returned by a large majority by the borough of Greenwich. Mr. Disraeli's ministry resigned in December, and Mr. Gladstone succeeded him as premier. The Irish church bill was passed at the session of 1869, the Irish land act in 1870, and the purchase of commissions in the army was abolished in 1871 by the exercise of the royal prerogative. He also procured the abolition of confiscation in English penal law. During the war between France and Germany the English government, under the lead of Mr. Gladstone, maintained a complete neutrality, and in order to avoid all complications with the great powers of the continent reluctantly consented to the abrogation of those provisos of the treaty of 1856 with Russia which established the neutrality of the Black sea. Under his administration the treaty of Washington, by which the matters in dispute between the United States and Great Britain were settled, was negotiated and carried into effect. At the session of 1873 Mr. Gladstone introduced an elaborate bill for the reform of university education in Ireland, the main object of which was the establishment of a system which should be acceptable to both Protestants and Catholics. The discussion in the house of commons made it clear that the bill satisfied neither, and it was defeated. Mr. Gladstone and his colleagues immediately resigned. The queen called upon Mr. Disraeli to form a new ministry, but after some days he announced to the house that he was unable, and if not unable unwilling, to do so, and declared that he did not regard the defeat of the university bill as exhibiting such a want of confidence in the general conduct of the government as required the resignation of the ministry. Mr. Gladstone and his colleagues accordingly returned to their posts; but repeated defeats of the ministry followed, and on Jan. 24, 1874, Gladstone unexpectedly issued an address announcing the dissolution of parliament, assigning as a reason for the step that the government felt its power was ebbing. He promised a diminution of local taxation and the abolition of the income tax. The succeeding elections for a new parliament resulted in the return of 851 conservatives and 802 liberals, a conservative majority of 49, against a liberal majority of 118 in that of 1868. Mr. Gladstone himself was returned from Greenwich by a vote of 5,968, against 6,586 in 1868. On Feb. 17 he resigned, and on the following day Mr. Disraeli accepted the premiership. — Mr. Gladstone's published works are: "The State in its Relations with the Church" (2 vols., 1838); "Church Principles Considered" (1840); "Studies on Homer and the Homeric Age" (3 vols., Oxford, 1868); "Essays on Oeoe Homo," and a pamphlet on the Irish church question, entitled "A Chapter of Autobiography" (1869); and "Juventus Mundi; the Gods and Men of the Heroic Age" (1899). He was
supervised a translation of Farini’s *State Romana* (4 vols., London, 1859). In 1851 he published a “Letter to Lord Aberdeen” on the cruelties inflicted on the political prisoners confined in the dungeons of Naples, which produced a universal and very deep impression. His statue, by Adams Acton, was unveiled in Liverpool on Sept. 11, 1870.

GLADWIN, an E. county of Michigan, intersected by Tittibawsee river; area, 570 sq. m.; returned without population in 1870. Its surface is uneven, and its soil consists of a sandy loam.

GLAGOLITIC, one of the two ancient Slovenic, or less correctly Slavonic, forms of writing. The name is derived from the fourth letter, *glagol*, equivalent to our hard *g*; it is also known as the Bukvitza, from *bukea*, letter, or from the names of the second and third letters, *b* and *s*; or, *b* and *c*. Its formation is attributed to some of the St. Jerome, and by others to Methodius, the apostle of Pannonia and Great Moravia (about 860). The shape of the 89 letters (of which 27 are also numeral signs) is very grotesque and protetan, little resembling the Greek. The Glagolitza was used in Illyria, Dalmatia, and Bulgaria. The other form of Slovenic writing is the Kyrillite, contrived by Cyril, the reputed brother of Methodius, many letters of which are like the Coptic, because they imitate the Greek forms. This consisted originally of 40 letters, and is still in use among the eastern Slavs and the Romanians. The Russian *aebuka* or *budkar* (alphabet) is a slight modification of the latter. These systems have been much extolled by some authors; but, though representing all the sounds of the languages, they are imperfect, inasmuch as they contain single signs for complex sounds, such as *e*, *et*, *stik*, *ge*, *yt*. The nations that employ these graphic systems belong mostly to the Greek church; while the Catholic Slavs (Poles, Bohemians, Slovaks, Lusatians, &c.) make use of the Latin or the so-called German letters, with some modifications. The most remarkable works in Glagolitic writing are: *Glagolitica Cesioniana*, by Count Paris Cloz of Trems in the 11th century, edited by Kopitar (Vienna, 1884); *Codex Asomannianus, continens Lectiones Evangelicas, Bibliotheca Vaticanum, in A. Mai’s Scriptorum Veterum Nova Collectio*; and *Codex continens Psalmos, cum Espositio Sancti Athanasii, &c.* at Bologna. All these are in the Bulgarian idiom; *Brevisarium* (edited by Brodzich, Vienna, 1861) is in Servian.

GLAIRÉ, Jean Baptiste, a French theologian and orientalist, born in Bordeaux, April 1, 1798. He completed his theological studies at St. Sulpice seminary, Paris, and afterward studied the oriental languages. Taking holy orders in 1822, he taught Hebrew in his seminary, and in 1825 he succeeded Chamae de Lanzae as professor of Hebrew at the Sorbonne. In 1841 he was made dean of the faculty of theology, and in 1849 was transferred to the chair of exegesis. In 1840 he became a canon of the metropolitan chapter of Paris, and in 1851 vicar general of Bordeaux. His most important works are: *Lexicon Manuale Hebraicum et Chaldaeicum* (1850; new ed., considerably enlarged and improved, 1843); *Principes de grammaire hébraïque et chaldéique* (1833; new eds., 1836 and 1843, with a *Chrestomathie chaldéaque et hébraïque*); *La sainte Bible en Lat et en Français*, with notes, explanations, &c. (3 vols., 1800; 1804); *Torath Mishné, Le Pentateuque*, with a French translation and notes, of which the first two parts only have been published, *Genesis et Exodus* (3 vols., 1806, 1808–7); *Introduction historique et critique aux livres de l’Ancien et du Nouveau Testament* (6 vols., 12mo, 1856), an abridgment of which appeared in 1854 (1 vol., 8vo); *Manuel de l’hébraïen*, containing a grammar, a chrestomathy or choice pieces, and a lexicon (1806); *Principes de grammaire arabe du Coran; Principes de grammaire arabe* (1857–61); *La Bible selon la Vulgate, translation and notes* (1863); and *Dictionnaire universel des sciences éloïstiques* (3 vols., 1867).

GLAISER, Alexandre, a French politician, born at Quintin, Côtes-du-Nord, March 9, 1800, died Nov. 7, 1877. He acquired prominence as an opposition member of the chamber under Louis Philippe. After the revolution of 1848 he was elected to the constituent assembly, but owing to his hostility to Louis Napoleon soon withdrew from political life. In 1863, however, he again became conspicuous as a representative by his incessant and eccentric interruption of the debates, and by almost invariably opposing the measures of the government. In the elections of 1869 he was defeated in his native department, but was returned in one of the metropolitan districts. On Sept. 4, 1870, he became a member of the government of national defence without portfolio, and subsequently represented it with Crémieux at Tours. The charges of embezzlement brought against him by the press he strenuously denied, declaring he had sacrificed his fortune in the public service. He was imprisoned by the commune in May. He wrote several plays, and in 1866 became director of a democratic weekly journal, *La Tribune française*.

GLASHEE, James, a British meteorologist, born about 1800. He early became conspicuous as an aëronaut, and subsequently as a meteorologist. In one of his balloon ascensions, Sept. 5, 1832, he reached the height of 87,000 feet. (See *Aëronautics*). He was elected fellow of the royal society in 1849; succeeded in 1865 Admiral Fitzroy as president of the meteorological department of the board of trade; and was one of the founders of the meteorological society, and, excepting the period during which he was its president, acted as secretary till 1878, when he resigned. He has published “Travels in the Air” (London, 1870), a popular account of balloon voyages and adventures.

GLAIZE, Auguste Barthélemy and Pierre Paul. See supplement.
GLANOMERSHIRE, a S. county of Wales, bordering on Caernarvonshire, Brecknockshire, Monmouthshire, the Severn, and Bristol channel; area, 856 sq. m.; pop. in 1871, 396,010. The northern portion is mountainous, but the southern is level and fertile. The principal crops are wheat, barley, oats, beans, peas, vetches, and turnips. The horned cattle are of superior quality, and in the mountain districts great numbers of sheep and ponies are reared. Glamorganshire is famous for its coal and iron mines. In the neighborhood of Merthyr-Tydvi the iron works are on a gigantic scale; within a small circuit are more than 60 blast furnaces, some of which have 6,000 workmen. Vast quantities of coal and iron are annually exported from Cardiff. This county has also some woolen manufactories, and numerous canals and railways. The principal rivers are the Rhyneyn, the Taff, and the Tawe. The chief towns are Cardiff, the capital, Merthyr-Tydvi, Swansea, and Neath.

GLAND (L. glana, an acorn), in anatomy, the general name of a variety of organs whose functions are to elaborate the various products of secretion from the blood, to perform certain offices connected with absorption and assimilation, and to assist in preparing and maintaining the circulating fluid in a normal condition. Of the first class of glands the liver and the salivary glands are examples, of the second the mesenteric and lymphatic glands, and of the third the spleen. The true secreting glands are of various form, size, and structure, but are all constructed with special reference to the arrangement of the nucleated and epithelial cells and tubes or cavities which enter into their texture; their products are poured forth either on the outer surface of the body, or into some cavity or canal communicating externally, and the cells which effect the separation of their special secretions from the blood are generally in the relation of epithelial cells to the inversions of the skin or mucous membranes that form the greater part of their follicles or tubuli. These cells generally minister to the act of secretion by absorbing from the blood its watery and saline ingredients, which they afterward exhale in the requisite proportions, and by generating at the same time a peculiar ingredient by their own powers of assimilation; thus producing a secreted fluid different in composition from the blood from which it was derived. The great majority of glands provided with ducts may be divided into three groups, according to the modes in which the cell-containing tubes are arranged: 1, the simple tubular glands, like the follicles of the stomach and intestines, which seem to be mere depressions in the mucous membrane, or more closely lined with secreting cells; 2, the aggregated or conglomerate glands, in which a number of follicles are grouped into lobules, and these again into lobes joined by loose areolar tissue, like the salivary, mammary, pancreatic, prostate, and lachrymal glands, and also the liver; 3, the convoluted tubular glands, as the respiratory and sebaceous glands ending in dilatations, cul-de-sacs, or loops. In all a large extent of secreting surface is packed in a small compass; while one end of the gland and duct opens on a free surface, the opposite end is closed, and has no direct communication with blood vessels or other canals. The glandular organs have been divided into two classes, according as their product is excrementitious and to be cast off, or to be used within the system; the former are called more properly excretory glands, and include the kidneys, and those which supply the cutaneous and pulmonary transpiration and the peculiar fecal matters of the lower part of the intestinal canal; the true secretory glands are the gastric, salivary, mammary, sebaceous, mucous, lachrymal, Brunner's, and the pancreas. The kidneys, liver, mammary glands (secreting respectively urine, bile, and milk), and the pancreas are described under their proper titles; the salivary and gastric glands are noticed under DIOSESION; the sebaceous, ceruminous, odoriferous, and sudoriparous glands (secreting the oily, waxy, odorous, and respiratory matters of the surface), are treated in the article SKIN; the follicles of Lieberkühn (in the small intestine), Brunner's glands in the duodenum, and the solitary glands most numerous in the
cesal region, under Intestines; the lacrimal glands under Eye; and the so-called glands of Pacchioli and the pinnae body or gland are allied to in the article Brain. The air passages of the chest and head, the alimentary canal above the stomach, and the genito-urinary apparatus, are provided with solitary and aggregated glands and follicles for the secretion of their lubricating mucus; the tonsils are glandular masses principally, and there are numerous follicles in the posterior fauces, and in the neighborhood of the epiplottis and entrance to the larynx, whose diseased secretions and ulceration constitute the kind of folliculitis popularly called "clergyman's sore throat."—Another system is that of the vascular or ductless glands, which possess all the elements of glandular structure, except the efferent ducts; restoring therefore to the blood whatever they take from it, it is generally admitted that they perform some part in the process of sanguification, probably acting upon such nutrient materials as are taken up directly by the blood vessels without in the first instance passing through the absorbents. These glands are the spleen on the left side of the abdominal cavity; the thymus gland, a fetal organ in the anterior mediastinum; the thyroid body, on the anterior portion of the neck; and the supra-renal capsules, surmounting the kidneys; these will be described in their alphabetical order. They are composed of vesicles or sacculi, simple and closed, or branched, of a delicate membrane surrounded with a vascular plexus, and filled with an albuminous fluid containing fat granules and nucleated cells. The opinion that these glands serve for the higher organization of the blood materials is supported by the fact that they are especially large and active during fetal life and childhood, when the most abundant supply of nutrient fluids is necessary. They are not essential to life in the adult; the thymus entirely disappears, the thyroid may be completely disorganized, and the spleen be removed (as has been often done in animals), without fatal consequences; the supra-renal capsules seem to be connected with the production of pigment, and their morbid condition or atrophy is connected with the peculiar disease known as "bronzed skin."—The last group includes the absorbent glands, the patches of Peyer, the mesenteric, and the lymphatic glands. The lachrymal and the fluid they convey have been described under Absorption and Chyle. Peyer's glands, most numerous toward the ileo-colic valve, are intimately connected with the lachrymal, whether single or in clusters, they are always in that portion of the intestine which is opposite the mesentery; they are capsules, containing fatty and albuminous materials, the most adherent and fibrous, all apparently undergoing rapid changes; the exterior and interior of the capsules are freely supplied with blood. In the mesentery are the mesenteric glands, which bear the same relation to the lachrymal glands to the lymphatic; each gland is enclosed by a fibrous sheath, which forms by its partitions an internal supporting framework; the intervening areolar cells are filled with a grayish pulp, as in Peyer's patches, penetrated by a fine capillaryplexus, and in free communication with the afferent and efferent ducts between which they are situated; the number of corpuscles of the chyle is greatly increased by passing through these glands, which perform a most important part in the blood-making or assimilating process. No lacteal or lymphatic reaches the terminal thoracic duct without passing through one or more of these glands. In the lower vertebrataplexuses of lymphatics occupy the places of the glands of birds and mammals. Glands are situated all along the course of the lymphatic vessels, both superficial and deep-seated. Familiar examples are the glands in the groin, the seat of syphilitic and scrofulous abscesses, and often swollen from irritation of any portion of the lower extremity; the axillary glands in the arm, when requiring surgical interference; the submaxillary glands, and abscesses; and the glands on the sides of the neck, frequently the seat of scrofulous suppuration.

Glanders, a malignant disease of the horse and other equine species, of a highly contagious character, and which may be communicated to man, but not, it is said, to other animals. It occurs in two forms, depending on the parts affected. When in the lymphatic system it is called farcy; when in the nasal cavities, glanders. The pus of one will produce the other, and farcy always terminates in glanders, unless arrested. Farcy commences with hard cord-like swellings of the lymphatic vessels and glands, called farcy buds, which suppurate and form fistulous ulcers, discharging sanguous pus. But it must not be understood that glanders usually commences in farcy; it is most commonly primary. In glanders as well as in farcy the blood is deficient in red globules, and otherwise unfit to nourish the body. The respiration is weak, and there is cough, and usually the bowels are relaxed. It is said to be produced by continuous bad treatment, overcrowding in filthy and particularly in unventilated stables, and other causes which produce a deformed state of the system. English cavalry horses are said to have been affected with glanders from such causes in the Crimea in 1854. Glanders may be divided into three stages. In the first it is difficult to distinguish the disease with certainty. There is a continuous serous discharge from one or both nostrils, which becomes thick and glairy, like the white of an egg. Uceteration of the pituitary membrane is considered conclusive of its presence, but this may be so far up the nose as not to be seen. The discharge and cough may be the effect of nasal catarrh. A test is sometimes applied by administering three successive eight-ounce doses of aloe, allowing two or three days to elapse between the doses. A glandered horse will
have his symptoms much aggravated; while if cold is the cause, the symptoms will be improved, although the horse may be weakened. The enlargement of a submaxillary gland and its adhesion to the bone is usual. If the disease is glanders, the discharge increases, and becomes foul and offensive, and it is said peculiar. This is the second stage. In the third stage the nasal membrane attains a dull leaden color, the lips and eyelids swell, parts of the face may become gangrenous, and the animal may die in a few days with a putrid fever, or he may die more slowly, the disease spreading to the lungs and other parts of the body, producing unhealthy abscesses, emaciation, and hectic. According to Youatt, the distinctive symptoms are the continuous discharge and the adhesion of the enlarged submaxillary gland. Sometimes the disease may last for years, if the animal is well fed and cared for. The form known as farcy is also not generally so rapidly fatal, and may sometimes be arrested and prevented from passing into glanders. The treatment in both forms consists in good feeding, tonics, disinfectants, and detergent washes and applications, particularly carbolic acid and creosote. The administration of iodine is generally beneficial in chronic cases. When the disease is communicated to man, it is usually considered fatal. A small portion of the diseased matter from the nostril of the horse is sufficient to communicate it if it falls upon the mucous membrane, or upon an abraded surface of the skin. The disease may appear as either glanders or farcy, and either may be acute or chronic. Acute glanders begins with the symptoms of putrid poisoning, such as lowness of spirits, wandering pains, fever, furred tongue, great thirst, profound nocturnal perspiration, great pain in the head, back, and limbs, and tightness of the chest. In a few days the symptoms increase in severity, with rigor and delirium; the perspiration becomes sour and offensive, and diarrhoea sets in. Diffused abscesses appear, commencing in red swellings, about the joints, especially the knees and elbows. The tongue becomes dry and brown, the throat ulcerated, attended by a low malignant fever. In 10 or 12 days from the commencement a dusky shining swelling appears on the face, extending over the scalp and closing the eyes. An offensive yellowish discharge, streaked with blood, flows from the nostrils, and a crop of hard pusules about the size of a pea appears on the face, and spreads over the neck and body; fresh abscesses form and suppurate, accompanied with delirium and tremors, and death ensues. The chronic form proceeds more slowly, attended with discharge from the nostrils, swelling of the nose and eyes, and emaciation, with profuse perspiration and abscesses near the joints. The distinctions between acute and chronic farcy are not very clear, although in the former the lymphatics leading from the point receiving the contagion become violently inflamed the sooner. The treatment of the human subject should be conducted upon the same general principles as that of the horse.

GLAVILL, or Glaville, Rauel de, chief justice of England in the reign of Henry II., died in 1190. He was of Norman descent, a child of Henry II. in repelling the invasion of England by William of Scotland, accompanied Richard I. on the crusade, and perished at the siege of Acre. To him is ascribed the Tractatus de Legibus Comitatus Angliae, Tempore Regis Henrici Secundi, first published in London in 1554. Some of the manuscripts say only that it was written in his time, without ascribing it to him. The best edition is that by John Wilmot (1760); English translation by John Beames (1812).

GLAVIILL, Joseph, an English divine and philosopher, born in Plymouth in 1686, died in Bath, Nov. 4, 1689. He was educated at Oxford, became a priest, and was made rector of the abbey church, Bath, in 1686. He became chaplain in ordinary to the king, and in 1678 was appointed a prebendary of Worcester cathedral. He is distinguished as an opponent of Aristotelianism, as a believer in witchcraft, and as the first writer in English who presented philosophical skepticism in a systematic form. His first work, entitled The Vanity of Dogmatizing, was published in London in 1681, and an enlarged edition of it appeared in 1685, under the title of The Vanity of Science, or Confessed Ignorance the Way to Science, with a dedication to the newly founded royal society, which body at once elected him a fellow. He made another attack on the ancient philosophy in his Pius Ultra, or the Progress and Advancement of Knowledge since the Days of Aristotle (1686), in which he exalted Bacon and Boyle and the inductive method. Notwithstanding his skepticism, he believed in sorcery and witchcraft, and wrote Philosophical Considerations concerning the Existence of Sorcerers and Sorcery (1666), the convictions expressed in which are repeated in his Sadduceism Triumphans, published posthumously (1681), with an account of his life and writings by Dr. Henry More. Among his other works are Luz Orientalis (1682), in which he treats of the preexistence of souls, following the views of Henry More; Essays on several Important Subjects in Philosophy and Religion (1676); Essay on Preaching (1678); and sermons edited by Dr. Horne (1681).

GLARUS, or Glarab. I. One of the smallest of the Swiss cantons, bounded N. and E. by St. Gall, S. by Grisons, and W. by Uri and Schwytz; area, 367 sq. m.; pop. in 1870, 35,150, of whom 28,238 were Protestants and 6,888 Roman Catholics. Mountain chains occupy almost its entire surface; the principal one extends from the Haustock to the Scheibe, and has an average height of 8,000 ft., but there are many separate peaks of much greater elevation. The Dödi or Tödi, nearly 12,000 ft. high, in the S. W. corner, is the loftiest mountain in eastern Switzerland. The principal valley, the L--
GLARUS

That, extends N. and S. and forms the basin of the Linth, which, after receiving nearly all the other rivers of Glarus, discharges into Wallenstadt lake. There are many other lakes, mostly small, but remarkable for their romantic scenery. The Stackelbergerbod, a sulphurous alkaline spring at the foot of the Braunwaldberg, is much frequented. Not more than one fifth of the canton is susceptible of tillage. The most fertile land lies in the valley of the Linth, where grain and fruit, particularly cherries, are cultivated with success. Large herds of cattle, sheep, and goats are pastured on the mountains. With the exception of marble, slate, and gypsum, there are no minerals of much importance. Small quantities of coal are found, and there are ancient mines, now almost exhausted, of silver, copper, and iron. The principal kinds of timber are pine, beech, ash, maple, and chestnut.

The most important manufacture is Schafsgeferdte. (See Cheese.) The other manufactures comprise cotton, woollen, linen, and silk goods, prints, muslin, writing slates, and many articles in wood. An active trade is carried on with Germany and Italy, transportation being effected through a number of mountain passes, and by means of two canals which connect the Linth with the lakes of Wallenstadt and Zürich. Glarus enjoys a singularly democratic form of government, the supreme power residing in a general assembly of all the males 18 years of age and upward, who meet annually to elect magistrates and accept or reject the laws proposed by the executive council of 80 members. Taxation is very light, there are few crimes, and education is almost universal. The military contingent is about 1,800 men. The chief towns are Glarus, Mollis, and Schwanden.—The name Glarus is supposed to be a corruption of St. Hilarius, in whose honor a church was built in this canton about 490 by an Irish monk called Fridolin, the founder of the convent of Seckingen on the Rhine. The upper part of the valley became the property of this convent, while the lower was dependent upon the nunery of Schänis. It was afterward subject to bailiffs nominated by the house of Hapsburg, to escape from whose tyranny the inhabitants joined the Helvetic confederation in 1832, and in 1838 secured their independence by the famous victory of Näfels. Zwingli was curate of Glarus from 1505 to 1516. The introduction of Protestantism gave rise to many disturbances. II. A town, capital of the canton, situated in a secluded Alpine valley at the foot of Mt. Glärnisch and Schilt, on the left bank of the Linth, here crossed by two bridges, 38 m. S. E. of Zürich; pop. in 1870, 5,516. It contains a Gothic church, used by both Catholics and Protestants, a free school for 700 children, a new government house, an old town house, a bank, and a printing office. The streets are crooked and narrow, and the houses are fantastically painted. Cottons, woollens, muslins, and hardware are the principal manufactures. In 1881 the town was almost wholly destroyed by fire, which caused a loss of 8,000,000 francs. The environs are very picturesque.

GLASCOCK, an E. county of Georgia, bounded S. W. by Ogeechee river and drained by Rocky Comfort creek; area, 225 sq. m.; pop. in 1870, 2,736, of whom 819 were colored. The surface is level and the soil moderately fertile. The chief productions in 1870 were 8,881 bushels of wheat, 52,986 of Indian corn, 8,289 of sweet potatoes, 5,406 of peas and beans, and 1,894 bales of cotton. Capital, Gibson.

END OF VOLUME SEVENTH.
SUPPLEMENT TO VOLUME VII.

FAED

FAED. I. John, a Scottish painter, born in Kirkcudbright in 1820. He painted miniatures with success when scarcely more than a boy, and at the age of 21 went to Edinburgh to study, where some years later he exhibited pictures of humble life which gave him a reputation. In 1864 he settled in London. His best known works are: “Shakespeare and his Contemporaries,” “The Cotter’s Saturday Night,” “The Soldier’s Return,” “Tam o’ Shanter,” “Catherine Sefton,” “The Shooting Match,” “The Stirrup Cup,” “The Gamekeeper’s Daughter,” “The Old Crockery Man,” “John Anderson, my Jo,” and “The Parting of Evangeline and Gabriel,” illustrating Longfellow’s poem. II. Thomas, a Scottish painter, brother of the preceding, born in Kirkcudbright in 1820. He studied at the school of design in Edinburgh, where he won many prizes. He at first devoted himself to watercolor drawing, and exhibited “The Old English Baron,” but afterward adopted oil painting as his profession, and has exercised his talents chiefly in genre. His works include “The Mitherless Bairn” (illustrating Thom’s poem), “Home and the Homeless,” “The First Break in the Family,” “Scott and his Friends at Abbotford,” “Sunday in the Backwoods,” “His Only Pair,” “From Dawn to Sunset,” “Bairn Father and Mither,” and “The Last o’ the Clan.” Mr. Faed was elected a royal academian in 1864.

FAITHFULL, Emily, an English philanthropist, born at Headley rectory, Surrey, in 1855. She is the daughter of a clergyman, was educated at Kensington, and entered the gay society of London. But she soon became interested in the condition of working women, and has since devoted herself to their interests. In 1860 she set up a printing office in London, employing women as compositors. This establishment turned out some very fine work, and Miss Faithfull was appointed printer and pub-

FALK LAWS

lisher in ordinary to the queen. In 1863 she began the publication of “The Victoria Magazine,” monthly, in which she advocated the claims of women to remunerative employment. In 1877 she started “The West London Express,” which has proved so great a success as to demand the enlargement of the printing establishment. Miss Faithfull has appeared successfully as a public lecturer, and has published “Change upon Change,” a novel, which has passed through several editions. In 1872–3 she visited the United States.

FALK LAWS, a series of legislative measures carried through the Prussian parliament by the government in the years 1872–8, which were prepared by the minister of worship, Dr. Falk. They were designed principally to transfer the direction of primary education in the Catholic provinces of Prussia from the clergy to the government, and also to secure the parish priests from arbitrary removal by the hierarchy for matters of belief. The dogma of papal infallibility, incorporated in the doctrines of the Roman Catholic church by the decree of the council of the Vatican in 1870, created more excitement in Germany than in other countries. Inside and outside of the Catholic church were awakened echoes of the old feelings of the reformation. After the conclusion of the Franco-German war and the consolidation of the empire, the German government found itself face to face with certain problems of policy arising from this question. These especially affected the Catholic provinces of Prussia, where the church and the state possessed joint powers in the direction of popular education and charities, by which arrangement the priests had become state officials, and the government had obtained a partial control over the ecclesiastical revenues. Impelled by the supposed dangers to national independence implied in the doctrine of infallibility, and feeling that the powers vested by the laws in the
clergy were repugnant to the Prussian theory of the state, and must prove a hindrance to the establishment of the Prussian system in the new empire, the government immediately entered upon a policy calculated to discredit the dogma of infallibility and render it practicable to the clergy by transferring to the hierarchy the right to discipline priests for its non-acceptance, and to divest the clergy of all rights and functions in the popular education. The imperial government, under the leading influence of Prince Bismarck, was not averse to inaugurating its career with an exhibition of vigorous policy which would be sure of general approval, and welcomed an opportunity for gratifying the feeling of nationalism by showing its power over the generally disliked Roman hierarchy, and thus diverting public attention from other questions which might arise to endanger the establishment of a powerful and concentrated national government. The courageous and sincere, but exceedingly impolitic, demeanor of the late pope, Pius IX., in this question, strengthened the hands of the Prussian administration, and emboldened it to put through sweeping reforms with confidence and rigor.

The first outbreak of hostilities was on the occasion of the suspension of a parochial teacher of religion by the bishop of Ermeland on account of his disapproval of the new dogma. Upon the action of the authorities in protecting him in the exercise of his office, a conference of bishops assembled at Fulda on Sept. 7, 1871, memorialized the king, and were answered that no disciplinary action based on the dogma of infallibility would be sanctioned until the matter was adjusted by a legislative provision. The Catholic division in the ministry of worship had been abolished in July, 1871. "Old Catholics" were sustained in the possession of churches and the tithes. The bishops paid no attention to the orders of the government, and were justified in their course by the provisions of the constitution of 1860. The Catholics of Prussia sympathized strongly with the church. An organized Catholic opposition, which developed later into the party of the centre, was formed by the election of 57 members to the first German parliament.

The project of a law transferring the public education to the state was presented in December, 1871, by the minister of worship, Muhler, but its discussion was postponed. A different kind of man was felt to be necessary in this arduous situation. He was induced to resign, and on Jan. 22, 1872, the portfolio of religion, instruction, and sanitary affairs was given to Dr. Falk. The new minister, who was the son of a clergyman, and was born in Silesia in 1827, had made his way through the slow grades of the Prussian civil service, and distinguished himself as a jurist, having been intrusted more than once with the delicate duty of imprisonment in the administration of justice. On Feb. 13 the Muhler law on the supervision of schools was passed in the house of deputies, and on March 8 in the upper house after a spirited contest with the eloquent representatives of the clerical party. The government, now that it had joined battle with the Roman church in the war of progress (the Culturrampf, as it was called), showed no hesitation in its reforms, but immediately assumed an aggressive and implacable attitude. A law was passed banishing members of the society of Jesus and kindred orders from the German empire. By an order of the ministry of June 15 members of ecclesiastical orders were incapacitated for teaching in the public schools. By an order of July 4 pupils of the secondary schools were forbidden to enter religious societies. The law requiring the inspectors of schools to be laymen was rigorously enforced. Cardinal Hohenlohe, who had been one of the leaders of the opposition to the dogma of infallibility in the conciliar council, was nominated ambassador to the papal court, but was indignantly rejected by the pope. On June 26 the pope expressed his resentment in his reply to an address presented by German subjects, in which he uttered the warning that "a stone would yet roll from the mountain top to bruise the heel of the colossus." Upon the pope's characterizing the behavior of the Prussian government as "impudent," the secretary of legation representing that government at the papal court was at once recalled.

Dr. Falk devoted the whole energies of his mind to the formidable task he had undertaken, which involved a radical change in the ecclesiastical laws of the country, and a complete and fundamental reformation of the relations between the state and its subjects and the clerical authorities. In November, 1872, he laid before the diet a project of a law defining the limits of ecclesiastical authority in the discipline and punishment of members of the church. In January, 1873, he brought forward three other bills, designed to limit the authority of the bishops over the inferior clergy, to reduce the powers of the clergy over the laity, and to secure for the civil authorities the means of correcting refractory bishops and priests. All the four laws were passed, after a long and bitter contest with the ultramontane members, and went into effect in May, 1873, whence they are called the "May laws." They embrace provisions regarding the qualifications and installation of priests, regarding secession from the church and the disciplinary powers of the bishops over the clergy, providing for the institution of a royal ecclesiastical court for the adjudication of causes affecting the church, and defining the nature and limits of the punishments which the clerical authorities are permitted to administer. These laws conflicted with the articles of the constitution guaranteeing to the church the right to administer its own affairs. Amendments to the constitution were therefore proposed and adopted, which brought it into harmony with the new laws.
The bishops declared a passive resistance to the May laws, and paid no attention to their provisions. The convents and removed priests without making the prescribed declarations to the civil tribunal, and refused to recognize the government inspection of their seminaries and convents. Many of these were closed by the authorities. The contumacious bishops were punished with fines; and the resolute Ledochowski, archbishop of Posen, was first deprived of his temporalities, and then ordered to abdicate. The government procured a law to be passed, enforcing a new form of oath to be taken at the investiture of bishops, by which they swore to observe religiously the civil laws. The Old Catholic Bishop Reinkens took the required oath, and was acknowledged as a Catholic bishop by the government and endowed with a revenue. In November, 1873, a new diet assembled, in which the centre counted 85 votes. If civil marriage was not a part of Falk's original programme, the great number of vacant curacies which resulted from the enforcement of the May laws made it a necessity. An obligatory civil marriage law was passed, and published in March, 1874. Two laws were passed which stimulated the clericals to renewed opposition, one supplementary to the law on the qualification and ordination of priests, and one relating to the administration of vacant bishoprics and securing the state against the investiture of refractory bishops. In February, 1874, the inflexible Ledochowski was imprisoned for contumacy, and the episcopal property taken possession of by royal administrators, after the ecclesiastical tribunal had deposed him from his see. Bishop Martin of Paderborn was divested of his office and incarcerated by the same court. The archbishop of Cologne and the bishop of Trèves also were imprisoned, and fines were imposed upon other bishops. The bishops rejected overtures from the government looking to a compromise. An intense feeling of alienation from the government spread among the Catholic population, one manifestation of which was the attempt upon the life of Chancellor Bismarck at Kissingen by the journeyman cooper Kullmann on July 13, 1874. The papal bull of Feb. 5, 1875, declared the May laws to be null and void, and forbade obedience to them. The pope also excommunicated the Old Catholics in a body, and bestowed a cardinal's hat upon Ledochowski. The "gag law" of April, 1875, was then passed, by which the bishops and clergy were required to sign a declaration of obedience to the laws before they could touch the tithes. A law was passed which proscribed all conventual orders and ecclesiastical societies in the Prussian dominions. By another law, trustees from the lay members of the parishes were given the control of the church property. When, in 1875, the programme of ecclesiastical and educational reform, which embraced also some changes modifying the position of the Protestant clergy that were not wholly acceptable, was completed and strengthened by the necessary supplementary laws, the government assumed a defensive and expectant attitude, waiting calmly until the clergy should succumb to the new order. In 1877 only four of the twelve Prussian sees were filled—those of Kulm, Ermeland, Hildesheim, and Osnabrück. The bishoprics of Posen, Paderborn, Breslau, Münster, Cologne, and Limburg had been declared vacant by the ecclesiastical court; and those of Fulda and Trèves were rendered vacant by the decease of their incumbents, and no successors had been appointed in accordance with the laws. On the accession of Leo XIII. to the papacy, Feb. 18, 1878, hopes were entertained that the unfortunate differences between the church and the Prussian government might be reconciled, and the deposed bishops and recalcitrant clergy restored to their curates. Repeated negotiations took place between the government and the holy see, but no basis for a compromise could be found, the exiled and disqualified prelates being as irreconcilable as ever, till June, 1883, when, after long debate, amendments were adopted which greatly modified the stringency of the laws.

FARJEON, Benjamin Leopold, an English novelist, born in London, May 12, 1833. His father was a Jew of French descent, and his mother was English. He received a liberal education, and at the time of the gold excitement went to New Zealand, and established a newspaper at Dunedin, which he continued to manage for five years. While in New Zealand he produced several dramas, and published a story entitled "Shadows on the Snow." In 1869 he returned to London, stopping to spend the summer in New York. His first novel that attracted attention was "A Story of Australian Life," which was published as a serial in "Tinsley's Magazine," and appeared in book form in 1871. His subsequent novels are: "Joshua Marvel" (1872); "London's Heart" (1873); "Jessia Trim" (1875); "Love's Victory" (1876); "Solomon Isaac" (1877); "The Duchess of Rosemary Lane" (1877); and "The Bells of Penraven" (1879). His works have been published both in London and New York, and several of them have been translated into French and German. His Christmas stories are: "Blade o' Grass" (1873); "Golden Grain" (1873); "Bread and Cheese and Kisses" (1874); "An Island Pearl" (1875); "At the Sign of the Silver Flagon" (1876); and "The King of No-Land" (1877). Mr. Farjeon has dramatized "Grif," and has written several other plays which have been acted with success. He has also lectured in London. As a public reader from his own works, he is a special favorite with the laboring classes. In 1877 he married Margaret, eldest daughter of Joseph Jefferson, the actor.

FARRAR, Frederick William, an English clergyman, born in the Fort, Bombay, Aug. 7, 1881. He was educated at King William's college,
Isle of Man, at King's college, London, and at Trinity college, Cambridge. He was classical exhibitioner of the university of London in 1850, graduated B. A. there, and was appointed university scholar in 1853. The same year he became a foundation scholar of Trinity college, Cambridge, graduated there in 1854, and was elected fellow in 1856. He carried off the chancellor's medal in 1852, the Le Bus prize essay in 1855, and the Norris prize essay in 1856. He became assistant master of Harrow school in 1855; honorary fellow of King's college, London, in 1858; fellow of the royal society in 1866; university preacher in 1868, 1874, and 1876; honorary chaplain to the queen in 1866; Hulsean lecturer at Cambridge in 1870; master of Marlborough college in 1871; chaplain in ordinary to the queen in 1872; canon of Westminster abbey in April, 1876; and rector of St. Margaret's the same year. Canon Farrar is a voluminous and popular writer. In fiction he has published "Eric, or Little by Little," "Julian Home," and "St. Winifred's." In philological and linguistic studies he has published "Origin of Language" (1860), "Chapters on Language" (1855), "Greek Syntax" (1867), and "Families of Speech" (1870). He is also well known for his productions in theology: "The Fall of Man and other Sermons" (1865), "Seekers after God" (1869), "Witness of History to Christ" (1871), "The Silence and Voice of God" (1878), "The Life of Christ" (2 vols., 1874), "Eternal Hopes" (1879), and "The Life and Work of St. Paul" (2 vols., 1879). Several of these works have passed through many editions, and still hold their place in popular esteem. Canon Farrar has also been a contributor to Kto's and Smith's dictionaries, and to periodicals.

**Fasting.** Cases of prolonged abstinence from food were recorded before the beginning of the Christian era, and fasts for long periods were apparently not uncommon among monks and hermits belonging to the various sects of the early Christian church. All these cases, together with the numerous examples of saints who practised partial or total abstinence from food at various times during the middle ages, are of course unauthenticated and often ridiculous. Ludicnne of Schiedam told some friars in 1423 that for eight years nothing in the way of nourishment had passed her lips. St. Joseph of Copertino was said to have remained for five years without eating bread, and for ten years without drinking wine, supporting life entirely upon dried fruits and bitter herbs. He fasted for 40 days seven times every year, eating nothing at all except upon Sundays and Thursdays. Nicholas of Flue, and a nun of Leicester, who was watched for 15 days by the clerks of Hugh, bishop of Lincoln, both claimed to live entirely upon the holy eucharist. Other saints who were supposed to have acquired the power of living upon sacramental bread were St. Catharine of Sienna, St. Rose of Lima, St. Collete, and St. Peter of Alcantara. Instances are also given by Görres of people possessed by devils who fasted from 20 to 70 days. In the 16th, 17th, and 18th centuries the religious fasters were succeeded by the "fasting girls," considered by scientists at present to have been remarkable cases of hysteria. Among them the most prominent examples were Margaret Weiss of Roda, near Spire, Apollonia Schroira of Bern, Katharine Binder of the Palatinate, Eve Fliegen of Meurs, Joan Balsam of Constance, and a maiden exhibited at Cologne in 1595, who were all popularly believed to have fasted for periods ranging from three to fourteen years. But accidents have several times furnished trustworthy data in regard to fasting. In Belgium, in 1698, four colliers were confined in a coal pit for 24 days, and lived on nothing but water. Three women buried underneath an avalanche in Bergemolletta, Piedmont, lived from March 19, 1755, until April 18, upon a pint of goat's milk a day. Fodére mentions the case of three workmen who lived 14 days in a cold, damp vault, without any food or any water except what was absorbed. Van Swieten reports the case of Guillaume Granet, a prisoner at Toulose, who resolved to starve himself to death. After the first 7 days his sufferings compelled him to take water, but he endured for 68 days, when he died in horrible convulsions. Viterbi, a Corsican, starved himself to death in 21 days. Capt. Casey, of the James Lowden, passed 28 days in an open boat, without food or water, except as much rain water as he could collect. Dr. B. F. Stoddard published an account of a fast undertaken from religious motives by Calvin Morgan of Mystic, Conn., who abstained from food for 40 days—from Dec. 30, 1839, to Jan. 29, 1840. Mr. Morgan drank water freely throughout the fast, and up to the 16th day attended to many of his usual duties; after which time he became more quiet, and toward the end was much reduced. He recovered, however, without any permanent bad effects. Mr. Morgan was under no accurate supervision, but his unimpeachable character caused his fast to be popularly accepted. (For other cases of prolonged fasting, see *Abstinence*.) Two remarkable cases of alleged fasting have occurred in this century, which were exposed by means of scientific inquiry. About 1810 Ann Moore of Tetbury, England, claimed, and was currently believed, to be able to live without food. Persons who watched her for three weeks reported her as really abstaining; but, a stricter watch being set, the woman was reduced to the point of death in nine days, and confessed that her daughter had supplied her with food by washing her face with towels wet with beef tea and other nutritive preparations, and by conveying food from mouth to mouth when kissing her. The Welsh fasting girl, Sarah Jacobs, whom many believed to have lived without food, and in regard to whom there was much excitement in 1864, lived exactly eight days from the
time she was placed under systematic inspection. Perhaps the most curious modern instances of alleged fasting are those of Palma d'Orio, and Louise Latean of Belgium, both of whom claim not only to live without food, but to have received the stigmata—i.e., to have been miraculously marked with the wounds received by Christ at the crucifixion. Both cases have been implicitly credited by the faithful of the Roman Catholic church, and utterly discredited by scientists, a committee of whom carefully examined Louise Latean.

Probably the best authenticated example of prolonged abstinence from food on record is that of Dr. Henry S. Tanner, an eclectic physician of Minneapolis, Minn., who fasted 40 days in New York—from June 28 to August 7, 1880. Dr. Tanner had frequently abstained from food for from 7 to 12 days, and in the summer of 1877 claimed to have fasted for 42 days, and thereby cured inflammation of the stomach and cardiac rheumatism. This fast was generally discredited. In the course of the next year Mollie Fancher of Brooklyn, N. Y., attained considerable notoriety on account of her alleged ability to live without food, and was offered $1,000 by Dr. W. A. Hammond of New York on condition of abstaining from food for one month. This offer was not accepted by Miss Fancher, and Dr. Tanner came to New York to present himself as her substitute. Failing in this, however, he placed himself under the charge of eclectic physicians, who were subsequently joined by others of the regular profession; and his fast, though not rigidly conducted as a scientific experiment should have been, was generally believed and acknowledged by prominent physicians to be a genuine case of prolonged abstinence from food. From the numerous credible instances of persons shipwrecked, buried in mines, suffering from disease, or otherwise prevented from taking food, the average duration of life without food has been placed at from 8 to 15 days, and without food or water at from 7 to 12 days. But no definite rule has been formulated by physiologists, who have generally admitted that the ultimate limit of existence without food is unknown. Water, however, has been found absolutely essential for the preservation of life beyond a comparatively short period. When no food is taken, and the vital functions still continue, a certain amount of force is required, which is obtained from the metamorphosis or consumption of the tissues of the body. These tissues are the products of food previously taken into the system and assimilated. Their oxidation is slow or rapid according to the intensity of thought, activity of the vital functions, and amount of muscular exertion. Pigeons, hawks, doves, fish, snails, chameleons, toads, frogs, lizards, and other cold-blooded animals have been observed under circumstances that left no doubt of the total deprivation of food for a very long time; while the familiar examples of hibernating animals, with the attendant emaciation, indicate an ability to subsist for months upon the tissues of the body when in a semi-torpid condition. In human beings, as in animals, the consequent emaciation is constant in its occurrence, and its absence may be looked upon as a proof of fraud. A striking example of this reduction in weight was afforded by a hog that was buried under a chalk cliff in Dover in 1810. At this time the animal weighed 160 lbs., and when exhumed, 160 days afterward, its weight had diminished to 40 lbs. It had nibbled the wood of the sty, and the sides of the cave looked smooth, as though the hog had continually licked them in order to obtain the moisture exuding from the rocks. Indian fakirs and persons in trances are able to live without other food than that supplied by their own bodies for very long periods, since the activity of the vital functions is reduced to the lowest possible point, this result being often attained among the fakirs by the use of opium and other narcotics. It has been found that the supply of fat in the body acts as a reserve of force-producing material, and it is therefore generally considered, other things being equal, that the greater the supply of fat the longer can life be sustained under abstinence from food. The great capacity of force-producing residing in the tissues of the body is shown by the fact that one gramme (15·492 grains) of fat, as oxidized in the human body, will develop an amount of energy sufficient to raise 27·778 lbs. one foot, and in like manner one gramme of lean muscular fibre will raise 14·806 lbs. one foot. So far as any exact limit to the force-producing powers of the body has been fixed, it has been done by the experiments of Ohsnass and Brown-Séquard upon animals. It was found that when they were deprived of food, death ensued as a mean result when 90 per cent. of the fat of the body was consumed, or when the body lost two-fifths of its original weight. A gradual but not extensive fall in temperature occurred during the first part of the enforced fast, and then the temperature fell more rapidly to a point 29° or 30° F. below the normal point, when a condition of torpor supervened, and death followed. In man, as in animals, the immediate cause of death from starvation is a decline in the animal temperature. Death is accelerated by cold, and delayed by the presence of moisture in the atmosphere. As would naturally be expected, mature adults endure deprivation of food for a much longer time than children and aged persons. From observations this positive rule has been laid down, that no person can exist without a supply of force which is obtained from the consumption of the tissues of the body; and that starvation may to an extent be used up in providing this force, there is a limit beyond which it is impossible to go without the restoration of the tissues by food, or the occurrence of death.—The known cases of fasting may be divided into
voluntary and involuntary. The former class includes religious fasts, abstinence from food on the part of insane and hysterical persons, fraudulent fasts, and deliberate attempts at self-starvation; the latter embraces cases where persons have been prevented from obtaining food by circumstances, or from taking it by such diseases as inflammation of the stomach, stricture of the esophagus, lockjaw, typhus fever, acute febrile diseases, and other disorders. Insane persons, especially those subject to melancholia, and hysterical patients, often take an aversion to food, and exist either on very small quantities or without any food at all for long periods; cases being cited of abstinence for from 18 to 61 days with nothing but water. Low cunning and a morbid tendency to decept, often characteristic of hysteria, explain many fasts, otherwise miraculous, including some so-called religious fasts. Deceptive fasts also originate from a love of notoriety and a desire to gain some advantage, as in cases that have occurred in hospitals. Persons absolutely debarred from food have frequently lived 15 days or longer, though their suffering and emaciation were strongly marked. In June, 1880, a case was reported in New York of a woman suffering from inflammation of the stomach, who lived five weeks without food. In cases of voluntary fasting, of course mental disturbance and the ranges of disease tend to shorten life. Cases of prolonged inanition in the human subject have never been scientifically studied, owing to their comparative rarity and the obvious obstacles that exist. Dr. Tanner's fast, before alluded to, though not regarded as an exact scientific experiment, developed several interesting points. His total loss in weight during the 40 days was 38 lbs. As experience had usually shown, he suffered from actual hunger only during the first few days. His temperature remained nearly normal throughout, there being no marked decline, as is usual in cases of starvation. Besides the loss in weight, none of the characteristic symptoms of starvation appeared, with the exception of slight and temporary evidences of cerebral disturbance on the 15th day, and a hardly perceptible fetid odor in the breath toward the close of the fast. That water is absolutely essential to life was never better illustrated than by this fast. From the 3d to the 10th day Dr. Tanner took no water, except what was absorbed from towels and sponges and retained in gurgling his mouth. On the 10th day, after undergoing severe mental excitement, he drank 4 oz., and then again abstained until the 16th day. At this time his appearance indicated intense suffering, and his condition was regarded as so precarious that his physicians seriously considered the advisability of supplying him with food. Forced by necessity, he drank water freely, and at once revived, seemed invigorated, and for a few days gained in weight. On the 25th day, however, water began to exert an irritating influence upon his stomach. He was troubled with nau-
FITCH, Aas, an American entomologist, born at Fitch's Point, Washington co., N. Y., Feb. 26, 1830. While studying in the Rensselaer polytechnic institute in Troy, which he entered in 1826, he conceived a passion for zoology, which gradually concentrated itself upon the investigation of insect life. He studied medicine in the Vermont academy of medicine at Castleton, in Rutgers medical college in New York, and in Albany. At the same time he learned all that had been written upon American insects. He accompanied Prof. Eaton in the capacity of assistant professor of natural history upon the Rensselaer institute expedition in 1830 to Lake Erie, where he left the party to make an extensive entomological expedition in the west. Upon his return in the following year he began the practice of medicine in the same office with Dr. Taylor Lewis, afterward professor of Greek in Union college, at Fort Miller, N. Y. He removed in 1833 to Stillwater, and in 1836 returned to Fitch's Point (Salem) to take charge of his father's business, giving up his profession. Engaged in agricultural pursuits, he was enabled to follow to better advantage his favorite investigations. He began in 1845 to publish in Dr. Emmons's "American Quarterly Journal of Agriculture and Science," and afterward in the "Transactions of the New York State Agricultural Society," essays upon subjects connected with economic entomology. In 1845 he published an article on the genus cecidomyia, and afterward papers on the wheat midge, the Hessian fly, and winter insects. His paper on the currant worm in the "Transactions" first brought the author to the notice of the scientific men of Europe. He was employed some time in collecting insects for the state cabinet of natural history, and in 1854 was appointed state entomologist. Of his three reports printed in the "Transactions of the State Agricultural Society," the first nine were collected and published separately. This work won a speedy recognition in the scientific world. Dr. Fitch had in view the preparation of a systematic work on entomology, which was never accomplished in the form intended; but at the time of his death as many as a hundred note-books were found upon his shelves, to be published posthumously.

FLORIDA. Of the population of the state in 1880 (269,498), 136,444 were males, 138,049 females, 259,584 of native and 9,509 of foreign birth; 142,605 white, 126,890 colored, 18 Chinese, and 180 Indians. There were 61,099 males twenty-one years old and over, of whom 34,210 were white (90,851 native and 8,859 foreign) and 27,489 colored. Of persons ten years of age and upward, 70,219, or 38 per cent., were unable to read, and 80,188, or 43.4 per cent., were unable to write, including 19.024 native whites, or 20.7 per cent. of that class, and 60,420 colored persons, or 70.7 per cent. of that class. There were produced 54,997 bales of cotton, 8,174,534 bushels of corn, and 488,119 of oats; 1,275,900 pounds of sugar, 1,029,868 gallons of molasses, 1,294,677 lbs. of rice, 1,657,618 bushels of sweet potatoes; live-stock on farms, 52,483 horses, 9,606 mules and asses, 16,141 working oxen, 42,174 milch cows, 409,055 other cattle, 56,681 sheep, and 297,051 swine. There were 426 manufacturing establishments; capital, $3,310,680; hands employed, 5,604; value of materials used, $8,546,446. The principal stock-raising counties, with the number of cattle in each, according to the tax books of 1881, are as follows: Manatee, 38,373; Brevard, 89,833; Monroe, 24,710; Polk, 22,083; Hillsborough, 21,233; Sumter (1880), 16,276; Hernando, 14,485; Volusia, 18,685; total for eight counties, 305,714. The number of bearing orange trees returned in 1880 was 292,324; oranges produced, 46,097,926. The yield of 1881 was about 30,000,000. The total receipts into the treasury on account of general revenue (including interest taxes) for the year ending Dec. 31, 1882, amounted to $350,598.80. The amount of warrants and coupons paid at the treasury for the year ending Dec. 31, 1882, was $289,698.68. The following is a statement of the bonded debt:

| Per cent. bonds of 1871 | 320,000 00 |
| Per cent. bonds of 1873 | 920,000 00 |
| Per cent. convention bonds | 1,500 00 |
| Total | $1,377,500 00 |

Of this indebtedness there is:

- In sinking funds | $150,500 00 |
- In school fund | 852,500 00 |
- In seminary fund | 87,400 00 |
- In agricultural college fund | 154,000 00 |
- Total | $666,100 00 |

Leaving in the hands of individuals | $309,698 00 |

The table of assessment for 1882 shows that the taxable valuations amounted to $45,285,977, a large increase since 1880. But more than $8,000,000 of this was upon railroad property for which exemption is claimed. The state
FLORIDA

taxes in 1882 were as follows: state tax, $200,827.38; sinking funds, $91,581.96; school fund, $45,383.71—total, $337,691.94. The county taxes were: County tax proper, $175,368.82; county school tax, $135,235.42; county special tax, $115,963.84—total, $425,569.08. The number of schools in 1877 was 556, with 29,678 pupils; in 1880, 1,181, with 29,315 pupils; for the scholastic year beginning Oct. 1, 1882, 1,189, with 51,945 pupils. The principal of the common-school fund has increased, rising from $246,900 in January, 1881, to $338,555.42 at the close of 1882. It has been ascertained that nearly 80,000 acres of school lands were due from the United States. Selections amounting to 43,746 acres have been approved. Under the agricultural college grant Florida received 90,000 acres, which were sold for $81,000. The proceeds of the sale were invested in $100,000 of Florida bonds. The interest has been invested, and the fund now has an income of about $9,000 per annum. As no portion of the fund nor the interest can be applied to building purposes, no institution has been established. On Jan. 1, 1881, there were 95 inmates in the insane asylum. During the two following years there were admitted 113; discharged, 60; died, 36; escaped, 6; readmitted, 5; in the institution Jan. 1, 1888, 198, of whom 36 were white males, 44 white females, 27 colored males, and 21 colored females. The East Florida railway company had the state convicts in charge during 1881 and 1882. It received the convicts at the several jails, paid all expenses after conviction, and, in addition, paid into the state treasury over $6,000 for their services during the two years. The convicts have been let for the years 1883 and 1884 for the sum of $3,200, the other conditions being the same as those in the railway lease. The number of convicts Dec. 31, 1890, was 129, which were handed over to the railway company; delivered to it during 1881, 101; discharged, 49; paroled, 4; escaped, 13; died, 14; sentence commuted, 1; remaining, Jan. 1, 1888, 149; delivered to the railway company during the year, 69; discharged, 56; paroled, 3; escaped, 5; died, 10; remaining at the close of the year, 185.—In January, 1881, Philadelphia capitalists negotiated a contract with the board of trustees of internal improvements for the drainage and reclamation of the lands lying south of township twenty-four, by affording an outlet for Lake Okeechobee, in consideration of receiving one half of the lands so reclaimed. The legislature in 1881 chartered the Atlantic and Gulf Coast Canal and Okeechobee Land company, who succeeded to all the rights under the contract. This company immediately had a series of surveys made to test the practicability of the proposed undertaking, and from these, and those made by the United States, under the direction of Gen. Gillmore, it was shown that Lake Okeechobee has an elevation of 28 feet above the Gulf of Mexico, and that Lake Tahoeekaliga, the head-
1880, was: Key West, 9,890; Jacksonville, 7,650; Pensacola, 6,948; Tallahassee, 2,494. See map at beginning of this supplement.

FORBES, Archibald, a British journalist, born in Morayshire, Scotland, in 1888. He served several years in the royal dragoons. Afterward he became a professional newspaper correspondent, and in the Franco-German war of 1870 accompanied the German army as representative of the London "Daily News," his letters to which gave him a high reputation. Since then he has been almost constantly in the field as correspondent of the same journal. He visited India during the famine of 1874, witnessed much of the fighting in the civil war in Spain, accompanied the prince of Wales on his tour through India in 1875-8, and in 1876 went through the Servian campaign. He followed the Russian army through the campaign of 1877, and was present at the most important engagements, including the battle in the Shipka pass and the attacks on Plevna. In 1878 he travelled in Cyprus, and in 1879 visited the seat of war in South Africa. He has published in book form "Drawn from Life," a military novel, "My Experiences of the War between France and Germany," "Soldiering and Scribbling," a series of Sketches, and "Glimpses through Cannon-Smoke." In October, 1880, he entered upon a lecturing tour in the United States.

FORESTS, North American. Forests play an important part in protecting the earth's surface and in modifying the extremes of climate. Regions are forest-clad in proportion to their annual average rain-fall and temperature; the most continuous and luxuriant forests occur in equatorial regions, where winter is unknown and rain falls daily, as in eastern tropical America, Ceylon, and the East Indies. In drier and colder regions, forest is less luxuriant; it disappears entirely in the Arctic and Antarctic regions; in the tropics even the summits of high mountains are treeless from absence of sufficient warmth, as are also rainless regions like the great interior plains of the Asiatic and North American continents, and the western rim of South America, from drought. The forest, then, is dependent on rain-fall; and rain-fall is not, as is often erroneously supposed, dependent on the forest. There is no evidence that the removal of forest has decreased the annual average rain-fall in any extensive region, or that the increase of forest area has anywhere increased the average rain-fall. Apart from the material which forests supply, they are of inestimable value in securing a constant and equal flow of springs and rivers, through their power to prevent the rapid waste of rain-fall by too rapid evaporation and superficial flow. Water falling on a tract of land stripped of its covering of trees is rapidly evaporated by the summer sun, or in winter flows off over the surface of the frozen ground without penetrating it. In a sufficiently wooded region summer rain is protected from evaporation by the trees which cover the ground, and, held as in a sponge, slowly percolates to the water-courses, while melting snow and winter rain gradually sink into the soil, which in the forest is never so deeply frozen as in the open ground. Forests, by the resistance they offer to the sweep of the wind, and because less extreme variations of temperature occur within their limits than in open plains, are important factors in regulating and equalizing climate. An area equal to 20 or 25 per cent. of any country should be preserved in permanent forest, in order to secure a constant supply of forest products for the use of its inhabitants, to modify and regulate the extremes of climate, and to insure the normal flow of springs and rivers. In mountainous regions it is essential to preserve in their natural condition the mountain forests. The total or partial removal of such forests causes the snow to melt rapidly and overflow the streams that rise in them. The beds of such streams, deprived of the protection which trees afford them, are gradually enlarged, forming torrents which carry into the valleys great masses of rock and earth, becoming every year more dangerous and destructive. The evil effects following the removal of mountain forests have been seen in Switzerland and in different parts of France and Germany, where immense losses of life and property have followed the destruction of the forests on the mountains of central Europe, and the consequent irregular and excessive flow of the rivers heading in them. In America less damage has as yet been done by such forest destruction; but the degradation of the California mountain forests, which protect an immense snow-fall and numerous large streams, is already a source of great danger. The forests of North America (that portion of the North American continent south of the territory of the United States will be omitted in this article, for the obvious reason that little scientific information exists in regard to its forests) are peculiarly rich in the number of species which they contain, as compared with the other great forest-clad regions of the north temperate zone. The continent of Europe contains 126 species of trees, representing 49 genera and 26 families, while in North America there are 412 species, representing 158 genera and 54 families. But as the semi-tropical arborescent species of the Florida coast have no equivalent in the European flora, they may be omitted from a comparison of the sylvas of the two continents. Thus reduced, the American forests contain 347 species, representing 110 genera and 37 families, or 173 per cent. more than the European forests. On the eastern coast of Asia, including Mantchooria, northern China, and extra semi-tropical Japan, there are, according to Ass Gray ("Forest Archaeology"), 168 arborescent species, representing 66 genera, while the Atlantic forests of North America contain 218 species, representing 87 genera. In making
such a comparison, however, it must be remembered that the Asiatic flora is still imperfectly known, and that the region in question is much less extensive than that occupied by the Atlantic forests of North America. The causes which led to the present distribution of the flora of the north temperate zone must be sought, as has been shown by Asa Gray, in the botany of the ante-glacial epoch. In the later tertiary period the climate of the Arctic region, judged by the fossil remains of the plants which then flourished there, could not have differed greatly from the actual climate of the middle Atlantic states. This circumpolar miocene flora, as the friguration of the latest glacial period extended southward, was gradually pushed down by advancing cold to the southern portion of North America, southern Europe, and middle Asia, only to recede northward again with the gradual return of heat. But not all the species survived these changes of habitat. The condition of climate not being essentially different, regions which from their topography offered the easiest means of escape and return to the species of the northerm miocene sylva will be found to possess the greatest number of the descendants of these species. Eastern North America, with its mountain range running north and south, and bordered on the south by numerous semi-tropical and tropical islands, to which the plants which then inhabited the southern states might retire when driven out by more northern species seeking to escape excessive cold, offered peculiar advantages for the preservation of the miocene flora, and it will be seen that the existing Atlantic forests contain a much greater number of the arboreous descendants of that flora than exist on the whole continent of Europe or in Pacific North America. The origin of the Atlantic and Pacific forests, now so distinct in composition and especially in number of species, was undoubtedly identical—as the remains of species so local even at the present time, as sequoia, are found in the tertiary deposits of Greenland. It is, therefore, permissible to believe that the poverty of existing arboreous species in the Pacific forest, as compared with that of the Atlantic region, is due to topographical difficulties and to unfavorable conditions of climate and rain-fall encountered by the miocene species in their southern migration into western America. Many species whose descendants now flourish in the Atlantic forest were doubtless unsuited to ascend the high elevations composing a large part of the region west of the Rocky mountains. Others might well have been irrevocably lost in the Pacific ocean, the trend of the coast line south of 35° N., from northwest to southeast, at an angle of 80° to 60° with the meridian, affording no escape to plants pushed down to the coast from the north. The topographical and climatic conditions of eastern Asia are not unlike those of eastern North America. South of both these regions numerous islands afforded a secure retreat, beyond the immediate influence of ice, for plants driven down from the north. It is not, then, remarkable that these two regions should bear a striking resemblance in the number and relationship of the arboreous species constituting their forests. The European miocene forest was, perhaps, not unlike in composition and variety the present Atlantic forest, judged by the palæontological remains found in the deposits of the late tertiary period, which include two sequoiae nearly identical with the existing species of California, gigante, magnifica, and many other species not represented in the existing European flora. This poverty of the European forests in species can only be explained by the topography of the European continent. It is traversed by mountain ranges running, not north and south, as in North America, but east and west; with the Mediterranean sea on the south, which during the glacial period was not restricted within its present narrow limits, but extended far eastward to beyond the Caspian, and perhaps northward to the Siberian sea. Species then moving southward had to pass the Pyrenees, the Alps, the Carpathian, and the Caucasus, standing directly in their path. Many could not have withstood the cold encountered in their attempt to ascend these mountains, while others, having passed over or around them, may well have been lost in the Mediterranean; and this is also true, no doubt, of species which in the ante-glacial period inhabited southern Europe south of the great mountain ranges. The friguration of the whole northern portion of the globe would reduce the temperature of southern Europe, and force its indigenous plants to move southward along a path hopelessly barred by a sea almost destitute of islands. It appears, then, that regions of the north temperate zone should now be rich in arboreous species; first, when their topography was such as to afford the species of the circumpolar miocene forest a safe line of retreat southward before the gradual reduction of temperature which accompanied the glacial period; second, where subsequent conditions of climate, and especially of abundant and evenly-distributed rain-fall, were favorable to the development and spread of forest growth. Eastern North America and eastern Asia in their topography and climate have been favorable to the escape and development of the northern flora, and are rich in arboreous species. Western North America, where the ancestors of the present flora had exceeding unfavorable climatic as well as difficult topographical conditions to overcome, is poor in arboreous species; while Europe, with its mountain barriers extending from east to west, has preserved still fewer descendants of its miocene forests. The continent of North America, considered in relation to the species composing its forest, may be divided into the Atlantic and the Pa-
specific regions. The former embraces the whole territory from the Atlantic coast to the eastern base of the Rocky mountains, and from Hudson's bay to the Florida keys and the Rio Grande; the latter, the region west of and including the central continental range of the Rocky mountains. These two forest regions, distinct in the character of the species composing them, and south of latitude 62° 30' N. separated by a broad, elevated plateau nearly treeless from lack of sufficient moisture to induce forest growth, are joined on the north by a forest belt extending from Labrador to Alaska, and containing a few species common to both the Atlantic and Pacific regions. At the south, a few species belonging to the peculiar Texano-Arizona flora of Mexican origin cross the continent from Texas to southern California, joining again the forests of the Atlantic and Pacific.

Thus considered, the American forest is composed of two very distinct groups of species, widely separated by the treeless plains of the central and southern portions of the continent, but united on their northern and southern extremities by a few species common to the two regions. Of the 412 arborescent species, representing 54 families and 158 genera, of which the American forest consists, 291 species, belonging to 52 families and 141 genera, are found in the Atlantic region; while the Pacific forest contains but 153 species, representing 24 families and 55 genera. Thirty-two species are common to both the Atlantic and Pacific forests; of these, 8 species (pyrus sambucifolia, betula papyrifera, salix longifolia, populus tremuloides, populus balsamifera, abies alba) cross the continent at the north; 11 species, of Mexican origin (condalia obesa, bigelowia orthocarpa, prosopis juliflora, prosopis glandulosa, acacia greggii, sambucus mexicana, fraxinus pistacioidea, chloroxylon saligna, morus microphylla, queva emoryi, guadua baccata), enter the Atlantic and Pacific forests at the south. Three species of the Atlantic region (peltia trifoliata, sapindus marginatus, salix nigra) extend into the extreme southern portion of the Pacific region. Four species (neyraud aceroides, ceits occidentalis, junipero virginiana, and ceratog tomentosa) of the Atlantic forest are also widely distributed in the Pacific region. One species (juglans regia) of the true Pacific sylva reaches Texas and the Atlantic forest. One species of the Pacific forest (junipero occidentalis) is represented in western Texas by a well-marked and rather distinct form. A single northern species (populus tremuloides), the most widely distributed North American tree, extends over the mountain-ranges of the whole continent. An examination of the composition of the Atlantic forest shows that of the 292 species of which it is composed 197 belong to the true American sylva, of probable northern origin; that the narrow forest belt of Florida south of Cape Canaveral and Cedar Keys contains 85 semi-tropical West Indian species, and that 29 species of the Texano-Arizona flora are found in Texas. Of the 188 species comprising the Pacific sylva, 111 are of probable northern origin. Of these, 81 species are common to the coast and great interior mountain region, which contains but 15 endemic species. The following comparison of the genera of the Atlantic and Pacific forests shows the wide difference in their composition. The semi-tropical genera of Florida and the peculiar genera of the Texano-Arizona flora are omitted, in order to restrict the comparison to the forms typical of the true northern American flora, as generally understood:

Forty-eight genera, then, of the Atlantic forest have no arborescent representatives in the Pacific region. Oeris, amelanchier, vaccinium, and rhodendron are, however, represented by shrubby Pacific species. Thirty-one genera are represented in both the Atlantic and Pacific forests, while only 13 Pacific genera (fremontia, ceanothus, cercocarpus, heteromeles, sambucus, arbutus, umbellularia, castanopsis, lobobedrus, cypressus, sequoia, pseudotox), are unrepresented by trees in the Atlantic forest, although ceanothus and sambucus have shrubby representatives in the Atlantic flora. Of these 13 genera, fremontia, sequoia, pseudotox...
The American forest, in its economic aspect, may be conveniently considered under several divisions characterized by the predominating species of each. The spruce forest of eastern sub-Arctic America extends from the Straits of Belle-Ile, or about latitude 52° N., round the southern shore of Hudson’s bay, and thence northerly to within the Arctic circle near the mouth of the Mackenzie river, in latitude 85° N., west to the Rocky mountains and south nearly to latitude 50°, where a different forest growth begins to characterize the country. The whole region occupied by this forest is interspersed with innumerable streams, lakes, and swamps; the trees are stunted by cold, and often widely scattered. The most northern, widely distributed, and valuable timber trees of this forest are the white spruce (picea alba), growing in rich interval lands and along the banks of streams and rivers, and the black spruce (picea nigra), occupying stony hills and deep, cold swamps. Associated with them, and extending north to nearly the same latitudes, are the American larch (larix americana), the balsam (populus balsamifera), the aspen (populus tremuloides), which often cover enormous tracts along the streams and lakes, the canoe birch (betula papyrifera), and the balsam fir (abies balsamea). To this forest belongs also the gray pine (pinus banksiana), with a northern range from 50° N. on the Atlantic to within the Arctic circle at its western limit, as now understood near the Mackenzie river, reaching its greatest development in the region between Hudson’s bay and Lake Nipigon, here often a fine tree 70 ft. in height. The black ash (fraxinus sachalinensis) and the yellow birch (betula lutea) just enter this region also, near their northern limits in about latitude 55° N., longitude 50° W. South of latitude 50° the Atlantic forest changes in character, growing gradually denser, more varied, and valuable. On the west it is bounded by the northern extension in Manitoba of the great treeless belt which reaches from latitude 62° 30’ southward along the eastern base of the Rocky mountains into Mexico. The northern limit of this division of the Atlantic forest is marked by the appearance of the white and red pines (pinus strobus, pinus resinosa), which extend from Newfoundland along the northern shores of the Gulf of St. Lawrence to Lake Winnipeg, and thence southerly into Minnesota, where, at longitude 95° W., this northeastern pine forest finds its western limit. Between latitudes 50° and 45° the American elm (ulmus americana), the sugar maple (acer saccharinum), the hemlock (tsuga canadensis), the red oak (quercus rubra), the most northern of the Atlantic oaks, the linden (tilia americana), the green ash (fraxinus viridis), the burr oak (quercus macrocarpa), the ash-leaved maple (negundo aceroides), and the beech (fagus ferrariceps) reach their northern limit and give value and variety to the forest. In the valley of the St. Lawrence, through the northern New England states, and westward along the southern shores of the great lakes, immense tracts are covered with the white pine and red pine, often intermixed with scattering bodies of hemlock, black oak, red oak, sugar maple, and birch; the numerous swamps abounding especially in the western portions of this region are occupied with a dense growth of larch, yellow cedar, and black spruce. Large bodies of black spruce, either interspersed with pine or occupying the ground nearly to the exclusion of other species, are characteristic of this northern forest; great bodies of spruce occur in northern Maine, on the Green mountains of Vermont, and in the Adirondack region of New York. The northeastern pine forest extends over a large part of New England, and south along the Alleghany mountains to Georgia. The white pine, generally mixed with hemlock, occupies large areas in southern New York, middle Pennsylvania, and West Virginia. In the mountains of the Carolinas, Tennessee, and Georgia, it is less multiplied, and it finally disappears in northeastern Georgia. The immense bodies of white pine which formerly existed north and south of the northern boundary of the United States, and in Pennsylvania, have given great importance to the forests of this region. Michigan,
Wisconsin, and Minnesota are now the great lumber-producing regions of North America, yielding over 7,000,000,000 ft. annually of merchantable pine. The white pine forests are rapidly disappearing, however, before such enormous drains. Of the natural divisions of the Atlantic region, the great southern maritime pine belt is next in economic importance to the northeastern white pine forests. This belt extends uninterruptedly, with the exception of the Florida peninsula, south of latitude 29°, and of the broad bottoms of the lower Mississippi and other rivers, from Virginia, in about latitude 38°, to the Brazos river in Texas. The characteristic tree of this region is the southern or long-leaved pine (pinus palustris). The low and often wide river bottoms of this region are covered with a dense growth of deciduous trees, the largest and most important of which is the bald cypress (taxodium distichum). Numerous low, swampy tracts, known as bay galls, densely covered with evergreen bays (persea caroliniana), magnolias (magnolia glauca), titti (cyrilla racemiflora and clytomenia ligustrina), and other secondary trees, are scattered through this open pine forest. The low, sandy plains, often extending 100 m. from the coast, with the exceptions above mentioned, are almost exclusively covered with the long-leaved pine. The lobolly or old field pine (pinus taeda), a species having little economic value, is sometimes associated with the log-leaved pine. This species occupies lower ground, often inhabiting swamps, or springs up on land exhausted by cultivation or fire. Farther from the coast, where the land is higher and often slightly rolling, oaks and a short-leaved pine (pinus sylvestris) are associated with the long-leaved species. The great value of the long-leaved pine as a timber tree has given rise to an immense lumbering industry along the whole southern coast. The turpentine and naval stores manufactured in the United States are produced from the long-leaved pine. The turpentine industry, formerly confined to North Carolina, has now extended south to Florida, Alabama, and Mississippi. The live oak (quercus virginiana), whose hard, solid, and very strong wood was once highly prized in ship-building, is a characteristic tree of the forest of the southern Atlantic and Gulf coast. It extends from Virginia to the Rio Grande, occupying the low, rich hammocks of the coast and islands. In Texas, the live oak extends northward and westward over large portions of the western part of the state, probably reaching its south western limit in the mountains of northern Mexico in about longitude 104° W. Except on the coast, however, it is of small size and inferior quality. With the exception of the pine belt of the north, with its long southern extension along the Alleghany mountains, and the maritime pine belt of the south, with a northern extension into Arkansas and southern Missouri of the short-leaved pine forest of Louisiana and eastern Texas, the forests of the Atlantic region are principally composed of broad-leaved trees. This forest, rich in valuable timber trees, extends from the Atlantic to beyond the Missouri river. West of the Missouri river it becomes less dense with the gradual rise of the wide, high plateau which forms the eastern base of the Rocky mountains. West of longitude 97° it is reduced to a narrow fringe of trees along the rivers, reaching its extreme western limit on the eastern slopes of the Black hills of Dakota, and in the western part of the Indian Territory in about longitude 100° W. East, however, of this wide, treeless plateau, between latitude 40° and 44°, great prairies exist, forming bays in the western edge of the forest. The cause of these treeless prairies has given rise to much discussion. The amount of rain falling on them is sufficient to insure forest growth, and the soil is admirably adapted to the growth of trees. Whatever cause may have originally produced them, the fact that they have decreased in extent through the gradual pushing out of the forest over land once treeless, since agricultural occupation and the decrease of the annual fires which formerly swept over this region, seems to indicate that their continuation, at least, is due to accidental rather than natural causes. There is every reason to believe that at the time of the discovery of the Mississippi river the open prairie extended much farther south in Missouri than at present, and that many treeless valleys, since densely forest-covered, existed in Pennsylvania and Virginia. These valleys were, without doubt, burned over annually by the Indians, to encourage the growth of grasses and improve their hunting; but with the disappearance of the Indians, fires became less frequent and destructive, and the forest gradually occupied the whole country. The Atlantic forest reaches its greatest development in number of species in western Florida. Here, in the undulating hilly region, between the Chipola and Oklokeese rivers, which may be considered the extreme southern point of the Appalachian mountain system, in an area of a few square miles, are crowded together 96 species of trees. The greatest average development of the largest number of species is found in the rich alluvial bottoms of southern Arkansas. Forests of great beauty, rich in magnificently developed specimens of a great number of species, clothe the southern Alleghanyes of the Carolinas, Tennessee, and Georgia. Less rich in species, but not less beautiful, are the forests of the “bluff formation” of Mississippi and western Louisiana, where the evergreen magnolia (magnolia grandiflora), the water oak (quercus aquatica), and the American beech (fagus ferruginea) attain their greatest development. The deciduous forests of the Atlantic region possess many trees of great economic value. They contain 23 species of oak, of which the white oak (quercus alba), the burr oak (quercus macrocarpa), the chestnut oaks (quercus prinus and quercus prionoides),
and the cow oak (Quercus Michoazae) are among the most valuable; 8 species of hickory, a genus exclusively confined to this region, and of great economic importance on account of its timber and the edible nuts furnished by several of the species. The valuable black walnut (Juglans nigra); the catalpa; birches; the nysaas, a genus peculiar to this region; the liquid-amber, the sassafras, seven magnolias, the locust (Robinia), and the sycamore (Platanus occidentalis), its largest tree, give value and variety to the forests of the Atlantic region.

The narrow belt of semi-tropical forest confined to the keys and hammocks of southern Florida is of little economic or commercial value. The species of which it is composed here reach their extreme northern limit, and are generally smaller than in the West Indies, and of inferior quality. Among the most valuable trees of this region are the mahogany (Swietenia mahagoni), the lignum vitae (Guaiacum sanctum), the red mangrove (Rhizophora mangle), bordering with almost impenetrable thickets the saline shores of rivers and bays, and furnishing a wood valuable in its ability to resist the attacks of the teredo; and the mastic (Sideroxylon mastichodendron), a large tree, valued in ship-building. The beautiful royal palm (Ceroxylon regia) is the most stately plant of this region.

The cocoanut, the wild orange, the guava, and other tropical plants, have become naturalized through the agency of man, and now form part of its forest growth. The forests of the Pacific region, composed almost entirely of coniferous species, are largely confined to the mountain ranges, the valleys being often entirely, although not invariably, destitute of trees. They reach their greatest development in Washington and Oregon west of the Cascade mountains, and on the western slope of the Coast Range and Sierra Nevada of California. They disappear entirely from the California coast south of latitude 35°, from southeastern California and western Arizona, and are stunted, scattered, and confined to the high mountain canyons and slopes of all the dry interior region inclosed between the Cascades and the Sierra Nevada on the west and the Rocky mountains on the east. The forests of the Rocky mountains, although much less dense and varied than those which cover the California Sierras, are of considerable importance and great local value. The Pacific forests extend northward to within the Arctic Circle. In the valley of the Yukon, in latitude 65°, the white spruce, the canoe birch, and the balsam poplar become trees of considerable size. The forest of the interior of Alaska is scanty and still imperfectly known; in latitude 65°, at Fort Selkirk on the Yukon, the twisted pine (Pinus contorta), probably the most northern of the exclusively Pacific species, occurs. On the coast, considerably to the north of latitude 55°, several species peculiar to the Pacific forest appear. Sitka and other Alaskan islands are heavily timbered with the tide-land spruce (Picea Sitchensis), the western hemlock (Tsuga heterophylla), the twisted pine, the western arbor vitae (Thuja plicata), and the Sitka cedar (Chamaecyparis Nutkaensis). The last attains its greatest development on the eastern islands, ranges southward along the Coast Ranges, and reaches its southern limit in the high Cascade mountains south of the Columbia river, in Oregon. It is the characteristic tree of the Alaskan forest coast, and one of the most valuable of North America, producing hard, very compact, and beautiful wood, of great utility in the arts. About latitude 55° N. the yellow fir (Pseudotsuga Douglasii) first appears. The great value of its timber and its wide geographical range make the yellow fir one of the most important trees of the North American forest. It extends over a large portion of British Columbia, from the coast to longitude 115° W., and south through western Washington territory and Oregon, and along the Coast and Sierra Nevada of California to the extreme southern limit of forest growth in California. It is the most valuable timber tree of the mountains of eastern Washington territory, Oregon, Idaho, and Montana west of the continental divide. It is common at low elevations throughout the Rocky mountains of Utah, Colorado, and New Mexico, in the northern and eastern Arizona, and extends south into northern Mexico. The yellow fir reaches its greatest development on Puget sound and the Oregon Coast Ranges, there forming forests unsurpassed in density by those of any other region of the north temperate zone, with the single exception of the sequoia forests of California, individual trees often attaining a height of 200 to 800 ft., with a diameter of 5 to 12 ft. The wood of the yellow fir is hard, strong, and rather coarse-grained, furnishing excellent material for ship-building, all kinds of construction, masts, spars, and railway-ties. Next to the yellow fir the most important tree of the Pacific forest, in extent of range and economic value, is the yellow pine (Pinus ponderosa). This tree first appears in about latitude 51° N., here occupying the dry interior region between longitude 118° and 122°, and a second long, narrow belt on the 115th meridian. The yellow pine does not occur in Washington and Oregon west of the Cascade mountains, except on a few small local deposits of drift. From the eastern slope of the Cascades, however, it extends east to the Black hills of Dakota, and south through the California and Rocky mountains to Colorado, New Mexico, western Texas, and Arizona, where, in the San Francisco mountains and the forest belts of the eastern part of the territory, the yellow pine is the prevalent and most valuable timber tree. The yellow pine produces strong, coarse-grained wood, valuable for all kinds of construction, railway ties, fuel, &c. The western arbor vitae (Thuja plicata) reaches its greatest development in the forests of Puget sound and the Oregon
coast, here often reaching 200 to 800 ft. in height, with a trunk 10 to 15 ft. in diameter. This valuable species is also widely distributed along the western slopes of the Cascade, Cabinet, Cœur d’Alène, and other western ranges of the northern Rocky mountains. With it are associated the western hemlock (Tsuga heterophylla), the largest of the genus, and in the interior northern forests the western larch (larix occidentalis). This tree, just reaching the western slope of the Cascades mountains, is otherwise confined to the northern interior region. It far exceeds in size and in the value of its timber its Atlantic, European, or Asiatic congeners. The twisted pine, the Pacific representative of the Atlantic P. Banksiana, is the characteristic tree over the southern part of the interior plateau of British Columbia, where it covers immense areas. An allied species (P. Murrayana) extends from the Blue mountains of Oregon, where above 6,000 ft. it forms extensive forests, over all the northern mountains to eastern Montana. The dense pine forest of the Yellowstone region is almost exclusively composed of this species, which extends also southward through Colorado and along the Sierra Nevada to southern California. The western white pine (Pinus monticola), the representative of the Atlantic P. strobus, is of considerable local importance in the interior northern forests. This species reaches the coast of southern British Columbia, extends southward along the high mountains to the California Sierras, and eastward to the western ranges of the Rocky mountains, forming extensive and important forests on the eastern and western slopes of the Cœur d’Alène and other northern ranges. South of latitude 43° the forests of the coast change in character. The coast may, in this connection, be extended to include the region between the Pacific and the summit of the Sierra Nevada, in distinction from the drier and less heavily forest-covered region of the interior, including the Rocky mountains proper. Many of the peculiar California trees first make their appearance south of latitude 48°. The valleys are often covered with heavy growth of the California laurel (Umbellularia California) and the great-leaved maple (Acer macrophyllum), in addition to the cottonwoods and willows which line the streams throughout the Pacific region. The oak (Quercus Garryana) of the British Columbian and Washington coasts is here joined by other species. The most valuable of the Pacific oaks, the California live oak (Quercus chrysolepis) and the chestnut oak (Quercus dentiflora), reach here their northern limit. The oaks of the Pacific region are of small economic importance, with the exception of these two species, the former nearly equalling the Atlantic live oak in the value of its timber, the latter prized for its bark, rich in tannin. Several of the California oaks, however, attain a great size and are the characteristic and often the only trees of the interior park-like valleys of central California. In latitude 43°, also, the sugar pine (Pinus Lambertiana) first becomes common. This magnificent tree, the largest of the genus, extends over southwestern Oregon and northern California, and thence southward along the Sierra Nevada to the extreme southern part of the state, characterizing the important forest belt which covers their western slopes between 4,000 to 8,000 ft. elevation. Among American pines, the wood of the sugar pine is second only to that of the Atlantic white pine for the special uses to which white pine is applied. On the coast of southern Oregon, just south of Umpqua bay, a heavy growth of the Port Orford cedar (Chamaecyparis Lawsoniana), mixed with yellow fir, gives great economic value to the forests of this region. This species, which attains a great size, is confined to a region about 50 m. long and 20 wide, with a few isolated outposts in the valley of the upper Sacramento, in northern California. The Port Orford cedar is only surpassed by its congeners the Sitka cedar in the beauty and value of its durable, aromatic wood. Just south of the Oregon line the forests of red-wood (Sequoia sempervirens) extend southward along the California coast almost continuously to latitude 37°. This tree occupies the sides and bottoms of the canyons and gulches facing the ocean, and within its direct influence. It hardly, if at all, crosses the Coast Range, and never extends more than 85 m. from the coast. The red-wood forest is probably surpassed by no other in productiveness. In favorable localities more than 200,000 ft. to the acre of marketable lumber stand over considerable areas. Situated as these forests are within easy access to tide-water, and producing in immense quantities a soft, easily worked, and durable timber, they are economically the most valuable of the North American continent. The second species of sequoia (Sequoia gigantea), the “Great Tree” of California, is confined to the western slopes of the southern Sierra Nevada. The northern limit of this tree, is found in Calaveras co. Here in the sugar-pine belt, at an elevation of 4,750 ft., an isolated grove exists. Similar groves, often widely separated, extend southward for 200 m. In Tulare and Kern cos. a forest 80 m. long, and often 6 or 8 m. wide, contains the only continuous body of this species, which, widely distributed through the miocene Arctic and European forests, has survived the later geological changes to which the earth’s surface has been subjected. South of latitude 44° the forests of the interior region are of little value. Junipers, and two peculiar species of nut pine (Pinus monophylla and Pinus edulis), supply scanty fuel. The upper canyons of the mountains are sometimes heavily timbered with pine and spruce. A characteristic tree of the region between the Sierra Nevada and the Rocky mountains is the mountain mahogany (Cercocarpus ledifolius),
a small tree yielding an exceedingly hard, brittle wood, highly prized for fuel. The most valuable timber tree of the central Rocky mountains, Engelmann’s spruce (picea Engelmanni), forms, at an elevation of between 8,500 and 12,000 ft. above the sea, extensive forests of great beauty and local importance. The Texano-Arizona forests, or rather the Mexican species which form the stunted and scraggly growth of the dry and barren valleys and low, detached mountain ranges of the extreme southern portions of the United States, are confined in Texas to the southern and western portion of the state, and to the southern portion of New Mexico, Arizona, and California. The most important species of this group, the mesquit (prosopis juliflora), extends from the Gulf of Mexico nearly to the shores of the Pacific. The wood of the mesquit furnishes admirable fuel and a practically indestructible building material; while its long and abundant pods, rich in sugar, yield nutritious forage to all grazing animals. The mesquit, within the limits of the United States, reaches its greatest development in the valleys of southeastern Arizona, here forming a tree nearly 50 ft. in height with a trunk 18 to 24 in. in diameter. In western Texas, where the yearly burning of the prairie grass prevents the growth of more than annual shoots, the roots of the mesquit attain immense development, and yield the only fuel of the region. Here the anomaly is seen of a single slender stem, a few feet only in height, springing from roots often several tons in weight. Such growths of the mesquit are locally known as “underground forests.” Several peculiar oaks and pines of Mexican origin cover the mountains of southern New Mexico and Arizona. Various arborescent succulents characterize the Texano-Arizona flora. Of these the largest (gusca brevifolia) forms a forest of considerable extent on the Mohave desert of southeastern California, where also a noble palm (Washingtonia filifera) is sparsely distributed. The most magnificent plant, however, of this southern flora, is the socalare, or giant cactus of southern Arizona (cereus giganteus), the largest representative of the family, its great, bare, fluted columns often attaining 60 ft. in height. Taken as a whole, the Texano-Arizona flora, with the exception of the mesquit, contains no arborescent species of first-rate economic importance.

FORTUNY, Mariano, a Spanish painter, born at Rents, in Catalonia, June 11, 1838, died in Rome, Nov. 21, 1874. The lithographs of Gavarni, which Fortuny (who had painted altarpieces but developed no decided style) first saw in 1855, set him to studying the life of the people. He began with ardoc the practice of sketching popular types, which he sought in the streets, in the theatre, and wherever he could find interesting subjects. In 1857 he won the Rome travelling pension. In 1860 he was commissioned by the municipal authorities of Barcelona to accompany the Spanish military expedition to Morocco, and make studies for compositions to commemorate the campaign. His friends remarked a surprising development in the innumerable sketches which he took in Africa, and which were of great value to him in his later works. In 1861 he painted the “Negro’s Head.” His painting of the “Battle of Tetuán” was last unfinished at his death. In 1863 he returned to Rome. Fortuny at this time began to make etchings, and produced oil paintings and aquarelles in greater numbers, most of them being single figures and slight subjects of the nature of studies, though their execution was careful and complete. In 1863 he had an attack of miasmatic fever, which sapped his robust constitution and finally carried him off at an early age. In 1866 he went to Paris, where his work was brought before the public in such a way by Goupil that his pictures afterward realized large sums, instead of the low prices he had been obliged to take from a few discerning admirers. In 1868 he married a sister of the painter Madrazo. Fortuny’s finished works are few, on account of the extreme thought and pains which they cost him; but his studies and water-color drawings, and even his etchings, are so full of force and original beauty that they are highly prized. Of all the painters of the new Spanish school, from which has issued one of the most genuine and vigorous art movements of the 19th century, none approaches Fortuny in power and thought; and few artists of any age have possessed so keen an instinct for the picturesque in form or in color. Fortuny’s best pictures include: “A Spanish Marriage,” “The Sword Sharpener,” “The Tamer of Serpents” (in the A. T. Stewart collection, New York), “A Moorish Fantasia,” “The Print Collector,” and “The Academicians of Arcadia.”

FRANCS, Joseph, an American inventor, born in Boston, Mass., March 12, 1801. He has been devoted to boat building from his boyhood. At the age of 10 he exhibited a fancy boat at a fair, and at 18 received from the Massachusetts mechanics’ institute the first prize for a fast row boat. He afterward established a boat yard in New York. In 1830 he built the first boat for the New York boat club. This was subsequently presented to the emperor of Russia, and replaced by a hand- some one, the Seadrift, which Mr. Francis constructed entirely by his own hands. This craft is 80 feet long, of chestnut oak, panelled with ebony, rosewood, and mahogany, and put together with copper rivets. Soon after this he built a four-oared race boat, to take part in a regatta at Chicago, the first American boat that had competed in a regatta with foreign-built boats, and she came off victorious. She was of Spanish cedar, 80 ft. long. Mr. Francis built a Venetian gondola, for use on the Hudson river, which was afterward transferred to Greenwood cemetery. He next invented a portable boat that could be taken apart and put together in a few minutes with
screws; and also a method of building boats over a frame or mould, with inch-square strips of cedar nailed edge to edge. But his greatest achievements have been in the construction of life boats. These began with experiments on wooden life boats, and culminated in the invention of the corrugated metallic life boat. After overcoming many difficulties in the production of efficient dies, he completed his first life boat in 1844. In 1845 he obtained patents in the United States, England, France, Germany, and Russia, for his method of constructing vessels of corrugated sheet metal, and for the machinery whereby they were produced. Life boats built on this principle were furnished for the Dead sea and Arctic expeditions, to the war, navy, and treasury departments, and to several European governments. One of his life cars was placed on the coast of New Jersey, near Long Branch, in 1849. In January, 1850, the ship Ayrshire was wrecked on Squan beach in a storm, and of the 201 persons on board 200 were saved by means of this life car. One man, who insisted on attempting to ride through the surf on the outside of the car, when his children were inside, was lost. This car is still preserved in the museum at Central park, New York. Mr. Francis has extended the application of corrugated metal to the building of steamers, floating docks, harbor buoys, and pontoon wagons. Among his inventions are a military hood for the protection of sentinels in a storm, a circular yachting, and a double-joint rowlock. He has received numerous medals and decorations from European sovereigns. He now (1888) resides at Tom's River, N. J.

FREYINET, Charles Louis de Saussure de, a French statesman, born at Foyx, Nov. 14, 1838. He was educated at the polytechnic school of Paris, graduated in 1845, and was engaged as a government engineer. From 1860 to 1861 he was chief engineer of the railways of southern France, and his powers as an organizer proved so great that his system was adopted by all the French railroads. He published at this time treatises on mechanics and railroad engineering, which are now used as text-books. He took up the study of sociology and political economy, and was commissioned by the French government to various scientific and industrial missions at home and abroad. His work on the labor of women and children in English factories was crowned by the academy in 1869; and through his efforts the laws of France were amended in the interest of working women and children. He also devoted much attention to the sanitary management of cities. In 1864 he received the rank of an ordinary engineer of the first class, and when the Franco-Prussian war broke out he was a member of the government on the right bank of the Garonne. Later he became prefect of that department; and when Gambetta came into the provinces in October, 1870, as leading minister of the outer delegation of the government of national defence, he intrusted Freyinet, at Tours, with the supreme control of the war department. In this capacity Freyinet rendered immense services to the country in the improvisation of armies. At the conclusion of peace he retired to private life, and wrote "La guerre en province pendant le siège de Paris," 1871. In January, 1876, he was elected to the senate from the department of the Seine, being one of Gambetta's candidates. He was minister of public works in the cabinets of Dufaure and Waddington; and when Waddington's ministry was broken up in December, 1879, Freyinet succeeded him as premier, becoming president of the council and foreign minister. The breaking up of the Jesuit establishments in France was the first important work of his administration. His subsequent moderation in dealing with the other unauthorized ecclesiastical orders caused a split in his cabinet, and led to his resignation, Sept. 19, 1880, Jules Ferry becoming his successor as premier.

FURNIVALL, Frederick James, an English philologist, born at Egham, Surrey, Feb. 4, 1825. He was educated at University college, London, and Trinity hall, Cambridge, has devoted himself to the study of early and middle English literature, and is one of the founders of the new school of English philology. Under his care, as secretary of the philological society, the collection of materials for an exhaustive dictionary of the English language was begun about 1857, and continued for several years. He established the "Early English Text Society" in 1864, the "Chaucer Society" and the "Ballad Society" in 1868, and the "New Shakespeare Society" in 1874. He has raised and expended nearly £20,000 in the printing of early manuscripts and rare books, many of which he has edited himself, either for the above-named societies or for the Roxburghe club. These include "Salut Graal: the History of the Holy Grail, in English verse by Henry Boa-

FURNIVALL, Frederick James, an English philologist, born at Egham, Surrey, Feb. 4, 1825. He was educated at University college, London, and Trinity hall, Cambridge, has devoted himself to the study of early and middle English literature, and is one of the founders of the new school of English philology. Under his care, as secretary of the philological society, the collection of materials for an exhaustive dictionary of the English language was begun about 1857, and continued for several years. He established the "Early English Text Society" in 1864, the "Chaucer Society" and the "Ballad Society" in 1868, and the "New Shakespeare Society" in 1874. He has raised and expended nearly £20,000 in the printing of early manuscripts and rare books, many of which he has edited himself, either for the above-named societies or for the Roxburghe club. These include "Salut Graal: the History of the Holy Grail, in English verse by Henry Bone-

Legend, A. D. 1808), and the Old-French Poem on which it is founded" (1862); "Political, Religious, and Love Poems" (1866); "The Book of Quaint Essence" (1886); "Bishop Percy's Folio Manuscript of Ballads and Romances" (2 vols., 1897-'98); "Ballads from Manuscripts on the Condition of Tudor England, 1520-50" (2 vols., 1866-'73); "Caxton's Book of Curteseye" (1866); "A Six-Text Print of Chaucer's Canterbury Tales, from the Manuscripts of Lord Ellesmere, Lord Leconfield, Mr. W. E. W. Wynne of Peniarth, the Cambridge University Library, Corpus Christi College, Oxford, and the British Museum" (7 parts, 1876-'78); "The Oxford Edition of Chaucer's Minor Poems" (1876); and "William Godward's Three Satires" (1877). Mr. Furnivall brought about a reform in the case of the ballast heavers, and was a member of
the executive committee of the workingmen's college, London, in which he taught regularly for more than ten years.

**Fusion Disk**, an instrument by which steel bars may be cut in two as a piece of wood is cut by a saw. It is the invention of Jacob Reese of Pittsburgh, Pa. It is a circular saw, of soft iron, and it fuses steel bars which are brought into close proximity to it without touching. The bar to be cut is made to revolve in the contrary direction with a speed of 200 revolutions a minute. The revolving disk is 48 inches in diameter, 1 inch thick; it is mounted on an arbor and set in motion with pulleys and belts, like an ordinary circular saw, and turns with a velocity of 2,300 revolutions, equal to a tangential velocity of 25,300 feet a minute. When the bar is brought almost into contact with the revolving disk, a small drop of molten metal appears on its surface. In a few seconds a notch is made, the molten metal flowing downward in a stream of sparks, and being thrown in sparks in all directions. The incandescent sparks, when they first leave the bar, are not hot. These sparks or drops of fused metal are of dazzling whiteness, yet their temperature differs but little from that of the surrounding atmosphere. In their path through the air those sparks which are projected sidewise acquire heat from the friction. At the distance of five feet or more they burn like a red-hot poker, while their vivid incandescence has given place to a dull red color.

**Gale, William**, an English painter, born in London in 1822. He entered the schools of the royal academy in 1841, carried off three medals, and in 1845 exhibited "Young Cela don and his Amelia." He went to Italy in 1851, spent several years in Rome, and in 1862, and again in 1867, visited the Holy Land, since which time he has dealt mainly with Scriptural subjects. His pictures are noted for their minute accuracy and finish. They include "Chancer's Dream," "A Peep at the Carnival," "Going to the Sistine Chapel," "The Return of the Prodigal," "Cupid's Ambassador," "Abraham and Isaac on the Way to Sacrifice," "Eastern Springtime," "Spoils of War," "Sick and in Prison," "Little Grandma," and "An Algerian Interior."

**Garfield, James Abram**, 20th president of the United States, born in Orange, O., Nov. 19, 1831, died in Elberon, N.J., Sept. 19, 1881. He lost his father in his infancy, worked on a farm in his youth, and for three months was a canal boatman. He was a pupil and afterward a teacher in the public schools, then attended the Eclectic institute (now Hiram college) at Hiram, Portage co., where he was fitted for Williams college, graduating at the latter institution in 1856, and carrying off the metophysical honor. Returning to Hiram, he became a teacher of languages in the school, and in 1857 its president. During this time he also studied law and was admitted to the bar. In 1859 and 1860 he was a member of the state senate. In 1861 he entered the army as colonel of the 43d Ohio volunteers, and served in Kentucky, where, in command of a brigade of 1,400 men, in January, 1862, he defeated 5,000 under Humphrey Marshall near Paintville, and drove them out of the state; for which he was made a brigadier general, being the youngest in the service. He subsequently served at Shiloh, at Corinth, and in Alabama, and in 1868 was appointed chief of staff of the army of the Cumberland, under Gen. Rosecrans. For gallantry at the battle of Chickamauga, he was made a major general of volunteers. He had been elected to congress in 1862, entered it in 1863, and was reelected eight times. In the house he had served on the committees on ways and means, Pacific railroads, rules, and banking and currency, and had been chairman of those on military affairs, appropriations, and others, becoming best known to the country in his connection with the committee on appropriations. From the time of the removal of Mr. Blaine to the senate in 1876, Gen. Garfield was recognized as the leader of the Republican side of the house, and he was its candidate for speaker in 1877 and 1879. In January, 1880, he was elected United States senator from Ohio, to succeed Allen G. Thurman, for the term beginning March 4, 1881. In the Republican national convention held in Chicago, June 2–8, 1880, after a long contest in which Gen. U. S. Grant, James G. Blaine, and John Sherman were the principal contestants for the presidential nomination, most of the opponents of Gen. Grant united upon Mr. Garfield; and he was nominated on the 36th ballot, receiving 399 votes, against 806 for Gen. Grant and 50 scattering. He was elected in November by the votes of nearly all the northern states, and was inaugurated March 4, 1881. His nominations for cabinet appointments, which were promptly confirmed, were as follows: Secretary of State, James G. Blaine, of Maine; secretary of the treasury, William Windom, of Minnesota; attorney general, Wayne McVey, of Pennsylvania; postmaster general, Thomas L. James, of New York; secretary of the interior, Samuel J. Kirkwood, of Iowa; secretary of war, Robert T. Lincoln, of Illinois; secretary of the navy, William H. Hunt, of Louisiana. In the time that intervened between the election and the inauguration, many of the party leaders had been called for consultation to Mentor, O., the home of the president-elect, among them his chief opponent, Senator Con kling, and it was believed that every necessary measure had been taken for a harmonious administration. But a difficulty soon appeared when the president nominated William H. Robertson for collector of the port of New York, and Mr. Conkling opposed the confirmation, on the ground that he should have been consulted as to all nominations for federal
offices in his own state. The contest became quite bitter, and resulted in the resignation of both senators from New York and a temporary division of the party. On the 2d of July, as the president entered the railway station at Washington, accompanied by Secretary Blaine, to take a train northward for a tour through New England (Mrs. Garfield intending to join him on the way), he was shot in the back by an assassin who had been watching his movements for weeks. The murderer was an unsuccessful office-seeker, whose motive was partly revenge for being refused an appointment, and partly, if not mainly, a morbid desire for notoriety. He was tried in Washington, found guilty, and hanged June 30, 1882. The wounded president was at first carried to the office of the company, on the second floor of the building, and after an examination of the wound was taken back to the executive mansion. The physicians believed that the wound was not necessarily fatal, but that it was unadvisable to attempt to extract the bullet. It had fractured the right eleventh rib, and its course thence was believed to have been forward and downward, perhaps grazing the liver. The president remained at the White House, with varying symptoms, till the heat of the season began to have a decided effect, in spite of the fact that his apartment was kept cool by artificial means. On the 6th of September he was removed to the Franklyn cottage at Elberon, Long Branch, by a special train fitted up for the purpose. The speed was at times as high as sixty miles an hour, and the car was run to the door of the cottage on a track three quarters of a mile long that had been laid across the lawns for the occasion. Here the patient remained, with fluctuating symptoms, till the 19th, when at half-past 10 o'clock in the evening he expired. The autopsy showed that the diagnosis of the wound had been totally wrong. What was taken for the track of the ball proved to be a cavity produced by the burning of pus. The ball had crossed to the left side of the spinal column, passing through the front of it, and splintering it, and lodged below the pancreas, where it became encysted. The physicians' report said: "The immediate cause of death was secondary hemorhage from one of the mesenteric arteries adjoining the track of the ball, the blood rupturing the peritonæum, and nearly a pint escaping into the abdominal cavity." The general conclusion was, that the wound was necessarily mortal, and that nothing more could have been done if the diagnosis had been correct. The body was taken to Washington, where it lay in state in the rotunda of the capitol on the 22d, and was then carried to Cleveland, O., where the funeral services were held on the 28th, and the remains deposited in a tomb in Lakeview cemetery. President Garfield was a member of the sect called Disciples. He married in 1855 Lucretia Rudolph, who had been his pupil at Hiram. She and three children survive him. After his death a popular subscription realized over $380,000, of which the income is to be paid to Mrs. Garfield during her life, and the principal to be divided among the children after her death. More than forty of Garfield's congressional speeches have been published in pamphlet form, and also his oration on the life and character of Gen. George H. Thomas. A volume of brief selections, entitled "Garfield's Words," was compiled by W. R. Babcock (Boston, 1881). His "Works," edited by Burke A. Hindsdale, were published in Boston in 1882 (3 vols., 8vo).

**GARRET, Edward.** See Mayo, Isabella, in supplement.

**GAY.** 1. Sydney Howard, an American historian, born in Hingham, Mass., about 1850. He graduated at Harvard college, and began the study of law in his father's office in Hingham, but gave it up because his conscientious scruples on the subject of slavery would not permit him to take the oath to support the constitution of the United States. After some experience as an anti-slavery lecturer, he was for several years editor of the "Anti-Slavery Standard." Resigning this post in 1858, he joined the staff of the New York "Tribune," of which journal he was the managing editor from 1862 till July, 1865. From 1867 till November, 1871, he was the managing editor of the Chicago "Tribune." Later he was associated with William Cullen Bryant in the New York "Evening Post," and through that relation became the author of an illustrated "History of the United States" (4 vols. 8vo, New York, 1876-80), to which Mr. Bryant's name was, with his consent, prefixed by the publishers. This history begins with the prehistoric races of America, and is brought down to the close of the civil war. Mr. Gay resides on Staten Island.

2. Winchworth Allen, an American painter, brother of the preceding. He was a pupil of Robert Weir, and studied in Italy and France, a part of the time with Troyon. He resides in Boston, where he has attained reputation as a delineator of mountain and sea-coast scenery. He has travelled in Egypt, China, and Japan. "A Scene in the White Mountains," painted for the Boston Athenæum, and "A Scene in Japan," painted for the Somerset club of Boston, are specimens of his earlier and later styles.

**GEIKIE, Archibald,** a Scottish geologist, born in Edinburgh in 1855. He was educated at the university of his native city, and in 1855 was appointed to the geological survey. He was associated with Sir Roderick Murchison in working out the true geological structure of the highlands, and in preparing a new geological map of Scotland. In 1867 he was appointed director of the survey, and in 1870 accepted the new chair of mineralogy and geology at Edinburgh. He has published the following works: "The Story of a Boulder" (1858); "Life of Edward Forbes," conjointly with Dr. George Wilson (1891); "The Phenomena of the Gla-
cial "Drift of Scotland" (1853); "Scenery in Scotland viewed in connection with its Physical Geology" (1855); "A Student's Manual of Geology," conjointly with J. B. Jukes (1871); "Physical Geography" and "Geology," in the series of science primers (1874); "Memoir of Sir Roderick I. Murchison, with Notices of his Scientific Contemporaries and of the Rise and Progress of Palaeozoic Geology in Britain" (2 vols., 1874); "Geological Map of Scotland" (1870); "Class Book of Physical Geography" (1877); and "Text-Book of Geology" (1882).

GEIKIE, Cunningham, an English clergyman, born in Edinburgh, Oct. 26, 1826. He is the son of a Presbyterian minister, and was educated at the high school and the university of Edinburgh. He followed his father to Canada, became pastor of a church near Toronto, and afterward was called to one in Halifax. In 1852 he accepted a pastorate in Sandhead and England, and five years later was called to old Islington chapel, London. In 1873 he relinquished his pastorate, devoting himself to literature. But in 1876 he took orders in the established church, and became assistant clergyman at St. Peter's, Dalwich. From 1879 to 1881 he was rector of Christ church, at Neurilly, Paris; and in May, 1888, Mr. Gladstone presented him to the living of St. Mary, Barnstaple, Devonshire. Dr. Geikie is an advocate of temperance and a champion of the evangelical party in the church, a frequent contributor to periodical literature, and a popular lecturer. He has published "The Backwoods of Canada" (London, 1864); "Entering on Life," a book for young men (1869); "The Great and Precious Promises" (1873); "The Life and Words of Christ" (1877); "Old Testament Portraits" (1879); "The English Reformation, and why we should uphold it" (1879); and "Hours with the Bible; or the Scriptures in the Light of Modern Discovery and Knowledge" (5 vols., 1881 et seq.).

Most of his works have been republished in the United States. The "Life of Christ" has passed through 25 editions in England and several in this country.

GEORGIA. The population in 1850 was 1,542,180, of whom 762,981 were males, 779,199 females, 1,581,616 natives, 10,564 foreign, 816,906 whites, 725,138 colored. The chief agricultural productions were 28,209,018 bushels of corn, 5,548,749 of oats, 101,716 of rye, 3,159,771 of wheat, 14,499 tons of hay, 601 hogheads of sugar, 1,565,748 gallons of molasses, 28,369,687 lbs. of rice, 814,441 bales of cotton, 226,980 lbs. of tobacco, 249,690 bushels of Irish and 4,897,778 of sweet potatoes; number of horses, 98,520; mules and asses, 192,078; working oxen, 50,026; milch cows, 815,078; other cattle, 644,812; sheep, 527,589; swine, 1,471,008; value of manufactures, $36,440,948.—The report of the treasurer for the fiscal year from Oct. 1, 1881, to Sept. 30, 1882, shows that the total amount received in the treasury was $2,403,978 61, and the disbursements were $1,713,507 48, leaving a balance in the treasury, Oct. 1, 1882, of $690,473 15, in which are included $275,000 in bonds of the state of Georgia ($115,000) and in United States registered bonds ($160,000) paid by the purchasers of the Macon and Brunswick railroad, and the suspended balances due from the Citizens' bank of Atlanta ($53,218 51) and from the Bank of Rome ($22,508 42). Deducing this unavailable amount, $350,424 74, from the stated balance of $450,472 15, the actual cash balance on Oct. 1, 1882, is $310,047 41.—The public debt of the state is $9,624,135, the annual interest on which amounts to $464,440. Of this debt, $100,000 mature in 1898; $100,000 in 1894; $175,685 in 1898; $4,000,000 in 1886; $2,989,000 in 1899; $937,500 in 1892; $543,000 in 1886; $2,298,000 in 1898; and $8,000 in 1892. The greater portion of this sum bears 7 per cent. interest. In addition to this bonded debt, the state is liable absolutely and contingently as endorser on bonds of the South Georgia and Florida railroad amounting to $464,000, and on the bonds of the Northeastern railroad amounting to $280,000.—The property owned and possessed by the state consists of the Western and Atlantic railroad, 188 m., leased at an annual rental of $300,000, the lease having 9 years to run; Macon and Brunswick railroad, 196 m., sold for $1,125,000, of which $625,000 are yet due; bonds of the Marietta and North Georgia railroad, $68,288 62; 186 shares of the Georgia railroad and banking company, $25,000, and 446 shares of the Southern and Atlantic telegraph, guaranteed by the Western Union Telegraph company, $10,000. The estimated receipts at the treasury for the year ending Dec. 31, 1888, are $1,350,000, and the estimated disbursements for the same period $1,381,817 14. In 1877 the public debt was $11,044,000, with an annual interest of $800,000. In 1876 the state had a floating debt of $258,000, all of which has been extinguished. The report of the comptroller general presents a very encouraging exhibit of the material condition of the state. The property of Georgia, as returned for taxation for the year 1889, shows an increase of $16,255,150; the whole amount of taxable property being returned at $287,249,408. The increase for 1881 was $18,977,611, making the total growth of wealth for the two years $55,233,761, yielding, at the existing rate of taxation (8 mills on the dollar), additional revenue to the amount of $105,698. The table on the next page shows in a consolidated form the aggregate value of the whole property in Georgia returned for taxation for the years 1881 and 1889. The number of polls returned by colored tax-payers for 1882 is 93,835, owning property, real and personal, of the aggregate value of $6,589,876. The report of the comptroller general as to the increase of revenue and its
assured permanence induced the general assembly, at its session in November and December, 1882, to reduce the rate of taxation from 6 to 5 mills.—The aggregate value of the taxable property of railroads in Georgia, as returned by their authorized agents for the year 1882, is $18,739,429. Their business during the year, notwithstanding the reduction of their rates and fares by the railroad commission, and the increased competition, has been satisfactory. The roads generally are in good order; steel rails are being substituted for iron; their equipment has been much improved, and faster schedules are being adopted; 325 miles of new railroad were constructed during the year.—The University of Georgia, at Athens, Clarke co., including the state college of agriculture and the mechanic arts, the medical college at Augusta, and the branch preparatory colleges at Dahlonega, Milligetville, Cutlertib, and Thomasville, shows a marked improvement. The total number of students for the collegiate year ending July 19, 1883, was 1,103. —The year 1883 shows a steady growth in the attendance of pupils at the public schools. The aggregate of school population was 507,861. In 1882 the state fund, estimating the poll tax at the same as in the previous year, amounts to $441,114 88. And if the sum raised under local laws in counties and cities prove to be the same, that is, $134,535 96, the whole sum raised in the state for the support of the public schools would amount to $775,270 84, or $77,000 increase as compared with the previous year. The school law requires that in every county arrangement shall be made for keeping the schools in operation at least three months of the year. This is an essential condition to a right to draw the pro rata of the school fund of the state. This was done in 1882 in every county by the parents of the school children agreeing to supplement the sum paid by the state, and thus the entire people enjoyed the benefits of the common schools. In an enumerated school population—between the ages of 6 and 18—of 226,819 white and 197,132 colored, making in all 423,944, the number of illiterates between 10 and 18 years is, whites 22,928, colored 63,807; and over 18, the number unable to read is, whites 20,889, colored 143,494. There are 1,080 private elementary schools scattered over the state, with 1,183 instructors, teaching whites 26,822, colored 6,671 —total, 33,493 children. Of male and female colleges, including Mercer university (Baptist), and Fio Nono college (Roman Catholic) at Macon, and Emory college (Methodist) at Oxford, and not counting the university of Georgia and its branches, there are 11 institutions of high grades, with upward of 2,000 students. The Atlanta university, where colored students exclusively are educated, and for the support of which the state appropriates annually $5,000—a sum equal to that paid to the university of Georgia in payment of her debt to that institution—is well conducted, and is doing successful work.—The "New South" has made wonderful progress in manufactures during the past few years, and Georgia is in the lead. Cotton goods are necessarily the chief manufacture; but iron foundries, oil mills, shoe factories, &c., have sprung up in various parts of the state, and they are all prosperous. The Atlanta cotton exposition of 1881 has given a great impetus to manufacturing industry. The principal cotton factories are at Augusta and Columbus, the former using the water-power supplied by the canal, and the latter the water of the Chattahoochee river. The factories now in operation at Augusta are: the Augusta factory, capital $1,000,000; consumes annually 13,054 bales of cotton; number of looms, 779; number of spindles, 26,000; producing 16,500,000 yards of goods. The Enterprise factory, capital state, and thus the entire people enjoyed the benefits of the common schools. In an enumerated school population—between the ages of 6 and 18—of 226,819 white and 197,132 colored, making in all 423,944, the number of illiterates between 10 and 18 years is, whites 22,928, colored 63,807; and over 18, the number unable to read is, whites 20,889, colored 143,494. There are 1,080 private elementary schools scattered over the state, with 1,183 instructors, teaching whites 26,822, colored 6,671 —total, 33,493 children. Of male and female colleges, including Mercer university (Baptist), and Fio Nono college (Roman Catholic) at Macon, and Emory college (Methodist) at Oxford, and not counting the university of Georgia and its branches, there are 11 institutions of high grades, with upward of 2,000 students. The Atlanta university, where colored students exclusively are educated, and for the support of which the state appropriates annually $5,000—a sum equal to that paid to the university of Georgia in payment of her debt to that institution—is well conducted, and is doing successful work.—The "New South" has made wonderful progress in manufactures during the past few years, and Georgia is in the lead. Cotton goods are necessarily the chief manufacture; but iron foundries, oil mills, shoe factories, &c., have sprung up in various parts of the state, and they are all prosperous. The Atlanta cotton exposition of 1881 has given a great impetus to manufacturing industry. The factories now in operation at Augusta are: the Augusta factory, capital $1,000,000; consumes annually 13,054 bales of cotton; number of looms, 779; number of spindles, 26,000; producing 16,500,000 yards of goods. The Enterprise factory, capital
GEORGIA

$550,000, consumes 12,000 bales; number of looms, 900; number of spindles, 30,000; producing 13,000,000 yards. The Sibley mills, capital $1,000,000, consuming 18,000 bales; number of looms, 800; number of spindles, 30,000; producing 12,000,000 yards. The Summerville mills, capital $100,000, consuming 1,500 bales; number of looms, 150; number of spindles, 4,000; producing 2,250,000 yards. The Globe (private enterprise), consuming 2,000 bales; number of spindles, 5,000, producing warps and yarns. Riverside works (private), consuming 2,000 bales; number of spindles, 2,400, producing warps and yarns. Sterling mills (private), consuming 1,000 bales; number of spindles, 2,800; producing warps and yarns; and Goodrich (private) consuming 600 bales; number of spindles, 2,000; producing warps and yarns. The John P. King mills, in process of construction, and nearly complete, have a capital of $1,000,000, and will run 750 looms and 25,000 spindles. Total number of looms, 3,879; spindles, 128,000; bales of cotton consumed during the year, 57,100. The Augusta factory has paid in cash dividends from 1885 to 1889, $1,467,000, or about two and a half times its capital. Besides this, it has a surplus of between $340,000 and $350,000, or over 50 per cent. of its capital. Its stock is worth $170 a share. The Augusta Crescent and Excelsior flour mills manufactured during the year 140,000 barrels of flour, valued at $1,050,000, and 750,000 bushels of meal, valued at $367,500. Another large and growing industry at Augusta is the Georgia chemical works, with a capital of $500,000, for the manufacture of fertilizers. They made and sold during the year 15,000 tons, half of which amount was ammoniated and half acid phosphate. A factory has been built and is in operation at Kirkwood, near Atlanta, where sulphuric acid is made out of the iron pyrites, thousands of tons of which are scattered over the rocky hills, and at a much less cost than it could be produced from the imported sulphur. In immediate proximity to these works are two fertilizer factories, a cotton-seed-oil mill, and works for the reduction of copper. The principal factories at Columbus are: the Eagle and Phenix mills, capital $1,250,000, running 45,710 spindles and 1,600 looms, making 100 varieties of goods; the Columbus manufacturing company, capital $285,000, running 4,156 spindles and 136 looms, making sheetings and domestics; Muscogee manufacturing company, capital $107,000, running 5,000 spindles and 240 looms, making cotton and domestics; the Steam Cotton mills, capital $30,000, running 3,000 spindles, making yarn and thread; the Excelsior mills, capital $25,000, running 96 looms, making checks and plaid; and A. Clegg & Co., capital $10,000, running 48 looms, making checks and stripes. Besides the above, there are at Columbus a jute factory, turning out 2,000 yards of bagging daily; iron works, plough factory, two large flour mills, a trunk factory, a clothing factory, a paper-box factory, and a gaslight company, with an aggregate capital of $2,048,500. There is a cotton factory at Atlanta, three at Athens, and small mills in other parts of the state. A number of cotton-seed-oil mills have been started, or are being built. Brown factories, works for the manufacture of wooden ware, ice factories, carriage and wagon factories, and other industries have sprung into existence. The report of the comptroller general estimates the value of the iron works in the state in 1889 at $569,231, an increase of $219,282, as compared with their value in 1881. His estimate of the amount of capital invested in mining in 1882 is $127,622, as compared with $101,675 in 1881. The lumber interest has grown largely. The exports coastwise from the port of Savannah alone up to Aug. 31, 1889, were 57,866,627 feet, and the foreign exports 14,675,279, making a total of 72,043,906 feet. The production of tarantine and naval stores from the immense pine forests has increased largely. The exports from Savannah for the year ending Aug. 81 were: turpentine, 1,635,560 gallons, worth $788,593; rosin, 168,408 barrels, worth $408,418. The population of the principal places, by the census of 1880, was: Atlanta, 87,409; Savannah, 80,709; Augusta, 21,891; Macon, 12,749; Columbus, 10,193; Athens, 6,099. See map at beginning of this supplement.

GERM THEORY OF DISEASE, the doctrine that infectious diseases are caused by living microscopic organisms, whose germs have entered the animal structure in air, food, or drink, through wounds, or in other ways, which multiply within the body to a sufficient extent to interfere with the vital processes, consuming or preventing the healthy formation of the substance of the fluids or tissues. The discovery of the infusoria by Leeuwenhoek, followed by that of the spermatozoa in 1877, which were at first supposed to be real animals, was the occasion of the revival and wide acceptance of the germ theory, which had been advanced more than once during the middle ages. Among the advocates of the theory in the succeeding period were Kircher, Lancisi, Vallisneri, Réaumur, and Linnaeus. In the earlier half of the 19th century the repeated mistakes of over-ingenious investigators, who announced that they had discovered the animalcules of smallpox, of cholera, and of other epidemic diseases, again and again, only to find that they had been misled by the bacteria of putrefaction, brought the germ theory into disrepute. Henle, a distinguished German physiologist, who maintained the doctrine of contagium vivum as early as 1840, and elaborated the theory with great ability in 1853, was almost alone in his pathological opinions. The indefinite extent of the action of infectious poison, which spreads throughout the whole organism whose tissues or fluids are contaminated in only a single particle, and which can
be communicated by inoculation from one organism to another without end, and will manifest in the thousands and thousands subject the same destructive vigor as at the outset, finds only two analogies in the other processes of nature: certain chemical phenomena, such as combustion, and the growth and reproduction of living organisms. At the time when the doctrine of living contagium was most discredited, the chemical theory was resorted to as a necessary alternative. The pathological phenomena of this class of diseases were held to be strictly analogous to the process of fermentation. Hence they were called zymotic or ferment diseases. The convincing evidence obtained in the experiments of Schwann and Pasteur of the organic nature of the different kinds of fermentation left the opponents of the germ theory without any etiological hypothesis. The absence of all direct evidence of the presence of animalcules in the body affected by the morbific symptoms prevented the ancient and natural explanation by contagium vivum from overcoming the disfavor into which it had been brought by overbold speculation in preceding generations. In the course of a few years, however, the discoveries by Davaine, Koch, Cohn, Klein, and Pasteur of specific bacterial forms as the attendants of certain affections which have been classed with the zymotic diseases have brought the germ theory of disease into higher credit than it had ever enjoyed before. The tendency to revert to this doctrine received a strong impulse from the discoveries made in the life history of certain entozoic parasites—the identification of the tapeworm with the cestode, the discovery of the sexual process of the trichina, and of the manner in which both these organisms find their way into the human system. The brilliant dialectic of Pasteur and Tyndall, and their heated controversy, as upholders of the germ theory of fermentation and disease, with the advocates of spontaneous generation, have obtained for this and the allied questions a wide popular interest. The germ theory, which had been advanced in its modern form by individual pathologists as a conjectural explanation of epidemics at the time of the cholera pestilences of 1832 and 1849, first won an influential support after Pasteur's discoveries of the parasitic origin of the silkworm epidemics and of the grape disease. Subsequent to Davaine's spirited controversy with Senan, Leplat, and other opponents regarding the organic nature of the poison of anthrax, the notion of contagium vivum obtained a strong hold upon the minds of the leading biologists and pathologists of Europe. In 1868 Davaine announced the rod-like bodies, observed by Pollender in 1855 and by Bransel in 1857 in the blood of animals and men, the victims of anthrax, to be genuine bacteria, or bacteridies, as he afterward called them, to distinguish them from the bacteria of putrefaction. Since that date the adherents of the germ theory have been constantly growing in numbers, until it has become the prevailing doctrine. Other diseases counted as infectious have been added since to be due to the propagation of living germs within the tissues; yet, with all the constantly accumulating evidence, the doctrine of parasitism, when applied to the most important and typical of the contagious and malarial diseases, still rests solely upon a theoretical basis. —The term "infectious" is applied to the class of diseases which it is sought to trace to the invasion of the body by living organisms, because they are due to some specific poisonous principle introduced into the system from without. These diseases collectively inmeasurably exceed, in the extent of their ravages and in the deadliness of their effects, all the other maladies which afflict mankind, and far overbalance all other causes of death. The constant uniformity of their symptoms, their specific character, and the fact that they are invariably due to specific causes, make the study of each disease a means of identifying its special disease, which conforms always to the one type and follows the same train of symptoms in every case, furnish not only the distinctive characteristics according to which infectious diseases are classified, but also, in connection with the contagiousness and unlimtedly propagable and inoculable qualities of most of them, the chief theorectical grounds for attributing them to living creatures multiplying within the fluids or fibres of the body. The idea of living contagia finds the most unquestioning acceptance and the most extensive application in Germany. A bacterial origin is claimed by prominent medical authorities in that country even for tuberculosis; and the efficacy of a novel cure for phthisis, which consists in inhaling fumes of the benzoate of sodium in large quantities, is attributed to the deadly effect of this substance upon the specific bacteria of the disease, to whose development in the lung tissue the tuberculizing process is due, which is believed to be effectually arrested when the characteristic bacteria are destroyed by the benzoic vapors. This view is sustained to some extent by the results of experiments with rabbits confined in an atmosphere impregnated with vapor of sodium benzoate, in which the disease refused to develop, although ordinarily these animals are peculiarly subject to tubercular consumption, and can be infected invariably by inoculation. The bacteria, or microdemes, as they have more recently been called, which are regarded as the causes of so much mortality among both men and animals, are classed by De Bary, Nageli, Cohn, and other German biologists as fungi, but by Dr. Burdon Sanderson and others are placed in the animal kingdom. Haeckel gives them, with the zoophytes, a position intermediate between the two kingdoms into which organic nature is divided. Anthrax, splenitis fever, or gangrene of the spleen (in German Milbrand, in French chardon)—which occurs primarily in herbivorous animals, but is communicable to
GERM THEORY OF DISEASE

man, and has occasionally raged as an epidemic in Asia and eastern Europe, notably in Russia, where it is known as the Siberian plague, in 1866—i.e., proved to be caused by filamentous bacteria which multiply with enormous rapidity in the blood. The disease is attended with carbuncle, and is allied to malignant pustule. The bacteriella or schizomyces, which constitute the specific poison of anthrax, are known at present under the name of bacillus anthracis. They are supposed to enter the body with dust. They fill even the smallest blood globules, but disappear entirely with the complete putrefaction of the blood. The facts that the blood of diseased animals soon lost its contagious qualities after death, while the disease would linger in a particular locality, reappearing in the same stable after several years of intermission, long puzzled investigators, until the researches of Koch cleared away the chief difficulties. Koch applied to the B. anthracis, which name he first bestowed upon this microbe, the method of cultivation which has been employed by Pasteur and other observers of minute organisms with most successful results. He found that while the bacterial forms observed in blood lost their vitality in about five weeks, the spores remained fertile for at least five years—a sufficient explanation of the mysterious tenacity with which the disease clings to particular spots, and returns after a disappearance of years. This bacillus is only distinguishable from the B. subtilis by the fact that while the latter is quite active, this one is motionless. It has been observed by Dr. Ewart, however, to pass through mobile stages at rare and irregular intervals. The similarity in the forms of the two bacteria has suggested the opinion that the B. anthracis is only a form of the ordinary B. subtilis, developed under certain circumstances. This hypothesis is based also on the fact that sudden inexplicable outbreaks of splenic fever occur at times among over-fed cattle. In a warm solution of the aqueous humor of an ox's eye, Koch observed a remarkably rapid growth of the anthrax bacillus. The short rods attaining in three or four hours 10 and 20 times, and ultimately 100 times, their original length; in some cases running out straight, in others following beautiful curves, and in others becoming intricately interlaced and forming a matted mass. After some time the spore formation followed. The spores developed within the integuments of the filaments along their entire length, and in due course the envelope disintegrated and the rods fell to pieces, releasing the infinitesimal ovoid germs. Another of the infectious diseases to which animals are subject, the hog cholera or typhoid fever of the pig, has been traced to bacterial germs by Dr. Klein, who gives to the complaint the name of infectious pneuomo-enteritis. He obtained the characteristic microbe, and cultivated it in infusions. This is also a bacillus, more delicate than the bacillus of anthrax, which has a mobile stage like the B. subtilis, and gives out spores and filaments like other bacilli. Both anthrax and pneuomo-enteritis have been communicated by inoculation to mice and rabbits; the latter, however, with difficulty. It differs essentially from the other disease in the entire absence of the disturbing bacteria from the blood of the diseased animal. Dr. Ehrlich in 1867 made the important discovery of spirilla in the blood of persons suffering from relapsing fever. They appeared in immense numbers when the paroxysm was approaching, but no trace of them was found after it was over. This organism, the sprochete Obermeir of Cohn, has been watched in its development in the blood of the diseased subject by Dr. Heydebreich, but not yet observed in the spore stage. The blood, in which alone this spirillum has been found, is infective, but only during the paroxysm; at that period the microbe swarms in the blood, but disappears entirely during the remission of the attacks. This bacterium cannot be distinguished in its form from other organisms which are innocuous. This fact, which holds true also of the bacillus anthracis, and the further analogy that this disease breaks out during famine, while anthrax frequently accompanies repletion, afford grounds for supposing that these deadly agents are only special forms of common species developed under peculiar conditions. Davaine in 1860 was the first to detect bacteria in cases of malignant pustule. He found them in large groups in the centre of the pustules, between the epithelial cells, and in scattered groups separated by epithelial cells in the periphery of the pustules, whence they penetrate into the blood and lymph vessels of the skin. An affection related to anthrax is the recently discovered disease called mycosis intestinalis, which is characterized by the occurrence of immense numbers of bacteria and vibrios in the blood, and by purulent inflammation of the mucous coats of the stomach and intestines, with abundant schizomyces, as the bacterial agents of infection have been called. Extensive investigations have been undertaken for the specific bacteria of throat diphtheria. Micrococci and bacteria have been found of various kinds, and in any number, not only in the epithelium of the throat, but in the mucous and submucous coats, in the young exudation cells, in the lymphatic vessels, in the lungs, in the blood, urine, &c. The infectious character of this disease is well established. By inoculating rabbits with diphtheritic matter, peculiar and specific symptoms are produced. The micrococci have been observed to consume the entire nitrogenous contents of a cell in the space of 24 hours. On account of the constant presence of the ordinary bacteria of putrefaction, the characteristic bacterium of diphtheria, if there be one, has probably not yet been distinguished, unless, as has frequently been suggested, the ordinary vibrio of putrescent fermentation is the actual toxic agent in
the disease. Ewart and Simpson of London identify the specific microphyle of diphtheria with an exceedingly minute spore observed by them, which in a favorable medium germinates into long and very slender rods. When these spores are brought into contact with raw flesh, it is asserted that they give rise speedily to the formation of a diphtheretic membrane. Oertel, Klebs, and other German physicians hold that diphtheria is due to bacteria. Drs. Curtis and Satterthwaite assert, on the other hand, that the inoculation of rabbits with diphtheritic membrane produces only the same effects that putrescent infusions cause.—Septicemia is traced beyond question to living organisms. The discoveries which have been made by Burdon Sanderson, Tyndall, and others, relating to the origin of pyemic and other traumatic affections, have led to important reforms in hospital practice, which promise to obviate entirely the different forms of blood poisoning which have constituted the serious danger in hospital surgery. Two methods for the prevention of septic poisoning have been devised, both of which proceed upon the theory that the noxious principles are introduced into the wounds by microdemes. The method of Lister, which, modified and improved in many ways, has been extensively introduced, aims, by diffusing in the air carbolic acid, which is fatal to the microphyles, to prevent the living germs from coming in contact with the injured surface. The other method, the open-air treatment, has for its object the greatest possible dispersion of infectious organisms. The invasion of the damaged tissue by bacteria, generally supposed to be the common bacteria of putrescence, or the hay bacterium (bacillus subtilis), is admitted to be the cause of wound fever, supplicative processes, mortification, &c.; yet they do not produce these degenerative processes by preying upon the fibres or fluids, or by increasing in such manner as to interfere with functional activities; the degeneration in these cases is the effect of a specific poison developed by the microphyles, as is proved by the fact that the septic poison can be obtained free from all germs and organisms in a clear fluid, which, after being filtered, boiled, and subjected to every test for the presence of living germs, retains its virulent qualities, with the difference that it then acts as an ordinary chemical poison, the noxious effects being proportional to the quantity introduced. Dr. Sanderson has shown that, while normally the common bacteroid forms do not possess in a marked degree the property of producing the septic poison when coming in contact with living tissue, or even with decayed tissue in the living body, yet it can be developed with increasing potency by injecting infusions containing these forms into the peritoneal cavity of guinea pigs, or into the rectum of rabbits, and injecting it again into a second animal, and so on. The result of this experiment offers a striking analogy to the development of intensified malignancy during the continuance of con-

lagious epidemics. In 1878 Tyndall opened hermetically sealed infusions in a room in the Bernese Oberland, in which a few years before he had dressed a slight wound that was followed by an abscess, and found the air strongly impregnated with putrescative bacteria. In 1873 and 1879 Koch subjected septicaemia to a long and full series of experiments. He found that putrid blood injected under the skin of mice produced death in a few hours, yet the blood of the diseased animals exhibited no traces of bacterial life, and was incapable of producing symptoms of disease in other animals; the bacteria injected remained enclosed in the subcutaneous cellular tissue. The fact that a certain quantity of the fluid required to be introduced in order to produce the disease, led him to infer that the effect was due to the chemical action of the poison generated by the putrescative bacteria, to which the name of septin or sepsin has been given. In about one third of the subjects, however, a true infectious disorder was produced, a peculiar form of septicemia. The disease passed through a regular order of characteristic symptoms, and was followed after a certain period by death. He carried this infection through seventeen successive subjects. The diseased blood was found to swarm with a bacillus of a definite shape and size. No other bacteria injected with these bacilli spread in the living tissue. A micrococcus, however, occasionally occurred, which multiplied with great rapidity in the subcutaneous tissue. This microphyle, when injected into the ear of the mouse, produced progressive necrosis in the tissues of that organ, completely destroying them in a brief time. The septicaemic bacilli would not infect the field mouse at all, and the micrococcus, which threw in this animal, would attack the tissues of the house mouse only when its blood was infected with the septicaemic bacteria. Injection of putrid blood into rabbits produced a very different effect, causing abscesses to form in the subcutaneous tissues, which gradually increased in size, and produced death in a few days. Examination of the abscesses showed them to be surrounded by a thin layer of micrococcus in the zoogleia state. The granular contents of the abscesses appear to be derived from the zoogleia and the decomposed tissue which they infest. An infusion of the matter of the abscess invariably caused the same symptoms in healthy animals, but the injection of the blood of the dead rabbits had no effect. In pyemia artificially produced in rabbits, a micrococcus was observed in the blood, occurring singly or in pairs, but neither in chains nor in zoogleia forms, and of a different form and size from those attending other diseases. He infected rabbits also with both septicaemia and crypseias by putrescent infusions. The former was accompanied by death from micrococcus, and was capable of transmission; the latter was characterized by a small bacillus, and was not communicable.—Pasteur announced in 1879 that he had discovered the mi-
crophyles which are the toxic agents in malignant pustule and in puerperal fever. He is convinced by his researches that the bacterium discovered by Dany is the true cause of malignant pustule. He obtained the organisms by cultivation, the method introduced by him in 1857. Sowing a drop of blood from a case of malignant pustule in the froth of beer yeast, and repeatedly infecting new yeast froth with the organisms, he kept on hand for years a constant supply. Malignant pustules were produced in guinea pigs, sheep, and other animals, by inoculating them with this liquid. In the same manner he has cultivated and infected fowls with the germs of poultry cholera. The microscopic organisms which produce puerperal fever are described by Pasteur as an entozen containing two, four, or six cells united; the cells have an average diameter of two thousandths of a millimetre. — A heated controversy between the friends and the opponents of the bacterial hypothesis took place concerning the seminal particles conveyed by the virus of yaws, leprosy, and cowpox observed by Cohn, by Beale, and by other microscopists in smallpox lymph and in vaccine lymph. While Cohn, Prof. Klebs, and Dr. Sanderson declare these granules to be micrococci, Dr. Beale asserts that they have no structural form. All agree that they have not been observed propagating, and that the infection takes place without their multiplying. — The least success in tracing disease to organic germs has been obtained in those classes which first suggested the theory, and for which it is a matter of transcendent importance to human civilization to discover this or some other preventable cause—the miasmatic diseases, and the so-called miasmatico-contagious class which is represented by cholera and yellow fever. The bacterial theory as applied to miasmatic contagium and elaborated by Nägeli is, that the germs, which are ordinarily harmless, acquire their poisonous potency in a special development under abnormal conditions. Dr. Eklund of the Swedish navy announced in 1878 that he had discovered the specific microbe of malarial fever. The organism to which he claims to have traced the miasma he named the lymnophyllalis hyalina. Prof. Klebs of Prague and Tommasi of Rome passed several weeks in the spring of 1879 in the Agro Romano, a part of the Roman Campagna, in which marsh or intermittent fever is particularly prevalent, in investigating the cause of this disease. The organism to which they succeeded in tracing the disease, and which they call a fungus, is a bacillus in structure, with peculiar characteristics. It exhibits numerous movable, shining spores of elongated ovoid form. They give to this organism the name of bacillus malaris. It is very small and does not get into the stream of the ground in that region. They cultivated it artificially in different kinds of soil. The residual solids of the bacteria, after the soluble matter had been washed out and filtered off repeatedly, when injected under the skin of a dog, engendered the disease, which passed through all the characteristic symptoms in their regular order. — Of the other hypotheses advanced to explain the phenomena of epidemic and contagious diseases, in opposition to the germ theory, the chief is the bioplastic theory, the leading exponent of which is Dr. Lionel S. Beale of London. According to this, the infective material is bioplasm, as living protoplasmic matter is called, which has developed abnormally. Diseases consist in the growth of this degraded bioplasm in the place of healthy cells; and when a particle of it is grafted into a sound organism, the bastard process continues. (See Dr. Beale's "Disease Germs," London, 1874, and "The Microscope in Medicine," London, 1880.) The explanation of periodical epidemics by a dearth or superabundance of ozone or atmospheric electricity in the air, or by astronomical conditions, and other cosmo-tellurian hypotheses, are not as frequently advanced as formerly, but still have their supporters. Different theories, pronounced by Dongall, Bastian, and others, make the degeneration of tissue in contagious disease the result of chemical changes. — The fullest exposition of the germ theory of contagious and miasmatic diseases is contained in the German work of Nägeli, Die niederer Pflze in ihren Beziehungen zu den Infektionskrankheiten und der Gesundheitspflege (Munich, 1877). See also Wagner's "Manual of Pathology" (New York, 1877), and John S. Billings, M. D., in the supplement to Zeissmen's "Cyclopedia of the Practice of Medicine" (New York, 1879). GERSBER, Etelka, a Hungarian singer, born at Kaschan, Hungary, June 16, 1857. She gave evidence of musical ability at a very early age, which was first recognized by the director of the conservatory at Vienna, who happened to hear her sing at the head of a religious procession in her native town. By his advice she studied for three years (1873—6) with Mme. Marchesi; and in January, 1876, she made her début with great success at Venice as Gilda in Verdi's "Rigoletto." She afterward sang in the rôles of Ophelia, Lucia, Amina, and Marguerite. From Venice she went to Berlin, where she created an unexampled furor; the managers were compelled to ask that applications for seats be made in writing, and 21,000 such applications had to be refused. After singing in Buda-Pesth, she went to St. Petersburg, where her success was almost as great as in Berlin, and the court bestowed upon her costly presents and other marks of distinction. She first appeared in London in June, 1877, in "La Sonnambula," and sang there through the season of 1878; and in 1878—9, and again in 1880, she appeared in the United States. She is married to-explain the phenomena of epidemic and contagious diseases, in opposition to the germ theory, the chief is the bioplastic theory, the leading exponent of which is Dr. Lionel S. Beale of London. According to this, the infective material is bioplasm, as living protoplasmic matter is called, which has developed abnormally. Diseases consist in the growth of this degraded bioplasm in the place of healthy cells; and when a particle of it is grafted into a sound organism, the bastard process continues. After singing in Buda-Pesth, she went to St. Peters-
1857 to 1862. Studying law at the same time, he was called to the bar in November, 1864. He became connected with the Scotch militia, and in 1865 was made a captain in the royal Aberdeenshire highlanders. For two years he went the northern circuit, and during this period contributed articles to "Punch," "London Society," and "Fm," in the last of which appeared his humorous verses, afterward published in a volume entitled "Balladade." Making the acquaintance of T. W. Robertson, the dramatic author, he was led to try his hand at writing for the stage; and in December, 1866, his first piece, "Dulcamara, or the Little Duck and the Great Quack," written in six days, a burlesque on "The Elixir of Love," was produced at St. James's theatre, and met with considerable success. It was followed three months later by an extravaganza on "La Figlia del Reggimento," entitled "La Vivandièr," which was played at Liverpool and at the Queen's theatre, London. The same year he furnished a pantomime for the Lyceum. Many other pieces of the style of those just named followed, and in 1869 Mr. Gilbert's first comedy, "An Old Score," was played at the Gaiety. But he was first brought into general notice by "Agas Aga," a musical legend, the joint work of himself and Frederick Clay, which was given at the Gallery of Illustration in December, 1868. "A Sensation Novel," by Gilbert and T. G. Reed, was produced at the same place. "The Princess," a blank-verse parody upon Tennyson's poem, followed "An Old Score" at the Gaiety; and in November, 1870, came "The Palace of Truth," a fairy comedy founded on a story by Mme. de Genlis, at the Haymarket. Similar pieces were "Pygmalion and Galatea," probably his most successful work, and "The Wicked World," which had long runs at the Haymarket, beginning respectively in December, 1871, and January, 1873, and which were followed thereafter by "Charity," a four-act play, in January, 1874. "Broken Heart," another fairy play, but of a more serious character than the others, was furnished for the reopening of the Court theatre in 1876, and is preferred by its author to all his other works; but its reception by the public was not very favorable. He had previously furnished the same house with several pieces, among them "Randall's Thumb," "On Guard," "Great Expectations," and Creatures of Impulse," and "Sweethearts," a dramatic contrast in two acts, had been very successful at the Prince of Wales's theatre, where it came out in November, 1874. His adaptation of Mrs. Edward's novel "Ought We to Visit Her?" was played earlier the same year at the Royalty. In 1876 "Tom Cobb," a farcical comedy, was rendered at the St. James's, and "Don't Leave me a Drama," at the Haymarket. Two comic operas were produced the same year—"Trial by Jury," in the preparation of which Mr. Gilbert was associated with Arthur Sulli-

---

This document appears to be a page from a book or a journal, listing contents and supplement details. The text is too detailed to transcribe completely but includes entries for various authors and topics. The layout suggests it's part of a larger work, likely a historical or scientific text, given the names and titles listed.
